

ROCKWELL PART# 93012SE3300

Schedule printing of graphic displays

Use a simple command to print any graphic display in the project at any time. You might want to schedule screen prints for auditing purposes or automatically print a graphic display when a particular event (such as a high-priority alarm) occurs. You can print a graphic display even if it is not running.

Manage screen real estate with display types

Manage your graphic displays at runtime by using one of three display types. The Replace display type opens a new display and automatically closes open displays using a single Display command. The On Top display type keeps a graphic display, such as a pop up display, on top of other displays already open on the screen. The Overlay display type allows multiple displays to run simultaneously, even if they overlap.

Display data values in trends

Track plant activity as it happens by dropping the ActiveX control, RSView32 TrendX, into a graphic display. TrendX provides real-time and historical trending for up to 100 tags on a single trend with extensive, flexible runtime capabilities. RSView32 also offers native trending with preconfigured objects available in the graphics library.

COMPREHENSIVE ALARMS EDITOR

RSView32 offers a complete, flexible alarm system. Display alarm messages on the screen, in an alarm log viewer, or export the .DBF alarm log data to any ODBC-compliant database program.

RSView32 alarm monitoring allows you to:

- Monitor up to 40,000 tags for alarms.
- Define up to eight severity levels to distinguish alarms visually and audibly.
- Define up to eight alarm thresholds with different levels of alarm severity to indicate an alarm's importance. Attract attention to high-priority alarms with blinking colors in the alarm summary.
- Add user-defined remarks to the alarm log description field.

- Tie alarm thresholds to tags to provide dynamic threshold values that change with a process.
- Filter alarm summaries to display only those alarms you need to monitor.
- Associate a mirror with an alarm to provide custom handling. For example, open a display that contains instructions on how to correct the alarm condition.
- Set up global alarm monitoring. Operators can acknowledge an alarm at one station and have it recognized at all stations.
- Notify a programmable controller that RSView32 has received an alarm.

Use RSView32 Messenger, an optional software extension, to announce alarms through pagers, faxes, email, telephones, cell phones, or even locally on your computer using a sound card.

FULL-FEATURED DATA LOG EDITOR

Data logging records specific tag values under conditions defined by up to 20 different log models. Data is stored in .DBF format and can be displayed in trends, archived for future processing or analysis, and displayed or analyzed using third-party software, such as Microsoft Excel, Crystal Reports®, FoxPro®, and RSView32. ODBC database support lets you log RSView32 tag data to an ODBC-compliant database, such as Microsoft SQL Server, Oracle® or Sybase®. You can still view the data graphically in a trend. You can specify a secondary path for all logged data. If the primary path becomes full or unavailable, RSView32 can automatically switch to the secondary path without losing any data. RSView32 automatically detects when the primary path is restored and reroutes the data from the secondary path back to the primary path so that you retain all of your data in one location.

SOPHISTICATED LOGIC AND CONTROL EDITOR

RSView32 offers derived tags, event control, expressions, macros, and embedded Visual Basic® for Applications. Use these powerful options to customize and automate your RSView32 projects.

Continuously calculate values with derived tags

A derived tag's value is the result of an expression. The expression can include mathematical operations, tag values from the RSView32 internal value table, If-then-else logic, and other functions. Use derived tags to perform continuous evaluations on a tag or for any loop processing.

Trigger actions with event expressions

An event is an expression that triggers actions. You might use event detection to respond automatically to an alarm. Or as a tank approaches a specified fill level, it might warn the operator by opening a Web browser and displaying instructions from your company's Internet site.

CATERPILLAR

ROCKWELL PART# 93012SE3300

Run sequential commands from a macro file

A macro is a series of commands stored in a file. Use the macro file menu item to run a macro and enter it anywhere you can use an RSView32 command. Entering a macro file name runs the macro and sequentially executes all the commands in the file.

SECURITY FEATURES

Secure RSView32 at the project level

RSView32 provides 16 levels of security to safeguard your system at the project level. Assign levels of security to commands, alarms, database tags, graphic displays, and OLE verb control. Assigning combinations of security levels to individuals or to groups of users allows different users access to different sets of features.

Secure RSView32 at the system level

At the system level, lock users into your RSView32 application so they cannot exit to the Windows operating system during runtime. Enabling Windows security synchronizes the user account list to the user list of one domain controller, providing a means for centralizing security management and allowing users a single login. Enabling RSView32 automatically logs a Windows user into RSView32. Changing the RSView32 password also changes the Windows user password.

CUSTOMIZE AND EXTEND RSVIEW32

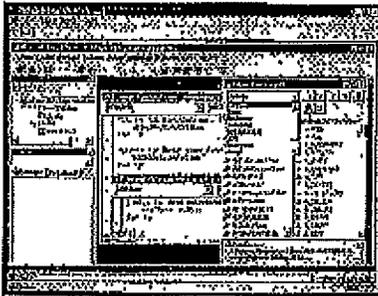

Customize projects with startup preferences

Use startup preferences to customize how a project looks and operates at runtime. Specify which graphic to display first, which window elements to display, and whether to disable or enable certain accelerator key sequences. You can also specify which subsystems to start automatically, including alarms, data logging, derived tags, and event detector.

Fully integrated VBA programming language

Microsoft Visual Basic for Applications (VBA) is fully integrated in the RSView32 core product. With the VBA integrated development environment, you can create, test, and debug VBA subroutines, and then run the subroutines from within RSView32.

By writing VBA code that interacts with the runtime Object Model of RSView32, you can manipulate RSView32 programmatically, extend its functionality, and automate processes.

OPC (OLE for Process Control)

RSView32 can function as both a native OPC client and OPC server. As an OPC server, RSView32 can serve data up to other applications. As an OPC client, RSView32 can communicate with a variety of devices and networks that cover all of your equipment, not just the Allen-Bradley devices.

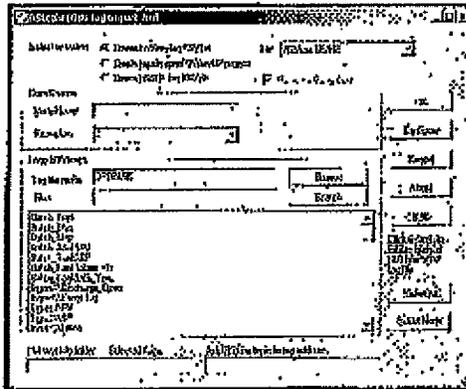

Customize RSView32 core features with Add-on Architecture

Add-on Architecture technology expands the functionality of RSView32 by integrating new software components directly into its core. Customize the RSView32 feature set by installing only those components you need.

ADDITIONAL RSVIEW32 FEATURES

RSLogix 5000 Tag Import utility

The RSLogix 5000 Tag Import utility imports RSLogix 5000 tags into RSView32, RSView Studio and RS501. In RSView32 v7.20, this utility has been enhanced to provide support for all ControlLogix, FlexLogix, and CompactLogix I/O modules. In addition, it provides support for up to 100,000 tags, arrays, user-defined data structures, module tags, and alias tags.

RSView LogViewer

The RSView LogViewer tool is an ActiveX control for displaying DataLog, Alarm Log, or Activity Log data in a grid format. It allows you to modify filter settings, select log type, display fields, data sort order and time span, or to indicate a specific time.

With RSView32 v7.20, the LogViewer ActiveX is installed as part of the core RSView32 tools.

Update projects online

RSView32 saves you time with online changes that don't require you to shut down your process. Edit graphic displays online, and the changes will take effect the next time you open the display. When you add or edit tags online, the changes take effect immediately.

CATERPILLAR

ROCKWELL PART# 93012SE3300

Organize tags in folders

RSView32 uses a convenient, intuitive folder structure to organize tags. For example, you might group all tags for Tank1 in one folder and tags for Tank2 in another folder. Browse for tags anywhere within RSView32 or from within VBA.

Reuse tag databases

RSView32 can reuse the same tags created in a PLC application. Simply open the tag browser and point and click to select the tags. Import an individual tag or groups of tags from an Allen-Bradley® PLC, SIM, or ControlLogix® database.

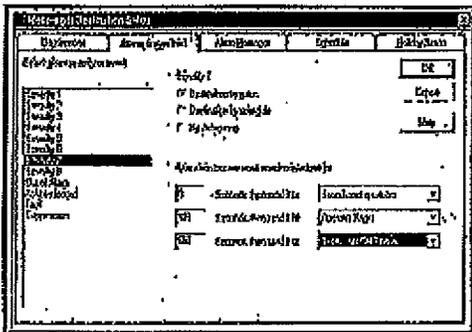

RSVIEW32 ADD-ONS

At no additional charge, you can install the following RSView32 Add-ons based on your needs:

RSView32 Messenger

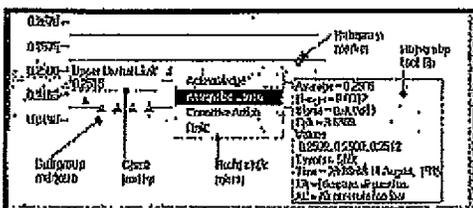

RSView32 Messenger announces alarms and simple reports through pagers, faxes, email, telephones, cell phones, or even locally on your computer using a sound card. With its scheduling capabilities, you can accommodate holidays, weekends, and business trips.

With RSView32 v7.2B, Messenger has been enhanced to allow the pager setup to be modified during runtime.

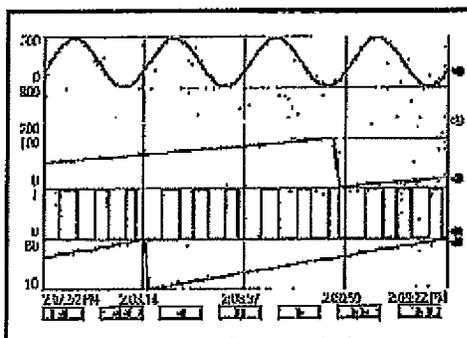

RSView32 SPC

This Add-on offers an integrated Statistical Process Control solution that provides real-time SPC analysis. SPC provides statistical methods for analyzing and controlling the variation of a process. Controlling a process is essential for producing quality products.

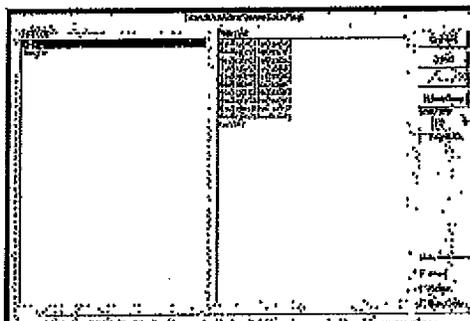

RSView32 TrendX

TrendX is an ActiveX control that integrates with RSView32 to provide real-time and historical trending from RSView32 data logs. TrendX offers extensive flexible runtime control. Add up to 100 pens on the fly, toggle between faded and overlapping trend lines, specify unique pen configurations, and plot one variable against another. Compare data by overlaying multiple trend snapshots, click and drag to reposition overlays, and click and drag to zoom in and pan through trend data.

RSView32 RecipePro

RSView32 RecipePro provides enhanced recipe management capability that allows you to configure multiple recipe project files in each RSView32 project and easily transfer process data requests to and from your automation equipment.

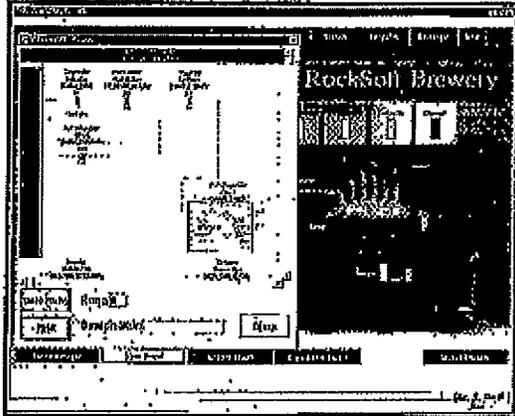

CATERPILLAR

ROCKWELL PART# 93012SE3300

RSILadder

RSILadder is an ActiveX control that displays ladder logic for the Allen-Bradley SLC[™] 500 and PLC[™] 5[™] families of processors.

FactoryTalk Diagnostics Viewer - Unfiltered

Time	Code	Message	Severity	Location	Resolution
10/10/2001 10:10:10	10001	Power supply failure	High	Power Supply	Check power supply
10/10/2001 10:10:15	10002	Temperature sensor failure	Medium	Temperature Sensor	Replace sensor

10/10/2001 10:10:55	10010	System shutdown	High	System	Restart system

NOTE: It is not necessary to install FactoryTalk Automation Platform[™] (FTAP) for RSView32 to work. If FTAP is not installed, the FactoryTalk Live Data server and Diagnostics functions in RSView32 will be disabled.

FACTORYTALK INTEGRATION

FactoryTalk[™] is a manufacturing information platform that integrates plant-wide control systems and connects the enterprise with the production facility. RSView32 v7.20 adopts the following three FactoryTalk technologies:

FactoryTalk Live Data server

RSView32 is a FactoryTalk[™] Live Data[™] server that provides tags to FactoryTalk clients such as RSView[™] Supervisory Edition[™] and RSWinWare[™] software products.

FactoryTalk Diagnostics

This feature allows RSView32 to log warning, error, and diagnostic messages to a system-wide FactoryTalk[™] Diagnostics[™] destination. The diagnostic messages can be viewed with a FactoryTalk Diagnostics Viewer.

FactoryTalk Activation

With RSView32 v7.20, the old floppy disk-based activation has been replaced by the new FactoryTalk[™] Activation[™] system that is based on activation files generated by Rockwell Software and distributed over the Internet.

RECOMMENDED REQUIREMENTS

The hardware and software you need for RSView32 depends on the demands your project places on the system. The following tables use points to rate the demands that various uses place on your system.

Use the first table to find the demand (in total points) your project places on the system. Use the second table to determine the hardware and software you need.

CATERPILLAR[™]

ROCKWELL PART# 93012SE3300

Feat	If you use:	R5View32
R5View32 Project	Routing displays, or editing your project using R5View32 Work	Add 7 points
	Using more than 30,000 tags	Add 2 points
	Using more than 5,000 tags	Add 1 point
	Changing displays, on average, more than 5 times per minute	Add 1 point
	Using more than 200 objects in displays	Add 2 points
	Using ActiveX controls in displays	Add 2 points
	Alarms	Monitoring more than 1,500 tags for alarms
	Monitoring more than 300 tags for alarms	Add 1 point
Number of Active Clients	Using typically more than 5 active clients	Add 2 points
	Using at least 1 client	Add 1 point
Data Log or Historical Trends	Logging fewer than 100 tags in 1 model	Add 1 point
	Logging between 100 and 1000 tags in 1 model	Add 2 points
	Logging to more than 1 model	Add 2 points
Event Detector, Derived Tags, or Real-time Trends	Using any	Add 1 point
VBA	Using any	Add 2 points
Add-ons	Using any, for each one	Add 1 point

Total Points:

Minimum system requirements for R5View32 based on points

For this number of points	You need:
4 or more	Pentium® II 400, 128MB RAM, Windows XP Professional* or Windows 2000 Professional** or Windows Server 2003***
6 to 7	Pentium 2 300, 128MB RAM, Windows XP Professional* or Windows 2000 Professional** or Windows Server 2003***
3 to 5	Pentium 200, 64MB RAM, Windows XP Professional* or Windows 2000 Professional** or Windows Server 2003***

* With Service Pack 1 or later
 ** With Service Pack 3 or later
 *** With Service Pack 1.

SPECTER PART# WIN-911/PRO-BT

Alarm Notification Software Version 7.00

WIN-911 is real-time Alarm Notification Software that works with your existing control software or SCADA system to monitor operations and notify personnel of problem conditions. With WIN-911, your operators can concentrate on other tasks while your computer system does the monitoring.

Applications Include:

Water & Wastewater Facilities, Power Plants, Military Facilities, Automobile, Semiconductor and Pharmaceutical Manufacturers, Bulk Drug Manufacturing & Security, and Oil & Gas Refining.

WIN-911 can be used with pagers, cell phones, fax/modem phones and most wireless communications.

REGISTRATION OPTIONS

SMS Mobile-to-Mobile

To provide the most secure, reliable and timely notification option, you may now choose SMS 1-Way or SMS 2-Way text messaging. This method does not require an internet or email connection. Just select a standard GSM modem and a text messaging plan from your local wireless carrier.

SMS 1-Way is featured with all WIN-911/Basic software installations. This allows SMS Text alarm messaging to be sent to all "on duty" users with a basic cell phone. It also gives notification when alarms have been acknowledged.

SMS 2-Way is available with all WIN-911/PRO installations. This feature includes:

- Text notification on alarms
- Individual alarm acknowledgement from your cell phone
- "On Demand" list of alarms which have been acknowledged, but are still in the alarm condition
- Health Status
- 2-Way Manual text messaging available in the WIN-911 alarm monitor

SMS 2 Way also supports the powerful Mobile-911 Smart Phone applications. (See the Mobile-911 data sheet.)

Telephony

Text-to-Speech & Voice Synthesis

- Instantly create all of your required voice sound files in just minutes...OPC and Direct Connects will use the tag descriptions from the SCADA database as the default text for the tag sound
- This version also offers the opportunity to select Dynamic Text-to-Speech Human Voice Synthesis
- Verbalize the text from the tag values and descriptions to the local audio and telephony notification types
- Eliminates the need for pre-recorded .wav files

Prmium Voices

This is a standard feature found on all new WIN-911/PRO systems. It offers professional sounding voices as an alternative to the Microsoft choices. Voices are available in male and female selections. The standard accent is US English. International voices such as UK English, French, and Indian are available as special order.

WIN-411

WIN-411 Reports is a standard feature with the voice telephony option and supports IFIX and Wonderware Direct Connects. (This feature is not supported with Rockwell Software products in this release.) Authorized users can call in and have access to current alarms and data values. Additionally, the user can change a data value in the SCADA database. This function is password protected and can be limited to minimum and maximum allowable values.

Dialogic Telephony Cards

WIN-911 continues to support the world's leader in computer telephony for applications requiring robust communications and multiple incoming lines.

Voice Capable (TAPI) Modems

Lower cost solutions for single line voice connections. These devices are typically "Plug & Play" and greatly reduce installation hassles.

Wireless & Email Notification

Support for Email using SMTP servers or AlphaNumeric Pagers using IAP protocol are also supported.

CATERPILLAR®

SPECTER PART# WIN-911/PRO-BT

2

DATA INTERFACE OPTIONS

This connection to your SCADA Database is the most advanced in the industry. Stand alone and Distributed installations are supported.

WIN-911 Direct Connect

- This offers the most seamless and powerful connection available
- Your SCADA system determines the alarm
- WIN-911 does the remote alarm notification
- User can acknowledge the alarms in your SCADA database locally or by phone

WIN-911 Direct Connect supports *Rockwell (RSView32, FactoryTalk View SE and FactoryTalk, GE Fanuc Proficy (FIX) and Wonderware InTouch - SCADA products.* (See separate datasheet for FactoryTalk)

Other Connections

- **OPC:** Operating as an OPC Client, WIN-911 is compatible with any OPC server that supports Data Access Version 1.0 & 2.0. Network connections are supported
- **Microsoft DDE:** The generic DDE connection is still available for other Windows applications that can be configured as a DDE Server

SCADA Database Import

- Import your existing SCADA Database or data from OPC Servers using WIN-911's Import Browser
- Select the data tags you want to include in WIN-911
- The Database Import Utility will instantly build a WIN-911 configuration
- Simply enter your pager & phone numbers, e-mail addresses, assign duty schedules & groups
- You're done in just minutes
- *Of Rockwell Software users may want to use the new Filter Tags. You may configure "filter tags" which are collected from the Alarm Database and brought into WIN-911 for remote notification on-the-fly.*

ADDITIONAL FEATURES

Alarm Log Manager

The ability to view, sort, arrange, and print your alarm history any way you would like.

- Personal notification attempts and confirmations
- Acknowledgements, events, and error codes
- Each line item may be annotated using the "Notes" feature

WEB-911 XTools

This is a new option for WIN-911 offering a family of ActiveX controls that will allow the user to drop WIN-911 configuration modules into most SCADA displays. Each module is called an XTool. They include:

- XContact - add or edit contacts in Phone Book
- XGroup - edit the Group function
- XSchedule - view and edit all users' duty schedules
- XApply - apply changes to the WIN-911 Runtime
- XStandby and XActivate - scripting controls for hot backup systems

Security Options

WIN 911 offers many levels of optional security and scripting tools for achieving unique integration with your SCADA installation.

- Password & Acknowledgment Codes can control access to most functions from a caller ID to restricting changes to authorized operators
- System Health Heartbeats and Watchdogs can be setup to monitor health of both WIN-911 and the SCADA Software
- Hot Backup capabilities with scripting tools are available for the SCADA system to control which WIN-911 system is responsible for the remote alarm notification

WIN-911 Now Available As A Service

You may now choose to apply WIN-911 runtime as a Windows Service for most applications. Contact factory for minor limitations or technical information.

Audit Modifications

Track and archive modifications to your WIN-911 configuration to a special text file using the Audit Modification tool. Using this text file with encryption software will meet the 21CFR11 requirements for monitoring changes in the configuration.

Product Data Sheet

9070T1500D1

Industrial Control Transformer, 1500VA

Schneider Electric

Technical Characteristics

Insulation Temperature	180 Degrees C
Application	Specifically designed to handle high inrush associated with contactors and relays for applications such as conveyor systems, paint lines, punch presses or overhead cranes
Approvals	UL Listed File Number: F81209 - CSA Certified File Number: I R37085 Guide: 184-M-90 - CE Marked
Enclosure Type	Open
Terminal Type	Screw Clamp
Width	7.00 inches
Phase	1-Phase
Mounting Type	Panel
Fuse Block	None
Temperature Rise	115 Degrees C
Type	T
Height	6.18 inches
Rating	1500VA
Winding Material	Copper
Secondary	120V or 115V or 110V
Depth	6.81 inches
Primary	240x410V or 230x460V or 220x440V

Shipping and Ordering

Category	16201 - Transformers, Industrial Control, 250 - 2000 va, Type T
Discount Schedule	C18

Pro-face

1341 Fanless, Diskless Industrial "Node" PC without Integrated Display

DS-134100(C)

The newest Xycom industrial PC from Pro-face America is designed for the harsh environments required for plant floor use. This 1341 addresses the growing concern for reliability of rotating hard drives in these environments. Utilizing solid state media to store the operating system and your application, higher levels of reliability are easily obtained. In addition there are no system fans to hinder cooling when air flow is restricted by dust and debris, often found in factory environments.

Higher Performance, Lower Power

The 1341 utilizes an Intel mobile Celeron M processor while utilizing nearly half the wattage of many Pentium 4 class PCs. The Celeron M 1.3 GHz with 512 K Cache running at 400 MHz system bus provides enough processing power for many simple factory automation applications. The custom designed housing, which acts as a heatsink, coupled with the lower power usage allows the 1341 to operate in environments up to 50°C without the need for a system fan or additional cooling devices.

Full Featured in a Compact Package

The 1341 offers 4 RS-232 serial ports, 4 USB 2.0 compliant ports,

10/100 Ethernet, parallel, video, PS/2 mouse and keyboard ports, and an audio port. Even more options are available with the half-length PCI expansion slot and the two PCMCIA card slots. There also is a CompactFlash™ Type I/II slot that is utilized for the system memory to store the operating system and application(s). All this is accomplished in a compact package that is about the size of a standard package of printer paper.

Superior Video Performance

The on-board 4X AGP graphics controller defaults to 4 MB system RAM to allow resolutions up to 1280 x 1024. In addition the 1341 automatically shares up to 32 MB system RAM to allow full 32-bit color depth and 3D rendering.

- Intel® Celeron® M 1.3 GHz, 512K cache, 400 MHz system bus
- 4X AGP video controller with up to 32 MB video memory (shared with system memory)
- 512 MB DRAM
- 4 GB CompactFlash™
- 10/100 Base-T Ethernet port
- 4 USB 2.0 compliant ports
- Audio port
- 4 RS-232 Serial ports
- Video port
- Parallel port
- PS/2 mouse and keyboard ports
- 2 externally accessible PCMCIA ports
- One half-length PCI expansion slot
- 9-30 Volt regulated DC input (AC power supply sold separately)
- UL and cUL recognized
- CE approved
- RoHS Directive-compliant
- Preloaded with Windows® XP Professional (Windows 2000 Professional optional)
- 2-year warranty included

Meets High Standards

To survive on the plant floor the 1341 meets FCC, UL, cUL and European CE mark requirements for industrial automation equipment. Xycom brand industrial PCs lead the industry in reliability, service, and support with an optional five year warranty available.

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

1.1 Introduction

Your PowerLynx Switchgear is designed to provide you with years of dependable emergency power. Great care has been taken to ensure that your system is reliable and easy to operate.

Typically, PowerLynx Switchgear is powered by at least 2 separate DC sources. The system automatically selects the best of these sources. Failure or disconnection of any of the sources will in no way interrupt your power protection.

PowerLynx Switchgear is furnished with several levels of fault tolerance. Hardware backup has been provided to allow you to run the system manually.

This manual provides a description of the operation of the PowerLynx Switchgear and the Touch Screen operator interface. The PowerLynx Touch Screen interface is designed to provide the operator with

- Easily operated controls
- Instantly available important system information
- Current system status conditions
- A selection of system reports

The Touch Screen operates intuitively; just touch the area you're interested in and the system zooms in on it.

***Note:** All information contained herein is proprietary and/or patent pending. Copying any portion of this manual without written permission from ISO or its licensed distributors is expressly forbidden.

1.2 Definition of Terms

Touch Screen Processor (TSP) - Computer that drives the Touch Screen.

Touch Screen (TS) - Computer monitor with touch screen operator interface.

Hot Area - An area on the Touch Screen that, when touched, will cause something to happen.

Hot Bus Indication- A bus is indicated on the HMI as energized by the light blue color and not energized by dark blue.

Load Shed - The opening of circuit breakers to de-energize certain selected loads when the generator plant is being overloaded.

Generator Demand Priority - The removal of generators, by assigned priority, according to the building's power demands.

Human Machine Interface (HMI) - The interface between the operator and the machine. On the PowerLynx the software running on the Touch Screen TSP.

Synchronization - The matching of the voltage waveforms of two power sources.

Engine Control Switch (ECS) - Four-position selector switch that controls the generators mode of operation.

Electronic Modular Control Panel (EMCP3S) - Caterpillar developed engine/generator controller.

Synchronization Mode Selector Switch (Sync Mode) - A Three-position selector switch that controls a sources synchronization mode.

Pre-alarm - A cautionary engine or generator condition that does not cause an engine shutdown, but indicates that corrective action is required.

Shutdown Alarm - An engine or generator condition that is serious enough to cause an engine to be automatically shutdown and removed from the bus.

Master Mode Selector Switch (MMS) - Four-position selector switch that controls the operational mode of all generators, as well as utility and tiebreaker operation.

Utility Fail Test Switch (UFT) - Two-position selector switch that causes a utility(s) failure to be simulated.

CEMF - Counter Electro-Motive Force is generated from residual magnetism in the rotors of de-energized motors as they wind down.

1.3 System Type Descriptions

1.3.1 EGP

An EGP system is defined as having 2-16 generators feeding a common generator bus. There is no utility main breaker in the switchgear and no control of a remote utility breaker in an EGP system. Distribution breakers on the common generator bus are optional. An EGP system can perform Emergency mode, No Load Test Mode and Utility Fail Test Mode/Test With Load as described in the Sequence of Operations.

- Automatic Start, Synchronize, Parallel, and Load Share on a common bus
- Main Lugs Output to feed downstream emergency distribution switchboard
- Optional Emergency Distribution CBs
- Load shed/add
- Generator priority demand
- For use with multiple downstream Automatic Transfer Switches
- Caterpillar switchgear is designed to integrate hand-in-glove with Caterpillar Automatic Transfer Switches. EGP is optionally available with direct communication to CAT ATS's to provide "fingertip" control and monitoring of all your facility ATS's from one convenient central location

1.3.2 XLM

An XLM system is defined as having one utility source and 1-16 generators feeding a common generator/load bus. This common bus is normally energized. There is no Tiebreaker between the utility breaker and the generator bus in an XLM system. There can only be one utility source in an XLM system. Distribution breakers on the common generator/load are optional. An XLM system can perform Emergency Mode, Transfer to Emergency Mode, Load Management Mode, No Load Test Mode, and Utility Fail Test Mode as described in the Sequence of Operations.

- Automatic Transfer to Emergency upon Utility failure
- Automatic Start, Synchronize, Parallel, and Load Share on a common bus
- Closed transition transfer back to Utility upon stable return of power, with soft generator unloading.
- Closed transition Load Management Mode with soft loading and unloading of generator system
- Closed transition transfer to Emergency Mode to facilitate maintenance, or for storm threat avoidance, with soft loading and unloading of generator system
- Load shed/add
- Generator priority demand
- Cost effective, technically superior alternative to conventional ATS arrangement

1.3.3 LM

LM – An LM as a generator plant system is defined as having one utility source and 1-16 generators feeding a common generator/load bus. This common bus is normally energized. There is no tiebreaker between the utility breaker and the generator along with the generator bus in an LM as a generator plant system. There can only be one utility source in an LM as a generator plant system. Distribution breakers on the common generator/load bus are optional but not typical. An LM as a generator plant system can perform Load Management Mode and No Load Test Mode as described in the Sequence of Operations. There is no Emergency Mode.

- Standardized, simple, cost effective control switchgear for local or remotely initiated starting, stopping, synchronizing, utility paralleling, load management, and distributed generation
- Available as:
 - o Base loading export
 - o Utility set-point import peak shaving

PowerLynx Technology brings the power and reliability of microprocessor technology to your generator power application. Through the use of the PowerLynx operator interface touch screen display, with easy to follow graphical presentations, the PowerLynx technology product merges the features of:

- Power Monitoring
- Switchgear Automation
- Generator Set Control
- Remote Communications

2.1 EGP Sequence of Operation

A. The System Controls shall be designed and integrated with the other specified control components to provide a completely functional total system which shall automatically perform the following generally described sequence of operations:

1) AUTOMATIC/STANDBY (UTILITY) MODE

- a. The automatic transfer switches are in the normal position serving utility power to the loads.
- b. The generator mains are open.
- c. The automation is standing by to act in response to a utility failure.

2) EMERGENCY (GENERATOR) MODE

a. Utility Failure

- (1) Automatic transfer switch(es) protective relaying senses utility undervoltage condition.
- (2) A run request is sent to the generator plant.
- (3) The first generator up to voltage and frequency is closed to the bus.
- (4) The remaining generators are synchronized and paralleled to the bus as they come up to voltage and frequency.
- (5) Automatic transfer switches transfer to emergency position via their time delays and via the Load Shed Control.
- (6) The system is now in Emergency Mode.

b. Utility Restoration and Exit from Emergency Mode

- (1) Automatic transfer switch(es) protective relaying senses utility voltage within tolerance.
- (2) Following the automatic transfer switch return to normal time delay, to assure that the utility power source is stable, the automatic transfer switches individually retransfer to the normal position.
- (3) When the last automatic transfer switch has retransferred to the normal position, the generator mains are opened.
- (4) The generators are allowed to run for their programmed Cooldown period.
- (5) The system is now in Automatic/Standby (Utility) Mode.

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

2.1.1 GENERATOR TEST MODE

a. Entry

1. The operator places the System Mode Selector Switch into the Gen Test position.
2. A run request is sent to the generators.
3. The first generator up to speed and voltage is closed to a dead bus.
4. The remaining generator is synchronized and paralleled to the bus when it has reached acceptable voltage and frequency.
5. The system is now running in Gen Test Mode, and the operator may manually close the load bank breaker to apply load to the generators.

b. Exit

1. The operator places the System Mode Selector Switch into the Auto position.
2. The generator mains are opened.
3. The generators are allowed to run for their programmed cooldown period.
4. The system is now in Automatic/Standby (Utility) Mode.

2.2 XLM / XLM-T Sequence of Operation

The System Controls shall be designed and integrated with the other specified control components to provide a completely functional total system which shall automatically perform the following generally described sequence of operations:

2.2.1 AUTOMATIC/STANDBY (UTILITY) MODE

- e. The utility main is closed serving utility power to its load bus.
- d. The emergency tie is open.
- c. The generator mains are open.
- f. The automation is standing by to act in response to a utility failure.

2.2.2 UTILITY FAILURE

EMERGENCY (GENERATOR) MODE

- g. Utility Failure (Conditional Load Shed)
 - 1. Utility protective relaying senses utility voltage or frequency out of tolerance.
 - 2. The utility main is opened.
 - 3. A run request is sent to the generator plant.
 - 4. All Non-Essential loads on failed load bus are shed.
 - 5. The first generator up to speed and voltage is closed to a dead bus.
 - 6. The emergency tie is closed.
 - 7. Essential Priority Levels will be added as a function of the on-line generator capacity by the user selected load add / shed time delays and within the user selected load add / shed limits.
 - 8. The remaining generator(s) is synchronized and paralleled to the bus when it has reached acceptable voltage and frequency.
 - 9. The system is now in Emergency Mode.
- h. Utility Restoration and Exit from Emergency Mode
 - 1. Utility protective relaying senses utility voltage and frequency within tolerance.
 - 2. Following a 30-minute time delay (which can be abbreviated by the operator) to assure that the utility power source is stable, the generators are passively synchronized and paralleled to the utility source, by closing the utility breaker.
 - 3. The generators are soft ramp unloaded until the utility source is nominally serving the entire system load.
 - 4. The emergency tie is opened when it's disconnect kW has been reached.

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

5. The generators are allowed to run for their programmed cooldown period.
6. The system is now in Automatic/Standby (Utility) Mode.

2.2.3 CLOSED TRANSITION TO EMERGENCY MODE

i. Entry

1. The operator places the System Mode Selector Switch into the Emergency position.
2. A run request is sent to the generators.
3. The generators are allowed to run for a five-minute warm-up time (which can be abbreviated by the operator).
4. The first generator up to speed and voltage is closed to a dead bus.
5. The remaining generator is synchronized and paralleled to the bus when it has reached acceptable voltage and frequency.
6. The generators are passively synchronized and paralleled to the utility source, by closing the tiebreaker.
7. The generators are then soft ramp loaded until the generators are serving nominally the entire load on the load bus and the utility main is opened.
8. The system is now running in Emergency Mode.

j. Exit from Emergency Mode

1. The operator places the System Mode Selector Switch into the Auto position.
2. Following a 30-minute time delay (which can be abbreviated by the operator) to assure that the utility power source is stable, the generators are passively synchronized and paralleled to the utility source, by closing the utility breaker.
3. The generators are soft ramp unloaded until the utility source is nominally serving the entire system load.
4. The emergency tie is opened when it's disconnect kW has been reached.
5. The generator mains are opened.
6. The generators are allowed to run for their programmed cooldown period.
7. The system is now in Automatic/Standby (Utility) Mode.

5.1 Automatic Operation

The System Controls shall be designed and integrated with the other specified control components to provide a completely functional total system which shall automatically perform the following generally described sequence of operations:

5.1.1 Standby Mode

A. RGP

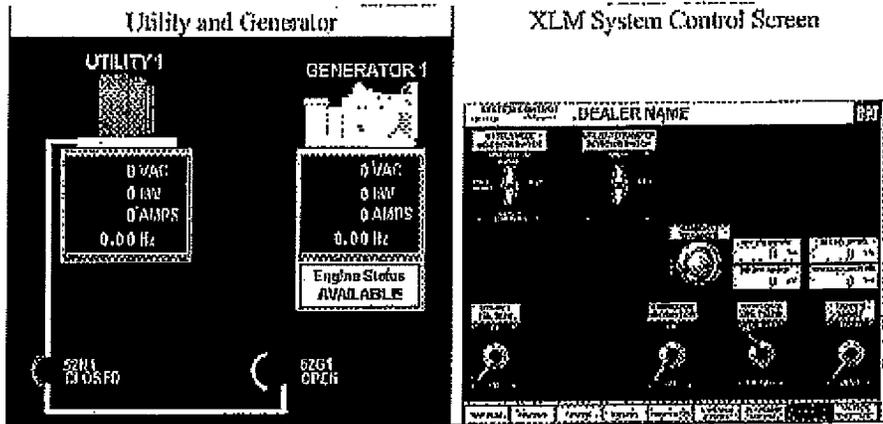

- a. The automatic transfer switches are in the normal position serving utility power to the loads.
- b. The generator mains are open.
- c. The automation is standing by to act in response to a run request from associated Automatic Transfer Switches.

B. XLM

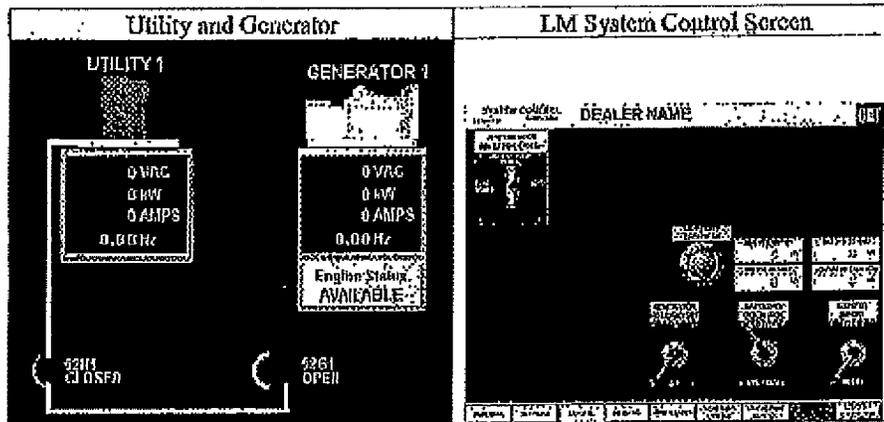

- a. The utility main breaker is closed serving utility power to the generator/loads bus.
- b. The generator main breakers are open.
- c. The automation is standing by to act in response to a utility failure.

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

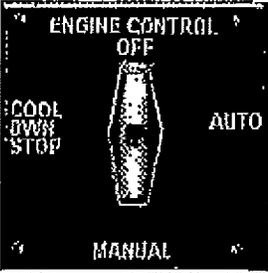

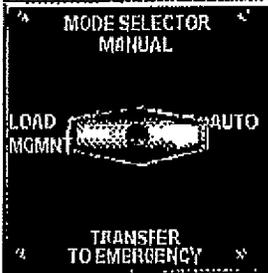

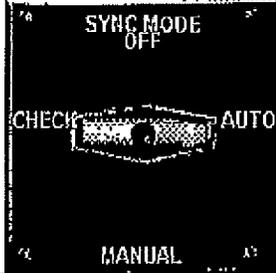

C. LM

- The utility main breaker (Optional) is closed serving utility power to the generator/loads bus.
- The generator main breakers are open.

- d. Automatic transfer switches transfer to emergency position via their time delays and via the Load Shed Control.
- e. The system is now in Emergency Mode.

XLM

- a. Utility protective relaying senses utility undervoltage or frequency out of tolerance condition.
- b. The utility main breaker is opened.
- c. A run request is sent to the generator plant.
- d. The first generator up to voltage and frequency is closed to the bus.
- e. The remaining generators are synchronized and paralleled to the bus as they come up to voltage and frequency.
- f. The system is now in Emergency Mode.

LM

There is no Emergency function on LM systems.

5.2 Load Shed

A. The System Controls shall include a Load Shed Control function to control the loads served by the generator plant. The Load Shed Control shall have one Essential Load Shed Priority Level for each generator in the system plus one Non-Essential Load Shed Priority Level (which is always shed in the Emergency Mode of operation). The Load Shed Control shall provide a 4 pole, 10A, 120VAC rated, form C set of contacts for each Load Shed Priority Level to allow the control of loads external to the Emergency Generator Paralleling Switchboard. Additionally, the Load Shed Control shall control each of the distribution circuit breakers within the Emergency Generator Paralleling Switchboard, which are shown on the drawings to be electrically operated. Each electrically operated distribution circuit breaker shall be field selectable to be assigned to any of the available Load Shed Priority Levels. The following controls shall be provided for each Essential Load Shed Priority:

- 1) One - Shed Delay Timer, adjustable from 0 to 255 minutes
- 2) One - Add Delay Timer, adjustable from 0 to 255 minutes
- 3) One - Load Shed By-Pass Selector (auto/manual shed/manual add)
- 4) Three - Status Indicators to show the 3 positions of the Load Shed By-Pass Selector
- 5) Two - Status indicators to show whether the Priority Level is Added or Shed

Confidential

CONFIDENTIAL

WTUR0000382

JA 00003177

CATERPILLAR EMCP 3.5 TRAINING/TECHNICAL MANUAL

B. The following controls shall be provided for the Non-Essential Load Shed Priority:

- 1) One - Load Shed By-Pass Selector (auto/manual shed/manual add)
- 2) Three-Status indicators to show the 3 positions of the Load Shed By-Pass Selector
- 3) Two-Status indicators to show whether the Priority Level is Added or Shed

C. Additionally, the Load Shed Controls shall have:

- 1) One - Load Shed Control Switch (On/Off)
- 2) One - User-settable Load Shed % (as a function of on-line generator capacity)
- 3) One - User-settable Load Add % (as a function of on-line generator capacity)
- 4) One - User-settable Bus Underfrequency Setpoint and time delay
- 5) One - Bus Frequency Normal indicator
- 6) One - Bus Underfrequency Indicator

D. Conditional/Load Sensitive

- 1) Conditional Load Shed: Upon entrance into Emergency Mode of operation, the Load Shed Control shall shed all Non-Essential loads. As generators come to the bus, Non-Essential Priority Level loads shall be added based on the number of generators on line. When the first generator comes to the bus, Priority Level 1 loads shall be added; second generator, priority 2, etc. After a time delay that allows all operational generators to come to the bus, Load Shed Mode shall shift to Load Sensitive Mode. (Provided the Load Shed Switch is in ON)
- 2) Load Sensitive Load Shed: After all generators have been given sufficient time to come to the bus, load shed shall shift to "Load Sensitive" mode. The system shall compare current generator on-line capacity (in kW) to current load requirements. If surplus capacity is greater than the calculated Load Add Setpoint, after the Load Add Time Delay the next Load Shed Priority will be added. This calculation will continue until all Sheddable Loads are added, or until surplus capacity is less than the calculated Load Add Setpoint. If surplus capacity is less than the calculated Load Shed Setpoint, after the Load Shed Time Delay the next Load Shed Priority will be shed. This calculation will continue until all Sheddable Loads are shed, or until surplus capacity is greater than the calculated Load Shed Setpoint. The Load Shed Control, in its automatic shedding and adding of loads, shall not override any manual load shed/add operation.

E. Should a generator fail off-line or should loads increase, Essential Priority Level loads shall be shed as a function of the on-line generator capacity by the user selected load shed time delays and within the user selected load shed limits. The Load Shed Control, in its automatic shedding of loads, shall not override any manual load add operation.

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

F. Should the load bus frequency fall below the user selected bus underfrequency, then an alarm is triggered and displayed on the system alarm summary.

(c) How to set Load Shed Levels

Hardwire

- The Load Shed Control shall provide a 4 pole, 10A, 120VAC rated, form C set of contacts for each Load Shed Priority Level
- Each Priority can be manually added or shed from the Touch Screen

Electrically operated breakers

- Each electrically operated distribution circuit breaker shall be field selectable to be assigned to any of the available Load Shed Priority Levels

5.3 Generator Demand Priority

A. The System Controls shall include a Generator Demand Priority Control function to automatically match the on-line generator capacity to the loads to avoid unnecessary operation of all the generators when the loads are low. This allows the operator to make most efficient use of available Genset capacity. The following controls shall be provided for each generator:

- 1) One - User-settable Generator Priority Selector
- 2) One - Status Indicator for the Generator Priority Selected
- 3) Two - Status Indicator for generator On-line or Off-line

B. Additionally the Generator Demand Priority Control shall have:

- 1) One - Generator Demand Priority Control Switch (On/Off)
- 2) One - User-settable Generator Remove Differential kW
- 3) One - User-settable Generator Minimum Reserve kW
- 4) One - User-settable Generator Remove Delay
- 5) One - User-settable Generator Immediate Add Reserve kW
- 6) One - User-settable Generator Add Delay
- 7) One - User-settable Minimum Number of Generators

C. Upon entrance into Emergency or Load Management modes, all generators shall be started and paralleled to the bus. After the settable Remove Time Delay times out, generators shall be removed from the bus in descending priority order (i.e. Generator Priority #3 removed first, Generator Priority #2 removed second) when the bus load drops under the Remove Setpoint of each Generator. The remove setpoint is a function of the generator size minus a minimum reserve Setpoint as well as Remove differential

Should the generator load increase to the user selected Generator Add Setpoint (GenSize minus the Minimum Reserve Setpoint) for the duration of the user

JA 00003186

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

- First generator up to voltage and frequency is closed to the bus.
- All remaining generators are synchronized and paralleled to the bus as they come up to voltage and frequency.
- The system is now in No Load Test Mode.

Exit from No Load Test Mode

XLM/LM

- Generator No Load Test Switch is taken to OFF position
- All generators are allowed to run for their programmed cooldown period.
- The system is now in Automatic Mode

BGP

- Generator No Load Test Switch is taken to OFF position
- All generator breakers are opened
- All generators are allowed to run for their programmed cooldown period.
- The system is now in Automatic Mode

Required Switch Positions

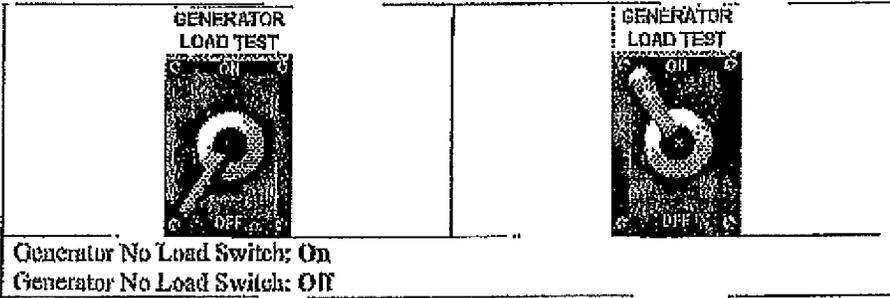

Master Mode Switch	Engine Control Switch	Sync Mode Switch
		
<ul style="list-style-type: none"> • Master Mode Selector Switch (Located on System Control Screen): Automatic • Engine Control Switch (Located on Overview Screen, Engine Control Screen): Automatic • Sync Mode Switch (Located on Engine Control Screen): Automatic 		

To initiate Generator No load Test, touch "GENERATOR NO LOAD TEST" Switch. The switch will move from the OFF position to the ON position beginning the test.

To exit from no load test, touch "GENERATOR NO LOAD TEST" Switch. The switch will move from the ON position to the OFF position ending the test.

5.6 Generator Test with Load

Purpose/Description

- Perform periodic testing of generators to include picking up all system loads

XLM/LM

- There is no Load Test function available.

EGP

- For Sequence, see Utility Fail Test Section 2.

Required Switch Positions

Master Mode Switch	Engine Control Switch	Sync Mode Switch
		
<ul style="list-style-type: none"> • Master Mode Selector Switch (Located on System Control Screen): Automatic • Engine Control Switch (Located on Overview Screen, Engine Control Screen): Automatic • Sync Mode Switch (Located on Engine Control Screen): Automatic 		

To initiate Generator Load Test, touch "GENERATOR LOAD TEST" Switch. The switch will move for the OFF position to the ON position beginning the test

Generator Load Test Switch positions	
	
<ul style="list-style-type: none"> • Generator Load Switch: Off • Generator Load Switch: On 	

CATERPILLAR EMCP 3.5 TRAINING/TECHNICAL MANUAL

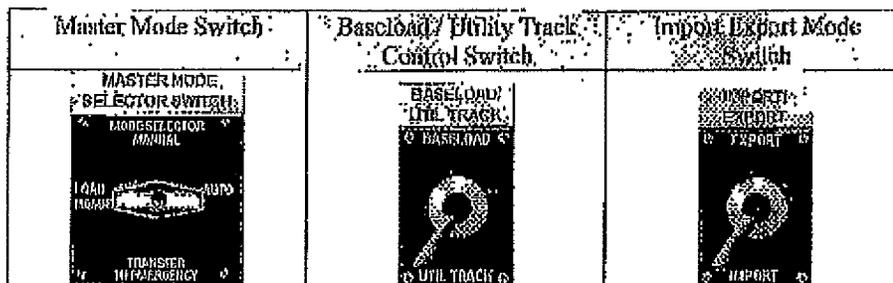

To exit from load test touch "GENERATOR LOAD TEST" Switch. The switch will move for the "TEST" position to the "OFF" position ending the test.

5.7 Load Management (XLM/LM only)

Purpose/Description

- A. **Import Limit-** Place the Import/Export toggle switch in the Import position and place the Base Load/Utility Tracking toggle switch in the Utility Tracking position. Set the Utility Import Setpoint to the desired amount of kW that you want to import through the Utility Circuit Breaker during Load Management Mode.
- B. **Export Limit-** Place the Import/Export toggle switch in the Export position and place the Base Load/Utility Tracking toggle switch in the Utility Tracking position. Set the Utility Export Setpoint to the desired amount of kW that you want to export through the Utility Circuit Breaker during Load Management Mode.
- C. **Base Load Import-** Place the Import/Export toggle switch in the Import position and place the Base Load/Utility Tracking toggle switch in the Base Load position. Set the Base Load Setpoint to the desired amount of kW that you want the generator plant to assume during Load Management Mode. The controls will not allow the generator plant to export kW through the Utility Circuit Breaker and will always maintain a nominal amount of Utility kW imported through the Utility Circuit Breaker.
- D. **Base Load Export-** Place the Import/Export toggle switch in the Export position and place the Base Load/Utility Tracking toggle switch in the Base Load position. Set the Base Load Setpoint to the desired amount of kW that you want the generator plant to assume during Load Management Mode. The controls will allow the generator plant to export kW through the Utility Circuit Breaker.

5.8 Utility Fail Test

Purpose/Description

- Perform periodic testing of system to respond to a utility outage.

Entrance into Utility Fail Test Mode

XLM

- Utility Fail Test Switch is taken to **ON** position.
- Voltage sensing at the utility protective relay is opened, which simulates a loss of utility.
- System enters Emergency Mode as described in 2.01.2(b)

EGP

- Utility Fail Test Switch is taken to **ON** position.
- A dry contact is sent to each ATS, which simulates a loss of utility within the ATS controls.
- System enters Emergency Mode as described in 2.01.2(a).

Exit from Utility Fail Test Mode

XLM

- Utility Fail Test Switch is taken to **OFF** position.
- Voltage sensing at the utility protective relay is restored, which simulates a return of utility power.
- System exits Emergency Mode as described in 2.01.5(b).

EGP

- Utility Fail Test Switch is taken to **OFF** position.
- A dry contact is removed from each ATS, which simulates a return of utility within the ATS controls.
- System exits Emergency Mode as described in Section 2.

6 System Pop Ups

Section 6.1 *Engine Cooldown Timers*
Section 6.2 *Utility Ok to Retransfer*
Section 6.3 *Utility Retransfer Timer*
Section 6.4 *Warm up Timers*
Section 6.5 *Transfer Imminent*
Section 6.6 *ATS Ok to Retransfer*

6.1 Engine Cooldown Timer

Description	
Engine Status COOLDOWN	3.26 min
<ul style="list-style-type: none"> • Located on the Overview Screen • Displays when the generator is unloading and it's respective breaker is opened or if running isolated from the bus and the operator places the switchgear ECS in the Cooldown/Stop position. 	

6.2 Utility OK to Retransfer

Description	
UTIL 1 RETRANSFER OK	
<ul style="list-style-type: none"> • Located on the System Control Screen • This will only display when the Utility Retransfer Selector Switch is in the Manual position and the Utility Retransfer timer has expired. 	

6.3 Utility Retransfer Timer

Description	
UTIL 1 RE-XFER TIMER 3.42 min	
<ul style="list-style-type: none"> • Located on the System Control Screen • Displays when the system detects the utility voltage and frequency are within acceptable tolerance and no other faults exist on the utility after a faulted condition. 	

6.4 Warm-up Timer

Description	
WARM-UP TIMER 1 4.17 min	
<ul style="list-style-type: none"> • Located on the ATS Control Screen • Displays when the engine plant is started while performing the following: Load Management or Close Transfer to Emergency. 	

6.5 Transfer Imminent

Description	
TRANSFER IMMINENT 1	
<ul style="list-style-type: none"> • Located on the Sys Control Screen • Displays when the operator bypasses any timer by pressing the "IMMEDIATE TRANSFER" pushbutton. Indicates generator is actively synchronizing to the utility. 	

6.6 ATS OK to Retransfer

	Description	
	ATS OK to Retransfer 2.25 min	
• Located on the ATS Control Screen		

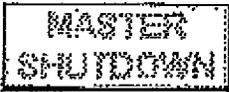

7 Master Shutdown

Section 7.1 *Purposes*
Section 7.2 *Location of Button*
Section 7.3 *Operation*
Section 7.4 *Resetting Master Shutdown*

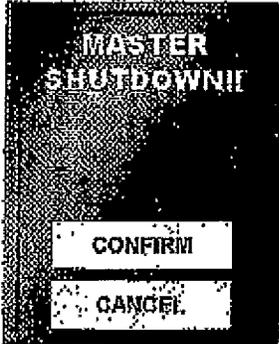

7.1 Purpose

The Master Shutdown function is available from all screens on your PowerLynx equipment. When activated, all generator breakers are opened, and all generators are shut down. If utility breakers are available, utility breakers will close following a Quick Utility Exit.

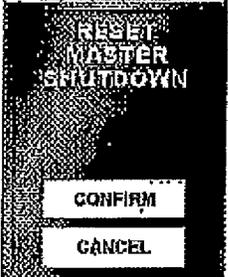

7.2 Location of Button

Master Shutdown Button	Operations
	<p>Basic operations of the Master Shutdown Button:</p> <ul style="list-style-type: none">• The Master Shutdown is located in the lower right hand corner of every screen.

7.3 Operation

Master Shutdown Popup	Screen Operations
	<p>Basic operations of the Master Shutdown Popup:</p> <ul style="list-style-type: none">• The Master Shutdown is initiated by touching the "Hot Area". A confirmation window will "pop up". From here you can "Confirm" or "Cancel" the operation.

7.4 Resetting Master Shutdown

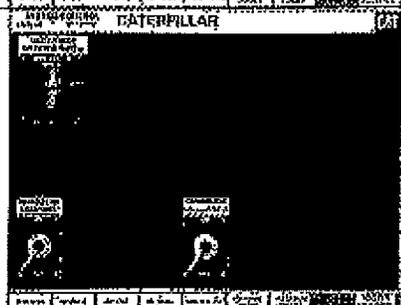

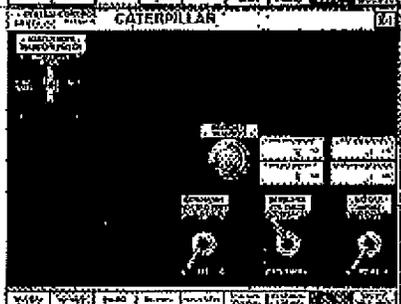

Reset Master Shutdown Button	Operations
	<p>Basic operations of the Reset Master Shutdown Button:</p> <ul style="list-style-type: none">Once the Master Shutdown has been initiated, a Reset Shutdown button will appear where the Master Shutdown button once was.
	<p>This will also need to be confirmed. The confirmation window will "pop up". From here you can "Confirm" or "Cancel".</p>

8 System Operation

Section 8.1..... System Control
Section 8.2..... System Metering
Section 8.3..... System Annunciation

8.1 System Control

This chapter describes typical System control screen EGP, XLM and LM system types.

System Control Screen	Screen Operations
	<p>Basic operations on the System Control Screen:</p> <ul style="list-style-type: none"> • Typical XLM • See System Operation (Section 2)
	<p>Basic operations on the System Control Screen:</p> <ul style="list-style-type: none"> • Typical EGP • See System Operation (Section 2)
	<p>Basic operations on the System Control Screen:</p> <ul style="list-style-type: none"> • Typical LM • See System Operation (Section 2)

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

Master Mode selector switch

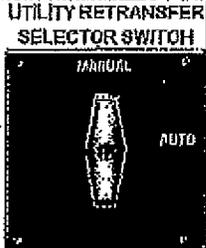

Master Mode Selector Switch	Switch Operations
 <p>The image shows a Master Mode Selector Switch with a vertical handle. The handle has four positions: 'MANUAL' at the top, 'AUTO' in the middle, and 'TRANSFER TO EMERGENCY' at the bottom. The text 'LOAD MOMENT' is visible on the left side of the handle.</p>	<p>Basic operations on the Master Mode Selector Switch:</p> <ul style="list-style-type: none">• Manual (EGP, XLM, LM) Removes all automatic functions for the PowerLynx system• Automatic (EGP, XLM, LM) Allows for automatic control of the PowerLynx system• Transfer to Emergency (XLM) Transfers system to generators in anticipation of utility outages• Load Management (XLM, LM) Places generators in parallel with utility to share load

Transition Selector Switch (Only available on XLM systems)

Transition Selector Switch	Switch Operations
 <p>The image shows a Transition Selector Switch with a vertical handle. The handle has two positions: 'OPEN' at the top and 'CLOSED' at the bottom.</p>	<p>Basic operations on the Transition Selector Switch:</p> <ul style="list-style-type: none">• Open: This is a Break-Before-Make operation. It occurs when transferring between two good sources. The load will be interrupted while going from generators back to utility.• Closed: This is a Make-Before-Break operation between two good sources only. There will be no loss of power to the load.

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

Utility Retransfer switch

Utility Retransfer Switch	Screen Operations
 <p>The image shows a selector switch with two positions: 'MANUAL' and 'AUTO'. The switch is currently in the 'MANUAL' position.</p>	<p>Basic operations of the Utility Retransfer Switch:</p> <ul style="list-style-type: none"> • Manual: System will wait for operator to press the Immediate Transfer Button on System Control Screen before initiating the retransfer to utility. • Auto: System will automatically transfer back to utility once retransfer timer has timed out.

Immediate Transfer push button

Immediate Transfer push button	Screen Operations
 <p>The image shows a circular push button with the text 'IMMEDIATE TRANSFER' in the center.</p>	<p>Basic operations of the Immediate Transfer push button:</p> <ul style="list-style-type: none"> • Pushing the Immediate Transfer button will bypass all warm-up timers and initiate automatic system operation.

Base Load/Utility Tracking

Base Load/Utility Tracking Switch	Screen Operations
 <p>The image shows a rotary switch with two positions: 'BASELOAD' and 'UTIL TRACK'. The switch is currently in the 'BASELOAD' position.</p>	<p>Basic operations of the Base Load/Utility Tracking Switch:</p> <ul style="list-style-type: none"> • See Load Management

Import/Export

Import/Export Switch	Screen Operations

CATERPILLAR EMCP 3.5 TRAINING/TECHNICAL MANUAL

 <p>The image shows a rotary switch with a keyhole. The top half of the switch is labeled 'IMPORT/EXPORT' and the bottom half is labeled 'EXPORT/IMPORT'. The switch is currently in the 'EXPORT' position.</p>	<p>Basic operations of the Import/Export Switch:</p> <ul style="list-style-type: none">• See Load Management
--	---

Utility Fail Test

Utility Fail-Test Switch	Screen Operations
 <p>The image shows a rotary switch with a keyhole. The top half is labeled 'UTILITY FAIL-TEST' and the bottom half is labeled 'ON/OFF'. The switch is currently in the 'ON' position.</p>	<p>Basic operations of the Utility Fail Test Switch:</p> <ul style="list-style-type: none">• ON: This will initiate a popup warning that must be confirmed to initiate a utility fail test. This will operate a normally closed relay simulating a loss of utility power to the utility protective relay.• OFF: This will operate a normally closed relay simulating a return of utility power to the utility protective relay.

9 Generator Operation

Section 9.1..... Generator Controls
Section 9.2..... Generator Metering
Section 9.3..... Generator Annunciation
Section 9.4..... Engine Monitoring
Section 9.5..... Expanded Engine Data

9.1 Generator Controls

Generator Control Screen	Screen Operations
	<p>Basic operations on the Generator Control Screen:</p> <ul style="list-style-type: none">• Generator and Bus Voltage, Frequency and Power Factor• Synchronization scope shows the phase relationship between the Bus and the Generator• Generator breaker Ampereage and power status• Touch and move slider to adjust Generator Voltage and Frequency when generator is running and breaker is open• Touch manual to enable manual Generator Operation, the push button closes the breaker when Generators are in manual mode

Switches/Buttons

- Engine Control Switch
- Sync Mode Switch
- Breaker Close Button
- Voltage / Frequency sliders

CATERPILLAR EMCP 3.5 TRAINING/TECHNICAL MANUAL

Engine Control Switch

Definition/Purpose

- To control the mode in which the generator operates

Operation

Engine Control Switch	Switch Operations
	<p>Basic operations on the Engine Control Switch:</p> <ul style="list-style-type: none"> Auto: Allows for all automatic functions to occur via PowerLynx controls Manual: Starts the generator Cooldown Stop: Unloads generator, opens breaker, then performs Cooldown, generator is unavailable Off/Reset: Turns generator off, resets any alarms that have cleared

Touching the "Hot Area" which you want the switch to be positioned operates ECS

*Note: If system enters Emergency Mode and the ECS is in manual with the Sync Mode switch in auto the breaker will close automatically.

Sync Mode

Definition/Purpose

- To control the mode in which you want the generator to sync

Operation

Sync Mode Switch	Switch Operations
	<p>Basic operations on the Sync Mode Switch:</p> <ul style="list-style-type: none"> Auto: Allows for all automatic synchronization functions to occur via PowerLynx controls Manual: Allows for manually closing the generator breaker from control screen push button Check: Holds the generator in sync with the bus without allowing closing of the breaker Off: Will not attempt to synchronize generator(s) to a hot bus. Does not allow the generator breaker to close

10.3 Utility Annunciation

Utility Annunciator Screen	Screen Operations
 <p>The screenshot shows a software interface for utility annunciation. At the top, it says 'UTILITY ANNUNCIATOR SCREEN' and 'CATERPILLAR'. Below that is a table with columns for 'ALARM', 'STATUS', 'TIME', and 'ACTION'. The table contains several rows of data, including 'OVERHEAT', 'OIL PRESSURE', and 'WATER LEVEL'. There are also some graphical indicators and buttons on the screen.</p>	<p>Basic operations on the Utility Annunciator Screen:</p> <ul style="list-style-type: none">• Lamp Test• Alarm Acknowledge• Status• Alarms

Your PowerLynx System uses ISA FSA First Out annunciator system. When multiple unacknowledged alarms are shown on the screen, pressing, "ACKNOWLEDGE," acknowledges all alarms except for the first alarm in. This remains flashing until the "ACKNOWLEDGE" button is pressed again, allowing the operator to see the original cause behind a cascade of events.

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

11.1 Emergency Tie Controls

Emergency Tie Control Screen

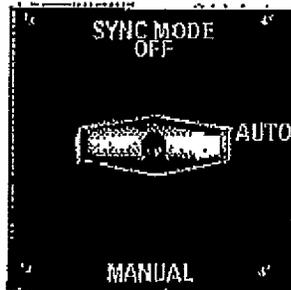

Screen Operations

Basic operations on the Emergency Tie Control Screen:

- Emergency Tie and Bus Voltage, Frequency and Power Factor
- Synchronization scope shows the phase relationship between the Bus and the Emergency Tie
- Emergency Tie breaker Amperage and power status
- Touch manual to enable manual Emergency Tie Operation, the Close button closes the breaker and the Open push button opens the breaker when Emergency Tie is in manual mode

Emergency Tie Sync Mode Switch
Emergency Tie Sync Switch

Switch Operations

Basic operations on the Emergency Tie Sync Switch:

Definition/Purpose

- To control the mode in which you want the Emergency Tie to sync

Operation

Touching the "Hot Area" which you want the switch to be positioned operates the Sync Mode Switch

- **Auto:** Allows for all automatic functions to occur via PowerLynx controls
- **Manual:** Allows for manually shutting the Emergency Tie breaker from control screen

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

Emergency Tie Breaker Button

Definition/Purpose

- Allows operator to manually close the emergency tie breaker in sync

Operation

- Single "Hot Area" is touched to send signal to plc to close emergency tie breaker

Required Switch Positions

Sync Mode Switch -	Emergency Tie Breaker Close Button
 <p>SYNCH MODE OFF AUTO MANUAL</p>	 <p>TIE BKR EMERGENCY TIE BREAKER</p>
<ul style="list-style-type: none"> • Sync Mode Switch: Manual 	

Emergency Tie Breaker Open Button

Definition/Purpose

- Allows operator to manually open the emergency tie breaker from the touch screen

Operation

- Single "Hot Area" is touched to send signal to plc to open emergency tie breaker

14.1 System Settings

System Setting Screen	Screen Operations
	<p>Basic operations on the System Setting Screen:</p> <ul style="list-style-type: none"> • Voltage • Frequency • System KW Ramp Rate

Operation

System settings are normally "View Only". To change setpoint, the password must be entered.

Setting Description

System Voltage: This is the voltage rating of the generator plant. This variable is used to determine the voltage output of each generator. Adjusting this value will raise the voltage output of the generator.

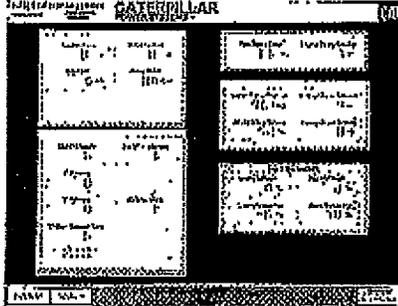

System Frequency: This is the frequency rating of the generator plant. This variable is used to determine the frequency output of each generator. Adjusting this value will raise the frequency output of the generator.

System KW Ramp Rate: This is the KW rating in percent of the Generator power per second. This distinguishes how fast the system is ramping up/down when ramping in parallel in the utility.

15 Generator Setup Settings

Section 15.1..... Generator Setup
Section 15.2..... Generator Protective Settings I

15.1 Generator Setup

Generator Setting Screen	Screen Operations
	<p>Basic operations on the Generator Setting Screen:</p> <ul style="list-style-type: none"> • Generator Rated Voltage and Current • Generator Rated KW and kVAR • Generator Cooldown time • Generator Engine Safety Alarm delay • Speed droop Setpoint and Settings • Voltage Droop Setpoint and Settings • Generator available Voltage settings • Generator available Frequency settings • Bus and Generator VT, CT ratios

Operation

Generator settings are normally "View Only". To change setpoints, the password must be entered.

Setting Description

Rated Voltage: This is the Voltage rating of the generator. This variable is used for other setpoints which are entered in percent of this generator rated voltage.

Rated KW: This is the kW rating of the generator. This variable is used to determine the size of the unit when operating the system in parallel with other generators such that facility load is shared equally among them. Also this variable is used for other setpoints which are entered in percent of this generator rated KW.

Rated kVAR: This is the kVAR rating of the generator. This variable is used to determine the size of the unit when operating the system in parallel with other generators such that facility reactive load is shared equally among them. Also this variable is used for other setpoints which are entered in percent of this generator rated kVAR.

Cooldown: This is the time allotted for the generator to continue running once separated from the generator bus prior to the unit shutting down.

CATERPILLAR EMCP 3.5 TRAINING/TECHNICAL MANUAL

Engine Safety Alarm: This is the time delay that the Generator protection is inhibited while the Generator is cranking and not already up to speed and voltage.

Bus VT Primary: This is the busbar primary Voltage transformer setting.

Bus VT Secondary: This is the busbar secondary Voltage transformer setting.

CT Primary: This is the Generator primary current transformer setting.

NGR CT Primary: This is the Neutral Ground Generator primary current transformer setting.

Voltage Measure Type: This sets the voltage measurement type. Following types are supported: 0 = 3phase4wire, 1 = 3phase3wire, 2=1phase2wire and 3 = 1phase3wire.

Speed Droop Setpoint: This sets the starting or threshold the Genset Target Frequency will be dropped in Hz.

Speed Droop Setpoint: This variable sets how much the Genset Target Frequency will be dropped in percent of the Genset's KW.

Lower Voltage (Gen & Bus Available): This setting is the lower variable setpoint where the generator voltage is considered to be in range. The value is entered in percentage of the generator rated voltage.

Upper Voltage (Gen & Bus Available): This setting is the upper variable setpoint where the generator voltage is considered to be out of range. The value is entered in percentage of the generator rated voltage.

Lower Frequency (Gen & Bus Available): This setting is the lower variable setpoint where the generator frequency is considered to be in range. The value is entered in percentage of the generator rated frequency.

Upper Frequency (Gen & Bus Available): This setting is the lower variable setpoint where the generator frequency is considered to be out of range. The value is entered in percentage of the generator rated frequency.

15.2 Generator Protective Settings I

Generator Protective Settings I	Screen Operations
	<p>Basic operations on the Generator Protective Settings I:</p> <ul style="list-style-type: none"> • Reverse kW Alarm settings • Over Excitation Alarm settings • Under Excitation Alarm settings • Reverse kW Setpoint & Time Delay • Over/Under Excitation setpoint • O/U Excitation Time delays

Operation

Generator settings are normally "View Only". To change setpoints, the password must be entered.

Setting Description

Reverse kW Alarm: This is a protective function that is detected within PowerLynx, which senses direction of power flow. In paralleled sets, a flow of reverse power (i.e. power flow into the generator) above the setpoint for the allotted time delay, will activate according to the set alarm class either trigger a prealarm or trigger a shutdown alarm that will open the breaker and shutdown the generator.

Reverse kW Alarm Class: This setting is the alarm class and the taken action when this alarm is triggered. The alarm classes A-F are supported. Please refer. APPENDIX D: Alarm Classes and Actions for details.

Over/Under Excitation: This is a protective function that is detected within PowerLynx, which senses the amount of reactive power. In parallel sets above or under the setpoints of reactive power for the allotted time delay will activate according to the set alarm class either trigger a pre-alarm or trigger a shutdown alarm that will open the breaker and shutdown the generator.

Over/Under Excitation Alarm Class: This setting is the alarm class and the taken action when the Over/Under Excitation alarm is triggered. The alarm classes A-F are supported. Please refer. APPENDIX D: Alarm Classes and Actions for details.

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

Reverse kW Setpoint & Reverse kW Time Delay

This is a protective function that is detected within PowerLynx, which senses direction of power flow. In paralleled sets, a flow of reverse power (i.e. power flow into the generator) above the setpoint for the allotted time delay will activate according to the set alarm class either trigger a pre-alarm or trigger a shutdown alarm that will open the breaker and shutdown the generator.

Over/Under Excitation Setpoint & Over/Under Excitation Time Delay

This is a protective function that is monitored within PowerLynx, that senses the frequency. When the generator frequency is below or above the setpoint for the allotted time delay (Under or Over Frequency Delay) will activate the trip function within PowerLynx, open the breaker and shutdown the generator.

15.3 Generator Protective Settings II

Screen Operations

Basic operations on the Generator Setting Screen:

- Under Voltage Alarm settings
- Over Voltage Alarm settings
- Over Frequency Alarm settings
- Under Frequency Alarm settings
- Over Voltage Setpoint & Time Delay
- Under Voltage Setpoint & Time delay
- Over Frequency Setpoint & Time Delay
- Under Frequency Setpoint & Time Delay

Operation

Generator settings are normally "View Only". To change setpoints, the password must be entered.

Setting Description

Under/Over Voltage & Time Delay: This is a protective function that is monitored within PowerLynx, which senses the generator voltage. When the generator voltage is below/above the setpoint for the allotted time delay (Under/Over Voltage Delay) will activate the trip function within PowerLynx, open the breaker and shutdown the generator.

Under/Over Voltage Alarm Class: This setting is the alarm class and the taken action when the Over/Under voltage alarm is triggered. The alarm classes A-F are supported. Please refer APPENDIX D: Alarm Classes and Actions for details.

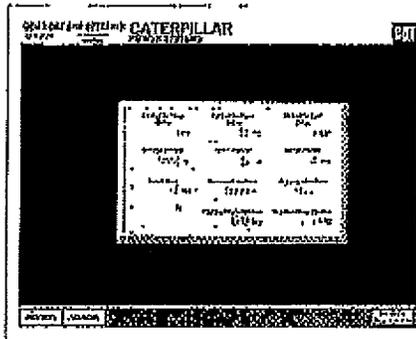

Under/Over Frequency Setpoint & Time Delay: This is a protective function that is monitored within PowerLynx, which senses the generator frequency. When the generator frequency is below/above the setpoint for the allotted time delay (Under/Over Frequency Delay) will activate the trip function within PowerLynx, open the breaker and shutdown the generator.

Under/Over Frequency Alarm Class:

This setting is the alarm class and the action when triggered for the over and under frequency alarms. The alarm classes A-F are supported. Please refer APPENDIX D: Alarm Classes and Actions for details.

***NOTE:** PowerLynx protective settings are calibrated at the factory to adequately protect your hardware. Consult the factory before changing settings to avoid possible voidance of your warranty.

15.4 Gen Circuit Breaker Settings

Basic operations on the Gen Circuit Breaker Settings screen:

- *CB Fail to Close /Open Delay*
- *CB Fail to Sync Delay*
- *Voltage Window*
- *CB On/Off Impulse*
- *Phase Angle Dwell Time*
- *Negative / Positive Slew Rate*
- *Positive / Negative Phase Window*

Operation

System settings are normally "View Only". To change setpoint, the password must be entered.

Setting Description

CB Fail to Open/Close Delay: This setting is the number of milliseconds allotted to open/close the generator breaker after an open/close command was issued. When this time is expired, a fail to open/close alarm will be generated for the appropriate generator.

CB Fail to Synchronize Delay: This setting is the number of milliseconds that a synchronizing attempt will be made. When this time is expired, a fail to synchronize alarm will be generated for the appropriate generator.

Voltage Window: This setting is the voltage dead band around the targeted bus voltage (\pm Bus Voltage) that the generator voltage must be within prior to issuing a command to close the breaker. It is entered in percent of the Generator rated voltage.

CB On/Off Impulse: This setting is the number of milliseconds allotted to the pulse On/Off timings on a generator breaker open or close command. The On pulse sets the time that an open/close command goes true. The Off impulse sets the time the signal stays false before going true again.

Dwell Time: This setting is the number of milliseconds that the phase angle must remain in the in the synchronizing window (Positive and Negative Phase Window) prior to issuing a command to close the breaker.

CATERPILLAR EMCP 3.S TRAINING/TECHNICAL MANUAL

Positive Phase Window: This setting is the number of degrees seen from the top of the Synchroscope meter (12:00) to left hand side (slow side) where the synchronizing window starts and initiates the dwell time.

Negative Phase Window: This setting is the number of degrees seen from the top of the Synchroscope meter (12:00) to right hand side (fast side) where the synchronizing window starts and initiates the dwell time.

Positive Slew Rate: This setting is the positive setpoint of the frequency dead band around the target bus frequency that the generator frequency must be within prior to issuing a command to close the breaker.

Negative Slew Rate: This setting is the negative setpoint of the frequency dead band around the target bus frequency that the generator frequency must be within prior to issuing a command to close the breaker.

0 To order operator with other than standard key removal position(s), select allowable option from table below and change last (underlined) digit of listed Catalog Number using Suffix Code shown. Example: E22K300 Three Position Selector Switch with key removable from Left and Center positions.

0 To order a different key and lock assembly, add suffix B7, C7, D7, E7 or F7 to the end of the Catalog Number.

Note: For Rear of Panel Extensions, see Table 47-128 on Page 47-59.

Magnum DS Metal-Enclosed Low Voltage Switchgear

EAT-N | Cutler-Hammer

Description	Page	Why Magnum DS Switchgear?
 Ratings 		
Voltage Ratings	3	<p>Face's Cutler Hammer Magnum DS switchgear is backed by 24 years of power circuit breaker and switchgear development that have set the industry standards for quality, reliability, maintainability and extended operating life. Magnum DS switchgear is designed to meet the changing needs of our customers by providing:</p> <ul style="list-style-type: none"> ■ Lower maintenance costs. ■ Higher interrupting ratings. ■ Higher coordination capability. ■ Increased rcting sensitivity. ■ Better isolation accuracy. ■ Higher quality and reliability. ■ Ease of life and monitoring and communications. <p>Magnum DS switchgear can meet the needs for general applications, service reliability, harsh environments, multiple source transfer, special grounding systems and many others.</p> <p>Modern designed Magnum DS Metal-Enclosed Low Voltage Switchgear and Power Circuit Breakers provide:</p> <ul style="list-style-type: none"> ■ 100% rated, fully selective protection. ■ Integral interlocking and dead breaker tripping systems. ■ Two-step stored-energy breaker closing. ■ 100 kA short circuit bus breaking standard. ■ Optional 150 kA and 200 kA short-circuit bus breaking, without increasing circuit limiting fuses. ■ Optional metal barriers isolate the cabin compartment from the bus compartment. <p>Many other features for coordinated, safe, convenient, trouble-free and economical control and protection of low voltage distribution systems are also provided.</p> <p>Magnum DS Switchgear conforms to the following standards: NEMA® 843 and 845, CSAP, ANSI C37.20.1, C37.51, and UL® Standard 1658 and is built in an ISO 9001 certified facility.</p> <p>Maximum ratings for Magnum DS Switchgear are 800 volts ac, 6000 amperes continuous cross bus and 200,000 amperes short circuit capacity.</p>

5000	5000	
6000	---	
8000	---	
10000	---	

Note: In addition to the available bus ratings shown above, bus bars have been tested for short circuit values of 65,000 amperes for a full 60 cycles.

Standards

Magnum DS switchgear conforms to the following standards: NEMA 6G3 and 6G4, CSA, ANSI C37.20.1, C37.61, and UL Standard 198E.

Certifications

Magnum DS Switchgear assemblies have undergone an extensive seismic qualification program. The test program utilized ANSI standard C37.61, the Uniform Building Code (UBC) and the California Building Code (CBC) as a basis for the test program. The assemblies have been tested and qualified to exceed these requirements.

American Bureau of Shipping (ABS) certification is available for these instances where it is required.

1) 250 kA available, contact your Cutler-Hammer Sales Office.

Table 4. Magnum DS Breaker Control Voltages and Currents

Control Voltage	24 dc	48 dc	125 dc	120 ac	240 ac
Close current (500, ampere)	7.70	1.38	4.67	0.59	0.24
Open current (500, ampere)	7.70	1.38	4.67	0.59	0.24
Spring charge release current (18 inch stroke)	N/A	4.97	3.00	3.90	N/A
Spring charge release current (18 inch stroke)	14.00	7.87	3.00	3.90	1.50
Control voltage ranges					
Close	18-25	01-34	100-140	104-127	240-254
Open	18-25	23-35	70-140	60-127	200-254

Motor currents are rating currents, inrush is approximately 400%. Motor running time to charge spring approximately is seconds.

Maximum voltages at which the interrupting ratings in Table 3 apply are:

Table 5. Voltages

System Voltage	Maximum Voltage
200 or 240	224
480	520
600	636

These interrupting ratings are based on the standard duty cycle consisting of an opening operation, a 15-second interval and a close operation, in succession, with delays (trip) in case of short-delay devices.

The standard duty cycle for short-time ratings consists of maintaining the rated current for two periods of 1/2 second each, with a 15 second interval of zero current between the two periods.

Ratings (Continued)

Table 6. Available Short-Circuit Rating and Rating Plug for DigiTrip RMS

Breaker Frame	Available Ratings
650	200, 250, 300, 400, 500, 600
1500	200, 250, 300, 400, 500, 600, 800, 1000, 1200, 1500
2500	200, 250, 300, 400, 500, 600, 800, 1000, 1200, 1500, 2000, 2500
3500	200, 250, 300, 400, 500, 600, 800, 1000, 1200, 1500, 2000, 2500, 3000, 3500
4000	2000, 2500, 3000, 4000, 5000
5000	2000, 2500, 3000, 4000, 5000
6000	2000, 2500, 3000, 4000, 5000

The Rating Plug is for 50 and 60 Hz applications. Rating Plugs are not interchangeable with 60 Hz or 50 Hz only Rating Plugs.

The narrow-band characteristic curve graphically illustrates the time-current rating obtainable in breaker systems with DigiTrip™ RMS tripping devices. Reproducibility is within 2%.

The maximum breaker current rating for any breaker frame size is determined by the rating of the sense coil.

The breaker current rating for any frame size can be changed by simply changing the sense coil and associated rating plug, which are easily removed from the breaker disconnector assembly. The wide range of long-delay pickup makes our set of sensors more flexible on a variety of types of loads. The DigiTrip RMS sense coil need not be changed when the associated sense coil rating plugs are changed.

DigiTrip RMS can be supplied in various combinations of low impedance, overcurrent protection functions:

- Long delay (L)
- Instantaneous (I)
- Short delay (S)
- Ground (G)
- Ground Alarm only (A)

Every Magnum DS trip unit conforms standard with IEC characteristics. Optional ground (G) or ground alarm (GA) may also be provided. Every trip unit also provides the ability to defeat instantaneous protection. In addition, short delay protection may be set to the maximum instantaneous level, effectively disabling short delay protection. Under no condition is it possible to set the trip unit beyond the capabilities of the circuit breaker.

Table 7. DigiTrip RMS Adjustable Trip Settings

Time/Current Characteristics	Pickup Setting	Pickup Point (see Note)	Time Band, Seconds
Long Delay	0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 0.8A, 1.0	I_1 Times Long Delay Setting	2, 4, 7, 10, 15, 20, 24 and 30 times pickup value
Instantaneous	1.0, 2, 3, 4, 6, 8, 10, 15	I_1 (see Instantaneous Setting)	
Short Delay	1, 2, 2.5, 3, 4, 6, 8, 10, 15	I_2 Times Short Delay Setting	0.1, 0.2, 0.5, 0.6, 0.8 (10) Response 0.1, 0.2, 0.5, 0.6 sec

5000	1200	1300	1500	1800	2200	2700	3300	4500
6000	1400	1500	1800	2200	2700	3300	4000	5500

¹ Tolerances on pickup levels are 10% of values shown in chart.
² For Testing Purposes Only: When using an external single-phase current source to test low level ground fault current settings, it is advisable to use the Auxiliary Power Module (APM), especially when the single-phase current is low, without the APM it may appear as if the trip unit does not respond until the current is well above the set value, leading the tester to believe there is an error in the trip unit when there is none. The reason this occurs is that the single-phase test current is not a good simulation of the normal three-phase circuit. If three-phase had been flowing, the trip unit would have performed correctly. Use the APM for correct trip unit performance when single-phase tests are made.

¹ Tolerances on pickup levels are 10% of values shown in chart.
² For Testing Purposes Only: When using an external single-phase current source to test low level ground fault current settings, it is advisable to use the Auxiliary Power Module (APM), especially when the single-phase current is low, without the APM it may appear as if the trip unit does not respond until the current is well above the set value, leading the tester to believe there is an error in the trip unit when there is none. The reason this occurs is that the single-phase test current is not a good simulation of the normal three-phase circuit. If three-phase had been flowing, the trip unit would have performed correctly. Use the APM for correct trip unit performance when single-phase tests are made.

Magnum DS Metal-Enclosed Low Voltage Switchgear

EST-M | Cutler-Hammer

Application

Standards

Magnum DS circuit breakers meet or exceed all applicable requirements of ANSI Standards 17.1, 13, C37.17, C37.50 and CSA.

System Voltage and Frequency

Magnum DS breakers are designed for operation on ac systems only, 60 Hz or 60 Hz, 600 volts maximum.

Continuous Current Ratings

Unlike transformers, generators and motors, circuit breakers are maximum-rated devices and have no built-in temporary overload current ratings. Consequently, it is vital that each application take into consideration the maximum anticipated current demand, initial and future, including temporary overloads.

The continuous rating of any Magnum DS breaker is limited to the sensor rating, or the frame size current rating, whichever is the lesser. For instance, an M136-B16 1600 ampere frame breaker with 800 ampere sensors has a maximum continuous rating of 800 amperes, but the sensor breaker with 1600 ampere sensors is limited to 1600 amperes maximum.

All current ratings are based on a maximum ambient air temperature of 40°C (104°F).

Ambient Temperature

The temperature of the air surrounding the enclosure should be within the limits of: -30°C (-22°F) to 40°C (104°F).

Altitude

The breakers are applicable at their full voltage and current ratings up to a maximum altitude of 6,600 feet (2,012 m) above sea level. When installed at higher altitudes, the ratings are subject to the following correction factors in accordance with ANSI C37.50.1.

Table 11. Altitude Derating Factors

Altitude Feet	Altitude Meters	Voltage Correction	Current Derating
0,000	2,012	1.000	1.000
2,000	2,134	0.989	0.989
4,000	2,256	0.977	0.977
6,000	2,378	0.965	0.965
8,000	2,499	0.953	0.953
10,000	2,621	0.941	0.941
12,000	2,743	0.929	0.929
14,000	2,864	0.917	0.917
16,000	2,986	0.905	0.905
18,000	3,108	0.893	0.893
20,000	3,229	0.881	0.881

Unusual Environmental and Operating Conditions

Special attention should be given to applications subject to the following conditions:

1. Damaging or hazardous fumes, vapors, etc.

2. Excessive or abrasive dust.

For such conditions, it is generally recommended that the switchgear be installed in a clean, dry room, with filtered and/or pressurized clean air. This method permits the use of standard indoor switchgear and avoids the derating effect of non-ventilated enclosures.

3. Salt spray, excessive moisture, stripping, etc.

Dry shields in equipment rooms and space heaters in indoor switchgear, or outdoor weather-proof enclosures, may be indicated, depending upon the severity of the conditions.

4. Excessively high or low ambient temperatures.

For ambient temperatures exceeding 40°C, and based on a standard temperature rise of 66°C, the continuous current ratings of breaker frame sizes, and also buses, current transformers, etc., will be subject to a derating factor calculated from the following formula:

$$\frac{66 - T_{\text{Amb}} - \text{Spec Ambient } T}{100 - T_{\text{Amb}} - 40} \text{ Standard Rating}$$

Circuit breakers are not adversely affected by very low ambient temperatures, particularly when energized and carrying load currents. The standard space heaters in weatherproof switchgear will raise the temperature slightly and prevent condensation.

Electrical components such as relays and instruments, however, must be applied within the manufacturer's specified limits.

5. Exposure to Seismic Shock.

Magnum DS enclosures and breakers have been certified for applications through UBC 709-4 and for the California Building Code. Assembly modifications may be required, so such conditions must be specified.

6. Abnormally high frequency of operation.

In line with above, a lesser number of operations between servicing, and more frequent replacement of parts, may be indicated.

Application (Continued)

Unit Substations

Most Magnum DS Switchgear Assemblies are configured as unit substations.

A Unit Substation, as referred to in this publication, is defined as a compact metal assembly consisting of 3 phase transformers with high voltage primary line sections and an assembly of low voltage distribution busbars, with the following parameters:

- Transformer kVA — 112.5 through 3750
- Low Voltage — 208, 240, 480 or 600V

Unit Substations may be indoor or outdoor, with a selection of high-voltage incoming sections, a choice of interrupter types and an arrangement of Magnum DS Switchgear to suit the application.

Why Unit Substations?

Unit substations follow the system concept of locating transformers as close as practicable to areas of load concentration at utilization voltages, thus minimizing the lengths of secondary distribution cables and buses. This concept provides several key advantages, such as:

- Reduced power losses.
- Improved voltage regulation.
- Improved service continuity.
- Reduced likelihood of faults.
- Increased flexibility.
- Minimized installation expense.
- Availability of non-flammable types of transformers eliminates necessity of vents.
- Efficient space utilization.

Advantages of Magnum DS Unit Substations

- Complete coordination, both mechanical and electrical.
- Extreme flexibility with wide choices of components and ratings to meet exact application requirements.
- Optimum safety to operators.
- Modern design.
- Meets all applicable ANSI, IEEE, NEMA and UL standards.

Transition Sections

All indoor Unit Substations utilizing liquid filled transformers require a 12-inch (305 mm) or 22-inch (559 mm) wide transition section. The center line location of the low voltage throat is based upon the depth of the Magnum DS assembly.

In many indoor applications, it is desirable to minimize floor space by eliminating the need for a transformer transition section. For these situations, Magnum DS switchgear is designed to accommodate close coupling to dry-type transformers if their low voltage terminations conform to a specific vertically oriented arrangement. This configuration may be provided if:
(1) additional space is not required for auxiliary devices such as grounding resistors, busbar extension, etc.;
(2) no sequence ground fault is not applied on main breaker; (3) application to assemblies with no main breaker or not utilize "A" or "B" position feeder breakers; (4) adequate conduit space is available for any top exit cable connections in this section.

Application (Continued)

Types of Systems

A. Simple Radial

- Simplest and least costly.
- Easy to coordinate.

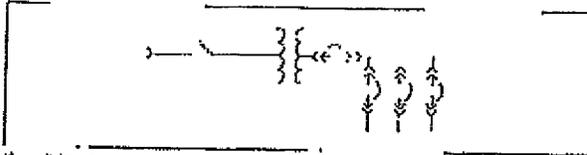

Figure 8. Simple Radial

B. Primary Selective Radial

Similar to simple radial, with the added advantage of spare primary incoming cable circuit. By switching to spare circuit, duration of outage from cable failure is limited.

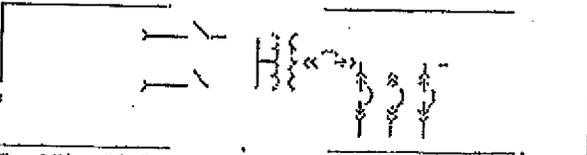

Figure 9. Primary Selective Radial

C. Secondary Selective

Normally operates as two electrically independent unit substations, with the breaker (T) open, and with approximately half of total load on each bus. In case of failure of either primary incoming circuit, only one bus is affected, and opening main breaker (M) on dead bus and closing the breaker (T) can promptly restore service. This operation can be made automatic, with duration of outage on either bus limited to a few seconds.

Since the transformers are and continuously paralleled, secondary fault currents and breaker application are similar to those on radial unit substations.

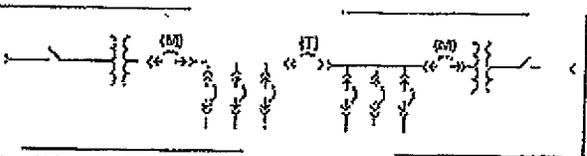

Figure 10. Secondary Selective

If required, and equipped with the appropriate relaying, either transformer can be removed from service and isolated with no interruption of service on either bus, by first closing the T breaker and then opening the associated main breaker.

Service continuity and restoration capacity can be further improved by substituting selector type primary switches, shown above in B.

D. Spot Network

The transformers are paralleled through network protection. In case of primary voltage failure, the usual recloser automatically opens. The other protector remains closed, and there is no "dead time" on the bus, even momentarily. When primary voltage is restored, the protector automatically checks for synchronization and recloses.

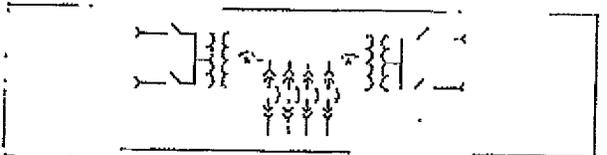

Figure 11. Secondary Selective

- Secondary voltage regulation is improved by paralleled transformers.
- Secondary fault capability is increased by paralleled transformers, and the feeder breaker and line breaking must be selected accordingly.

- Primary switches are usually selector or duplex type, so that transformers can be transferred to alternate live sources, thus shortening duration of outages.

Page 17

Application (Continued)

System Application

Select Magnum DS Switchgear by type from power transformer. To facilitate minimum breaker sizing, Table 12 lists the calculated secondary short circuit currents and applicable main secondary and feeder breakers for various transformer sizes and voltages.

The short circuit currents are calculated by dividing the transformer base (100%) rated ampere by the sum of the transformer and primary system impedances, expressed in " $\%Z_{total}$ ". The transformer impedance percentages are standard for most secondary unit substation transformers. The primary impedance is obtained by dividing the transformer base (100%) kVA by the primary short circuit kVA. The motor contributions to the short circuit currents are estimated as approximately 4 times the motor load ampere, which in turn are based upon 50% of the total load for 20% system voltage and 100% for all other voltages.

High transformer impedances and/or lower percentages of motor loads will reduce the short circuit currents correspondingly. Supplementary transformer cooling and temperature ratings will not increase the short circuit currents, provided the motor loads are not increased.

The tables do not apply for 3-phase banks of single-phase distribution transformers, which usually have impedances of 2% to 3% or even lower. The short circuit currents must be recalculated for all such applications, and the breakers selected accordingly.

Transformer Main Secondary Breakers

Transformer secondary breakers are required or recommended for one or more of the following purposes:

1. To provide a one step means of removing all load from the transformer.
2. To provide transformer overload protection in the absence of an individual primary breaker, and/or when primary fuses are used.
3. To provide the fastest clearing of a short circuit in the secondary main bus.
4. To provide a local disconnecting means, in the absence of a local pickup switch or breaker, for maintenance purposes.
5. For automatic or manual transfer of loads to alternate sources, as in double ended secondary collective unit substations.
6. For simplifying key interlocking with primary interrupter switches.
7. To satisfy N.E.C. service entrance requirements when more than six feeder breakers are required.

Main secondary breakers, as selected in Table 12, have adequate interrupting ratings, but not necessarily sufficient continuous current ratings. They should be able to carry continuously not only the multiplied maximum continuous output of the transformer but also any temporary overloads.

For a fully selective system, instantaneous protection on main breakers should be selected, as they typically cannot be coordinated with downstream devices.

Maximum capabilities of transformers of various types, in terms of kVA and secondary current, are given in Table 12. It will be noted that the maximum ratings will often require the substitution of larger frame main breakers than those listed in the tables. Even if a self-cooled transformer only is considered, it should be remembered that with ratings of 700 kVA and higher, provision for the future addition of cooling fans is automatically included. It is recommended that the main breaker have sufficient capacity for the future fan-cooled ratings, plus an allowance for overloads, if possible, particularly since load growth cannot always be predicted.

The same considerations should be given to the main bus capacities and main current transformer ratios.

Bus Sectionalizing (Tie) Breakers

The minimum recommended continuous current rating of bus sectionalizing or tie breakers, as used in double-ended secondary selective unit substations, or for connecting two single-ended substations, is one half that of the associated main breakers. The interrupting rating should be at least equal to that of the feeder breakers. It is common practice to select the tie breaker of the next frame size below that of the main breakers. However, many users and engineers prefer that the tie breaker be identical to and interchangeable with the main breakers, so that under normal conditions it will be available as a spare main breaker.

In general, the tie breaker, like the main breaker, trip unit should have the instantaneous tripping delayed.

Automatic Transfer Schemes

Often loads are fed from multiple sources, most often a primary source and an alternate source. In cases where the power source is required to transfer between the normal and alternate source automatically, a transfer system must be utilized. Of course, electrically separated main breakers are necessary to accomplish this transfer.

Suggested transfer logic, description and features for such a transfer is given in the following paragraphs. Certain loads or plant processes may dictate a different scheme.

Dual Source, No Tie, Open Transition

The logic of the transfer system functions via a microprocessor. The set points are field adjustable without the use of special tools.

A digital readout displays each option as it is functioning. Readout display actual line-to-line voltage, line frequency and times. When times are functioning, the microprocessor displays the time remaining to next. All set points can be re-programmed from the front of the logic panel when the transfer system is in the program mode. A test pushbutton is included as part of the microprocessor. The microprocessor is compatible with a Cutler-Hammer PowerNet™ microcommunications system.

CATERPILLAR

CUTLER HAMMER LV MAGNUM DS TECHNICAL DATA

Technical Data

Page 10

Effective March 2003

Magnum DS Metal-Enclosed Low Voltage Switchgear

EAT-N | Cutler-Hammer

Application (Continued)

The transfer system includes the following features:

1. Time delay normal to alternate, adjustable.
2. Time delay alternate to normal, adjustable.
3. Time delay neutral.
4. LEDs to indicate normal and alternate position.
5. LEDs marked "Source 1" and "Source 2" to indicate that respective source voltages are available.
6. LEDs to show which source is preferred.
7. LED to show the last energized.
8. Historical transfer information via the front panel.
9. Two position selector switch permitting two (2) modes of transfer system operation: **AUTO** (standard automatic operation), **MANUAL** (disconnects logic and allows manual operation of the main breakers with interlocking).

When the alternate source is an engine generator, the following features are also provided:

1. Adjustable time delay engine start.
2. Adjustable time delay engine cool off.
3. Engine start contact.
4. Frequency/voltage relay for alternate source, frequency adjustable from 45 to 60 Hz and voltage fixed at 80% pickup, 70% dropout.
5. Delayed transition time delay, adjustable from 0 to 120 seconds, to allow disconnection of the load during transfer in either direction to prevent excessive inrush currents due to out-of-phase switching of large inductive loads.
6. Plant exciter.

Sequence of Operation

1. The transfer system shall automatically transfer its load circuit to an emergency or alternate power supply upon failure of its normal or preferred source.
2. Upon loss of phase to phase voltage of the normal source to 80% of nominal, and after a time delay, adjustable from 0.5 to 10 seconds, to override momentary dips and/or outages, a 10 ampere, 20V dc contact shall close to initiate starting of the emergency or standby source power plant. Transfer to the alternate source shall take place immediately upon attainment of 80% of rated voltage and frequency of that source. For schemes not involving engine generator sets as the alternate source, transfer shall occur after an adjustable time delay of 1 to 60 seconds to override momentary dips and outages.
3. When the normal source has been restored to 80% of rated voltage, and after a time delay, adjustable from 0.5 to 30 minutes (to ensure the integrity of the normal power source), the load shall be returned to the normal source.
4. A time delay, adjustable from 0.5 to 32 minutes, shall delay shutdown of the emergency or standby power source after retransfer to allow the generator to run unloaded for cooldown, after which the generator shall be automatically shut down.
5. If the emergency or standby power should fail while carrying the load, transfer to the normal power supply shall be made automatically upon restoration of the normal source to satisfactory conditions.

Dual Source, With Tie, Open Transition (Closed Transition)

The logic of the transfer system functions via a microprocessor. The set points are field adjustable without the use of special tools.

The transfer system displays status as it is functioning. When times are malfunctioning, the system displays the timer counting down. All time delays can be set from the front of the equipment using a touch sensitive screen on the display.

The transfer system includes the following features:

1. Time delay to transfer on loss of Source 1, adjustable.
2. Time delay to transfer on loss of Source 2, adjustable.
3. Time delay re-transfer to Source 1, adjustable.
4. Time delay to transfer to Source 2, adjustable.
5. Time delay neutral (main and tie open), adjustable.
6. Main Tie Main one line on system display.
7. Main and tie breaker status shown on system display. (Open, closed, tripped, out of call)
8. Indicator on system display marked "Source 1" and "Source 2" to indicate that respective source voltages are available.
9. Automatic/manual mode selector.
10. Pushbutton for manual breaker control on system display.
11. Alarm information via the system display (loss of source, breaker trip).
12. [Open/Closed transition mode select pushbutton on system display.]

Page 13

Application (Continued)

Sequence of Operation Automatic Mode

- Under normal conditions the main breaker are closed and the tie breaker is open.
- Upon phase loss or loss of phase to phase voltage of either utility source to between 80% and 100% of nominal, and after a time delay, adjustable from 1 – 60 seconds to initiate momentary trips and outages the transfer system will open the affected main breaker and close the tie breaker.
- When normal voltage has been restored after a three phase outtage from 10 – 800 seconds to ensure the integrity of the source, the transfer system will open the tie breaker. The transfer system will have an adjustable neutral position timer (0 – 10 seconds) to allow voltage to decay sufficiently before the affected main breaker is then closed. Upon transition retransfer (When normal voltage has been restored after a time delay, adjustable from 10 – 600 seconds to ensure the integrity of the source), the transfer system will verify the two sources are in sync via a sync check relay (26), close the affected main breaker and open the tie breaker. (closed transition retransfer)
- If Source 2 should fail while carrying the load, transfer to Source 1 shall be made instantaneously upon restoration of Source 1 to satisfactory conditions.
- If both sources should fail simultaneously no action is taken.
- If the main or tie breakers trip due to a fault the transfer system will be reset to manual mode and manual operation of that breaker will be prevented until its overcurrent trip switch is reset.

Manual Mode

- Breakers may be opened and closed using control switches or pushbuttons on the transfer system display while in manual mode. Interlocking is in place to prevent the closing of both mains and the tie simultaneously.

Breakers may be opened and closed using control switches or pushbuttons on the transfer system display while in manual mode. While in open transition mode interlocking is in place to prevent the closing of both mains and the tie simultaneously. If closed transition mode is selected all three breakers may be closed for an adjustable time delay (5 – 60 seconds). The operator may open the affected breaker via its push button on the system will open the tie breaker after the time delay has expired.

Generator Breakers

In most applications where generators are connected through breakers to the secondary bus, they are used as emergency standby sources only, and are not synchronized or paralleled with the unit substation transformers. Under these conditions, the interrupting rating of the generator breaker will be based solely on the generator kVA and sub-transient reactance. This varies with the generator type and size, from a minimum of approximately 8% for a 2-pole 3600 rpm turbine driven generator to 15% or 20% or more for a medium or slow speed engine type generator. Thus the feeder breakers selected for the unit substation will usually be adequate for a standby generator of the same kVA as the transformer.

Most generators have a 2-hour 25% overload rating, and the generator breaker must be adequate for this overload current. Selective tripping and short delay trip protection only is usually recommended for coordination with the feeder breakers, with the long delay elements set at 125% to 150% of the maximum generator current rating for generator protection.

In the case of two or more paralleled generators, with medium recovery power relays (device 17) are recommended for protection of the prime movers, particularly piston type engines. For larger generators requiring a Magnum MDS-632 or larger, voltage-sensitive type overcurrent relays (device 61W) are recommended.

Feeder Breakers - General

Circuit breakers for feeder circuit protection may be manually or electrically operated, with long and short delay or long delay and instantaneous type trip devices, and trip settings, as required for the specific device and load requirements.

Feeder breakers as selected in Table 12 have adequate interrupting ratings, and are assumed to have adequate continuous current ratings for maximum load demands.

General purpose feeder breakers, such as for lighting circuits, are usually equipped with long delay and minimum momentary trip devices, with the long delay pickup set for the maximum load demand in the circuit. Where arc-fault protection is required, the instantaneous trip setting should be as low as practicable consistent with inrush requirements.

Motor Starting Feeder Breakers

These breakers are usually electrically operated, with long delay and instantaneous tripping characteristics for motor running, locked rotor and fault protection. The breaker sense rating should be chosen so that the long delay pickup can be set at 175% of motor full load current for motors with a 1.18 service factor, or at 115% for all other motors. Contactors are recommended for this application when there are a number of daily operations involved.

When systems short circuits are less than 40 times the motor full load current, the motor breaker tripping characteristics should include a short delay characteristic for greater fault protection.

Group Motor Feeder Breakers

Typical loads for such circuits are motor control centers. The feeder breakers may be either manually or electrically operated as preferred, and are usually equipped with long and short delay trip protection only for coordination with the individual motor circuit devices. The minimum long delay pickup setting should be 115% of the running current of the largest motor in the group, plus the sum of the running currents of all other motors.

Application (Continued)

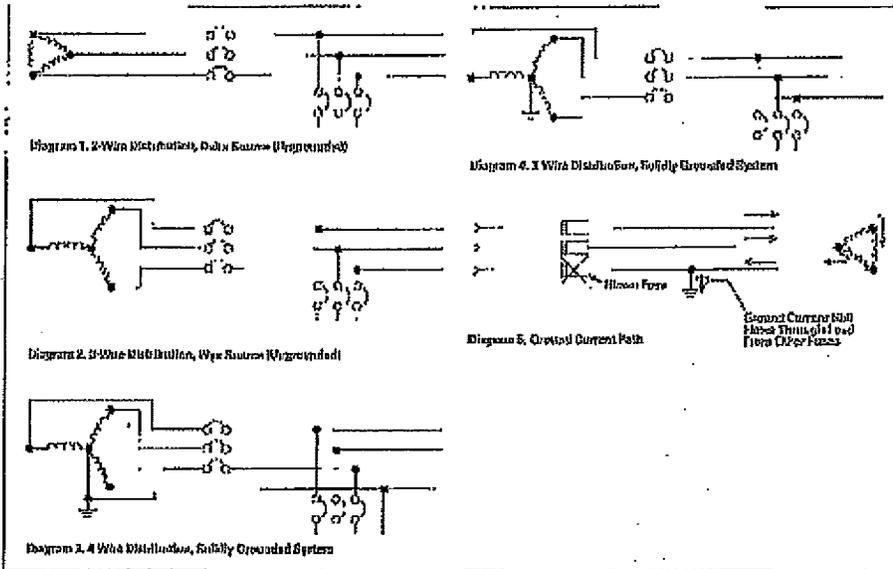

Figure 12. Distribution Systems

Ground Fault

Distribution Systems

The power distribution in 3-phase low voltage systems can be 2- or 4-wire distribution. The 2-wire distribution can be served from either delta or wye sources, but the 4-wire distribution is obtained from a wye solidly grounded source only. Diagram 1 in Figure 12 shows 2-wire distribution with delta source and Diagram 2 in Figure 12 shows 3-wire distribution with wye source. It is significant on Diagram 2 in Figure 12, that the wye connection of a transformer secondary does not necessarily mean 4-wire distribution in switchgear. This is worthwhile to note because 4-wire distribution in switchgear frequently assumed when the transformer secondary is wye connected. The low voltage system in 3-phase 4-wire distribution only if a fourth wire is carried through the switchgear, the transformer neutral is solidly grounded, and single-phase loads are connected to fuses breakers. This fourth wire is the neutral bus. The neutral bus is connected to

the neutral of the wye connected transformer secondary as shown on Diagram 3 in Figure 12.

Three- or 4-wire sources can be grounded or ungrounded in service. Generally, where the source is delta connected it is ungrounded, but in some very rare cases it is grounded at one corner of the delta, or at some other point. When the source is wye connected it can be grounded or ungrounded, and when grounded, the grounding is at the neutral. When low voltage systems are grounded they are generally solidly grounded; however, occasionally the grounding is through a resistor. Three- and 4-wire solidly grounded systems are shown on Diagrams 3 and 4 in Figure 12. Most installations are solidly grounded. Solidly grounded systems have the advantage of being the easiest to maintain, yet have the potential for producing extremely high fault levels.

When feeding critical facilities, or continuous industrial processes, it is sometimes preferable to allow

the system to continue operating when a phase conductor goes to ground. There are two methods of accommodating this application; the source transformer may either be left ungrounded or high impedance grounded. If the correct system conditions of inductance and capacitance manifests themselves, arcing ground on ungrounded systems can produce excessive line-to-ground voltages, which in turn can lead to insulation breakdown in other devices. This condition is known as ferroresonance. The high impedance grounded system does not suffer from this potential phenomenon. Regardless of which system is selected, both require the application of an appropriate LL recognized ground detection method. Upon grounding of one of the phase conductors, the detection device sends operators of the condition. Personnel should be aware these grounds can die and renew the ground when the process ceases or another ground occurs on another phase.

Page 21

Application (Continued)

Since ungrounded and resistance grounded systems produce minimal ground currents, no damage occurs to the grounded equipment. These ground currents are also too low for detection by integral trip and ground elements, therefore there is no ground fault tripping function if applied on these systems. Ground fault elements on these types of systems can, however, provide supplemental protection. If a second ground occurs on another phase, and exceeds the ground element pickup setting, the ground element can cause an alternate selective short delay trip.

Ungrounded or resistance grounded systems can not be applied on 4-wire networks. Even if supplied from a 4-wire source, no line-to-neutral loads may be served. These applications are limited to 3-wire distribution systems only.

Need for Ground Fault Protection

If the magnitude of all ground currents would be large enough to operate the short delay or instantaneous elements of the phase overcurrent trip devices, there would be no need for separate ground fault protection on solidly grounded systems. Unfortunately, because low magnitude ground currents are quite common, this is not the case. Low level ground currents can exist if the ground is in the vicinity of a motor or a transformer, or if it is a high impedance ground. Low level ground currents may also be due to an arcing type ground. The arcing type grounds are the source of the most severe damages to electrical equipment. The lower limit of the arcing ground currents is unpredictable and the magnitude may be considerably below the setting of the breaker phase overcurrent trip device. It is for this reason that the National Electrical Code, and UL, require ground fault protection for all service disconnect breakers rated 1000 amperes and greater, applied on systems with greater than 150 volts line-to-ground.

Since the breaker phase overcurrent trip devices cannot provide sensitive enough protection against low magnitude ground faults, there is a need for an additional protective device. This additional device is not to operate on normal overloads and it is to be sensitive and fast enough to protect against low magnitude grounds. It is also important that this additional ground protecting device be simple and reliable. If the Magnum DS breaker solid-state tripping system including an optional "ground element"

is selected, good ground fault protection will be ensured.

The Ground Element

The ground element of the solid-state trip unit is in addition to the usual phase protection. The ground element has adjustable pickup with calibrated marks as shown in Tables 8 and 9 and adjustable time delay. The input current to the trip unit can be provided by:

- A. Residual connection of phase sensors, with the residual circuit connected to the ground element terminals. This is the Magnum DS Low Voltage Switchgear standard ground protection system for 2-wire systems. On 4-wire systems, standard ground fault protection includes a fourth "neutral sensor." It is connected to vectorially subtract from the residual current of the phase sensors, its only function is to sense residual current. These systems produce pickup values as shown in Table 8.
- B. External ground sensing current transformers connected to the ground element terminals. This means that this external ground sensor will trip the breaker whenever its secondary output current exceeds the values shown in Table 9. Tripping is independent of phase currents. The lower the CT ratio, the more sensitive the ground fault protection.

Ground Fault Protection Application and Coordination

In all power systems, continuity of service is very important. For reliable service continuity, selective tripping is applied between main, tie, and feeder breakers, and downstream protecting devices, for phase-to-phase faults. Similar selective tripping is desirable when breakers trip on grounds. The application of ground protection only to main breakers may ensure good ground protection. However, it will not provide good service continuity because the main breaker will trip on grounds that should have been cleared by feeder breakers. For proper protection and for good service continuity, main, tie and feeder breakers all should be equipped with ground fault protection.

In view of the above, it is evident that properly applied ground protection requires ground elements as far down the system to the loads as practical. For best results, downstream molded case breakers should have individual

ground protection. This would result in excellent ground protection because ground elements of Magnum DS and downstream breakers having similar tripping characteristics can be coordinated.

Depending on the sensitivity of the ground fault protection method applied, coordination between Magnum DS breaker ground elements and downstream branch circuit fuses is sometimes impractical. This is due to the basic fact that the blowing of one phase fuse will not clear a ground on a 3-phase system. The other 2-phase fuses will let the load "single phase," and also continue to feed the ground through the load, as shown in Diagram 5 in Figure 12.

High Resistance Grounding

Where continuity of service is a high priority, high resistance grounding can add the safety of a grounded system while maintaining the best of service interruptions due to grounds. The concept is a shunt path provides a path for ground current via a resistance that limits the current magnitude, and monitor to determine when an abnormal condition exists.

The ground current path is provided at the point where the service begins, by placing resistance in the connection from system neutral to ground. Control equipment continuously measures ground current. A relay detects when the current exceeds a predetermined level. An alarm alerts building personnel that a ground exists. The system has built in fault limiting means to assist in finding the source of the ground. An integral transformer provides control power from the primary source.

240 Volt (Downward) Delta Systems

To add high resistance grounding to an ungrounded delta connected system, a neutral point must be created. Three single-phase transformers can be interconnected in a delta or wye broken delta configuration to provide such a neutral point. The transformers and grounding resistors are chosen to limit the ground current to a maximum value of 5 amperes.

Note: The neutral point may not be used to serve phase-to-neutral loads. Also, this technique may be applied to wye-connected sources when the neutral point is not conveniently accessible from the service entrance location.

Application (Continued)

600/247 Volt (Maximum) Wye Systems
To add high resistance grounding to a wye-connected system, resistors are placed in series with the neutral-to-ground connection of the power source. The resistors are chosen to limit the current to a maximum value of 5 amperes.

Note: Per IEEE NRC 250-5b, Exception No. 5, these neutral limits may not be extended to a system where the neutral is resistance-grounded.

Ground Current Detection

Any time a system is energized, a small ground current called the "capacitive charging current" will be observed. For low voltage (600V and below) systems, this naturally-occurring current is typically 1 ampere or less.

When one phase becomes grounded, additional current above the capacitive level will flow. As all ground current must flow through the grounding resistor/grounding transformer assembly, an ammeter in this circuit will read the total amount of ground current. By placing a current sensing relay in series with the ammeter, the current relay can be adjusted to pick up at a level in excess of the capacitive charging current, thus indicating the abnormal condition.

Alternatively, an optional voltmeter-relay can be connected across the grounding resistors. The voltage across the resistors is proportional to the amount of ground current. The voltmeter-relay's pickup adjustment is set above the capacitive charging current, to the desired detection level.

In both current and voltage detection methods, the ground current ammeter provides a direct reading of the total, actual ground current present in the system. At that time, it will be helpful to periodically note the ammeter's reading trend towards higher values may indicate the need for equipment maintenance, and hence reduce the occurrence of unplanned shutdowns.

Indication and Alarm Circuits

When a fault is detected, an adjustable time delay is provided to suppress transients. When the time delay has been exceeded, the green "normal" light will turn off, the red "ground fault" light will turn on, and the ground alarm contacts will transfer. If equipped with the optional alarm horn, it will sound.

When the fault is cleared, the current/voltage relay will reset. If the reset control is set on "pulse," the lights will return to "normal" or, "ground fault" off, and the ground alarm contacts will re-transfer. If the reset control is set on "normal," the lights and relay contacts will remain latched until the operator turns the reset control to "reset." The lights and ground alarm contacts will then return to normal. The system can be reset only if the fault has been cleared.

During a fault, the optional alarm horn can be silenced at any time by using the "alarm silence" pushbutton. It will not re-sound until either the system is reset, or the re-alarm timer expires. The re-alarm timer is activated by the "alarm silence" control. If the horn has been silenced but the fault has not been cleared, the timer will run. It has a range of 2 - 48 hours. When the timer times out, the horn will re-sound, alerting maintenance personnel that the fault has not been cleared.

Test Circuit

A test circuit is provided to allow the user to quickly determine that the system is working properly. The test circuit will operate only under normal conditions — it will not allow testing if the system is sensing a fault. A separate grounding resistor is provided, connected to a relay operated by the "test" position of the cable selector switch. The relay's contact grounds Phase B through the test resistor, causing ground current to flow. The system then reacts as it would under actual system ground conditions: lights transfer, alarm contacts transfer and the (optional) horn sounds.

Pulsed Circuit

The pulsed circuit offers a convenient means to locate the faulted feeder and trace the fault to its origin. The pulser is available any time a fault has been detected. An adjustable recycle timer controls the pulse intervals. The "pulser" light flashes on and off, corresponding to the on/off cycles of the pulser contact. The pulser contactor switches a bank of resistors on and off, thus allowing a momentary increase in the ground current (approximately 5 ampere current pulses above the ground current).

Locating a Ground Fault

The current pulses can be noted with a clamp on ammeter when the ammeter is placed around the cables or conductors feeding the fault. The operator tests each conductor or set of cables until the pulsing current is noted. By moving the ammeter along the conductor, or checking the conductor periodically along its length, the fault can be traced to its origin. The fault may be located at the point where the pulsing current drops off or stops.

If the arc or change in the pulsing current is noted along the entire length of a cable, then the fault may be in the connected load. If the fault is a panel board, distribution center, or motor control center, repeat the process of checking all outgoing cable groups to find the faulted feeder. If the fault is not found in an outgoing feeder, the fault may be internal to that equipment.

NOTE: It may not be possible to precisely locate faults within a conduit. The ground current may divide into many components, depending on the number of cables per phase, number of conductors per feeder, and the number and positions of each ground point along the conductors. The resulting currents may be too small to allow detection, or may take a path that the ammeter cannot trace. An important note to keep in mind is that while the pulser test greatly aids in locating a fault, there may be certain conditions under which the pulser cannot be easily traced, and other test procedures may be needed, such as high-potential, etc. may be needed.

Application (Continued)

Sequence of Operation

Normal

- Green "normal" light on.
- Red "ground fault" light off.
- White "pulse" light off.
- System control switch in "normal" position.
- Reset control switch in either "auto" or "manual."

Test

Turn and hold the system control switch in the "test" position. The test circuit will be grounded via the test resistor. The ground current will activate the sensing circuit, causing the green "normal" light to turn off and the red "ground fault" light to turn on. The pulse will be activated as well. The white "pulse" light will turn on and off as the pulse conductor closes and opens. The ground current meter will display the total ground current, including the incremental pulse current. When ready, return the system control switch to "normal." The pulse will stop. If the reset control is in the "manual" position, turn it to "reset" to reset the fault sensing circuit. The red "ground fault" light will turn off, and the green "normal" light will turn on. Test main is not available if the system is detecting a ground. The sensing circuit will disable the test circuit.

Ground Fault

When the sensing circuit detects a fault, the green "normal" light will turn off and the red "ground fault" light will turn on. The ground current ammeter will indicate the total ground current. To use the pulse, turn the system control switch to "pulse." The pulse conductor will cycle on and off as control led by the recycle timer relay. Use the clamp-on ammeter to locate the faulted feeder. Open the feeder and clear the fault. If the reset control switch is in the "manual" position, turn it to "reset" to reset the sensing circuit. (If reset control is in "auto," it will reset itself.) When ready to restore service to the load, close the feeder. Return the system control to "normal."

Zone Selective Interlocking (ZSI)

By definition, a selectively coordinated system is one where by adjusting trip unit pickup and time delay settings, the circuit breaker closest to the fault trips first. The upstream breaker serves two functions:

1. Back-up protection to the downstream breaker.
2. Protection of the conductors between the upstream and downstream breakers. These elements are provided for on Digitrip™ trip units.

For faults that occur on the conductors between the upstream and downstream breakers it is highly desirable for the upstream breaker to trip with no time delay. This is the feature provided by zone selective interlocking. Digitrip trip units may be specified to utilize this option.

Zone selective interlocking is a communication signal between trip units applied on upstream and downstream breakers. Each trip unit must be applied as if zone selective interlocking were not employed, and set for selective coordination.

During fault conditions, each trip unit that senses the fault sends a restraining signal to all upstream trip units. This restraining signal results in causing the upstream trip to continue timing as it is set. In the absence of a restraining signal, the trip unit trips the associated breaker with no intentional time delay, minimizing damage to the fault point. This restraining signal is a very low level. To minimize the potential for induced noise, and to provide a low impedance interface between trip units, special twisted pair conductors are utilized for interconnection. For this reason, zone selective interlocking must be specified.

Ground fault and short delay pickup on Digitrip Trip Units may be specified with zone selective interlocking. Since most system faults start as single ground faults, zone selective interlocking on ground fault pickup only is usually adequate. Zone selective interlocking on short delay pickup may be utilized when no ground fault protection is provided.

Zone selective interlocking may be applied as a type of time differential protection. It must be recognized, however, that one must accept the minimum pickup of the trip unit for sensitivity.

- It must also be recognized that not all systems may be equipped with zone selective interlocking. Systems containing multiple sources, or where the direction of power flow varies, require special configurations, or may not be suitable for this feature. Digitrip zone interlocking has been tested with up to three levels with up to 20 trip units per level.

Table 12. Guidelines for Ground Fault Protection

System	Advantages	Disadvantages	Equipment Available for Protection			Notes
			Main Breaker	Isa Breaker	Feeder Breaker	
Ungrounded (3-Wire)	Minimum disturbance to other devices. Currents in the majority of grounds will be limited to capacitance charging current of the system. Can operate with the first ground until it is removed during a regular shut down. Low cost. Simple protective protection for an ungrounded system will delay trip until ground cleared.	When ground detector shows that a ground exists, correction must be taken in the earliest possible shut down. However, expense increases that this system is not always possible. Therefore, these systems tend to operate with one phase grounded through the first impedance ground. A high impedance ground on another part of the system would result in low voltage of current, which would not operate a breaker phase trip, and could produce fire damage. High voltages from arcing grounds are possible.	Long type ground detectors by ground directly with or without voltage transformers. If voltage transformer is used, a ground alarm relay can be added for remote or local alarm. A zero residual protection, after main pickup, has a second time delay. See Figures 19, 22 and 24 on Pages 26 and 27.	3-wire residual protection, main pickup, 0.22 second time delay. See Figures 22 and 24 on Page 27.	3-wire protection, main pickup, 0.22 second time delay. See Figures 19, 22 and 24 on Pages 26 and 27.	2D
Single Grounded	2D	2D	Standard residual ground protection for single source system, and 200% ground, see Figure 23 on Page 27, for multiple ground source. Minimum pickup, 0.50 second time delay.	Ground 3 wire or 4-wire per required fault protection. Minimum pickup, 0.22 second time delay. See Figure 27 or 23 on Page 27.	Ground 3 wire or 4-wire per required fault protection. Minimum pickup, 0.22 second time delay for zero sequence current transformer fault into 1-1/2 unit. See Figures 19, 20 and 24 on Pages 26 and 27.	This is the most common system in use today. As long as it is not necessary to coordinate with phase devices down the line, it will give very good results and lesser protection.
High Resistance Grounded (3-Wire)	Ground fault current is limited. Unsymmetrical currents in high voltage during arcing grounds, and they are softened by high resistance grounding. Can operate with the first ground until it is removed during a regular shutdown.	Very sensitive detector is required to detect the limited fault current. When the ground detector shows that a ground exists, corrective action must be taken at the earliest possible shutdown. However, expense increases that this system is not always possible. Therefore, these systems tend to operate with one phase grounded through the first impedance ground. A high impedance ground on another part of the system would result in low voltage of current, which would not operate a breaker phase trip, and could produce fire damage. Higher cost than ungrounded.	Same as for ungrounded except ground voltage alarm relay is connected across grounding resistor, or can run relay between resistor and ground.	Same as for ungrounded.	Same as for ungrounded.	Same as for ungrounded. This system is most effective when supplied with a peaking option.

Technical Data
1 October 1998 (March 2003) Page 20

Application (Continued)

Breaker Arrangements (continued)

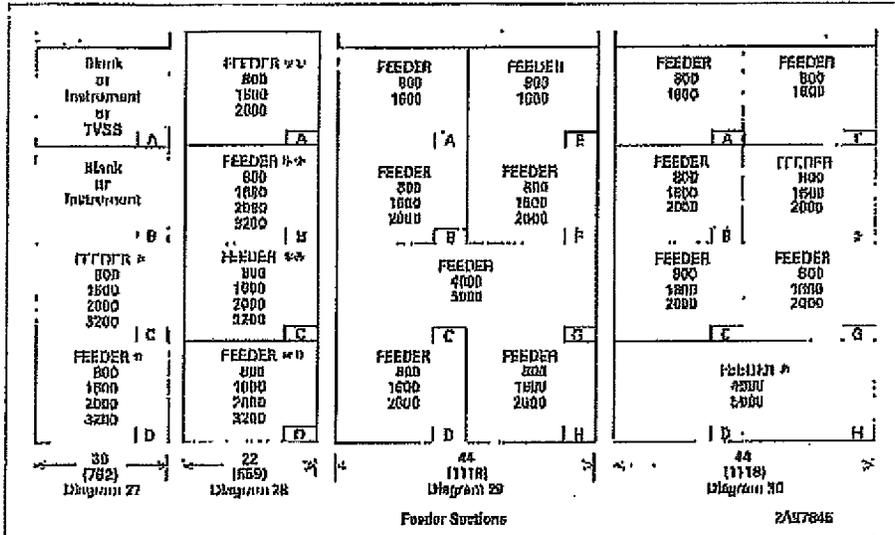

Figure 25. Breaker Arrangements (continued)

Breaker Arrangement Footnotes

1. Maximum (standard) indoor shipping condition width is 6 vertical sections of 129 inches (3048 mm), while never to exceed. Maximum (standard) outdoor shipping width is 84 inches (2133 mm) including side doors, any transformer connections, etc.
2. All vertical sections are 82 inches (2083 mm) high plus 4 inches (102 mm) for vertical line and main connection fitting height. When a top of gear breaker door is used, height is 80 inches (2032 mm) high.
3. When bus ducts and/or the feeder sections are required, the depth of the bus may increase and vertical stacking may be affected. Refer to the Cutler-Hammer handbook.
4. Vertical section bus is sized per IEEE 800 bus maximum rating or by ANSI C27.30.1 section 2A.1.1 (Table 10) to a maximum of 5000 ampere.

5. Any compartment can be a blank or 22-inch (559 mm) wide enclosure (with 1118 mm) with the following exceptions: A 44-inch (1118 mm) wide instrument compartment must be adjacent to another 44-inch (1118 mm) wide compartment in the only 44-inch (1118 mm) wide compartment in the enclosure.
6. Conditions that there is sufficient (air) space for all layout configurations.
7. A transition section is required descending to a non-enclosed dry-type transformer or auxiliary and other devices are to be located in a transition section or there is a bus pump breaker required or there is a non-sequence ground fault required.
8. A maximum of 12 3200 ampere breakers are permitted per 22-inch (559 mm) width of vertical space, one of which must be a main or tie. A 3200 ampere frame breaker cannot be mounted in the same enclosure with a 4000 ampere main or tie. For a 3200 ampere frame breaker mounted in the same enclosure with a 4000 or 5000 ampere main or tie, contact the Cutler-Hammer business.
9. Fixed instrument and breaker are not permitted in the "D" position.

10. Except the Cutler-Hammer bypass for protection of 2000 ampere bus or breaker in the compartment.
11. A maximum of 12 2000 ampere breakers per 22-inch (559 mm) width of vertical space if (B) are required, positions "C," "D," and "E" must be closed.
12. If you have 4 wire service and service entrance requirements, busway connection or main connection, the bus or cables must enter from the top.
13. Service entrance cables is not available with feeder breakers mounted in this structure.
14. If you have 4-wire service with service entrance requirements, busway connection or cable connection, the bus or cables must enter from the bottom.
15. Busway or cable entrance must be from the top.
16. "B" and "D" position features must be reverse end.
17. Subject to your elevation drawing if the compartment is to be a main or tie breaker.

- 1) It is recommended that clearance for breaker removal with top-of-switchgear-mounted breaker floor. If portable breaker floor is to be used, allow at least 64 inches (1626 mm) of aisle space.
- 2) Breaker row clearances shall be 1.25 inches (32 mm).
- 3) Hot lead location for rooming the switchgear should be as required. Floor clearance not included.
- 4) When a non-suspension ground fault (GFI) is connected on the side of 1000-ohm or 4 inches, unless CC dimension by 10 inches (254 mm).
- 5) For availability for bus duct connection, specify the Cutler-Hammer bus ducts.
- 6) Spacing must be 2 inches (50 mm) minimum in power cable area, 1 inch (25 mm) minimum in control wiring area.

Application (Continued)

Center of Gravity Location
For seismic calculations, the following dimensions should be used to locate the center of gravity for indoor Magnum DS Switchgear:

Table 15. Center of Gravity Location

Axis	Position
X (Vertical)	60 inches (1524 mm)
Y (4-to-Right)	Center of Lineup
Z (From the Front)	20 inches (508 mm)

Table 16. Heat Loss Data¹²

Breaker Range	Estimated Heat Loss Per Breaker (Watts)	
	Fixed Mounting	Drawout Mounting
150	180	180
175	180	220
200	172	214
225	164	208
400	377	749
600	469	939
1000	8 ¹²	0 ¹²

¹² For lower than maximum load currents, heat loss may be estimated by reducing the full load loss by the following:
 $W_L = 1/4 I_L^2 W_{FL}$

Where:

- W_L = Load Watts
- W_{FL} = Full Load Watts
- I_L = Actual Load Current
- I_{FL} = Full Load Current

¹³ Contact the Cutler Hammer business.

Table 17. Estimated Heat Loss (Watts)

Rating	Vertical Bus	Drawout Bus
2000	410	228
2500	1623	1153
4000	1957	1150
5000	2110	836
6000	8	1225
8000	—	0 ¹²
10,000	—	0 ¹²

¹² For lower than maximum load currents, heat loss may be estimated by reducing the full load loss by the following:
 $W_L = 1/4 I_L^2 W_{FL}$

Where:

- W_L = Load Watts
- W_{FL} = Full Load Watts
- I_L = Actual Load Current
- I_{FL} = Full Load Current

Page 40

Effective March 2013

Magnum DS Metal-Enclosed Low Voltage Switchgear

ET-N | Cutler-Hammer

Features

Structure

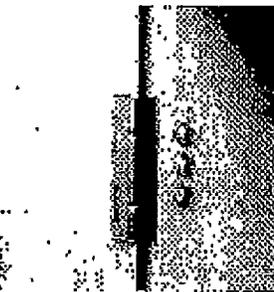

Standard Finish
Grey paint finish (ANSI 5H) using a modern computerized automatic and continuously monitored electrostatic powder coating. This computerized monitoring system includes spray de-grime and clean, spray primer, iron phosphate spray coating, epoxy resin, non-chemical seal, oven drying, electrostatic powder spray paint coating and oven curing.

Integral Base

The rugged formed base greatly increases the rigidity of the enclosure and reduces the possibility of damage during the installation of the equipment and is suitable for rolling, jacking and handling. A lifting angle is permanently welded into the bus compartment structure for increased strength.

Heavy Duty Door Hinges

Each breaker door is mounted with hinge pins. Removal of the door is easily accomplished by just lifting the hinge pin. This allows easy access to the breaker internal compartment for inspection and maintenance.

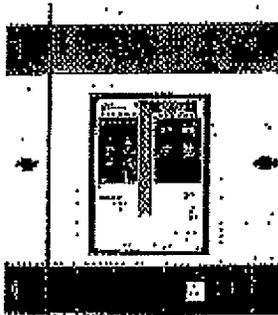

Heavy Duty Hinge Pin

Door Cover/Flaps

In Magnum DS Switchgear standard rear covers with captive hardware are the bolt-on type. They are split into two sections to facilitate handling during removal and installation. Optional rear doors are also available.

Through the Door Design

The following functions may be performed without the need to open the circuit breaker door: levering the breaker between positions, operate manual charging system and view the spring charge status lamp, close and open breaker, view and adjust trip unit and read the breaker rolling manplate.

Through-the-Door Design

Front Accessible

When the door is open or removed each breaker compartment provides front access to isolated, vented secondary, primary disconnects, rail circuit transformers and other breaker compartment accessories for ease of field wiring and trouble shooting field connections.

Breaker Cell

Four Position Drawout

Breakers can be in connected, test, disconnected or removed position. The breaker compartment door can be closed in the connected, test and disconnected positions.

Coil Spring Automatic Discharge

Mechanical interlocking automatically discharges the closing springs when the breaker is removed from the compartment.

Optional Safety Shutters

Positive acting safety shutters which isolate the breaker compartments to the main bus when the breaker is withdrawn from the cell is an option offered for additional safety beyond our standard design. Insulating covers ("boots") are furnished on the main stationary disconnecting contacts in compartments equipped for future breakers.

Breaker Inspection

When withdrawn on the rails, breaker is completely accessible for visual inspection; tilting is not necessary. The rails are permanent parts of every breaker compartment.

Interference interlocks are supplied on breakers and in compartments where the compartments are of the same physical size to ensure no incorrect breaker cannot be inserted.

Key Interlock (Switchgear Mounted)

Breaker can be stored in compartment, and completely removed for maintenance or for use as a spare without disturbing the interlock. No modification of the header required, this mechanism holds the breaker mechanically trip-free to prevent electrical or manual closing. An additional simple cylinder breaker mounted key interlock is also available as an option.

Optional Mechanical Interlock

Available between adjacent breakers.

Magnum DS Metal-Enclosed Low Voltage Switchgear

Fluxostat (March 2003)

Page 41

Features (Continued)

Bus

Busbar Connections

Vertical and cross bus ratings in Magnum DS switchgear are based on a UL and ANSI standard temperature rise of 65°C above a maximum ambient air temperature of 40°C.

Bus Arrangement

Vertical and cross bus ratings in Magnum DS are 2000, 3200, 4000, and 6000 amperes. In addition, 5000, 6000 and 10,000 ampere cross bus ratings are available.

Bus Bending

Unique vertical bus configuration provides an optional industry leading short circuit withstand rating of 200,000 amperes within the new for propulsion vessel through buses. Standard bending is 100,000 amperes. The "U" shaped bar is the heart of the Magnum DS vertical bus. This configuration provides a much higher mechanical strength. To further demonstrate the strength and rigidity of this bus system, it has been verified through testing to withstand 25,000 amperes short circuit for a full 80 cycles.

Silver Plating

Buffed, silver-plated copper main buses are standard. The plating is over the entire length of the bar, not just at the joints. Optional tin plated copper buses are available.

Bus Joints

All joints are bolted and secured with Belleville-type spring washers for maximum joint integrity. These washers reduce the potential of joint hardware loosening during the change of joint temperature associated with variations of the loads.

Full Neutral

For 4-wire applications, the neutral bus is rated 100% of main bus rating as a standard, up to a maximum ampere rating of 6000 amperes.

Ground

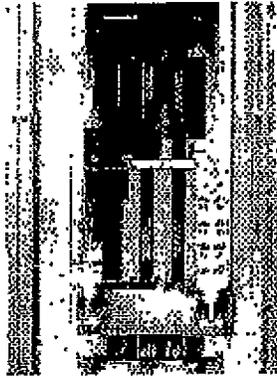

A ground bus is furnished the full length of the switchgear assembly and is fitted with terminals for purchaser's connection.

Glass Reinforced Polyester and Ultramid® Stand-Off Insulation System

Glass reinforced polyester has been used on both low and medium voltage switchgear for decades. By combining this industry proven material with Ultramid insulation, a total system providing exceptional mechanical and dielectric withstand strength, as well as high resistance to heat, flame, and moisture, is produced. Substantial testing to demonstrate mechanical effects of heating and cooling on the mechanical and dielectric properties of this system prove it to provide superior performance for decades of trouble-free operation.

Optional Conductor Insulation Covering

For applications requiring additional bus protection in harsh environments, Magnum DS Switchgear is designed for the addition of optional conductor insulation covering. In addition to providing full UL air clearance without insulation. This material is applied during the assembly of the bus end covers and vertical and horizontal phase bus bars. Removable bolts provide access to service-to-access bus joints for inspection and maintenance purposes.

Optional Insulated Bus

Barriers

Optional grounded metal barriers isolate the main bus and connections from the cable compartment providing added safety to the workers while reducing the potential of objects falling into the bus compartment.

Features (Continued)

Wiring

Cable Compartment

The cable compartment gives ample room for terminating the power cables. Removable top roof sheets allow for easy conduit bulk installation. The floor of the cable compartment is open to allow cable entry from under ground duct banks. Optional floor plates are available.

Optional grounded metal barrier isolates the main bus and connections from the cable compartment, as well as optional barriers to separate adjacent cable compartments.

In addition to cable, Power-A-Way Busway (not necessarily bus duct) can be terminated in the compartment.

Lug Pad

The lugs are located on the breaker run-backs to accommodate lug orientations at a 45° angle to reduce the bending radius of the cable needed for making the connections, thus reducing installation and maintenance time. Misaligned screw type lugs are standard. Optional NEMA 2 hole compression lugs are available as an option.

Control Wireway

An isolated vertical wireway is provided for routing of factory and field wiring in each switchgear section. Breaker secondary terminal blocks are mounted as standard above each circuit breaker. The terminal blocks are rated 30 amperes and will accept lugs wire, ring or wedge terminals for wire size ranges of #22 to #14. Expanded lugs are punched in side sheets of the vertical wireway to allow routing of customer control wiring without the use of adhesive wire anchors.

For applications involving excessive wiring, or nonstandard terminal blocks, terminal blocks are mounted on the rear frame with the power cables wires they are used by accessible for use to make connections and inspection.

Control Wireway

Control Wire

Standard wire is Type SIS insulated stranded copper, extra flexible No. 18 AWG minimum.

Control Wire Marking

Each wire is imprinted with ink cured under ultraviolet light for durability and for easy identification by the user. The enhanced solvent resistance and durability of the aerospace grade UV cure ink has been tested for severe environments. The imprinting is made periodically along the length of the wire, with the ends being imprinted more frequently. The point of origin, wire designation and point of destination are imprinted in the following format: *weight zone/wire gauge/destination zone*. Each device has a uniquely designated zone. "L" indicates the direction of the wire origination and "R" indicates the direction of the wire destination. As an option, wire marking can be made utilizing sleeve type or heat shrink sleeve type.

Secondary Terminal Compartment Door

The customer's secondary terminal connections are located behind a separate door providing access to these connections without the need to open the breaker compartment door.

Short Circuiting Terminal Blocks

One provided for each set of instrumentation or relaying application current transformers.

Shipping Split Connection

At each shipping split, the control connections are made with plug in terminal blocks rated 500 volts, 30 amperes. The terminal blocks interlock mechanically without removing the bus or load connections. This method of making the shipping split control connections increases the speed of installation and reduces the potential of incorrect connections.

Control Wire Marking

Magnum DS Metal-Enclosed Low Voltage Switchgear

Eaton | Cutler-Hammer

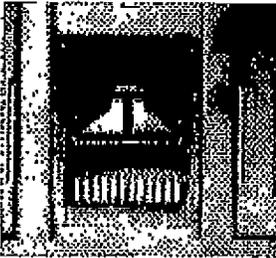

Features (Continued)

Breaker

Contacts

The Magnum DS has silver tungsten moving contacts and silver graphite stationary contacts. The contacts provide a long-wearing, low resistance joint. The contacts are protected from arcing damage even after repeated interruptions by the "hard-toe" action which causes the integral arcing contacts to mate before the main contacts part. The arcing contacts then part last, striking the arc away from the main contacts.

The main contacts are of the butt type and are composed of a multiplicity of fingers to give many points of contact without alignment being critical.

Magnum DS High-Voltage Contacts
(Arc Chutes Removed)

Stored-Energy Mechanism

A cam-type closing mechanism closes the breaker. It receives its energy from a spring that can be charged by a manual handle on the front of the breaker or by a universal electric motor.

Release of the stored energy is accomplished by manually depressing a button on the front of the breaker or electrically energizing a releasing solenoid.

Arc Chute

There are three basic means of extinguishing an arc: lengthening the arc path; cooling by gas blast or convection; deionizing or physically removing the conduction particles from the arc path.

The DE-ION® principle is incorporated in all Magnum DS circuit breakers. This makes possible faster arc extinction for a given contact travel, ensures positive interruption and minimum contact burning.

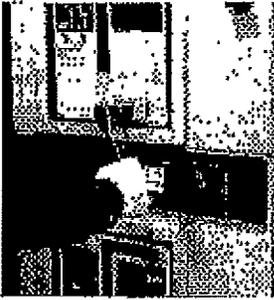

Levering Mechanism

The worm gear levering mechanism is self-contained on the breaker drawout element and engages with the breaker compartment. A removable crank is used to lever the breaker between the connected, test and disconnected positions.

Mechanical interlocking is arranged so that levering cannot be accomplished unless the breaker is in the opened position.

Protection During Levering Operation

When levering the breaker between the connected, test and disconnected positions, the operator is protected from contact with live parts by the breaker door.

Levering Magnum DS Breaker

Two-Step Stored-Energy Closing allows to the sequence required to charge and close the breaker.

1. The breaker closing springs are charged either through the manual-charging handle or by the optional charging motor. The breaker is mechanically interlocked to prevent closing of the breaker until the closing springs are fully charged.
2. With the closing springs fully charged, the breaker can then be closed by pressing the manual close pushbutton on the breaker, or by the optional spring release and through a remote electrical signal.

This means that the energy required to open the breaker is always stored following a closing operation.

"Stored energy" is energy held in waiting, ready to open or close the breaker within five cycles or less. The unique cam and spring design provides necessary energy for a single close-open sequence as well as the energy for multiple charge-close operations (with) as this possible sequence: charge close-recharge-open-close-open.

The closing springs are interlocked with the breaker locking mechanism to insure the closing springs are fully charged before the breaker can be removed from the compartment.

Manually Operated Breakers

Manually operated breakers are equipped with a manual charging handle to charge the closing springs. Manual closing and tripping pushbuttons are utilized to operate the breaker. Remote closing and tripping can be accomplished by installing optional electric spring release and shunt trip coils (see Table 4 for available control voltages, currents and motor-operated spring charging times). The breaker closing springs must be charged manually, then remote closing and tripping signals can be sent to the breaker.

Electrically Operated Breakers

Electrically operated breakers are equipped with a spring charging motor and electrically operated spring release and shunt trip coils (see Table 4 for available control voltages, currents and motor-operated spring charging times). The breaker manual charging handle can be used to charge the closing springs when power is not available to the charging motor.

Provisions for Padlocking

All breakers include provision for padlocking open to prevent electrical or manual closing. This padlocking pin secures the breaker in the connected, test or disconnected position by preventing levering of the breaker.

Ease of Inspection and Maintenance

Magnum DS breakers are designed for maximum accessibility and the utmost ease of inspection and maintenance.

Features (Continued)

Breaker

Magnum DS Switchgear — Trip Units

Digital RMS Trip Unit

The Digital RMS trip units feature a dependent curve that is stippled in the non-trip area by a hatched area of the trip curve. The dependent curve affords better protection flexibility. Additionally, all of the trip units have, as standard, thermal memory, 60/60 Hz operation, and thermal cut protection at 50°C.

Also, the 520M trip units have a large display window and 2% measuring accuracy.

Digital RMS Integral Microprocessor-Based Breaker Overcurrent Trip Systems

Provides maximum reliability with little time needed as standard, gives excellent repeatability, and requires minimum maintenance. No external control source is required for its protective functions.

Trip Functions

Magnum DS trip units provide the maximum in flexibility and are available in the following configurations: LSI, LSI-G, LSI-A (ground fault alarm only). In each case, either the short delay or instantaneous (and both) functions may be defeated. This reduces the need for spare breaker inventories and provides maximum utilization of interchangeable breakers.

Change to Trip Rating

The overcurrent trip pickup range is established by a combination of trip unit rating plugs and auxiliary current sensor ratings on the breaker.

Optional Breaker Attachments and Accessories

- A. Shunt trip on manually operated breakers, for any standard control voltage.
- B. Auxiliary contacts on manually or electrically operated breakers. Maximum of 6 normally open and 6 normally closed contacts (5 normally closed contacts on electrically operated breakers) are available on any breaker, manually or electrically operated. The contact rating is 10 amperes.

C. Compartment position switch, 4 or 8 Form C contacts, actuated by movement of drawout breaker from the connected position. Most common uses are for disconnection (by remote control circuits of electrically operated breaker, and for bypassing "U" interlocking auxiliary contacts when breaker is withdrawn from the connected position).

D. Undervoltage trip (see and de available). Acts to trip the breaker when the coil voltage is insufficient to restrain a spring-loaded core. The dropout point is within 30 to 60 percent of the nominal coil voltage and is not adjustable.

F. Overcurrent (trip multi) (OIS). A latching type switch with two independent Form C contacts. Operates only when the trip unit trips the breaker. It may be used for alarm and/or interlocking circuits. Resetting is done by a push-button on the breaker faceplate.

F. Electric close on manually operated breakers, for any standard control voltage. Breaker can be closed by remote control switch or pushbutton after the closing spring is manually charged.

G. Operation counter.

H. Breaker mounted key interlock.

I. Speed shunt trip coil in place of OVR coil.

**Magnum DS
Metal-Enclosed
Low Voltage Switchgear**

Technical Data

1 Edition, March 2003

Page 02

Typical Specification

General

Magnum DS indoor low voltage metal-enclosed switchgear shall consist of a stationary structure assembly and one or more removable Magnum DS power circuit breakers complete with disconnecting devices and other necessary accessories. The switch gear shall be suitable for 601 volt maximum service and shall withstand a 220kV ac dielectric test in accordance with ANSI standards. It shall be designed, manufactured and tested in accordance with the latest applicable standards of IEEE, NEMA, ANSI, IEC and CSA. Documentation of design testing shall be third party certified.

Secondary Structure

Each steel unit forming part of the stationary assembly shall be a self-contained housing having one or more individual breaker or instrument compartments, and a rear compartment for the buses and outgoing cable connections.

Traying slots shall be provided on the base of the structure for ease of positioning in equipped rooms.

A rigid integral steel base shall be provided for each section, which will allow movement of shipping groups directly on rollers without the need for a separate skid.

Each circuit breaker compartment shall be equipped with primary and secondary contacts, drawout extension rails, stationary latching mechanism parts, and required instrument current transformers. A formed steel door, supported on concealed hinges with removable pins, shall be provided for each circuit breaker compartment. Access to the integral circuit breaker control panel, including the trip unit, shall be provided without the need to open the breaker compartment door. Closed-door spring latching and latching operations shall also be accomplished without the need to open the breaker compartment door.

The top of the unit shall be enclosed with removable steel sheets, which include necessary hooded ventilation openings. A separate removable access panel shall be provided for drilling of control conduit holes. A hand highway with removable covers shall be provided for utility access. Full-apart type terminal blocks shall also be provided for signal, auxiliary, shipping and assembly. A metal-enclosed vertical wiringway shall be

provided for routing of field installed control wiring.

The structure shall be so designed that future additions may readily be made at any time. The steel structure shall be thoroughly cleaned and zinc plated prior to the application of the ANSI No. BT finish.

A white, laminated, plastic engraved circuit designation nomenclature shall be provided on each circuit breaker door.

Buses and Connections

Each breaker circuit shall include the necessary three phase copper bus and connections between the source bus and one set of circuit breaker studs. NEMA 7-hole cable lugs, attached to acceptable copper extensions for the outgoing cables, shall be provided on the other set of circuit breaker studs. The buses and connections shall consist of high-conductivity (silver-plated) (66 plated) copper bar mounted on heavy-duty supports, and having bolted joints. All bolted bus joints shall utilize Belleville type spring washers to maintain maximum joint integrity through continuous thermal cycling. The bus system shall be suitable for applications on power systems requiring a (100) (150) (200) kA short circuit withstand rating without upstream current limiting fuses.

Terminal blocks with integral-type barriers shall be provided for circuit breaker secondary circuits. The terminal blocks shall be front accessible through a hinged access panel above each circuit breaker.

All control wiring shall be securely fastened to the switchgear assembly without the use of adhesive wire supports. A dedicated wiring path shall be provided for purchaser's installed control wiring. Non-adhesive anchors shall also be provided for anchoring of purchaser's installed wiring.

Disconnecting Devices

The stationary part of the primary disconnecting devices for each circuit breaker shall consist of a set of contacts extending through a glass polyester insulating base. Buses and outgoing cable terminals shall be directly connected to them. The corresponding moving contacts shall consist of a set of contact fingers suitably spaced on the circuit breaker studs. For ease of inspection and maintenance, contact fingers shall not be a permanent part of the stationary structure. In the "nonconnected" position, these contacts shall form a current-

carrying bridge. The assembly shall provide a multitude of silver-to-silver high-pressure point contacts. High uniform pressure on each finger shall be maintained by springs. The entire assembly shall be full floating and shall provide ample flexibility between the stationary and moving elements. Contact engagement shall be fully tested only in the "connected" position.

The secondary disconnecting devices shall consist of floating fingers mounted on the stationary unit and automatically engages contacts located at the front of the compartment. The secondary disconnecting contacts shall be silver plated to ensure performance of contact. Contact engagement shall be maintained in the "nonconnected" and "test" positions.

Removable Element

The removable element shall consist of a Magnum DS power circuit breaker equipped with the necessary disconnecting contacts and interlocks for drawout application. The removable element shall have four position features and shall permit closing the compartment door with the breaker in the "connected," "test," and "disconnect" positions.

Power Circuit Breakers

The circuit breaker shall be Magnum DS, operating on the DE-IGN arc interruption principle. These breakers shall incorporate specially designed arc-interrupting devices that provide high interrupting efficiency and minimize the formation of arc flame and gases.

The primary contacts shall have an easily accessible wear indicator to indicate main contact erosion. The breaker closing time shall be no more than three cycles. Each breaker shall have three windows in the front cover to offer clear indication of trip and close electrical accessories mounted in the breaker. The breaker shall be equipped with "DE-IGN" arc chutes which effectively enclose the arcing process and confine the arc to reduce the disturbance caused by short circuit interruption. Each breaker shall be equipped with a position indicator, mechanically connected to the circuit breaker mechanism.

CUTLER HAMMER LV MAGNUM DS TECHNICAL DATA

Technical Data

Page 43

Electrical Manual 7033

Magnum DS Metal-Enclosed Low Voltage Switchgear

Typical Specification (Continued)

Each breaker shall be equipped with a microprocessor-based, true rms sensing trip device. The adjustments shall be:

- Long delay pickup between 40% and 100% of the trip rating
- Long delay time between 2 and 24 seconds at 6 times trip rating
- Short delay pickup between 7 and 10 times long delay trip setting, short delay time between 0.1 and 0.5 seconds at 2.5 times short delay pickup. Short delay protection shall be defeatable, but only if instantaneous protection is activated. Both "I₁" and "I₂" protection shall be provided. (Optional) Zone Selective Interlocking Trip Units and necessary wiring within the switchgear shall be provided for each breaker indicated on the drawings.
- Instantaneous pickup between 2 and 12 times trip rating. Instantaneous protection shall be defeatable, but only if short delay protection is selected.
- (Optional) Ground fault pickup approximately 25% of sensor rating, and ground fault time between 0.1 and 0.5 seconds. Both "G₁" and "G₂" protection shall be provided. Pickup shall not exceed 1200A, regardless of circuit breaker maximum continuous rating. Ground fault shall be field adjustable for residual zero sequence or 3-phase ground protection. Selectability shall be made in the circuit breaker configuration, not on the circuit breaker element, to indicate the possibility of interchangeability of power circuit breakers. (Optional) Zone Selective Interlocking Trip Units and

necessary wiring within the switchgear shall be provided for each breaker indicated on the drawings.

It shall be possible to test and verify the time and current characteristics and trip circuit by means of a portable plug in test device.

Both electrically operated and manually operated breakers shall have stored energy auxiliary mechanism. The device to which the breaker shall be by means of a mechanical push-button, which insures positive contact of the closing operation.

Seismic

The switchgear assembly and circuit breakers shall be suitable for and certified to meet all applicable seismic requirements of IBC (The California Building Code) for Zone 4 application. Guidelines for the installation, consistent with these requirements, shall be provided by the switchgear manufacturer and be based upon actual testing of representative equipment. The test response spectrum shall be based upon a 5% minimum damping factor, (insert the following for UBC: a peak of 0.78g, and a ZPA of 0.38g), (insert the following for IBC: a peak of 1.0g, and a ZPA of 0.45g). The test shall fully envelop this response spectrum for all equipment natural frequencies up to at least 30 Hz.

Factory Assembly and Tests

The switchgear shall be completely assembled, wired, adjusted and tested at the factory. After assembly, the complete switchgear control and instrumentation circuits shall be tested for operation under simulated service conditions to ensure the accuracy of the wiring and the functioning of the equipment.

The main circuits shall be given a dielectric test of 2200 volts for one minute between live parts and ground and between opposite polarities. The wiring and control circuits shall be given a dielectric test of 1500 volts for one minute, or 1000 volts for one second, between live parts and ground.

Note: An adjustment sheet and single line diagram should accompany the written specification.

CUTLER HAMMER PART# TRNB24AD

TR Series

TR Timing Relays

Product Description

The upgraded TR Series Timing Relays are designed to meet most timing requirements by offering more flexibility in range of input voltage, timing range and functionality. Use a rotary switch to choose from 20 selectable time ranges from 0.1 second to 600 hours. We offer both a power triggered and signal triggered model each with expanded operation modes. There is a green LED to indicate when power is ON and an orange LED when output is ON.

Features

- 20 time ranges and 10 timing functions
- Time delays from 0.1 sec to 600 hrs.
- Space-saving, compact packages
- High repeat accuracy of $\pm 0.2\%$
- LED indication
- Standard 8- or 11-Pin and 11-blade termination
- 2 Form C DPDT delayed output contacts
- 10A Contact Rating

100 - 240V AC	TRFP240AC	TRFB240AC

CATERPILLAR®

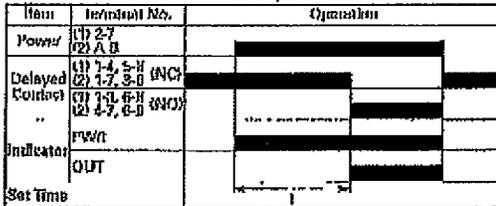

CUTLER HAMMER PART# TRNB24AD

Operation

TRNB, TRNB

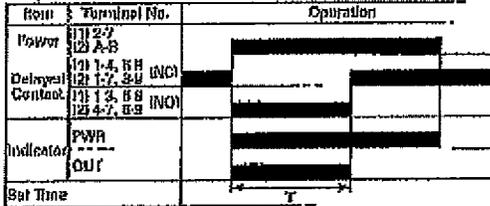

A: ON-Delay 1 (Power Start)

Set timer for desired delay, apply power to coil. Contacts transfer after preset time has elapsed, and remain in transferred position until timer is reset. Reset occurs with removal of power.

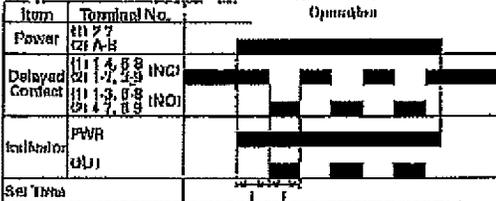

B: Interval (Power Start)

Set timer for desired delay, apply power to coil. Contacts transfer immediately and return to original position after preset time has elapsed. Reset occurs with removal of power.

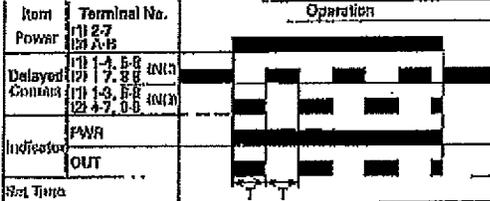

C: Cycle 1 (Power Start, ON Time)

Set timer for desired delay, apply power to coil. First transfer of contacts occurs after preset delay has elapsed, after the next elapse of preset delay contacts return to original position. The timer runs cycles between on and off as long as power is applied (Duty Ratio 1:1).

D: Cycle 3 (Power Start, ON Time)

Functions in same manner as Mode C, with the exception that first transfer of contacts occurs as soon as power is applied. The ratio is 1:1. Time On = Time Off.

Notes: 1-Set Term, 2-Greater Than Set Term.
11-TRNB, 12- TRNB, 1A-TRFP, 1B-TRFB

APPLICATION SPECIFIC SWITCHES SERIES 24 AND SERIES 31 ROTARY SWITCHES

POWER-FACTOR-Switch

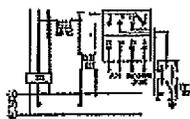

3-phase, low current transformers.
On or 100 percent coils.
Depth Behind Panel 2.4"
Handle: Brass, Alumin.
Engaging and jumping as shown

Order #
Series 24 - 2422C includes HP 100-2714
Series 31 - 3122C includes HP 310-2714

SYNCHRONIZING-Switch

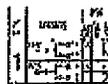

Machine-to-fans with interlocks.
Depth Behind Panel 2.9"
Handle: Cast Aluminum
Engaging and jumping as shown

Order #
Series 24 - 2424E includes HP 110-2517

MOTOR CONTROL-Switch, Governor or Rheostat

Split-Field motor
Depth Behind Panel 2.6"
Handle: Plastic-Body, Spring-Return
Engaging and jumping as shown

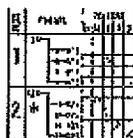

* Contacts 11-12 & 13-14 normally
default to normal position

Order #
Series 24 - 2421B includes HP 103-2172
Series 31 - 3121B includes HP 313-2172

TEMPERATURE METER- Transfer Switch

Transfer 3 low wires to three coils,
with "TRIP" and "OFF"
Depth Behind Panel 2.9"
Handle: Brass, Cast
Engaging and jumping as shown

* Dec. #2289 (standard)

Order #
Series 24 - 2432C includes HP 100-5710
Series 31 - 3132C includes HP 310-5710

CIRCUIT BREAKER- Trip Switch

Double-pole single-throw contacts
normally open
Depth Behind Panel 2.4"
Handle: Plastic-Body, Spring-Return
Engaging and jumping as shown

Order #
Series 24 - 2438D includes HP 100-1118

CIRCUIT BREAKER- Control Switches

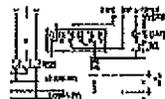

Depth Behind Panel 2.4"
Handle: Plastic-Body, Spring-Return
Engaging and jumping as shown

Order #
Series 24 - 2438D includes HP 100-2823

1939L 19" LCD Open-Frame Touchmonitor

High-quality panel and choice of touch technology in a compact form factor

The Elo TouchSystems 1939L 19" LCD open-frame touchmonitor delivers a cost-effective touch solution for OEMs and systems integrators, and complements the expanding family of Elo touch solutions for applications in the retail self-service and gaming/entertainment markets. This compact touchmonitor is "designed for touch" with proven Elo expertise and reliability built in, not added later by altering an existing monitor.

The 1939L features a brilliant wide-viewing-angle panel to instantly grab and hold the users' attention, whether they are checking out retail goods with a self-service kiosk or playing games in a casino or arcade. Because the enclosure is controlled by specifications and tooling, Elo open-frame touchmonitors have a history of product availability—important for continuity through all phases of project rollouts and when servicing. The 1939L also features a unique, injection-molded minibase with a virtually invisible watertight seal, making it well-suited for the rigors of public use.

Narrow borders, multiple mounting options and a dual serial/USB touch interface add to the versatility of the 1939L. Worldwide agency approvals, as set forth on the back side of the spec sheet, cover the entire monitor that is designed, built and supported by a true single source supplier.

Benefits

- Bright, high-contrast display with wide-viewing angle to attract and hold users' attention
- Choice of Elo touch technologies
- "Designed for touch" from the ground up: includes a protective minibase for sealing against liquids
- Slim and compact outer dimensions
- Enclosure controlled by Elo specifications
- Multiple mounting options
- Dual serial and USB connectivity
- Worldwide agency approvals
- Three year standard warranty
- Designed, built, and supported by Elo

Applications

- Casino and amusement games
- Information kiosks
- Self service
- Industrial process control

 **Tyco Electronics**
Our Commitment. Your advantage.

ELO PART# 19-24VDC-ISO-VI

1939L 19" LCD Open-Frame Touchmonitor Specifications

Case/Bezel color	Steel/black
Display type	Active matrix TFT LCD
Display size	19.0" diagonal
Useful screen area	Horizontal/vertical 14.6" (376 mm)/11.9" (302 mm)
Monitor dimensions	Width: 16.3" (415 mm) Height: 13.3" (343 mm) Depth: 2.0" (51 mm)
Original (native) resolution	790 x 1024
Other supported resolutions	1280 x 1024 60 Hz, 768 x 1280 60 Hz, 1152 x 864 75 Hz, 1024 x 768 60, 70, 75 Hz; 1024 x 768 65 Hz (Sun); 632 x 624 75 Hz (Mac); 800 x 600 36, 60, 72, 75 Hz; 120 x 400 70 Hz; 720 x 360 70 Hz; 640 x 480 60, 72, 75 Hz; 640 x 480 66 Hz (Mac)
Colors	16.7 million colors
Brightness (typical)	LCD panel: 250cd/m ² with AccuTouch: 200 cd/m ² with Acoustic Pulse Recognition: 230 cd/m ² with Carroll Touch: 250 cd/m ² with Intelli Touch: 230 cd/m ² with SecureTouch: 230 cd/m ² with Surface Capacitive: 212 cd/m ²
Response time (typical)	20 msec (combined rise/fall)
Viewing angle (typical at a CR>10)	Horizontal (left/right) 89°/89° Vertical (up/down) 89°/89°
Contrast ratio	1000:1
Input video format	RGB analog
Input sync format	Separate H & V sync, composite sync, and sync on green
Input video signal connector	Mini D Sub 15-pin VGA type
Scanning frequency	Horizontal/vertical 48.5 kHz/60.0 Hz
Power dissipation	Monitor only 46 W (max.) Monitor and power brick 50 W (max.)
Power supply	External AC to DC power brick is provided
Input voltage requirement	Monitor input: +12VDC 1.5A, 5.2A (typical), 5.8A (maximum) AC to DC power brick input 100-240 VAC, 50/60 Hz
Temperature	Operating/storage 0°C to 40°C/-20°C to 60°C
Humidity (non condensing)	Operating/storage 20% to 80%/10% to 90%
Mean time between failures (MTBF)	10,000+ hours demonstrated
Backlight lamp life (typical)	50,000 hours to half brightness
Weight (approx.)	Actual/shipping 5.2 kg (11.5 lbs)/7.8 kg (17.1 lbs)
Other Features	Digital on-screen display (OSD); Fully RoHS compliant; Patent pending bezel rest and patented touch technology
Mounting options	75 mm and 100 mm VESA mounting; rear mount with or without bezel mounting brackets (included)
User's controls	OSD buttons: menu, left, right, select, power; OSD: contrast, brightness, H/V position, RGB (color temp), clock, phase, recall, language (English, German, Spanish, Japanese, French); OSD disable/enable, power disable/enable; optional remote OSD
Warranty	Touchmonitor: 3 years
Touch Interface	Serial and USB
Agency certifications	UL, cUL, SEMKO, CN, TÜV-T, CE/FCC/VCCI/C/C-TICK (Class B)

PQM II

POWER QUALITY METER

Continuous metering of three-phase systems

KEY BENEFITS

- Power quality analysis with waveform capture and historical data logging
- Easy to program and use with keypad and large illuminated 40 character display
- Multiple communication ports for integration with DCS and SCADA systems
- Supports DNP 3.0 and Modbus protocols
- Digital and analog I/Os for control and alarms
- Voltage disturbance recording capability for electrical sag and swell events

APPLICATIONS

- Metering of distribution feeders, transformers, generators, capacitor banks and motors
- Medium and low voltage systems
- Commercial, industrial, utility
- Flexible control for demand load shedding, power factor, etc.

FEATURES

Monitoring and Metering

- Ia Ib Ic Ia
- Va Vb Vc Vab Vbc Vca
- VI imbalance
- True PF Crest and K factor
- Hz W var VA
- Wh varh VWh W crest
- Demand AM var VA
- Harmonic analysis through 63rd with THD and THF
- Event recorder - 150 events
- Waveform capture
- Data logger 99,000 events
- Voltage Disturbance Recorder (VDR) - 500 events

Communications

- Local RS232 serial port 11,200 to 19,200 bps
- Two (two) RS485 serial ports with Modbus and DNP 3.0 protocol
- Ethernet connectivity provided by MultiNet
- EnerView™ software is provided for setup and monitoring functions
- Federal tel-in modem capabilities

Protection & Control

- Load shedding
- Power factor control
- Pulse input totalizing

CATERPILLAR

Introduction

GE Multilin has set a new standard in metering technology with the introduction of the PQM II. This meter designed to the latest industry specifications, provides accurate and reliable three phase power metering with an optional Ethernet and fiber communications module in a small and modern package. The PQM II can be used in a variety of applications including metering of distribution feeders, transformers, generators and motors.

Robust Metering and Power Quality Capabilities in One Package

The PQM II is an ideal choice when continuous monitoring of a three phase system is required. It provides accuracy for current, voltage, real and reactive power, energy use, cost of power, power factor and frequency. Waveform capture and Voltage Disturbance Recorder continuously monitors power quality. Programmable relays and 4 assignable output relays allow control functions to be added for specific applications.

Communications Made Easy

Integrate process, instrumentation and electrical requirements in a plant automation system by connecting PQM II meters to a DCS or SCADA system. Meter provides multiple communication protocols and can provide data simultaneously to multiple masters such as SCADA, DCS, BMS etc. Meter supports both Modbus and DNP 3.0 protocol. A computer running FreeVista™ software can change system setpoints, monitor values, status and alarms. Continuous monitoring minimizes process downtime by immediately identifying potential problems due to faults or changes.

Industry leading software makes setup simple

The PQM II comes complete with FreeVista™ GE Multilin's suite of software tools for managing the entire lifecycle implementation of the PQM II. FreeVista™ contains all the tools for setting up and configuring your PQM II in minutes via RS232, RS485, external modem or Ethernet LAN.

Ethernet capability

With the optional Multilin module, users can add Ethernet capability to their meter. Multilin is an Ethernet communications module that allows connection of up to 30 Modbus devices, providing Modbus TCP/IP communications for these devices over Ethernet. This allows connection to fiber optic LAN and WAN systems for remote access to data on the PQM II.

Standard Features

The PQM II provides continuous monitoring of a three-phase system. It provides metering of current, voltage, real and reactive power, energy use, cost of power, power factor and frequency. Ethernet communications are available through the optional Multilin module.

Metering

PQMII is a true RMS meter with 0.2% accuracy for voltage and currents. The PQMII provides advanced features for monitoring and metering which include:

- Ia Ib Ic In
- Va Vb Vc Vab Vbc Vca
- V Unbalance
- True PF crest and K factor

- Hz W var VA
- Wh with VAh Wcost
- Demand A W var VA

Keypad and illuminated 40 character display provides local setpoint settings and monitoring of values and status.

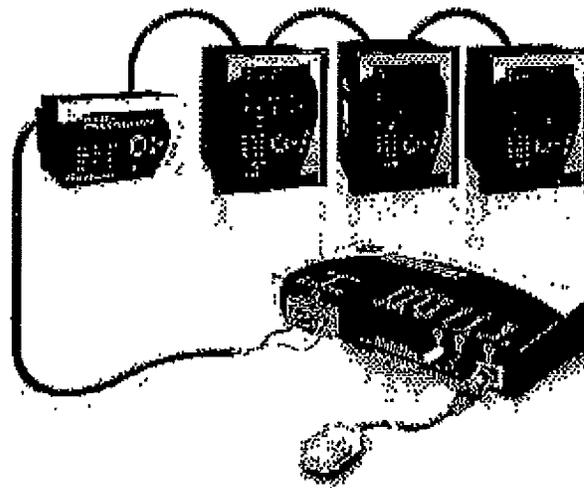

Mounting Versatility

PQM II panel mount with display, offers an easy local interface. Standard models have RS485 communications for programming and monitoring. Users can replace expensive additional devices by adding the CONTROL, TRANSDUCER and POWER analysis options to the PQM II as required.

Alarms

Any of the assignable outputs may be used to trigger an alarm for specific applications. Simple alarm messages provide easy notification.

CONDITION	APPLICATION
overcurrent	motor/transformer
undercurrent	pumps/compressors
neutral current	industrial motor
unbalanced current	motor
overvoltage	equipment protection
undervoltage	motor/blast transfer
phase sequence	process equipment
overfrequency	generators
underfrequency	load shedding
power factor	capacitor banks
switch input	process control

Connect up to 32 Modbus devices to your Ethernet network

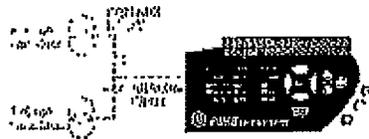

Communications

Interpret trends, maloperation and electrical requirements in a plant automation system by connecting PQM II meters to a DCS or SCADA system. Initially PQM II meters can be used as stand-alone units. Open architecture allows connection to other Modbus® compatible devices on the same communication link. At a later stage PQM II can be integrated in a complete plant wide system for overall process monitoring and control.

The standard PQM II comes complete with a rear RS485 and front RS232 port. RS232 port can be used for data collection, printing reports or problem analysis without disturbing the main RS485 communication interface of rear. The standard meter provides:

- RS485 Modbus 1,200 m 19,200-bps
- DNP 3.0 Level 2 Protocol
- Mini H-D SCADA system component
- Measure actual values
- Read status
- Issue control commands
- Load all setpoints from a file
- Change individual setpoints

A computer running Inverista® software can change system setpoints, monitor values, status and alarms. Continuous monitoring minimizes process downtime by immediately identifying potential problems due to faults or changes.

Connect two 4 to 20 mA transmitters to process variable measurement and control.

Future Expansion

The PQM II uses non-volatile flash memory for firmware storage. This allows future product upgrades to be loaded via the serial port. Upgrades can also be downloaded from the GE Multilin website.

Options

There are a variety of options available to the user, allowing a range of custom configurations.

Transducer

Four Analog Outputs: Four isolated analog outputs can be used to replace eight analog transducers. Output signals can be selected from any of the measured parameters for direct interface to a PLC or other devices.

Analog Input: PQMII meter can accept two analog inputs from external devices. Meter can be programmed to activate a control relay based on analog input from transducers (temperature, level etc.)

Communications

Second Rear Comm Port: An additional rear RS485 comm port is provided for simultaneous monitoring by process, instrument, electrical or maintenance personnel.

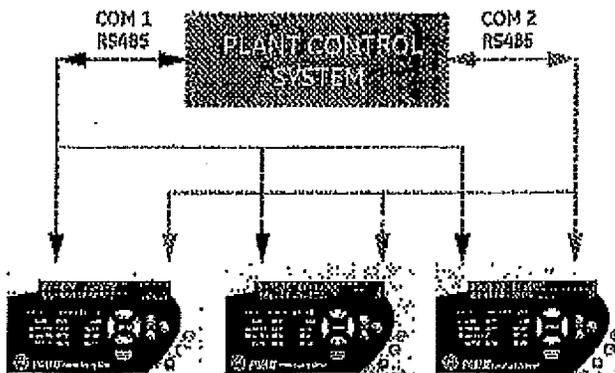

Control

Three output relays and four inputs allow measured parameters from the standard PQM II to be combined with setpoints and ZCs for control applications. With the control option, three output relays and four switch inputs are added along with programmable setpoints to make a mini RTU. Output relays can also be controlled via the communication port or assigned to different setpoints for custom programming to accommodate many applications such as:

- Undercurrent alarm for pumps
- Over and undervoltage for generators
- Unbalance alarm for rotating machines
- Low level power factor for capacitor bank switching
- Head or quantity/demand output for load shedding resulting in power cost savings
- kWh, kvarh and kWh pulse output for PLC interface

Power Analysis

Data Logger (Trending): Trending is useful as a troubleshooting aid when a problem is detected. Measured values can be selected and plotted with a programmable sampling rate to suit the time interval of interest. The generated chart recorder screen can be printed or

Redundancy in data security systems is provided by the 2nd RS485 comm port.

CATERPILLAR

Installed to other programs for report writing

Harmonic Analysis: Non-linear loads such as variable speed drives, converters and electronic ballasts can cause harmonics which may lead to problems such as resonance breaker tripping, in-phase interference, transformer, capacitor or motor overheating. Harmonic analysis can be used for fault diagnosis such as detecting undetected neutral wiring, need for a harmonic rated transformer, or effectiveness of harmonic filters. Data is of the harmonic spectrum are useful and available with the power analysis option.

Voltage Disturbance Recorder (VDR)
The Voltage Disturbance Recorder (VDR) function adds to the PQM II the ability to monitor and record Sag and Swell disturbances. It can record up to 300 sag/swell events for all voltages simultaneously.

Waveform Capture: Voltage and current waveforms can be captured and displayed on a PC using the LiveView™ program supplied with the PQM II or using third party software. Extensive points or patches from SCR systems may be used for taking corrective action.

Event Recorder: Alarms, setpoint triggers, input and output events can be stored in a 150 event record and time and date stamped by the internal clock. This is useful for diagnosing problems and system activity. Minimum and maximum values are also continuously updated and timestamped.

Trace Memory: The PQM II can be configured to record a maximum of 30 cycles of data on all voltage and current inputs based on overvoltage, under-voltage, overcurrent or switch input state change.

SmartView™ Software

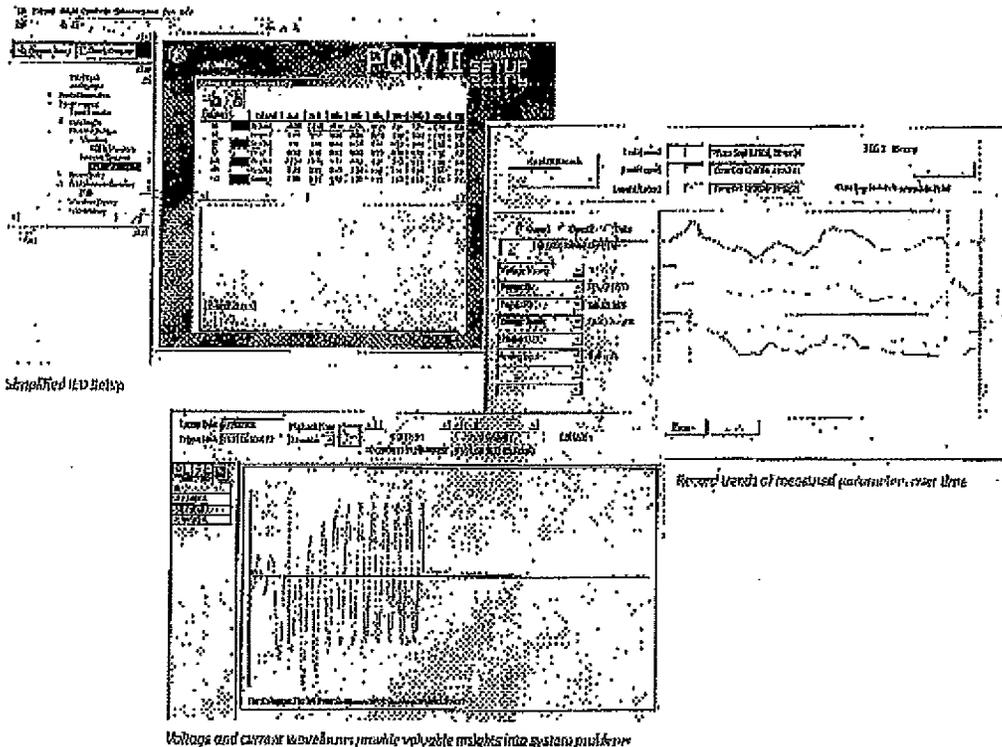

EnerVista™ Launchpad

The EnerVista™ Launchpad is a powerful software package that provides users with all of the setup and analysis tools needed for configuring and monitoring GE Multilin products. Launchpad allows configuration of devices in real-time by communicating using RS232, RS485, Ethernet, or modem connections.

The intuitive user interface makes it simple to make adjustments, read metered values, monitor status and evaluate power quality. Powerful troubleshooting features make it easy to retrieve and view voltage & current waveforms and harmonic analysis. This vital information can help provide early warning of problems and prevent equipment damage or nuisance breaker tripping.

EnerVista Launchpad PQM II Setup and Analysis

PQM II setup program contains many tools and reports that simplify device configuration and allows viewing of power system events

CATERPILLAR®

GE PART# PQMII-T20-C-A

Included in EverVista is a document archiving and management system that ensures critical documentation is up to date and available when needed by automatically archiving for and downloading raw waveforms of parameters, applications rates, specifications, and service manuals.

Viewpoint Monitoring

Viewpoint Monitoring is a simple to use, full-featured monitoring and data recording software package for remote systems. Viewpoint Monitoring provides a complete HMI package that instantly puts critical real-time device data on your PC through pre-configured graphical screens with the following functionality:

- Plug & Play Device Monitoring
- System Ring e-Line Monitoring & Control

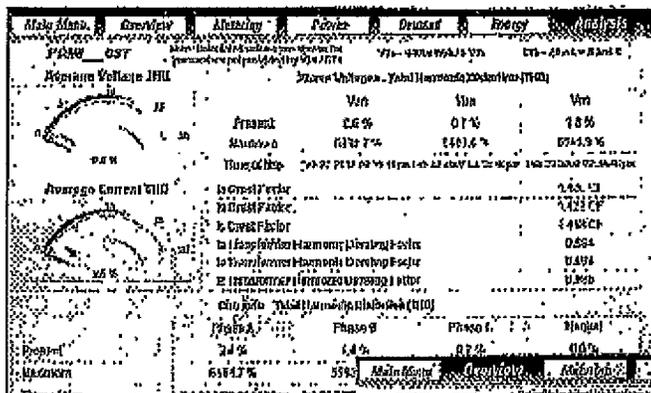

- Apparatus Alarm Screens
- Trending Reports
- Automatic Level Retrieval
- Automatic Waveform Retrieval

EnerVista® Integrator

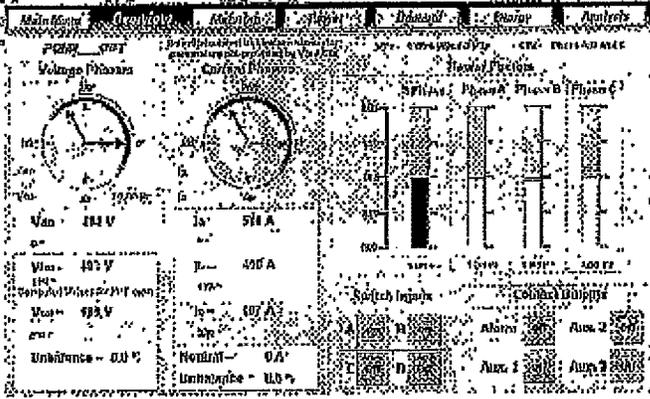

EnerVista® Integrator is a toolkit that allows seamless integration of GE Multilin devices into new or existing automation systems by sending GE device data to HMI, DCS, and SCADA systems. Included in EnerVista Integrator is:

- OPC/Modbus Server
- GE Multilin Drivers
- Automatic Level Retrieval
- Automatic Waveform Retrieval

EnerVista Viewpoint Monitoring Plug-and-Play Screens

Viewpoint Monitoring PQMII analysis screen for detailed power quality information

Viewpoint Monitoring PQMII real time overview screen for detailed device status

2	ROCKER BRACKET FOR 1/2" DIA. ROLLER - 1/2" DIA.

NOTE: DIMENSIONS ABOVE ARE APPLICABLE FOR ONE RACK ONLY. DIMENSIONS IN PARENTHESES ARE FOR CONSTRUCTION OF THE STANDARD SUBSIDIARY RACK.

URGENT SERVICE ARRANGEMENT FOR SERVICE BENDING IS A SINGLE RACK OF 20 RACK RACK 4 STRENGTH RACKS FOR COMPLETE DEFORMATION & STOPPING THE RACK. PLUS ONE SERVICE BENDING KIT PER RACK RACK.

MARATHON™

From the World Leader in VRLA Battery Technology

Designed for durability in Telecommunications and Electric Utility applications, the GNB TOP Terminal MARATHON™ series provides high performance and reliability in long duration discharge applications. The MARATHON™ family of batteries highlights another example of GNB's extensive experience and world wide leadership in VRLA technology.

"Designed in" Quality Manufacturing

Quality manufacturing processes for the MARATHON™ series batteries incorporate the industry's most advanced technologies including: an automated hydrogen leak detection system, a computer controlled "fill by weight" acid filler, and a temperature controlled water bath formation process. Each and every unit is capacity tested.

High Performance MARATHON™ Series Features

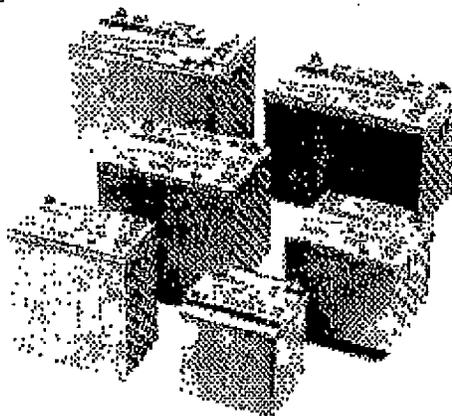

- Standard Reinforced polypropylene container and cover
- Optional flame-retardant reinforced container and cover compliant with UL94 V 0, 20% L.O.I.
- Integrated flash-arrester ultrasonically welded into cover.
- Patented "Diamond Side-Wall" design to maintain structural integrity in higher operating temperatures
- Heat sealed case-to-cover bond to ensure a leak proof seal
- High-Compression Absorbent Glass Mat (AGM) technology for greater than 99% recombination efficiency
- High-purity calcium, silver, lead positive plate design for maximum service float life; 10 year design life @ 25°C (77°F)
- Heavy duty copper alloy terminals for ease of assembly and reduced maintenance
- Reliable one-way, self-revealing safety vents
- Multicell design for faster installation and reduced maintenance
- Horizontal or vertical operation
- Removable carry handles for ease of installation.

Applications

MARATHON™ series batteries incorporate GNB's advanced VRLA technology designed for long life and high performance in:

- Telecommunications
 - Distributed Power
 - PCS
 - Cellular
 - Broadband

- Electric Utility
 - Switchgear Control Power
 - Communications

Float Voltage & Charging

Constant Voltage charging is recommended
 Recommended float voltage: 2.27 VPC @ 25°C (77°F)
 Float Voltage Range: 2.25 to 2.30 VPC @ 25°C (77°F)
 Equalize voltage: 2.24 VPC for 24 hours

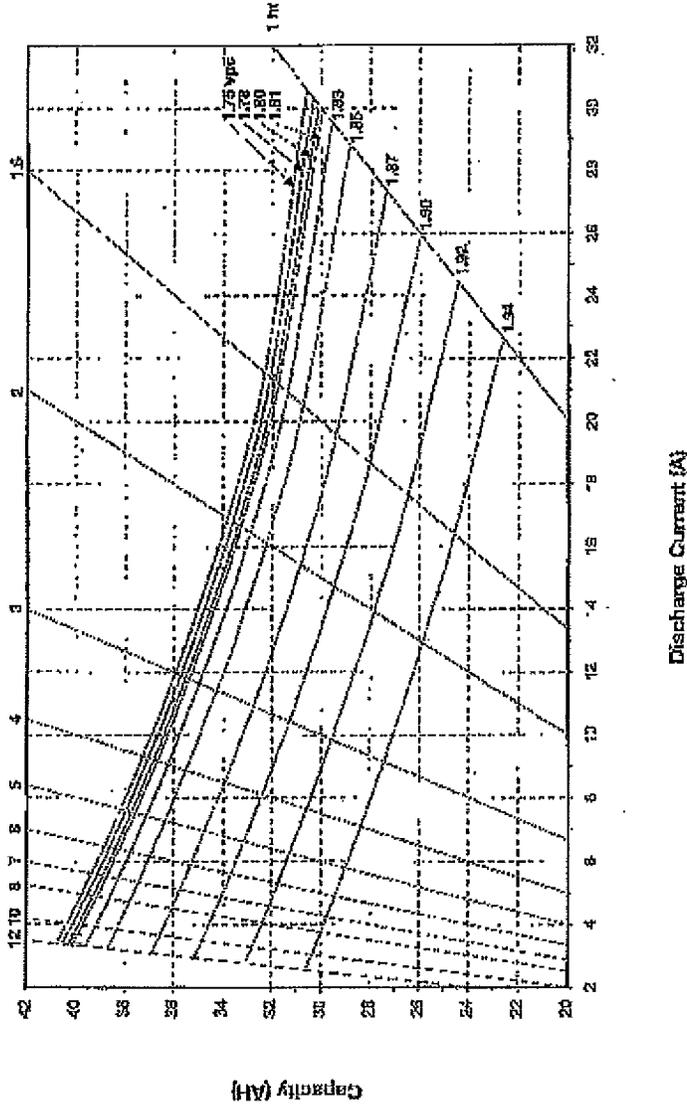

¹ D12L Design motor specifications to float to charge and reduce. If operation is to be used for 24 hours, refer to the manual for more details.

Single-Door Type 12 and 13 Wall-Mount Enclosures

WALL-MOUNT
ENCLOSURES
Bulletin
A12

Application

For use in housing electrical and electronic controls, instruments, components, and associated wiring, these enclosures incorporate hinged doors that provide convenient access. Designed for indoor use in protecting components from dust, dirt, oil, and water.

Construction

- Enclosure bodies are either 14 or 16 gauge steel. All doors are 14 gauge steel.
- Seams continuously welded and ground smooth; no holes or knockouts.
- External wall-mounting brackets are 14 gauge steel.
- Raised flanges around plate sides of door and all sides of enclosure prevent splash liquids and contaminants.
- Door closures are quick and easy to operate.
- Removable heavy gauge continuous hinge pin.
- Deep seal strips for padding.
- Over panel is high-impact thermoplastic.
- Collar studs provided for mounting optional panels.
- Shielding provision on floor.
- Optional panels are 12 gauge steel.

Finish

White inside with ANSI 61 gray outside finish over phosphated surfaces. Optional panels have white or conductive finish.

Industry Standards

UL 508A, File No. 961997; Type 12 and 13
NEMA IEMAC Type 12 and 13
IEC standard EGP-1-1967 (14 gauge only)
CSA, File No. 42144; Type 12
IEC 60529, IP65

Accessories

- See also accessories chapter.
- Blower Package
 - Clamp Kit (AL13)
 - Door Stop Kit (ADSTOPK)
 - Drift Shield Kit
 - Electric Heater
 - Electrical Interlocks
 - Enclosure Stabilizers
 - External Data Pocket
 - Fan Cooling Products
 - Fast Operating Clamp Assembly (AFCH1755)
 - Floor Stand Kit
 - Folding Shelf
 - INTERSAFE Data Interface Ports
 - Keyboard Kit (CKBC24)
 - Latch Kits and Lock Kit
 - Lighting Kit
 - Panel Support Kit
 - Pinch (see cable)
 - Rack Mounting Angle Kit
 - Sealing-Out Panel Kit (ANADHK)
 - Terminal Block Kit Assembly
 - Touch-Up Paint (ATPPY61)
 - Window Kit

Modification Services Program

You can customize this product to your unique requirements by specifying from these options:

- Enclosure height, width, depth
- Over 180 standard finish colors and textures
- Holes and cutouts in body, doors, subpanels
- Typical holes, features in enclosure or subpanel
- Mounting
- Doors
- Subpanels
- Structural changes
- Environmental control (louvers, fans, filters)
- Windows
- Standard accessories

To order, contact your local Hoffman sales representative.

NOTE: For information about modifications outside the scope of the Modification Services program, contact your Hoffman sales representative.

Intel® PRO/1000 MT Dual Port Server Adapter

Two Gigabit Copper Server Connections in a Single PCI Slot

The Intelligent Way to Connect

Conserve valuable PCI slot space in servers, eliminate server bottlenecks and migrate existing Category-5 networks to Gigabit Ethernet easily and cost-effectively with the Intel® PRO/1000 MT Dual Port Server Adapter. Featuring fixed bit rate negotiating 10/100/1000 Mbps performance, the Intel® PRO/1000 MT Dual Port Server Adapter is designed to automatically adapt to gigabit networks.

Enhance server performance further by loading the server connections together in front with other Intel® PRO Server Adapters using Intel's advanced server driver software to achieve multi-Gigabit scalability and redundant failover capability. A compact form factor and unpopulated low-profile brackets allow this dual port Gigabit adapter to fit in even high-density, rack-mounted 1U and 2U servers. With a flexible design that fits almost any type of PCI bus, the standards-based management features and wide network operating system support help to ensure extensive third party compatibility with the Intel server and networking environments.

Easy cost-effective 10/100/1000 migration and existing CAT-5 cabling

- Multi-Gigabit scalability and increased uptime through advanced server features
- Optional low-profile brackets allow for 1U and 2U server rack-mounted servers

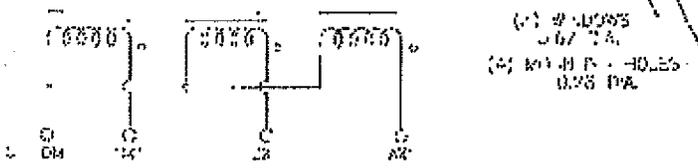

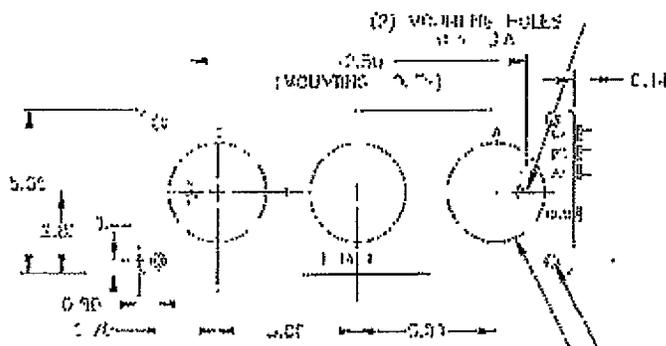

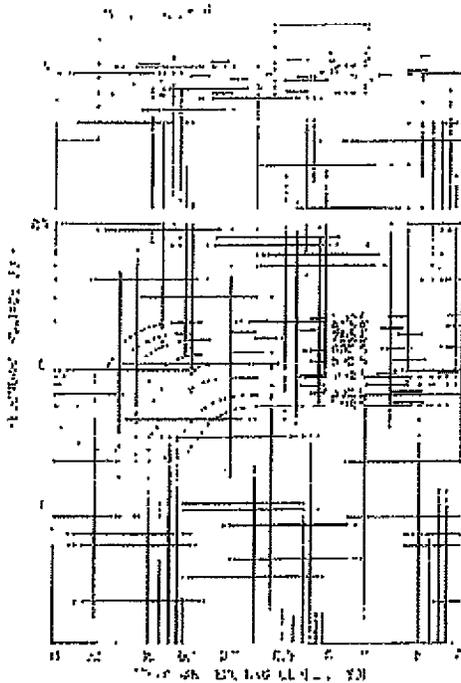

Feature	Benefits
Vendor-Agnostic Compatibility	Enables widespread deployment
Support for IPv4/IPv6	Current driver suite for Gigabit Ethernet reduces installation complexity
Intel® High-Density Technology	Current driver suite for Gigabit Ethernet reduces installation complexity
Backward Compatibility with previous generations of Intel 10/100/1000 Network Adapters	Reduces support costs and simplifies installation and maintenance
Supports 64-bit or 32-bit PCI-X 1.0 or PCI 2.0 buses	Installation, with standard adapters works in a variety of host types
Remote Management Support (RMM, RSL, SNMP/DM)	Reduces support costs with remote management based on industry-wide standards
IEEE 802.3ab Compatibility	Supports Gigabit Ethernet industry-wide networking standard

NEW FEATURES IN THE INTEL PRO/1000 MT DUAL PORT SERVER ADAPTER	
Intel® 82549 Gigabit Controller	Enables two Gigabit connections in a single adapter, delivering increased bandwidth for slot constrained servers and providing high performance, reliability, and low power use in a single, integrated, dual port Gigabit Ethernet controller chip
Full height and low-profile, server-agnostic brackets installed with each adapter	Compatible with full-height and low-profile PCI slots—the standard for 1U-2U servers can be easily swapped out and replaced by the shorter, low-profile bracket for rack servers of high-density 1U and 2U servers that feature low profile PCI slots
Interrupt Autoclear	Delivers enhanced performance with significantly reduced CPU utilization
Advanced Cable Diagnostics	Dynamically tests and reports network port/cable integrity, error rate, cable length and automatically reconfigures for cable length (cross over cables, wrong pin configurations)
Large Send Offload/TCP Segmentation Offload	Compatible with large Send Offload and in all Microsoft Windows® Server 2003 and XP which enables file speed performance with low CPU utilization
Extended Advanced Server Features	Intel® ANS software increases uptime with redundant, mirrored connections and enables bandwidth by balancing network load across multiple server connections, High Speed Select Patch Technology and Tool Switch Configuration to help server reliability and further increase uptime

Model 468

- The core and coil assembly is enclosed in a thermoplastic shell and filled with resin.
- These transformers are designed for operation line-to-line. They may also be operated line-to-ground or line to neutral at reduced voltage voltage, (80% of rated volts)
- It is desirable to use a 0.80 amp fuse in the secondary to protect the transformer.
- With two exceptions these transformers are ANSI C57.13 group 1. Those marked * are group 2.
- Models 468-380, 468-400, 468-415 designed specifically for 50Hz. operation are available with reduced performance. Consult factory for details.
- Each transformer has two plastic terminal covers.

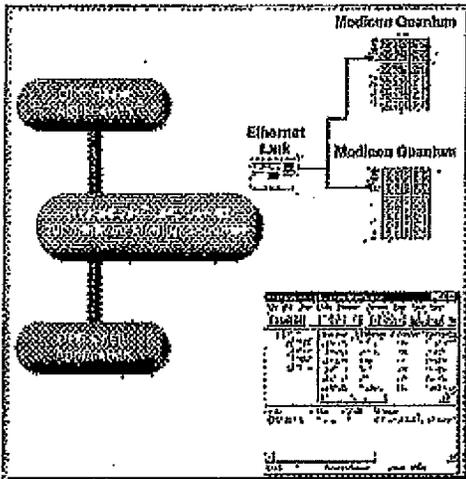

KEPWARE PART# OPC-MDBUS-NA00

Modbus Ethernet OPC Server

Overview

KePware's 32 bit Modbus Ethernet device driver works in conjunction with our OPC Server KEPServerEX, to provide data exchange between OPC Clients and Modbus Ethernet protocol compliant PLCs. KePware's implementation of Modbus Ethernet supports master and slave operations simultaneously. The slave mode allows the server to receive data by exception from other Modbus Ethernet devices. KEPServerEX automatically optimizes your data acquisition based on client demand. Data integrity is ensured with our extensive error handling.

The Modbus Ethernet driver now offers direct integration with Modicon Concept and ProWORX programming packages. If you are using either of these packages you will be able to directly impart the tags used in your PLC application directly into KEPServerEX. This time saving step makes all of the relevant PLC data available to your OPC client applications instantly.

This driver is part of the Modicon Modbus Communications Suite. Purchasing either the Modbus RTU serial, Modbus RTU Slave serial, Modbus ASCII serial, Modbus Plus SABB, or the Modbus Ethernet TCP driver entitles you to all five drivers.

Supported Devices:

Device	Note
Modbus Ethernet	n/a
Mailbox	Consult your Modicon Documentation on the MSTR instruction for sending unsolicited requests to the Modbus Ethernet driver.
Huenta PGM	n/a
Roxar RIM	n/a

Features:

Specific Features

- Automatic Tag Database Generation.

CATERPILLAR

KEPWARE PART# OPC-MDBUS-NA00

- Supports Multiple PLCs via IP addressing.
- Supports Modicon Ethernet to Modbus Plus bridging.
- Supports Multiple or Single socket usage for better gateway resource management.
- Supports Tag Import from Concept and ProWORX programming packages.
- Supports Memory Accesses to 65535.
- Hex Addressing Support (0-FFFF).
- User Definable Read Block Sizes.
- Adjustable Address Base (0 or 1).
- Word Order Swapping for Floating Point and LONGs.
- Output Coils, 1xxxx - Input Coils, 3xxxx - Internal Registers, 4xxxx - Holding Registers.
- All data types and arrays are supported.

General Features

General

- Multi-threaded design ensures optimum performance
- Supports up to 16 concurrent serial port and PC card configurations
- Full Time On line operation allows on the fly changes
- Built Diagnostic system with protocol display
- OPC Diagnostic feature provides a real-time and historical view of OPC events that occur between any OPC client and the server.
- Modem support included on all Serial port drivers
- CSV file import and export of Server tags for easy configuration on large projects
- Supports running as a Windows service
- Supports direct scaling of device data which allows raw device data to be converted to engineering units for OPC client applications
- Online full time
- Includes a built in User Manager that allows complete control over what types of functionality each individual user can access
- Allows the user to specifically select a NIC card for use with any Ethernet driver or serial driver running in Ethernet Emulation mode.

OPC

- Supports OPC 1.0 Data Access Specifications
- Supports OPC 2.05a Data Access Specifications
- Supports OPC 3.0 Data Access Specifications
- Includes OPC 2.0 Automation Interface and comprehensive Visual Basic examples

DDF

- AdvancedDDF supports RSView32 and Simplicity
- FastDDF and Softlink Support Wonderware FactorySuite 2000
- CF-Text supports all DDF aware applications
- NetDDF supports shared network access to device data

KEPWARE PART# OPC-UCNPS-NADL

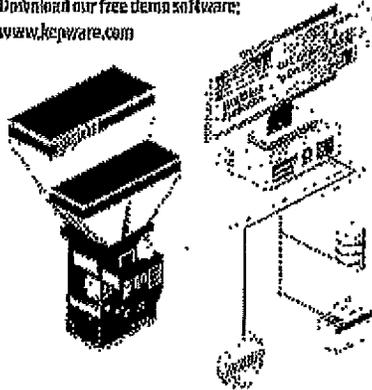

Automation's Best Friend | U-CON datasheet

Kepware Technologies Automation's Best Friend 1-888-Kepware sales@kepware.com www.kepware.com

User-Configurable Driver + OPC / DDE server

The User-Configurable driver by Kepware enables you to quickly and easily develop communication drivers for new types of Ethernet devices. The U-CONs (pronounced like a menu driver) feature, which allows the configuration of read & write transactions (data packets) to establish reliable communication with the device. These transaction are uploaded as tags to our reliable and field proven OPC/DDE server. Typically users create transaction profiles for their specific device but the Magnum III API protocol by Kepware can work easily with Magique Protocol to provide a pre-configured profile for use with their controllers.

Download our free demo software:
www.kepware.com

Product Description	Product ID #
U-CON Protocol Server	OPC-UCNPS-NADL

or choose U-CON as a plug-in to KPServerEX

U-CON driver for KPServerEX	OPC-UCNPS-NADL
-----------------------------	----------------

For connectivity to Magique controllers
Kepware provides a free U-CON profile for use with our
User-Configurable driver/server products. Please contact us
to obtain the .opj project file.

Support:	Sales:

support@kepware.com	sales@kepware.com

Please visit www.kepware.com for complete product listing

Performance & Ease of Use:

- Kepware OPC servers are proven with HMI, SCADA, HCS data, and custom applications like Visual Basic, Visual Basic .NET, Excel, etc.
- Software includes 5+ unique driver and server interface source code
- License purchase includes 72 hours of phone & unlimited email support
- No device or tag limits with increased U-CON production
- Free product help files, user manual, FAQs, server utility guides

Application Connectivity:

- OPC Data Access:
1.0a, 2.0, 2.05a, 3.0

- Additional Formats:
CF_Text (DD*), Advanced DDE
FUD interface for HX; FastDDE; & SuiteLink for Wonderware

Which U-CON license do you need?

The U-CON Protocol Server is based upon the same technology found in our industry leading KPServerEX. The OPC/DDE server features are identical between U-CON Protocol Server and KPServerEX, but U-CON is used in applications where only configurable connectivity is needed. KPServerEX on the other hand is a single OPC server interface with multiple "plug-in" drivers for numerous additional connectivity to Allen Bradley, GE, Mitsubishi, Modicon / Modbus, Siemens, Yokogawa and more. So choose the U-CON plug-in for KPServerEX when you also need other types of connectivity supported through a single OPC server interface.

OptiMate® Series

Intelligent Operator Interface Peripherals for Control & I/O

OptiMate 1000 Series

OptiMate 600 Series

OptiMate 400 Series

Overview

Nematron has sixteen operator interface terminals in the OptiMate Series. All of the terminals are compatible with the major brands of PLC's. The OptiMate Series is also compatible with computer or microprocessor based applications using the OptiMate Hex protocol.

All of the operator terminals are low cost, high performance, man/machine interface modules with a broad range of input and display capabilities. The OptiMate product line is the most cost-effective solution in control & I/O on the market today.

OptiMate modules are compatible with any computer that has either an RS232 or RS422 port. They are also compatible with many major PLC's (see PLC Compatibility Chart on page 2).

Hazardous Locations Approvals

All OptiMate operator panels are available in models that are UL Class I, Division 2, Groups A, B, C, and D certified for use in hazardous conditions (see ordering information on page 4).

Broad Compatibility

OptiMate operator panels are compatible with most major brands of PLCs, as well as PC or microprocessor-based applications using the OptiMate Hex protocol.

Compatible PLC brands include:

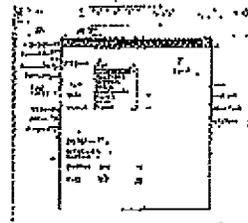

- Allen Bradley
- AutomationDirect
- Entiron
- GE Fanuc
- IDEC
- Keyence
- Koyo
- Mitsubishi
- Modbus
- Mexicon
- Omron
- Siemens
- Toshiba

See PLC Accessory Cables on page 3.

Easy-to-Use Software for OptiMate Panel Configuration

OM-WINEDIT is a graphical, user-friendly software program that runs on any Windows-compatible computer. It is available to configure any OptiMate panel system, or define all system parameters.

 OM-WINEDIT can be downloaded from the Nematron.com website at no charge. It can also be purchased on CD-ROM and comes with OM-ACBL-1 and OM-CCBL cables to connect the PC and operator panels.

Our Configuration Editor, OM-WINEDIT is designed specifically for custom configuration of our systems, allowing you maximum flexibility in customizing the way your panels will operate.

2x20 char. LCD with 100 message capacity, alphanumeric keypad, four pushbutton pads

OM640 Operator Panel
4x20 char. LCD with 400 message capacity, three LED light base, four pushbutton pads

400 Series

OM408 Indicator/Pushbutton Panel
Six LED light base and four pushbutton pads

OM415 Solipoint Display Panel
One 4 digit numeric display and six numeric pads

OM414 Solipoint Display Panel
One 8 digit numeric display and six numeric pads

OM420 2-Line Operator Panel
2x20 char. LCD with 100 msg capacity and four pushbutton pads

OM440 4-Line Operator Panel
4x20 char. LCD with 400 message capacity

OM9001 Communications Master

The OM9001 Communications Master provides up to 32 input registers to connect your PLC and up to 31 connected OptiMate panels (1000 Series or 600 Series). The OM9001 communicates readily to the PLC, transferring register data in both directions, and transparently manages operations amongst the OptiMate panels. The Communications Master can be configured via the OptiMate Communications Master menu tree of several industry standard PLC protocols. Baud rate, parity and other protocol specifics are transparently selectable to enable communications. Once configured, the OM9001 will continuously transfer data between all modules and the PLC to read and write the appropriate data registers. The OM9001 and the OptiMate panels take care of the rest.

PLC Compatibility Chart

How to Order: Use the PLC Compatibility Chart below to determine the letter to append to the model number that you are ordering. Examples: To purchase an OM640 for use with an AB PLC, then the model number to order would be OM640C. For use with a Modbus PLC then it would be OM640H. A "-" indicates that the model is incompatible with the corresponding PLC.

OPTIMATE PART# OM1124 & OM9001

OptiMate Accessories

Configuration Cables - All Cables are 6 ft. long unless stated otherwise.

OM-ACBL-1	Connects any 600 or 1000 series panels and a PLC. (Also used with A/B PLCs)
OM-CCBL	Connects between 400 series panels and PC

PLC Communication Cables - All Cables are 6 ft. long unless stated otherwise.

***Allen Bradley PLCs**

OM-ACBL-1	Connects any 600 or 1000 series OptiMate panel to an Allen Bradley SLC 500 or 504 PLC
OM-ACBL-2	Connects any 600 or 1000 series OptiMate panel to an Allen Bradley Micrologix PLC
OM-ACBL-3	Connects any 400 series OptiMate panel to an Allen Bradley SLC 503 or 504
OM-ALBL-4	Connects any 400 series OptiMate panel to an Allen Bradley Micrologix PLC

***GE Fanuc PLCs**

OM-SCBL-1	Connects any 1000 series OptiMate panel to GE Fanuc S1400 or 6030 PLC
------------------	---

***Keyence PLCs**

OM-KCBL-1	OptiMate 400 series panel to Keyence CPU
OM-KCBL	OptiMate 600 series panel to Keyence CPU

***Mitsubishi (AutomationDirect.com) PLCs**

OM-2CBL	OptiMate 600 or 1000 series to DL100, DL200, DL300 or DL400 CPU. 15 pin 'Y' shell to RJ12 jack.
OM-2CBL-1	OptiMate 600 or 1000 series to DL200 in-line panel. 15 pin 'D' shell to 15 pin 'Y' shell.
OM-2CBL-2	OptiMate 400 series to DL00, DL100, DL200, DL300 in DL400 CPU. RJ12 to RJ12.
OM-3CBL	OptiMate 600 or 1000 series to DL340 CPU. 15 pin 'D' shell to RJ11
OM-3CBL-1	OptiMate 400 series to DL340 CPU. RJ12 to RJ11
OM-4CBL-1	Connects 600 or 1000 series panel to DL400 CPU. 15 pin 'Y' shell to 15 pin 'D' shell
OM-4CBL-2	Connects 600 or 1000 series panel to DL400 or DL350 CPU. 15 pin 'Y' shell to 25 pin 'D' shell
OM-4CBL-3	Connects 400 series panel to DL400 CPU. RJ12 to 15 pin 'D' shell

***Modicon PLCs**

OM-MCBL-1	OptiMate 600 or 1000 series to Modicon PLCs
OM-MCBL-2	OptiMate 400 series to Modicon RJ45

Power Supplies

OM-PS1	Wall plug power supply for 600 series, 1000 series panels. 24VDC (unregulated) @ 1A output.
OM-PS400	Wall plug power supply for 400 series panels. 5V @ 250mA with center negative. Required for configuration and for connection to PLCs that do not have a 5VDC connection on their communication port.

Light Bar Kits

OM-GREEN	4-Pack of Green Light Bars
OM-RED	4-Pack of Red Light Bars
OM-YELLOW	4-Pack of Yellow Light Bars

Connector Kits

OM-CRCON-1	Package of 4 RJ45 cable connectors OM9001 to OptiMate connector.
OM-CRCON-2	Package of 4 solder type 15 pin (male) 'Y' shell connectors for OM9001 to OptiMate connector.
OM-CRCON-3	Package of 2, 15 pin 'D' shell to 4 pin terminal block converters for 600 or 1000 series RJ45 connection.
OM-PSCON	Package of 4 terminal plugs for power connection to 600 or 1000 series panels.

Configuration Software

OM-VINEDIT	OptiMate panel configuration software on CD-ROM. Comes with OM-ACBL-1 and OM-CCBL cables to connect the PC and operator panels. Software can be downloaded separately at no charge from AutomationDirect.com.
-------------------	---

www.automationdirect.com

Nematron

Configuration Options

PLC Stand Alone

Optimate modules plug directly into most PLCs. A simple RS232 cable connection allows you to interface and control the Optimate module via PLC data registers and ladder logic. To do this the operator terminal uses a bank of mapped PLC registers. Complete operator interface is performed using the PLC registers for display message selection, data entry, function key interface and indicator light control. The Optimate module continuously accesses these PLC registers and performs operations under ladder logic control on a real-time basis.

PLCs are slave devices on their standard communications ports. This means that a panel attached to the standard port must control the transfer of information by reading and writing the PLC registers. Optimate modules will perform this communications for most major PLC protocols.

PLC Multi Modules

Larger systems involving operator panels can be configured using an OM9001 Communications Master and multiple 800 and 1600 series panels. This configuration uses an RS422 link with up to 31 modules installed on the communications cable. The OM9001 Communication transfers data between the PLC and the individual Optimate modules. Modules can be located together to form custom modules or they can be distributed anywhere within 4000 feet.

The OM9001 Communications Master provides a transparent interface between the PLC and a group of Optimate modules. The communication interface between modules requires only four wires. The OM-WinEdit software program is used to configure both the OM9001 and the connected panels.

This modular approach to custom applications provides a nearly limitless number of possibilities.

Microprocessor Based Systems

Optimate modules can also interface directly to most computers or microcontrollers using the Optimate Hex protocol. In a microprocessor based system, the host microprocessor is the system master. The Optimate modules are slave devices that respond to commands from the host. The Optimate Hex protocol is used to develop a program that allows the user to directly control Optimate module operation and retrieve operator inputs. A serial port is required and the modules communicate over either RS232 for a single panel configuration or RS422 for multiple panel configurations.

With RS422 communications modules can be located together to form custom modules or they can be distributed anywhere within 4000 feet.

Ordering Information

Ordering Optimate Panels with Class I, Div 2

To order Optimate panels with Class I, Div 2 approvals for hazardous locations, simply replace the "M" in the product number with an "H". For example, an OM1406 and OM1812 would be ordered as OH406x and OH1212x. The "x" represents the lot designation of the brand of PLC required in your application. See PLC Compatibility Chart on the bottom of page 2.

Nematron and Optimate brand products are available worldwide through our network of factory authorized distributors. For distributor contact information in your area, please visit our website at www.nematron.com and submit a Request for Quote or call Nematron's Customer Care Center at your nearest regional sales office. OM-WINEDIT software can be downloaded free of charge from the Nematron website.

Product description

The bus coupler for the Modbus/TCP(UDP) protocol has 4 digital outputs and 8 digital inputs. This package contains all the necessary inline connectors for connecting the supply and the I/Os.

The inline terminals can be labeled using pull-out labeling fields. The fields have insert cards that can be labeled individually to suit the application. Additionally, there is the ZBF-M-6... Zack marker strip for labeling the terminal points.

PHOENIX PART# 2703981

IL ETH BK D18 D04 2TX-PAC Order No.: 2703981

Technical data

Interface

Fieldbus system	LoKabus
Name	Inline local bus
Type of connection	Inline data jumper
Transmission speed	500 kBits, 2 Mbits (Automatic detection, no combined system)
Fieldbus system	Modbus/TCP (UDP)
Name	Modbus/TCP (UDP)
Type of connection	RJ45 socket, autoconfiguration
Transmission speed	10/100 Mbits
Name	Supply
Type of connection	8 pos. inline connector

Digital inputs

Input name	Digital inputs
Description of the input	HN 61 131-2 type 1
Type of connection	Inline connectors
Connection method	2, 3-wire
Number of inputs	8
Protective circuitry	Polarity protection Suppressor diode
Input voltage	24 V DC
Input voltage range "1" signal	15 V DC ... 30 V DC

Digital outputs

Output name	Digital outputs
Type of connection	Inline connectors
Connection method	2, 3-wire
Number of outputs	4
Maximum output current per channel	500 mA
Protective circuitry	Short circuit and overload protection Free running circuit
Output voltage	24 V DC -1 V (At nominal current)
Nominal output voltage	24 V DC
Maximum output current per module / terminal block	2 A
Maximum output current per module	2 A
Nominal load, inductive	12 VA

CATERPILLAR

PHOENIX PART# 2703981

IL ETH BK DI8 DO4 2TX-PAC Order No.: 2703981

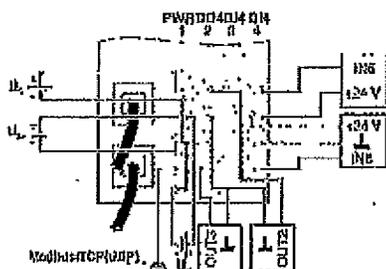

Nominal load, lamp	12 W
Nominal load, ohmic	12 W
Power supply for module electronics	
Supply voltage	24 V DC
Range of supply voltages	19.2 V DC ... 30 V DC
Supply current	70 mA
General data	
Width	80 mm
Height	119.8 mm
Depth	71.5 mm
Note on dimensions	Specifications with male connectors
Weight	375 g
Note on weight specifications	With male connectors
Ambient temperature (operation)	-25 °C ... 55 °C
Ambient temperature (storage/transport)	-40 °C ... 55 °C
Permissible humidity (operation)	10 % ... 85 % (As per EN 61131-2)
Permissible humidity (storage/transport)	10 % ... 85 % (As per EN 61131-2)
Air pressure (operation)	70 kPa ... 106 kPa (up to 3000 m above sea level)
Air pressure (storage/transport)	70 kPa ... 106 kPa (up to 3000 m above sea level)
Degree of protection	IP20
Mechanical tests	Vibration resistance in acc. with IEC 60068-2-6 5g Shock test in acc. with IEC 60068-2-27 Operation: 25 g, 11 ms duration, semi-sinusoidal shock impulse
Mounting type	DIN rail
Inline potential routing	
Communications voltage U_1	7.5 V DC $\pm 5\%$
Power supply for U_1	Max. 0.8 A DC
Supply for mesh circuit U_n	24 V DC -15% / +20% (in acc. with EN 61131-2)
Power supply for U_n	Max. 8 A DC (Sum of $U_n + U_1$)
Segment power supply voltage U_s	24 V DC -15% / +20% (in acc. with EN 61131-2)
Power supply for U_s	Max. 8 A DC (Sum of $U_n + U_s$)
Current consumption from U_s	Max. 2 A
I/O supply voltage U_{IO}	24 V DC -15% / +20%
Power supply for U_{IO}	Max. 0.5 A DC (observe derating)

Technical data

Interfaces

Interface	Ethernet (RJ45)
No. of ports	16 RJ45 ports
Type of connection	RJ45 socket, autonegotiation and autocrossing
Transmission physics	Ethernet in RJ45 twisted pair

PHOENIX PART# 2832849

FL SWITCH SF 16TX Order No.: 2832849

Transmission speed	10/100 MB/s (RJ45)
Transmission length	100 m (per segment)
Signal LEDs	Data receive, link status
Interface	Potential-free signaling contact
Type of connection	Plug-in/screw connection via COMBICON
Function	
Basic functionality	Unmanaged switch / autonegotiation, complies with IEEE 802.3, store and forward switching mode
Status and diagnostics displays	1 LEDs: U ₊ , U ₋ (redundant voltage supply), link and activity per port
Network extension parameters	
Cascading depth	Network, line and star structure: any
Maximum conductor length (twisted pair)	100 m
Supply voltage	
Supply voltage	24 V DC
Residual ripple	3.6 V _r (within the permitted voltage range)
Range of supply voltages	18.5 V DC ... 30.2 V DC
Typical current consumption	Typ. 300 mA
Max. current consumption	Typ.
General data	
Weight	360 g
Width	205 mm
Height	94.3 mm
Depth	30 mm
Degree of protection	IP20 in acc. with DIN 40050/IEC 60529
Ambient temperature (operation)	0 °C ... 55 °C
Ambient temperature (storage/transport)	-20 °C ... 70 °C
Permissible humidity (operation)	20 % ... 85 % (non-condensing)
Housing material	Aluminum
Electromagnetic compatibility	Conformance with EMC directive 89/330/EEC
Emitted interference	EN 61000-6-4
Immunity to interference	EN 61000-6-2:2005

CATERPILLAR®

Product description

QUINT POWER is the high-capacity DC current supply of 80 - 960 watts for universal use worldwide. This is ensured by the wide-range input, one and three-phase versions as well as an international approval package that has yet to be matched. QUINT POWER stands for guaranteed supply: Generously dimensioned capacitors guarantee a mains buffering of more than 20 ms under full load. All three-phase devices provide the full output power, even in the event of a continuous phase failure. The Power Boost power reserve easily starts loads with high inrush currents and ensures that fuses are reliably triggered. A preventive function monitoring diagnoses improper operating states and minimizes downtime in your system. Remote monitoring is provided by an active transistor switching output and a floating relay contact. All devices are protected against idling and short circuits and are available with a regulated and adjustable output voltage of 12, 24 and 48 volts DC with output currents of 2.5, 5, 10, 20, 30 and 40 A. The comprehensive range of

PHOENIX PART# 2938604

QUINT-PS-100-240AC/24DC/10 Order No.: 2938604

products is rounded off by power supplies for use in the Ex zone 2, uninterruptible solutions, AS-I power supplies and a Quint diode.

Technical data

Input data

Nominal input voltage	100 V AC ... 240 V AC
AC input voltage range	85 V AC ... 204 V AC
DC input voltage range	80 V DC ... 350 V DC
AC frequency range	45 Hz ... 65 Hz
DC frequency range	0 Hz
Current consumption	Approx. 2.34 A (120 V AC) Approx. 1.2 A (230 V AC)
Nominal power consumption	240 W
Inrush surge current	< 16 A (typical)
Power failure bypass	> 80 ms (120 V AC) > 60 ms (230 V AC)
Input fuse	6.3 A (slow-blow, internal)
Recommended backup fuse	10 A 16 A (characteristic B)
Name of protection	Transient surge protection
Protective circuit/component	Variator

Output data

Nominal output voltage	24 V DC \pm 1%
Setting range of the output voltage	22.5 V DC ... 26.8 V DC
Output current	10 A (up to 60 °C) 15 A (with POWER BOOST)
Connection in parallel	Yes, for redundancy and increased capacity
Connection in series	Yes
Max. capacitive load	Unlimited
Current limitation	on. $I_{peak} = 15$ A (for short circuit)
Control deviation	< 1 % (change in load, static 10% ... 80%) < 2 % (change in load, dynamic 10% ... 80%) < 0.1 % (change in input voltage \pm 10%)
Residual ripple	< 10 mVPP (with nominal values)
Peak switching voltages nominal load	< 60 mVPP (20 MHz)
Maximum power dissipation Idling	2 W

CATERPILLAR

CS241210
Fast Recovery Single Diode Modules
100 Amperes/600-1200 Volts

Description:

Powerex Fast Recovery Single Diode Modules are designed for use in applications requiring fast switching. The modules are isolated for easy mounting with either components on common heatinks. POW R BLOC™ has been tested and recognized by Underwriters Laboratories (UL) as Power Switching Semiconductor.

Features:

- Isolated Mounting
- Planar Chips
- UL Recognized

Applications:

- Inverters
- Choppers
- Switching Power Supplies
- Free Wheeling

Ordering Information:

Select the complete eight digit module part number you desire from the table below.

Example: CS24 1210 is a 1200 Volt, 100 Ampere Fast Recovery Single Diode Module.

RSVIEW32 v7.20

OVERVIEW

RSView32™ is an integrated, component-based HMI software product for industrial automation, process control, and supervisory monitoring. It enables operators to interact with automation machines and processes while providing a flexible, easy-to-use design environment for control engineers to create, test, and deploy HMI solutions for real-world applications.

RSView32 is an open system that allows plant floor data to be shared with other manufacturing systems throughout the enterprise. This provides a vital link to real time manufacturing information for the enterprise to achieve process optimization and increase productivity. Designed for Microsoft® Windows® environments, RSView32 integrates easily with the Rockwell Software integrated product line, Microsoft products, and other third-party offerings.

You can extend your RSView32 applications with the RSView32 Active Display System™, a client/server option that allows you to interact with your RSView32 applications remotely – across either a Local Area Network or the Internet.

RSView32 products include:

- RSView32 Works – includes both the development and runtime software to create, test, and run RSView32 applications.
- RSView32 Runtime – includes the runtime software to deploy and run RSView32 applications.

Additional RSView32 products:

- RSView32 Active Display System – a client/server application that extends the reach of your HMI application to virtually any computer on a network. (See 93012AD-TD001B-EN-B)
- RSView32 WebServer – allows anyone with a valid RSView32 user account to connect to an RSView32 project over the Internet. (See 93012AD-TD001B-EN-1)
- RSView32 MessengerPro – provides additional messenger features that allow you to dial in using a regular phone line to hear and respond to status and run RSView32 commands or macros.

FEATURES

Get started quickly with RSView32's point-and-click access to its options and many of its functions. An intuitive folder system makes it easy to organize project files. To switch between the development and runtime systems, you simply click the tabs in the convenient Project Manager. It's quick and easy to change your project on the fly during runtime.

POWERFUL GRAPHICS EDITOR

Design high-level graphics for even the most complex application using the RSView32 drawing environment. You can also use graphic files from other drawing software, such as AutoCAD®, CorelDRAW®, and Photoshop®. And you can add animations to vector-based graphic objects.

Graphic Import/Export Wizard

The new Graphics Import/Export Wizard in RSView32 v7.20 lets you export complete graphic displays as XML (Extensible Markup Language) files. You can edit the elements and attributes you need for your graphic displays using an external programming tool or

XML editor and then import the file back into RSView32 to modify the existing graphic objects or create a new display.

CATERPILLAR

Customize the look of graphic displays

RSView32 offers a full set of display setup features, including background color, highlight color, input field text and fill colors, scaling, window size and position, security code, and startup and shutdown commands. You can also set default values so that all graphic displays in a project share similar characteristics.

Use any of the standard Windows colors for objects in graphic displays, or create your own custom colors. To draw an operator's attention to an object at runtime, animate the object to change color as its value changes, using up to 16 different color updates.

Copy and paste animations

After attaching animation to an object, copy the animation and paste it onto another object. If the object has more than one type of animation, all animation is copied and pasted with a single click.

Edit objects and properties as a group

To edit a common property of several objects (for example, their color, size, or orientation), group the objects together and then change all of them with just one click.

Simulate runtime with the click of a button

During development, quickly test the animations in a graphic display by clicking a button on the toolbar. RSView32 immediately simulates run mode from within the graphics editor without starting the runtime software. To continue editing, simply click another toolbar button.

Represent multiple machines with a single graphic display

When you create the graphic objects in a display, assign tag placeholders to the objects instead of tag names, and assign a parameter file to the graphic display. A parameter file defines the tags that the graphic display uses at runtime. To change the tags associated with all of the objects on a graphic display at runtime, simply change the parameter file. A single graphic display can handle information for many similar sources - so you have fewer graphic displays to create, edit, save, and update.

Build commands by pointing and clicking

You don't have to remember complicated command names and syntax; the command wizard in RSView32 steps you through the process with lists, prompts, and check boxes. To run commands quickly during either development or runtime, use the built-in command line.

Enter input with an on-screen keyboard

The on-screen keyboard allows operators of touch-screen terminals to enter input without a keyboard attached to the terminal. When the on-screen keyboard is enabled for a graphic display, a keypad opens when the operator selects an input field. If the operator selects a text input field, a full QWERTY keypad opens. If the operator selects a numeric input field, a numeric keypad opens.

Continuously update hidden graphics

Even when hidden from view, displays can remain actively running or collecting data at the configured scan rate. For example, use this feature to keep an Acthawk™ control running continuously or to update real-time trend data, even if the graphic display is closed.

Continuously update input fields

To help you track a tag's value, configure an input field to update continuously with its current value, while allowing values you enter values manually.

Resize objects and graphic displays

RSView32 automatically scales objects on a graphic display to fit the runtime screen resolution. This eliminates the need for configuring separate graphic displays for different display resolutions.

Document objects with pop-up tool tips

Assist runtime operators by adding pop-up tool tips to buttons and other touch-control objects.

Animate objects with changing colors

Edit a common property of several objects (for example, their color, size, or orientation) by grouping the objects and then changing all of the properties with just one click.

Animate motion by clicking and dragging

With Object Smart Path™, animate an object's range of motion by simply dragging the object from its starting point to its final position. RSView32 automatically calculates the pixel offset and moves the object through the range at runtime, eliminating counting pixels, taking measurements, and trial and error.

Simplify tag replacement by using parameter files

When you create the graphic objects in a display, assign tag placeholders to the objects instead of tag names, and assign a parameter file to the graphic display. A parameter file defines the tags that the graphic display uses at runtime. To change the tags associated with all of the objects on a graphic display at runtime, simply change the parameter file. A single graphic display can handle information for many similar sources - so you have fewer graphic displays to create, edit, save, and update.

Replace tag names and character strings quickly

Like tag substitution lets you quickly replace the tag names or placeholders, comments, macros, file names, or command parameters associated with all currently selected graphic objects. This timesaving feature allows you to change quickly a large number of tag names or other character strings associated with multiple objects without editing each object individually.
