Admission Information: Admit Days = 2, Patient Type = Inpatient

Impression and Plan Diagnosis

ASSESSMENT AND PLAN:

1. A 52-year-old female, status post reduction of incarcerated incisional hernia, operative nick to the colon and repair, now with postoperative abdominal pain, distention, sepsis, leukocytosis, and fever. This could represent fecal peritonitis
2. The patient is developing acute renal insufficiency, uncontrolled hyperglycemia. AND RESP FAILURE INTUBATED ICU ABD DISTENTION

In this patient, from Infectious Diseases, I would recommend:

- a. antibiotics IV VANCO intravenous meropenem 1 g q.12 h. This would cover gram negatives as well as enterococcus species.
- b. Intravenous Flagyl to continue.
- c. intravenous Diflucan 200 mg once daily.
- d. The patient should have an abdominal imaging as a CT scan of the abdomen in the next 3 days AND POSSIBLE RE-EXPLORATION OF ABDOMEN
Surgical followup, wound care icu care follow up need of nasogastric tube.

Progress Notes

ct chest and abd

1. No central pulmonary embolism. Respiratory motion limits evaluation of the segmental and subsegmental vessels.
2. Small right pleural effusion. Bilateral areas of consolidation in the lungs bilaterally likely representing atelectasis. Pneumonia is not excluded.
3. Recent repair of incisional hernia. A small hernia remains over the anterior abdomen contains free air and free fluid.
4. Small amount of free fluid in the abdomen with no drainable fluid collection identified.

Impression and Plan Diagnosis

ASSESSMENT AND PLAN:

1. A 52-year-old female, status post reduction of incarcerated incisional hernia, operative nick to the colon and repair, now with postoperative abdominal pain, distention, sepsis, leukocytosis, and fever. This could represent fecal peritonitis
2. The patient is developing acute renal insufficiency, uncontrolled hyperglycemia. AND RESP FAILURE INTUBATED ICU ABD DISTENTION

In this patient, from Infectious Diseases, I would recommend:

- a. Modify antibiotics to ADD IV VANCO intravenous meropenem 1 g q.12 h. This would cover gram negatives as well as enterococcus species.
- b. Intravenous Flagyl to continue.
- c. intravenous Diflucan 200 mg once daily.
- d. The patient should have an abdominal imaging as a CT scan of the abdomen in the next 3 days
Surgical followup, wound care icu care follow up need of nasogastric tube.

Progress Notes

ct chest and abd

1. No central pulmonary embolism. Respiratory motion limits evaluation of the segmental and subsegmental vessels.
2. Small right pleural effusion. Bilateral areas of consolidation in the lungs bilaterally likely representing atelectasis. Pneumonia is not excluded.
3. Recent repair of incisional hernia. A small hernia remains over the anterior abdomen contains free air and free fluid.
4. Small amount of free fluid in the abdomen with no drainable fluid collection identified.

SIGN INFORMATION:

Addendum by Akbar, Tanveer MD on 04 July 2015 20:46

pt became more tachypneic and tachycardiac despite O2, IVF, Cardiazem, developed CP, picc placed, EKG didn't show ST elevation.

CPK borderline, MERT was called by RN, pt desated, placed on NRB, d/w RN and CCM, transfer to ICU.
Came back to eval, now better after dilaudid given, more calm, HR still 160's on Cardiazem gtt,
repeat cbc shows bandemia and worse leukocytosis.

In broad spectrum ABx, might need Insulin GTT, further management per CCM.

Reason For Exam

(CT Abdomen+Pelvis w/ Con) Abdominal distension, recent hernia repair

Report

EXAM: CT Abdomen+Pelvis w/ Con 7/15/2015 4:06 PM

COMPARISON: 7/9/15.

HISTORY: Abdominal distension, recent hernia repair

TECHNIQUE: CT of the abdomen and pelvis was performed in axial plane without contrast. Coronal reformations were obtained.

FINDINGS:

Visualized lung bases reveal small right-sided pleural effusion with right lower lobe atelectasis. Heart size is normal. No pericardial effusion.

Free fluid in the right subphrenic space extending along the right perihepatic space and into the abdomen. Multiple pockets of subcutaneous air on the right side of the abdominal wall and also free intraperitoneal air predominantly in the supraumbilical region anteriorly deep to the ventral hernia. Pockets of gas are noted just below the umbilicus extending cranially. Large air-fluid level anteriorly in the supraumbilical region due to the hernia. The large air fluid level best seen on axial image 39 appears to be extraluminal. Large pocket of gas in the subcutaneous soft tissues at the site of previously seen ventral hernia. It's not entirely clear if this is due to bowel loop filled with air or a contained extraluminal gas.

Liver, spleen, pancreas are normal in attenuation. Increased attenuation within the gallbladder from previous contrast examinations.

Adrenal glands and kidneys are normal in attenuation.

Abdominal aorta normal in caliber.

Pelvis: Urinary bladder is empty and catheterized. Free fluid in the pelvis.

Generalized anasarca.

No suspicious lytic or sclerotic lesions.

IMPRESSION:

neumoperitoneum with free fluid in the abdomen predominantly in the right perihepatic and subphrenic space.

Large air-fluid level in the supraumbilical midabdomen not entirely clear if this is a dilated loop of bowel versus a peritoneal collection of air fluid level.

Reason For Exam

(CT Abdomen+Pelvis w IV Con) evaluate for colonic leak post-op

Report

EXAM: CT Abdomen+Pelvis w IV Con

CLINICAL INDICATION: evaluate for colonic leak post-op abdominal pain

TECHNIQUE: CT of the abdomen and pelvis was performed after the administration of intravenous and oral contrast. Coronal reformatted images were submitted.

COMPARISON: 7/5/2015.

FINDINGS:

Heart size is within normal limits without pericardial effusion. There is a small right and trace left pleural effusion with bibasilar dependent subsegmental passive atelectasis. Appearance of the lung bases are unchanged.

The liver, gallbladder, spleen, pancreas, adrenals and kidneys are within normal limits.

There is a small amount of abdominal ascites. There is ascites seen filling a supraumbilical ventral right parasagittal hernia. There is a small amount of air hernia sac which has improved. There does appear to be mesh subjacent to the hernia.

Oral contrast reaches the rectum. Bowel is of normal caliber without evidence for obstruction. There is no extravasation of oral contrast and no CT evidence for colonic anastomosis for leak. There is suture seen along the superior margin of the transverse colon.

Aorta is of normal caliber without aneurysm. Nasogastric tube terminates at the junction second and third portions of the duodenum. There is a Foley catheter in a decompressed urinary bladder.

There is anasarca. There is no destructive bony process.

IMPRESSION:

1. Small amount of abdominal ascites.
2. There is a right supraumbilical parasagittal ventral hernia. Hernia sac contains fluid and free air. Component of free air has decreased.
3. There is no extravasation of oral contrast from the bowel.
4. Small right and trace left pleural effusions with bibasilar atelectasis.
5. Anasarca.

Report

EXAM:

1. Chest CTA.
2. CT abdomen/pelvis.

COMPARISON: Chest radiograph 7/4/2015.

INDICATION: Recent incisional hernia repair, Sepsis.

TECHNIQUE:

Chest: Contiguous axial CT images of the chest are acquired after the uneventful administration of IV contrast. Coronal and sagittal reformations are generated and reviewed. 3-D workstation available during interpretation.

Abdomen/pelvis: Contiguous axial CT images of the abdomen and pelvis were acquired after the uneventful administration of IV contrast. Coronal reformations are generated and reviewed. Delayed phase images are acquired through the kidneys.

FINDINGS:

Chest:

Normal caliber main pulmonary artery. There are no pulmonary emboli identified in the main, right, left, or lobar pulmonary arteries. Respiratory motion limits evaluation of the segmental and subsegmental vessels. Normal heart size. No paracardial effusion. Normal course and caliber the thoracic aorta. There is no mediastinal, axillary, or supraclavicular lymphadenopathy by CT size criteria. The visualized portions of the thyroid are unremarkable. PICC line is in place with tip in the high right atrium.

There is a small right pleural effusion. There is bibasilar consolidation likely representing atelectasis. There is some linear atelectasis in the left midlung as well as the right upper lobe. No pulmonary nodules are identified. Respiratory artifact limits evaluation of small pulmonary nodules.

Abdomen/pelvis:

A small incisional hernia is noted in the right upper quadrant containing air and fluid. No bowel loops extend into the hernia. A small amount of surgical mesh near the entrance to the hernia. There is extensive edema in the anterior abdominal wall. There is free fluid noted in the abdomen primarily around the liver and in the low pelvis. No drainable fluid collection.

Normal liver attenuation and contour. Patent hepatic vasculature. No biliary dilation. No liver lesions. A small focus of fat noted on the right hepatic lobe margin. The spleen, adrenal glands, and the pancreas are unremarkable. Kidneys enhance symmetrically. No hydronephrosis or nephrolithiasis. No collecting system filling defects in the delayed phase images. There is no bowel obstruction. There is no bowel wall thickening. Urinary bladder is compressed by Foley catheter. The aorta is normal in caliber. The iliac veins and IVC are patent.

Bones:

There are no acute or aggressive osseous abnormalities identified.

IMPRESSION:

1. No central pulmonary embolism. Respiratory motion limits evaluation of the segmental and subsegmental vessels.
2. Small right pleural effusion. Bilateral areas of consolidation in the lungs bilaterally likely representing atelectasis. Pneumonia is not excluded.
3. Recent repair of incisional hernia. A small hernia remains over the anterior abdomen contains free air and free fluid.
4. Small amount of free fluid in the abdomen with no drainable fluid collection identified.

(XR Abdomen AP Decub Erect) intestinal obstruction/free air/

Report

Clinical history: 52-year-old female, followup of intestinal obstruction free air.

Comparison: CT performed on 7/9/2015.

Technique: Supine and upright AP radiographs of the abdomen were obtained at 9:16 AM on 7/12/2015.

Findings:

Contrast within colon seen on prior study remains within colon. Bowel gas pattern is nonobstructive. No free air is visualized on this study. Tip of enteric tube is located within the third portion of the duodenum. Tip of endotracheal tube is similar. No masses or calcifications are visualized. Visualized thoracic structures are similar to prior chest radiograph performed earlier in the day. There is no acute bony or soft tissue abnormality.

Impression: Findings are likely compatible with ileus. No obstruction or free air on these radiographs.

SPECIMEN:

A-old prosthetic abdominal mesh

B-transverse colon

PRE-OP: Perforated viscus

REMARKS: MRN: 10016420; Admit Diagnosis: 552.21;

Procedure: Exploratory laparotomy and possible bowel resection, likely removal of old prosthetic mesh and placement of new biologic or absorbable mesh, likely ostomy and drain placement, any other indicated procedures

DIAGNOSIS:

A-PROSTHETIC ABDOMINAL MESH:

MESH (ABDOMEN); (BY GROSS EXAMINATION ONLY)

B-TRANSVERSE COLON AND OMENTUM, 9.5 CM RESECTION:

THREE FOCI OF COLONIC ULCERATION WITH TRANSMURAL ACUTE INFLAMMATION AND PERFORATION. SEE COMMENT.

ASSOCIATED ACUTE SEROSITIS AND OMENTUM WITH ACUTE INFLAMMATORY EXUDATE AND REACTIVE CHANGES.

PROXIMAL AND DISTAL SURGICAL MARGINS VIABLE WITH NO SIGNIFICANT INFLAMMATION.

BACKGROUND COLON WITH RARE DIVERTICULA.

NEGATIVE FOR MALIGNANCY.

SEE COMMENT.

COMMENT:

B-The histologic features of the ulcerations are not specific for an etiology. The colonic mucosa away from the ulceration shows no significant pathologic change. The differential diagnosis includes ischemia, ruptured diverticulitis and/or prior procedure/surgery.

Surgical Pathology Report

Clinical correlation is recommended.

GROSS:

A-Received in formalin labeled "Farris, Titina M, DOB 10/24/1962" and "old prosthetic abdominal mesh" is a tan, smooth, flat, ovoid 22.0 x 17.5 x 0.2 cm piece of mesh material with focal associated blue sutures. The mesh material has focal areas of associated gray soft tissue, and the largest tissue measures 4.0 x 2.5 x 0.1 cm. The portion of mesh material displays an ovoid 0.6 x 0.5 cm defect. No sections submitted. Gross only. (JP)

B-Received in formalin labeled "Farris, Titina M, DOB 10/24/1962" and "transverse colon" is a segment of colon, an irregular intestinal tissue, and a portion of omental adipose tissue.

Colon: 9.5 cm segment of colon. The unoriented margins are secured by metallic staples and inked as follows: One-green (diameter-4.0 cm) and opposite-black (diameter-4.2 cm). The colon has an overall diameter ranging from 2.0 cm to 4.2 cm. The margins are irregular.

Serosa: Purple to tan-red, smooth, and displays multiple gray-white areas of exudate which extends to within 1.2 cm of the green inked margin and 2.4 cm of the black inked margin. Three transmural defects are identified along the length of the colon. The first defect is located roughly within the mid aspect, measures 2.0 x 1.6 cm, and the borders are inked orange. This defect is located 2.9 cm from the green inked margin and 2.6 cm from the black inked margin.

The second defect is located within a markedly thinned area of wall with an overall measurement of 3.7 x 3.5 cm; the wall within this area measures less than 0.1 cm and the defect measures 0.9 x 0.5 cm. The borders are inked yellow. This defect is located 2.8 cm from the black inked margin, 5.3 cm from the green inked margin, and 1.6 cm from the orange inked defect.

The third defect measures 1.0 x 0.4 cm, is located 0.6 cm from the orange inked defect and 2.2 cm from the yellow inked defect, and the borders of this defect are inked violet. This defect is located 1.9 cm from the green inked margin and 3.4 cm from the black inked margin. This defect is contiguous with a 1.7 cm staple line which grossly appears to be a possible side-to-side anastomosis site. The staple line (possible anastomosis site) is located 0.9 cm from the nearest green inked margin.

Adipose tissue: Moderate, soft yellow adipose tissue.

Surgical Pathology Report

Mucosa: Contiguous with the green inked margin and involving a 4.0 cm segment the mucosa is tan-red, smooth, displays a slight decrease in the usual folds, and is focally slightly edematous. The remainder of the mucosa contiguous with the black inked margin is tan, smooth, displays the usual folds and is demarcated from the aforementioned mucosa. A mass is not grossly identified.

Wall: Less than 0.1 cm to 1.0 cm in thickness. Located 1.5 cm from the black inked margin a 0.7 cm diverticulum is identified.

Lymph nodes: Distinct lymph nodes are not identified.

Annular intestinal tissue: 2.5 x 2.4 x 2.2 cm. The annular intestinal tissue has a moderate amount of associated yellow adipose tissue. The tissue is partially surfaced by tan, smooth mucosa which displays the usual folds. The wall measures 0.2 cm thick. Lymph nodes are not identified within the adipose tissue.

Omentum: 16.0 x 9.5 x 3.8 cm. The omental adipose tissue is yellow to dark red, focally hemorrhagic, and displays focal gray-white irregular areas of exudate; the largest area of exudate measures 7.2 x 7.0 cm. The cut surface is yellow, lobulated, and soft.

Representative sections are submitted as follows: B1- resection margins; B2- first defect; B3- second defect; B4- third defect; B5- colon adjacent to possible side-to-side anastomosis site; B6- colon towards green inked margin with focal slightly edematous areas; B7- colon towards black inked margin; B8- diverticulum; B9- annular intestinal tissue; B10-B11- omental adipose tissue. Number of cassettes: 11. (JP)
