- 11 Mr. Burns was qualified in prior hearings and is qualified
- here in this hearing in the areas of groundwater hydrology,
- 13 surface water hydrology and hydrogeology.
 - Ms. Drici was previously qualified and is
- 15 qualified in this proceeding in the area of groundwater
- 16 modeling and groundwater hydrology.
- And, Mr. Burns, Exhibit 3 that SNWA's provided is
- 18 your resume. Is that a true and correct copy of your resume?
 - MR. BURNS: Yes, sir.
- MR. TAGGART: Okay. And then, Ms. Drici,
- 21 Exhibit Number 4 is your resume. Same question to you?
- MS. DRICI: Yes.
- BY MR. TAGGART:
- 24 Q. And we have done a pre-qualifying exercise to

Page 879

Page 880

- 1 avoid spending time, significant time on voir dire and
- 2 questioning witnesses. But I would like, if you could for the
- 3 record, to briefly describe your background in the areas that
- 4 you're about to testify about so that the record's clear on
- 5 your level of qualifications.
- 6 So can we start with you, Mr. Burns?
- 7 ANSWERS BY MR. BURNS:
- 8 A. Sure. Well, my background is a hydrologist.
- 9 I've worked in this area, in the Great Basin range province my
- 10 whole career. I started at the Nevada test site, principal
- 11 responsibilities being data acquisition and data analysis. I
- worked there for about six years with Ms. Drici and
- Dr. Waddell on the test area project.
 - Subsequent to that, I worked for the State of
- 15 Nevada and the Colorado River Commission in doing Colorado
- 16 river modeling.

14

- Moved to the Southern Nevada Water Authority
- 18 where I continued to do the Colorado River modeling. And then
- at about 2002/2001 time frame, worked in earnest on this area,
- 20 setting up monitoring networks, doing investigations as we'll
- 21 talk about today.
- So I've been working not only in this area, but
- 23 in the eastern Nevada for other groundwater projects, doing
- 24 this of type of work.

- 1 MR. BURNS: Yes.
- MS. DRICI: Yes.
- 3 MR. TAGGART: And did each of you sign that
- 4 report?

11

- 5 MR. BURNS: Yes.
- 6 MS. DRICI: Yes.
- 7 MR. TAGGART: And then also did each of you work
- 8 and contribute to what is marked as SNWA Exhibit 9, and did
- 9 you sign that report?
- 10 MR. BURNS: Yes.
 - MS. DRICI: Yes.
- MR. TAGGART: And just for the hearing officer,
- 13 those reports also include biological resource assessments and
- so the biological witnesses that testify on Monday will be
- 15 presented. And after they're presented, then we will offer
- those into evidence.
- 17 HEARING OFFICER FAIRBANK: So the report
- 18 regarding the Lower White River Flow System assessments are so
- admitted and we will admit the biological reports at that time.
- MR. TAGGART: Okay. Thank you.
- BY MR. TAGGART:
- 23 Q. All right. So, Mr. Burns, could you describe how
- 24 SNWA went about -- how and why SNWA went about developing the

Page 881

Page 883

- 1 Q. Okay. Thank you.
- 2 Ms. Drici, could you please describe for the
- 3 State Engineer briefly your background and experience?
- 4 ANSWERS BY MS. DRICI:
- 5 A. Sure. Warda Drici. So my education is in
- 6 petroleum engineering and management. However, my whole
- 7 experience has been in dealing with the groundwater and
- 8 surface water problems.
- 9 So I started out by working for the Kansas
- 10 Geological Survey for a few years. From there, I moved to
- 11 Long Beach to work with First Technology, the people who
- drilled all the wells for the MX project in Nevada. I wasn't
- there when they did it, though. I came in after.
- And then from there, I went to work for
- 15 contractors for the Department of Energy. And like Andrew
- 16 said, for a while, we worked on the Death Valley model for the
- 17 DOE with Andrew and Dr. Waddell, too. And after that, I came
- 18 to work with SNW -- for Parson's, but on SNWA projects.
- And since 2010, I've been working with SNWA on
- 20 projects relating to groundwater and surface water.
- 21 Q. Thank you. And did each of you participate in
- 23 Engineer and has been marked as State Engineer Exhibit

the development of the report that was submitted to the State

Number 7?

22

- 1 two reports I just described?
- 2 ANSWERS BY MR. BURNS:
- 3 A. Sure. First, we appreciate the opportunity to
- 4 present our summary conclusions in this presentation, and I'll
- 5 first just review the general approach to how we went about
- 6 analyzing -- collecting, analyzing and reporting on the data
- 7 pertinent to this Order 1303.
- 8 And the first part of our effort, of course, was
- 9 a compilation processing of data, literature review, that sort
- 10 of thing. Groundwater levels are from various sources of EWR
- 11 website.
- Our own data basis is the USGS precipitation data
- 13 from NOAA, ground water production data available to everyone
- 14 to on NWRD website, and then USGS data surface water, stream
- 15 flow data, perennial stream flow data, of course, and spring
- data. So that was the first step in our effort.
- Next, we performed a quality assessment. So
- these are time series data that we've collected and we've compiled and now we wanted to look at them in a qualitative
- 23 complied and now we wanted to rook at them in a quantative
- 20 sense through time to see what they -- how they informed our
- 21 knowledge of the system as behavior. We had -- and I'll go
- 22 through a series of these hydrographs, but --
- (Reporter interrupted proceedings.)
- MR. BURNS: So we looked at winter season

Min-U-Script® Capitol Reporters (5) Pages 880 - 883 775-882-5322

Page 884

- 1 precipitation from Nevada climate division 4, as I mentioned,
- 2 groundwater levels from wells throughout this domain, spring
- 3 discharge, perennial screen flow, groundwater production. And
- 4 so that was a -- we looked at this and these time series data
- 5 in a qualitative sense to see how they formed and told us what
- 6 was happening with this system, given various stress
- 7 conditions we know are occurring, whether it's climate related
- 8 or man related.
- 9 So after looking at those hydrographs, we saw
- 10 some relationships. We also -- we performed simple linear
- 11 regression analyses to assess correlation between water levels
- 12 responses and what we refer to as representative carbonate
- wells in these basins with EH-4.
- And as you heard described previous testimony,
- 15 EH-4 is an indicator well of the conditions, the groundwater
- conditions at the spring area, principally, the Pederson
- 17 Spring area, which is in close proximity. We considered that
- 18 an index well.
- Then we know that there's been, as a result of
- 20 the test, drawdown responses measured in the MX-4. So we
- 21 wanted to see what we thought we saw and confirm that with
- 22 linear regression analysis to assess the correlation of these
- 23 same wells with drawdown responses that we know were measured
- 24 at MX-4.

5

- 1 to a definitive conclusion.
- In doing so, we quantified what we were terming a
- 3 Muddy River flow deficit. This is a depletion, in essence, on
- 4 the river and we did that for a period of 1993 to 2018. So
- 5 that's the general approach we took and I'll go through these
- 6 in that order.
- 7 So first, you can take a look at a map and I know
- 8 you've seen a lot of water level and a lot of hydrographs this
- 9 week, but I appreciate your patience in giving us time to give10 our perspective on what we've seen.
 - This figure is a figure in our report and it's of
- 12 the Lower White River Flow System domain, and we have water
- 13 levels, carbonate wells, alluvial wells depicted here
- 14 throughout.

11

- And what I want to go through is -- first is this
- qualitative assessment that we performed and here's -- under these orange circles are the wells that we're going to look at
- and to give you perspective on where they are within
- 19 relationship to other wells within the flow system.
- So on the next slide, we look at well CSVM-1 and
- 21 this is a well just down the road on 168 across from MX-5 in
- very close proximity. And then I had mentioned EH-4, if you
- can go back, I'll try to point these out.
- So here is CSVM-1, EH-4, here by the springs.

Page 885

5

11

Page 887

- 1 Next, we had looked at the same type of analysis,
- 2 but using EH-4, our index well, with spring discharge. And
- 3 these are the high elevation springs of Pederson Spring
- 4 complex and Warm Springs West Gage.
 - Next, we performed a multi-linear regression
- 6 analysis to assess the effects of individual basin carbonate
- 7 production on EH-4 water levels and then we performed a ratio
- 8 analysis to estimate the contribution of various springs to
- 9 the total Muddy River Springs discharge over a period of
- 10 several years and under different stress conditions.
- And when we refer to total -- well, I'll call it
- 12 MRSA discharge, we're talking about the Muddy River flow
- itself. ET in the area, groundwater production, fluid
- 14 groundwater production. So that constitutes the total
- 15 discharge that we're talking about.
- In that analysis, we're approximating the slope
- of the lines correlating a given spring record to this total
- 18 discharge. And we estimate a change in the discharge basin
- 19 not a change of the Warm Springs West Gage for that same
- 20 period.
- And then finally, we observed, in the flow
- 22 record, a long-term tend of declining flow and we wanted to
- 23 investigate that try to identify its causes. We had our
- suspicions, but we wanted to go through the analysis to come

- 1 And then next is the Paiute TH-2 well in the California Wash,
- 2 the GB-1 well, which is on the boundary of Hidden Valley and
- 3 Garnet Valley. And then to the very south is BMDL-2, which is
- 4 in the Black Mountains area.
 - And so this next to the slide, what we're showing
- 6 here is just the time series data of water levels at these
- 7 locations over the period 1993 to 2020 or 2019. On the Y axis
- 8 is the elevation of the water level.
- The bottom panel, as I mentioned before, we
- 10 looked at the Nevada division or climate division 4, and
 - what's represented here is the percent of winter season
- 12 precipitation.
- We used October through March as the definition
- 14 for the winter season and we computed the average for 1990 to
- 15 2019. And what these bars represent is a percentage of that
- average over this period of record.
- So blue bars are above normal. And then so if
- 18 you look at 2005, what I'll talk -- and I'll present in
- 19 hydrographs, that's about almost 300 percent of normal. So if
- 20 the average was, let's say, four inches, that would be about
- 21 12 inches that year.
- On the bottom is below normal or below average of
- 23 percent of average winter season precipitation. Those are the
 - red bars. And, of course, those can only go to zero, and you

Min-U-Script®

Capitol Reporters 775-882-5322

24

(6) Pages 884 - 887

Page 888

can see how the distribution of these red and blue bars overtime.

Now, then we look at what we see in the

- 4 hydrographs when you do this assessment, and the first thing
- 5 we see is that all of these look very similar. They have very
- 6 similar seasonal change.
- 7 They have very similar long-term trends. What
- 8 always pops out first is the 2005 effect from this 300 --
- 9 almost 300 percent of normal precipitation, winter season precipitation.

We see a general decline and then we see, in the

- gray shaded area, this is the period of the test, your 1169
- pumping test, and we see declines there as well. And so
- 14 this -- we wanted to look at these a little closer and so we
- 15 did so. So I want to go back to look at these a couple at a
- 16 time.
- So that -- this slides shows you, it's the two
- 18 I'm going to talk about, which is, again, CSVM-1 and GB-1.
- 19 CSVM-1 by MX-5, GB-1 on the boundary of Hidden and Garnet
- 20 Valleys.
- Okay. So I've added something to this panel as
- 22 well at the very -- the bottom panel, which is carbonate
- 23 groundwater production. This is -- and the reason we choose
- 24 this period, the 1993 to 2019, is because that's when all of

- the road off 168, towards Muddy River Springs area. And it's
- 2 just on the shoulder of the highway. If you go back to the
- 3 map, I'll -- so MX-5 is just right here and CSVM-1 is right
- 4 there on 168.
- 5 Q. Thank you.
- 6 A. Now, so what we notice in these records is we go
- 7 to the south at the boundary between Hidden and Garnet Valleys
- 8 is the same -- essentially what we see is the same record in a
- 9 different well. And you have this peak from 2005 and you have
- an observed decline during the test period. And then some
- recovery, all be it, it looks muted, and then water level declines since.

Next, I'd like to talk about EH-4 and Paiute

14 Tribe well TH-2. So EH-4, you can't see on the screen very

- well, but EH-4 is just opposite -- just upgradient from the
- 16 Pederson Springs complex on the other side of Battleship Wash.
- And the well there is important, as we heard in previous
- testimony, because it's representative of the conditions, the head conditions at the springs themselves.
- The next one was TH-2, which is on -- in
- 21 California Wash and so the next slide will show you
- 22 hydrographs there. And TH-2 has some intermittent record, but
- you can generally see the same pattern. EH-4 and EH-5B are
- 24 wells that have the longest period of record, and you can see

Page 889

2

Page 891

- 1 the data series are available to us.
- 2 So on this bottom panel, this carbonate
- 3 groundwater production by basin within the Lower White River
- 4 Flow System, you can see that it starts at about 1993 in the
- 5 Muddy River Springs area and then starts to increase with
- 6 Black Mountains production and so on.
- 7 And then you can see in 2006, it begins -- it
- 8 sort of levels off from 1999, 2005, increases in 2006 with
- 9 Coyote Spring pumping. Then you can see the test effects of
- production in 2011, '12 and '13. In that period, the increase
- is about almost 3,000-acre-feet at its peak between 2012 and
- 12 2013, for example.
 - So at any rate, we have those indicators as well.
- And here we see at the top panel, CSVM-1, and we see the
- 15 effect that this 2005 precipitation has had on the record.
- 16 Water levels increased somewhat dramatically with respect to
- 17 the rest of the record and then the -- they go down, and then
- 18 right before the test, you can see the influence of production
- 19 from MX-5 and the test itself.
- 20 Q. Mr. Burns, just for the record, could you
- 21 describe how far is CSVM-1 to where the pumping occurred at
- 22 MX-5?

13

- 23 A. CSVM-1, I -- off the top of my head, I'm not sure
- exactly the distance, but it's about maybe a quarter mile down

- 1 that there's a pretty consistent decline since 1998, 2004.
 - And then in 2005, we, again, have our
- 3 precipitation effect or -- I'll call it -- it's really -- we
- 4 use precipitation as an indicator, but it's really a recharge
- 5 effect. And then, of course, we see the decline during the
- 6 Order 1169 test period, a slight recovery, and what we view as
- 7 a declining trend since about 2016.
- 8 Okay. Next, we talk -- I want to talk about
- 9 KMW-1, which is on the boundary of the Kane Springs Valley and
- 10 Coyote Spring Valley and then CSVM-4, which is also near the
- 11 boundary by carbonate rock outcrop. These are both monitor
- 11 boundary by carbonate rock outcrop. These are both monitor
- wells located to the northern third of Coyote Spring Valley onthe east side.
- So, again, we see here, CSVM-4 record. You see
- this, the effect, but it looks a little bit delayed or taking
- a little bit longer to see this recharge influence from 2005,
- 17 the stabilization of water levels pretty much. And then
- 18 during the test period, a noticeable decrease or decline
- 19 during the test. Subsequent to that, water levels come up a
- 20 little bit and stabilize and then look -- appear to be going
- 21 downward after.
- 22 CMW is a shorter period record that exhibits very
- 23 similar traits as CSVM-4. The declines, the variations are --
- aren't as dramatic as these other wells, but we think we can

Min-U-Script® Capitol Reporters (7) Pages 888 - 891 775-882-5322

Page 892

still see the effects from not only the recharge of that, but 1 also the pumping at MX-5. 2

So with that qualitative assessment, we've seen 3

- how these -- we think that these water levels behave in
- concert with each other. We believe that they were correlated
- well with EH-4, and so our next step was to perform linear 6
- 7 regression analysis to assess the correlation of these
- variables. 8
- Q. Mr. Burns, can I just ask you a couple questions 9
- quickly about the qualitative assessment that you completed? 10
- 11 Based on that qualitative assessment, were you
- able to observe these -- any similarity in groundwater level 12
- declines between where pumping occurred in Coyote Spring 13
- Valley and Garnet Valley, for instance? 14
- 15 A. Yeah -- excuse me, yes. We see it as very
- similar pattern in CSVM-1, for example, which is next to MX-4 16
- 17 on the east side of Coyote Spring Valley, and then also GB-1,
- which I talked about, which essentially has the same patterns 18
- 19
- 20 Q. Okay. Same question with respect to California
- Wash? 21
- A. California Wash, the Paiute TH-2 well, again,
- although the record's a little -- there's some missing parts 23
- early on, the record shows very -- to me, it was very clear, 24

- Figure 510 of our report. We have ours squared here, but the
- national correlation coefficient is higher. But you can see 2
- that they're all very high, all in the 90's and above. 3
- The lowest one is CSVM-4, which is .82, and I 4
- 5 attribute that to the Kane Springs fault and perhaps low --
- lesser permeability units between the pumping centers -- or
- 7 between EH-4 and this well to have an attenuating effect on
- water levels, whether they're affected by recharge or other 8
- stresses. And so what we did is observe a trial and error 9

effort -- or trial and error. 10 We looked at it doing it repeatedly lagging 11

- months from no lag to 12 months of lag. And we found the best 12
- 13 fit to be a three-month lag for the correlation with EH-4.
- Q. Okay. And then did you also see if there was a 14
- 15 statistical correlation during the pumping test period?
- A. Yes. Well, before I get there, so what this 16
- 17 indicates with these high correlations is that these wells all
- are highly correlated with responses measured in EH-4, and 18
- 19 this implies the interconnected nature of this system
- throughout, independent of the stress condition. So these 20
- water levels in these wells behave the same way, whether it's 21
- reacting to a climate stress or a pumping stress. 22
- But what we really wanted to look at then is 23 24 since the pumping test was of keen interest to all of us, we

Page 893

5

Page 895

- 1 has a very clear response as the other wells do to the various
- stresses, whether they're climate related or pumping related. 2
- Q. Okay. And finally the same question with respect
- to the Muddy River Springs area?
- A. Yeah. So we use, as I said EH-4 as our index 5
- well. And you saw in the hydrographs I presented that 6
- 7 those -- all of these wells that I mentioned appear to have
- very strong correlation with each other, and therefore, that 8
- 9 implies an interconnected nature of this aquifer in this area.
- Thank you. And then did you attempt to 10
- statistically analyze the data to confirm your observations? 11
- Yes.
- Q. Could you describe that, please? 13
- A. Right. So the process that we've gone through
- here is we computed monthly average values for the entire 15
- period of record for these wells. 16
- And we wanted to see -- because EH-4 and the 17
- conditions at the spring are so important, we wanted to see 18
- how well these wells throughout the basins correlate with 19
- 20 that -- the water levels at that location.
- And so we just did a simple linear regression on 21
- the data and we found a linear relationship and high 22
- correlation between all of them, as we suspected when we did 23
- our qualitative assessment. And those are presented on 24

- wanted to see how these wells correspond to a known pumping
- stress measured at MX-4. So we just took the monthly average 2
- values at MX-4 for the period of the test, and of course, MX-4
- is maybe 200 feet away from MX-5. 4
 - So during the pumping test, we can attribute the
- drawdowns or the water level declines at MX-4 predominantly to 6
- 7 the -- as a result of the pumping at MX-5. So that's the
- predominant stress of lowering the water tables at MX-4. We 8
- 9 wanted to see how these other representative wells correspond
- 10
 - to those water levels that were measured.
- So we did the same analysis for the same wells 11
- and those are listed in Figure 514 of our report, and again, 12
- we find a high degree of correlation between these wells at 13
- the MX-4 drawdown. 14
- So now we can confirm that these wells also --15
- not only are they interconnected, but they also respond in the 16
- 17 same way to MX-4 drawdown. And so there's a connection there
- as well. 18
- Q. All right. Thank you. Did you then look at 19
- 20 spring flows?
- 21 A. Right. So we did the same assessment. We did a
- qualitative assessment on the spring flows and our interest 22
- primarily is a high elevation springs, Pederson Spring 23
- complex, and the Warm Springs West Gage, which measures the 24

Min-U-Script® (8) Pages 892 - 895 Capitol Reporters 775-882-5322

Page 896

confluence of that discharge. 1

- I have here a Figure 6.1 from our report. This 2
- Figure 1, it shows the distribution of springs throughout the 3
- Muddy River Springs area. On the lower right-hand side is the
- Muddy River near Moapa Gage, and I have elevations posted next 5
- to the spring names. 6
- 7 And you -- and on the backdrop is the
- elevation -- digital elevation model with the darker colors 8
- being the higher elevation and the lower colors -- or the 9
- lighter colors being lower elevations. And so this just --10
- 11 this shows you a distribution of the springs with respect to
- 12 elevation as well.
- 13 Now, I noted again the elevation of the springs
- behind their name. So if we focus on Pederson Springs here on 14
- 15 the refuge, the highest -- the one we're looking at is
- Pederson Spring Gage, itself, at 1811 feet in elevation. And 16
- 17 so we wanted -- we did a qualitative assessment there as well,
- looking at Pederson Springs and Warm Springs west. 18
- O. And just one quick -- a couple quick questions. 19
- So is Pederson at the highest elevation of all the springs? 20
- 21
- Q. And why the focus on high elevation springs in
- your analysis? 23
- 24 A. Well, one, they're the most sensitive because of

- production at the bottom.
- And what we see here, what I see is a response 2
- similar to those measured in the wells that I just discussed, 3
- and I also have shaded here is the test period for the Order
- 1169 test. And here we see another decline like we see in the
- wells, and we see a slight recovery and then it looks to be
- 7 declined after.
- And then similar to the Warm Springs West Gage, 8
- you see previous to this long-term decline, the effect, you 9
- know, from '98 to 2004, let's say. And then the effect of the 10
- recharge event in 2005, the start of the test at the end of 11 12
 - 2012 and this decline by 2013 and beyond really.
- Now, on this chart I also have listed or marked the initial trigger level for the 2006 MOA, which is the 14
- 15 3.2 CFS.

13

- 16 Q. And how close does the hydrograph indicate the
- 17 flows came to 3.2 CFS at any time in the data set?
- A. Well, right -- so the test ended at the end of 18
- 19 2012, but the pumping at MX-5 continued through April, mid
- April of 2013. And you can see, you know, after the springs, 20
- at least at Warm Springs west, continued to decline almost 21
- reaching 3.2, but not reaching it for any period of time or 22
- extended period of time. 23
- 24 Q. And could you describe your understanding of the

Page 897

Page 899

- the elevation of the orifice with respect the potential metric 1
- surface of the carbonate aquifer. So the driving force is 2
- small. The driving force defined by the heads in the aquifer 3
- with respect to the spring elevation is small relative to 4
- those on the basin floor like Big Muddy Springs, for example, 5
- which is quite a bit lower. 6
- So it's -- I think Tim Mayer gave an eloquent 7
- discussion on why this spring is so sensitive, but it -- our 8
- 9 interest is because of the sensitivity, we can measure sort of
- detailed effects of groundwater pumping from the carbonate 10
- aquifer at this location based on the head elevations measured 11
- at EH-4. 12
- Q. And do you expect this to be the first place 13
- you'd see a signal from groundwater pumping?
- 15
- Q. Okay. Could you turn to Figure 5-7 and explain 16
- what's shown there? 17
- A. So as I mentioned before, you know, in our 18
- process, we look at the time series qualitatively. We try to 19
- 20 identify trends or certain instances that we can relate to
- other factors. 21
- We have two panels at the top, Pederson Spring 22
- first and then Warm Springs West Gage next, and then again, 23
- the same winter season precipitation chart and groundwater 24

- source of water for the springs versus the source of water for
- which MX-5 was pumping? 2
- 3 A. Well, it's the same source. So this is the
- carbonate rock aquifer that underlies and interconnects the 4
- basins of Lower White River Flow System. So they are the same 5
- source. 6
- Q. Okay. Did you do additional analysis of the data 7
- related to these surface -- or these flow records?
- A. Yes. So we wanted to look at, again, is how --
- since we use well EH-4 as an indicator for groundwater 10
- conditions at the springs themselves, we wanted to see how 11
- 12 those head levels at that location correlate to the spring
- discharge. 13
- And we figured it would be a linear relationship 14
- when we did our regression analysis. This is very similar to 15
- what Tim Mayer did and presented the other day. 16
- But high correlation between hydraulic head at 17
- 18 EH-4 with spring discharge at Pederson Spring. So we know there's certainly a connection between head levels in the 19
- 20 carbonate system and spring discharge at Pederson Spring.
- We did the same thing for Warm Springs West Gage, 21
- which is -- measures the confluence of the Pederson Spring 22 complex and any gains from the spring orifice to the Warm 23
- 24

Springs West Gage, and we did the same analysis.

Page 900

- We showed that the head levels, again, in the 1
- carbonate system at EH-4 with respect to Warm Springs West 2
- Gage were highly correlated and linear in nature. 3
- Q. So, Mr. Burns, did the statistical analysis you
- just described confirm what you observed when you reviewed the
- hydrographs?
- A. What we saw in our qualitative assessment of the
- hydrographs, these time series plots was confirmed by the 8
- regression analysis that we performed, the high correlation 9
- that we found with respect to the representative wells in EH-4 10
- represent an interconnected nature of the carbonate rock 11
- aquifer in this area. 12
- 13 Further, we found or confirmed that the discharge
- from the springs was highly correlated to the head levels in 14
- 15 the EH-4 well, which is representative of the aquifer
- conditions at that location at the spring heads. 16
- 17 Q. And when you say the aquifer at that location, is
- that the carbonate aquifer? 18
- A. Correct. 19
- Q. And going forward, do you consider EH-4 to be an
- index well?
- A. Index -- yes, I do.
- Q. Okay. 23
- 24 A. It's an index for the conditions, the groundwater

- 1 Q. And there's been some discussion of water budgets
- in prior testimony at the hearing.
- Do you have a view of the role water budgets can 3
- play in making hydrological conclusions about the
- connectedness of the Lower White River Flow System versus the
- type of empirical data you've been describing?
- 7 A. Well, I don't think that water budgets are, at
- this point, very informative with I think the data that we've
- collected or collectively. 9
- It's certainly more informed because we're at 10
- a -- we're not really litigating or debating water budgets so 11
- 12 much as how pumping affects this system, affects discharge,
- 13 affects depletions in the Muddy River. And it's those
- responses that I think are more important than a debate on 14
- 15 water budgets themselves.
- Q. All right. And lastly, when you went through the 16
- 17 observations of the hydrographs for groundwater or groundwater
- levels, and this was in Figure 5-5 and 5-14 -- I'm sorry, 5-5 18
- and 5-12, was there a similar recovery signal in those 19
- hydrographs as well? 20
- A. Yes, I'm looking at Figure 5-12, page 6 of the 21
- handout, and yeah, I mentioned before that you can see the 22
- recovery beginning -- and this is at CSVM-1, promptly 23
- beginning after the MX-5 well is shut off. And it appears to 24

Page 901

2

Page 903

- 1 conditions observed at the springs, themselves, and underlying
- the springs. 2
- Q. All right. A couple quick questions before we
- move onto the next part of the analysis was that performed. 4
- Could you describe the conceptual model of how 5
- the carbonate aquifer is related to the river or the springs 6
- and how the alluvial aquifer is related to the river or the 7 springs, and how this empirical information from the pumping
- 8
- 9 test compared to that previous conceptual model?
- A. Well, if I understand your question, you're 10
- asking about what we viewed as a conceptual model at the Muddy 11
- River Springs area, which is the -- we think of the alluvial 12
- system there as an alluvial reservoir as we call it, and that 13
- water is sourced by the carbonate aquifer.
- But you also have discrete springs, such as 15
- Pederson Spring and others that are -- that discretely source 16
- to the carbonate aquifer and they behave, I guess, separately. 17
- So what we've seen is you can pump the alluvial 18
- reservoir without impacting the springs, but you -- when you 19
- 20 pump the carbonate aquifer, you can affect the spring
- discharge as we just described by that relationship. And that 21
- 22 ultimately captures flow, any diffuse flow that would go into
- the alluvial reservoir or discharge from discrete springs like 23
- Pederson Springs. 24

- recover by the first quarter of 2016. 1
 - And I see the same thing in GB-1, which is,
- again, at Hidden and Garnet Valley boundary. That one may be
- attenuated -- or affected by local pumping in Garnet Valley, 4
- so it does appear that recovery was as high. 5
- Let's see. But you see this recovery throughout 6
- 7 at TH-2 in California Wash, EH-4, Muddy River Springs area,
- and even to the far north of CSVM-4. All be it somewhat 8
- 9 muted, you can still see a recovery by about 2016, half part
- of 2016. 10
- Q. All right. Thank you. 11
- 12 Ms. Drici, I'm going to now have some questions
- 13 for you.
- ANSWERS BY MS. DRICI: 14
- 15 A. Yes.
- 16 Q. Did you perform any further analysis of the cause
- of change in water levels and spring flows based on the 1169 17
- pumping test? 18
- A. Yes. The analysis that I performed is the MLR. 19
- 20 So MLR stands for "multiple linear regression," and basically
- it's just a little bit more complex form of the simple linear 21
- equation that Andrew was describing. 22
- Instead of having -- so you have an -- in the 23
- simple linear regression, you have Y equals AX plus B. So the 24

SE ROA 53341

(10) Pages 900 - 903 Min-U-Script® Capitol Reporters 775-882-5322

Page 904

- A is like a slope of the line that correlates two variables. 1
- Y is the dependent variable, for example, spring discharge, 2
- and X is, for example, the water level at EH-4 in the -- some 3
- 4 of the correlations that he showed.
- In the multiple linear regression, so you have 5
- the same Y, but you have an intersect, the B in these 6
- 7 equations, but you have several independent variables, like
- X-1, X-2, X-3. 8
- And the way I used it is to answer the question, 9
- how much each of the basin groundwater production contributes 10
- to, for example, the water level at EH-4 because what you 11
- measure at, for example, EH-4, you see a curve. 12
- But that curve is like a combination of the 13
- effects of different stresses, including, you know, 14
- 15 productions from different basins and then recharge pulses
- coming in at different times. And you can't really -- for 16
- 17 recharge, you can't really separate that, because like I
- really -- I don't know. 18
- I just know that it's coming in as pulses at 19
- different times from the different recharge areas. But I 20
- can't quantify -- I don't want to use any proxies. I just 21
- want to separate the responses to the groundwater production 22
- from the different basins. 23
- So in this MLR, Y is the EH-4 water levels and 24

- off.
- 2 Q. And, Ms. Drici, just for the record, you're
- referring to Figure A-3 in your expert report?
- 4 A. Yes.

13

21

22

- Q. Okay. And now, can you continue on talking about
- those figures?
- 7 A. Sure. The second figure is the response to
- groundwater production from the carbonate aquifer in the
- California Wash. In this one, we see that the groundwater 9
- production is not really a lot. It's relatively small, and 10
- yet, it produces a significant response at well EH-4. Next 11 12 slide, please.

The next figure, Figure A-5, we see the response

to groundwater production from the Coyote Spring Valley. And 14

in this one, you see that there's a lot of -- a lot of 15

pumping, especially during the Order 1169 pumping test. 16

17 But here the response, I mean, is not huge and this is because of the higher transmissivity in that area. 18

When you have very high transmissivity, you might not see a 19

great response, as great as you think. 20

Figure A-6 is the response to groundwater pumping in Garnet Valley. As you can see, the response for the

23 magnitude or the changes in the groundwater production. And

24 the last one, Figure A-7, is the response to groundwater

Page 905

Page 907

- 1 the X's are the -- X-1, for example, the first one might be
- the total production in the Black Mountain area, excludes the 2
- total production in the California Wash, et cetera. So 5, 6 3
- basins basically, six X's or independent variables. 4
- So the reason we can do this, you know, we use 5
- principles superposition where in an aquifer like this, that's 6
- highly interconnected and we saw that it is acting like a 7
- combined aguifer. So therefore, it acts -- it behaves in a 8
- 9 linear fashion because the transmissivity is constant. It
- doesn't change with changing water levels. 10
 - So when we conduct this analysis and we extract
- the responses to the individual basin groundwater production 12
- from the carbonate aquifer, and if you look at the first graph 13
- there, the slide, that would be the Black Mountain area. And
- it appears, from this analysis, that the groundwater 15
- production from Black Mountain is not really affecting the 16
- water levels at EH-4. 17

Min-U-Script®

11

- So it's an indication that, perhaps, the boundary 18
- down there might be a little bit off because the boundary was 19
- 20 defined based on the observation well, the VMDL-2, I believe.
- And VMDL-2 did respond to the MX-5 pumping during 21
- the Order 1169 aquifer test, and these wells, the production 22
- wells are just a little bit south of there. So this is an 23
- indication that, perhaps, the boundary might be a little bit

- pumping from the Muddy River Springs area. Again, the response follows the magnitude of the pumping to time.
- But perhaps it's not as significant as you might
- think it is, is because it's close. But the response at a
- given observation well is not just a function of the distance.
- It's also a function of the level of connectivity between the 6
- groundwater production and the observation well. 7
- And the last figure I have here, Figure 3-2, this
- 8
- 9 is basically the -- putting together, adding up all those --
- the responses to groundwater pumping from all the basins at 10
- EH-4. And I show in comparing them with the observed, so the 11
- orange line is the calculated EH-4 water levels and the blue 12
- is the observed EH-4 water level. 13
- Now, when you do the regression, you always have 14 residuals. In theory, if you knew what all the stresses were, 15
- you would be able to extract the responses to every one of 16
- them and the residuals would only represent the errors. 17
- And they would be randomly distributed and they 18
- would show up as, you know, random points about the zero line. 19 20 It's like you would be -- you would want to be error, whatever
- is left zero, like the residuals, the difference between 21 observed and calculated. 22
- But in this case, because I could not extract 23
 - specifically the response to the recharge variations, I left

Capitol Reporters 775-882-5322

(11) Pages 904 - 907

Page 908

- 1 it in with the residuals.
- 2 So the residuals in this case, they are some kind
- 3 of indicator of the effect of recharge on EH-4 water levels
- 4 during this period that I looked at, which is from 1993 to
- 5 2018. And this period represents the period during which
- 6 carbonate pumping was occurring.
- 7 I know that the carbonate -- the pumping, the
- 8 carbonate production from the carbonate aquifer started a
- 9 little bit earlier.
- But the records -- I don't know if they were not
- 11 kept, we could not find them, we did not want to use any
- 12 estimated -- anything, we wanted to stick with the data and so
- this is what we get.
- As you can see, the downward trend in the water
- 15 levels at EH-4 is clearly caused by groundwater production in
- all these basins of the system. And the drop caused by
- 17 groundwater pumping from '93 to 2018 is about four feet,
- whereas the recharge variations have been causing like, perhaps, a maximum of like 1.4 feet around like in 2013, you
- 20 see that deviation from the zero line for the residuals.
- So the relative contribution of the recharge to
- 22 the water levels or the decline in EH-4 water levels is
- 23 relatively small compared to the effect of groundwater
- 24 production.

- 1 by the carbonate aguifer as represented by EH-4 as the index
 - 2 well.
 - 3 So based on that model, conceptual model, I think
 - 4 that the flow that you see at any spring and, for example,
 - 5 Warm Springs West Gage, which is like a -- represents spring
 - 6 discharge from the group of springs, the Pederson Springs and
 - 7 some seeps in between would behave in a linear fashion with
 - 8 the total discharge in the spring area.
 - 9 Now, the total discharge in the spring area
 - 10 cannot be managed directly because we don't have just a bunch
 - 11 of discrete springs. And so we could like just measure each
 - one of them and add them up and come up with like, okay, this
 - is the total discharge to this area.
- We have a combination of springs and then seepage into the alluvial reservoir. And so the only way that we can
- estimate what the total discharge in the springs area is by
- using the Moapa Gage on the Muddy River.
- 19 Table 6-1, the way we do that is we take the flow as measured
- at the Moapa Gage adjusted for like over land flow, and we add
- all the losses that occur above the gage.
- And the losses include the stream diversions, the

And the way to do that is if you look at

- 23 alluvial groundwater production from the alluvial reservoir in
- 24 the Muddy River Springs area, and the ET that occurs above the

Page 909

18

2

Page 911

- 1 Q. Thank you. And when you -- in your last
- 2 statement about recharge and its role in affecting the
- 3 hydrograph, does that recharge term include climate and the
- 4 types of precipitation that's been talked about at this
- 5 hearing already?
- 6 A. Yes, definitely include. I mean, the recharge
- 7 is -- starts as precipitation on high elevations and it's
- 8 mostly precipitation during the winters that turns into
- 9 recharge and moves down the system.
- 10 Q. Okay. Now, I'd like to ask you, Ms. Drici, about
- a separate analysis that you performed. And so let's move
- 12 again to Figure 6-1.
- And did you then perform an analysis of
- 14 proportional flow at springs versus the Muddy River to
- 15 determine the long-term annual quantity of groundwater that
- 16 could be pumped from the Lower White River Flow System?
- 17 A. Yes. In this analysis, I was trying very hard to
- 18 answer the question that the State Engineer asked, which was
- 19 basically, you know, how much can we produce from this
- 20 carbonate aquifer in the sustainable manner. And like we said
- 21 before, sustainable can mean different things.
- So this analysis is mostly concerning the Moapa
- Dace. And to do this, based on the conceptual model that
- 24 Andrew was describing that all the springs in the MRSA are fed

- Moapa Gage.
 - So if you are looking at this table, let me see.
- 3 The cone, 1, 2, 3, 4, 5, 6, 7, the seventh column, which is
- 4 labeled "total MRSA discharge," gives you the estimated total
- 5 discharge to this area.
- 6 Q. Ms. Drici, let me look -- there's a lot of
- 7 information on this table. So let me just make sure I -- the
- 8 record's clear.
- 9 So we're looking at Table 6-1, and in the first
- 10 column is the year obviously. And that second column, is that
- annual -- average annual CFS; is that a value from a
- 12 measurement?
- 13 A. Yes.
- 14 Q. Okay. And the column total or annual total, is
- that just a conversion of that CFS into acre feet?
- 16 A. Yes.
- 17 Q. Okay. And then the next three columns that are
- 18 all under the heading "losses above MR Moapa Gage," just could
- 19 you describe again what those three columns are?
- 20 A. Okay. So the first one is the total three-year
- of all the stream diversions that occur above the gage.
- 22 Q. Okay. And what about the next one?
- 23 A. The next one is the total annual production from
- 24 the alluvial reservoir, which is located above the gage, too.

SE ROA 53343

Min-U-Script® Capitol Reporters (12) Pages 908 - 911 775-882-5322

Page 912

- 1 Q. And then ET?
- 2 A. And the ET also is the annual ET from -- there's
- 3 an ET area within the Muddy River Springs area that is above
- 4 the gage. So this is what those numbers represent.
- 5 Q. And what's the source of those numbers?
- 6 A. The source of those numbers. They're
- 7 measurements and -- let me see. I have a little cheat sheet
- 8 here. The diversion data came from NEWR, NV Energy, and NVWD
- 9 and some of it from USGS.
- The alluvial production came from NEWR, NV Energy
- and NVWD. What else? The DET -- oh, yeah, I need to say
- 12 this. ET, we don't have measurements of ET all the time. But
- for this period of time that I considered, and this is why I
- considered this -- sorry, I should have said this before.
- The reason we're looking at only from 2001
- 16 through 2002 is because a study was conducted to estimate ET
- above in the MRSA area for those years.
- 18 Q. And those years being 2001 through 2012?
- 19 A. Yes. And so these were estimated during that
- 20 study for other years. All we have before was Eakin 1964
- estimate or -- and I don't know.
- Right now, we could probably try to figure out
- 23 the other years by looking at satellite imagery and all that,
- but we did not. We just used what we had.

- 1 relatively large so that you couldn't really figure out what
- 2 the slope would be.
- 3 So that's why I calculated the ratios and these
- 4 ratios are, in my opinion, approximations of that slope. And
- 5 knowing the slope would allow us to basically say, hey, if the
- 6 discharge at Warm Springs varies, say, by .1 CFS, what does
- 7 that correspond to in terms of the total discharge to the
- 8 MRSA.
- And then you could use that number and say, well, what if this reduction in total discharge is caused by production from the carbonate aquifer.
- So you could use that number to say if I don't
- 13 want to bring down Warm Springs West by more than, you know,
- this much, then I shouldn't be pumping more than this
- proportional quantity of groundwater.
- 16 Q. And did -- were you able to make a conclusion
- 17 about whether there was a proportional relationship between
- 18 Warm Springs West flow and MRSA discharge?
- 19 A. Yes. To confirm it farther that basically this
- would be applicable to different springs in the area, if you
- 21 look at the Figure 6-2, you can see that for the same period
- 22 of time, the Baldwin Springs and Jones Springs also show a
- relatively constant ratio with a total discharge of spring
- 24 data.

Page 913

Page 915

- 1 Q. And that work was done by Justin Huntington?
- 2 A. Yes
- 3 Q. Okay. And then those three columns, losses above
- 4 the gage were added together to reach the total MRSA
- 5 discharge?
- 6 A. Exactly.
- 7 Q. All right. And then what did you do?
- 8 A. Well, after we had that, I mean, we obtained
- 9 measurements for the Warm Springs West Gage, which are
- 10 measurements at that gage, and we took them -- again, we
- 11 converted from CFS to acre feet.
- I mean, you could do these -- the last column is
- 13 the ratio basically. You just take the Warm Springs West
- 14 discharge for a given year, divided by the total MRSA
- discharge for that year, and you get the ratio.
- This ratio is something I did not mention in the
- 17 report because I was trying to keep it as simple as possible,
- 18 represents the slope of the line that correlates these two
- 19 measurements. Warm Springs West Gage discharge versus the
- 20 total MRSA discharge.
- So because if you plot these and you try to fit a
- 22 line, because the MRSA -- the full MRSA discharge is not
- 23 measured -- it's not known very accurately, you do see a trend
- 24 that looks like, you know, a linear trend. But the scatter is

- 1 Q. And on Figure 6-2, is that in the lower two rows,
 - 2 Baldwin and Jones?
 - 3 A. Yes.
 - 4 Q. Okay. In preparation for this hearing, did you
 - 5 discover a clerical error in this table?
 - 6 A. Yes. The first -- well, the second row. The
 - 7 first row is the year and the second row is supposed to be the
 - 8 total Muddy River Springs area discharge.
 - 9 In putting this figure table combination
 - 10 together, we inadvertently used the ET values from the table,
 - 11 rather than the total MRSA discharge numbers.
 - 12 Q. Okay. And do you have a new version of the
 - 13 table?
 - 14 A. Yes, it is the one shown here. It says
 - 15 "corrected".
- 16 Q. Okay. And did this clerical mistake affect your
- 17 analysis?
- 18 A. No. It was just a presentation.
- 19 Q. Okay. And just for the hearing officer, we had a
- 20 copy of the corrected Figure 6-2 that we'd like to offer into
- evidence as our next exhibit in order, which I think is
- 22 Number 85?
- 23 HEARING OFFICER FAIRBANK: So basically what --
- if I'm understanding you correctly, you're just offering that

Min-U-Script® Capitol Reporters (13) Pages 912 - 915 775-882-5322

Page 919

Page 916

- as an errata to this particular form. We'll accept it as an 1
- 2
- MR. TAGGART: Thank you. 3
- (Exhibit 85 admitted into evidence.) 4
- BY MR. TAGGART:
- Q. So did looking at Baldwin and Jones Spring 6
- confirm what you found with respect to Warm Springs West?
- A. Yes. 8
- Q. Okay. 9
- A. It appears that there is linear relationships
- between discharge at these springs and total discharge to the
- MRSA to the carbonate aquifer. 12
- 13 Q. All right. Now, I'd like to ask you what you did
- next and we've got a slide up on the screen relating to Eakin
- 1964? 15
- A. Okay. So in search of a good approximation of 16
- 17 this slope between Warm Springs West and the total discharge
- with the MRSA, I found a -- I think a more accurate value, 18
- looking into the literature, namely the work of Eakin in the 19
- 60's. 20
- So the reason I think that this would -- his 21
- numbers would provide more accurate estimate of the slope of 22
- the linear relationship is because he measured the -- all the 23
- springs he could measure at the time. He measured the 24

- that and takes them to zero or negative numbers or whatever.
- They don't mean anything.
- 3 Q. Okay. And, Ms. Drici, was that one of the
- critiques against this approach that was presented in rebuttal
- reports?
- A. Yes.
- 7 Q. Okay. So if all the springs are flowing, that's
- an assumption in your approach?
- A. Yeah, this is -- I think this is a good
- approximation if all the springs are flowing. 10
- 11 Q. Okay. Now, how -- compare -- I'm sorry. Strike
- 12 that, please.
- 13 Of the Eakin number that you have on the screen,
- is that comparable to the values that were calculated for the 14
- ratio between 2001 and 2012? 15
- 16 A. Yes, it is.
- Q. Okay. Now, once you derived that ratio, what did 17
- you do next? 18
- A. Okay. So the -- that ratio was used to estimate 19
- the decrease in the total discharge that would be -- that 20
- would correlate with a decrease in Warm Springs West. And we 21
- did this in Table 6-2 by using the Warm Springs flow 22
- 23 conditions that were in the MOA, 2006. And so this table, if
- you look at it, it has in the first column the Warm Springs 24

Page 917

- 1
 - flow conditions.
 - The first one is the -- what it was or what we 2
 - estimated it was during predevelopment conditions as
 - calculated from 1945 to 1962. So it's like an average of what 4
 - was going on there at that time. 5
 - And I think that starting from that value rather 6
 - than from what we see now is conservative, so that you're not 7
 - taking into account, you know, the variations in recharge and 8
 - 9 considering the extraordinary recharge spikes that we saw, for
 - example, in 2005 because, of course, you can't count on that 10
 - 11 to develop groundwater. We have to use like a -- some kind of

 - 12 a base or basic number.
 - So we went back to predevelopment conditions and 13
 - we started from the average of 3.82, and then we moved down 14
 - by, you know, 2, 3.6, 2.4, 2.2, 3, 2.9, 2.8 and 2.7. Some of 15
- these, I think starting at 3.2 down to 2.7 were in the MOA. 16
- Q. And just quickly, when you say they're in the 17
- MOA, those are values for triggers in the MOA? 18
- 19 A. Yes.
- 20 Q. Okay.
- 21 A. They were defined as triggers to protect the
- Moapa Dace. So from there, we go to Column 2. It's -- that's 22
- just a difference between, so 3.82, the first number in column 23
- one minus the next one, basically the decrease from average 24

discharge at various times between 1963 and 1964 and he also

measured the flow at the Moapa Gage on the Muddy River. 2 And so at that time, he had a measurement at Warm 3

- Springs West of 3.78 CFS, whereas the total MRSA flow or
- discharge was at 49.8 CFS. And at the time, what he said is 5
- it wasn't much human activity going on there, except maybe for 6
- a few irrigation wells that were -- he accounted -- he put 7
- them like within the ET. 8
- 9 And he figured that in -- if he measured the flow
- in the river in January, that ET would be minimal at that 10
- time, and so therefore, because he didn't have any other 11
- production going on upstream from the gage or in the carbonate 12
- aquifer in the '60's, so therefore, the January measurement of 13
- the Muddy River at the Moapa Gage represents a total discharge
- to that whole area. 15
- So from there, you take the -- you divide the 16
- Warm Springs West by the discharge, by the total discharge 17
- coming in, and you get a ratio of 0.076. 18
- And this ratio is probably representative, it's 19
- 20 the most accurate representation of the slope of the line
- correlating these two discharges. And I want to add that 21 these relationships with the springs are only valid when the 22
- springs are flowing. 23
- I disagree with anybody that takes them below 24

Page 920

- predevelopment conditions. 1
- So you go down the line that way. From the third 2
- column, we convert those numbers into acre feet per year, and 3
- in the fourth column, we calculate the corresponding volume of
- water that the total discharge to the springs area would 5
- decrease by. 6
- And this decrease, of course, could be caused by
- different stresses. It could be climate or it could be 8
- production. But in our calculation, we're saying it -- we
- 9 would attribute these to groundwater production for management 10
- purposes because we can't control what the climate does. We 11
- can only control what we do, educating the production from the 12
- carbonate aquifer. 13
- Q. Okay. And then in the columns related to MRSA 14
- 15 discharge, what is contained there?
- A. Well, that is the basically the number in CFS, 16
- 17 you just take the Warm Springs West discharge and CFS, and of
- course you don't do it for the first one, but you would be 18
- 19 dividing -- you know -- well, you would get zero anyway.
- 20 But anyway you take the decrease in the Warm
- 21 Springs West discharge, for example, 0.22, you divide that by
- the ratio of 0.076 and you get a 2.89 decrease in the MRSA
- discharge. 23
- Convert it to acre feet, that means if the Warm 24

- shouldn't be pumping more than 4 to 6,000-acre-feet per year
- from the carbonate aquifer.
- 3 Q. And that's rounding up from the 5908?
- 4 A. Yeah.
- 5 Q. Based on the limitations of the approach that you
- just described?
- 7 A. Yeah, definitely. I mean, we kept the -- all the
- significant digits here just for tracing the calculations.
- But we know it's not going to be down.
- Q. Okay.
- 11 A. To that level of accuracy.
- Q. Now, at the beginning of your discussion of this 12
- proportional flow analysis, you indicated that this was 13
- related to the Moapa Dace. 14
- 15 Is there a different analysis for what amount of
- pumping is allowable without impacting senior groundwater 16
- 17 rights -- or let me ask it differently.
- Is this a separate and distinct concept from what 18
- 19 would be required regarding senior groundwater rights?
- A. Yes, definitely. 20
- Q. Okay. All right. We're going to move to another 21
- topic. This might be a good time for a break. 22
- HEARING OFFICER FAIRBANK: We've been going for 23
- 24 about an hour and a half, but we can go ahead and take a break

Page 921

Page 923

- 1 Springs West, it drops to divide .22 CFS -- no, I was in acre
- feet. If the Warm Springs West discharge drops by 159 in acre 2
- 3 feet per year, that would mean that the total discharge to the
- MRSA is going down by about a couple thousand acre feet. 4
- And if all that's going on is groundwater 5
- production from the carbonate aquifer, you could equate that 6
- 7 to the groundwater carbonate aquifer. You turn it around and
- you say, if I pump a couple thousand acre-feet, the Warm 8
- 9 Springs West discharge will go drop by about 0.2 CFS.
- Q. And according to this analysis, what amount of 10
- carbonate pumping can occur in the Lower White River Flow 11
- System to maintain the 3.2 CFS at Warm Springs West Gage? 12
- A. Well, on this table, if you look at the rows --13
- the row where the Warm Springs West in the first column is at
- 3.2 CFS, you go across and you see that's the corresponding 15
- decrease in the discharge in the springs area is about 16
- 6,000-acre-feet per year. 17
- I'm not going to say that these numbers are a 18
- hundred percent accurate. They are approximate again, because 19
- 20 the analysis, we don't have like extremely accurate data.
- That's why we chose a range rather than a number. 21
- 22 Q. And you chose 6,000, is that what you mean by --
- A. Well, we said that to protect the Warm Springs 23
- West discharge or keep it at about 3.2 CFS per year. We

- right now if that works, if that's convenient for everybody.
- MR. TAGGART: I think that would be good. 2
- HEARING OFFICER FAIRBANK: Okay. Let's go ahead 3
- and take a ten-minute break and we'll get back at 10:15. 4
- MR. TAGGART: Thank you. 5
- (Recess at 10:05 a.m.) 6
- 7 HEARING OFFICER FAIRBANK: Okay. Let's go ahead
- and go back on the record. Mr. Taggart, you may continue. 8
- 9 MR. TAGGART: Thank you.
 - BY MR. TAGGART:
- Q. All right. Welcome back. And my next set of 11
- questions are to you, Mr. Burns. 12
- The number of experts in this proceeding have 13
- offered opinions regarding weather. The Lower White River 14
- Flow System groundwater levels are in a steady state condition 15
- or are continuing to decline. Have you reviewed that 16
- 17 question?

10

775-882-5322

- ANSWERS BY MR. BURNS: 18
- A. I have. 19
- 20 Q. Okay. And what is your view on that question?
- 21 A. Well, when I look at the water levels in the
- carbonate system throughout the domain, I see, after the 22
- recovery period, that I believe sort of obtained it's peak in 23
- 2016. About the first quarter, I see after that period of 24

Min-U-Script® Capitol Reporters

(15) Pages 920 - 923

Page 924

- time, that water level trends have been declining in the wells 1
- I've looked at. 2
- Q. All right. I want to show you Figure 3-3 from
- your rebuttal report, which is Exhibit SNWA Exhibit 9. Could
- you describe that, please?
- A. Okay.
- 7 Q. And please describe whether this figure is
- significant with respect to your opinion regarding whether
- water levels in the Lower White River Flow System are at
- steady state or are continuing to decline? 10
- A. Correct. This is a figure with -- I'm going to 11
- go back to hydrographs, and I want you to look at this period 12
- 13 after 2016 or at the peak of the view as recovery, 2016 to
- current. If you could back up a slide in your presentation, I 14
- 15 want to show you, again, where these wells are located.
- The first one, CSVM-1, again, is maybe a quarter 16
- 17 mile, half a mile to the east of MX-5 pumping well on the way
- to Muddy River Springs area. 18
- Again, there's GB-1, which is at the boundary of 19
- Hidden Valley and Garnet Valley and then Paiute TH-2 is in 20
- California Wash. All these are carbonate completed wells. 21
- So if we look at that period from 2016 to 22
- current, what I did here was to take the maximum water level 23
- that occurred in the year, and typically that's in the first 24

- illustrate with some of the numbers of production. Here, if
- we look at 2016, for example, the last three rows of this 2
- Table 2016, 2017, 2018, at the top we have Coyote Spring 3
- Valley from left to right. Coyote Spring Valley, Black
- Mountains area, Garnet Valley, California Wash, Muddy River
- Springs area. 6
- 7 Q. And, I'm sorry, Mr. Burns, this is Table C-3?
- 8 A. Yes, sir.
- 9 Q. Okay. Go ahead.
- 10 A. And then on the far side is the total production
- and this is carbonate aquifer and groundwater production. So 11
- 12 I mentioned earlier about these declining trends in these
- 13 wells.

14

- I'd like you to look at the total on the very far
- 15 right-hand side, and these are the production numbers during
- that period, about 7800 in 2016, less than that, 2017, and 16
- 17 then 7,630 and in 2018, 7,344.
- Q. Mr. Burns, what about specifically in Muddy River
- Springs area? What was the change in production from 2017 to 19
- 2018? 20
- 21 A. Well, in 2016 and 2017, it's about the same,
- around 2800. But it -- production was reduced by about, let's 22
- 23 say, 150-acre-feet in that area. If you'll oblige, I'd like
- to talk about California Wash as well and some of these other 24

Page 925

Page 927

- quarter of the year, and with those four values, just 1
- developed a trend line. And that's depicted on the chart. 2
- And, of course, you can see for each of these three wells, the 3
- trend line is going down. 4
- Now, I want to make a point here of some of the 5
- other conditions occurring during this time frame. One, if 6
- you look at the bottom panel, it's not that easy to see on 7
- this figure, but we can maybe go to the table and I'll show 8
- 9 you. But what you see from 2016 to 2018 that groundwater
- production has actually gone down. 10
- In this period, 2017 -- or in the same period, 11
- 2016 is essentially a normal year, but the -- two of the three
- years after are above the -- I'm sorry, let me back up. The 13
- precipitation index is greater than normal in 2017 and 2019. 14
- So the average annual percent of winter season 15
- precipitation is higher than average. 2018, it's actually 16
- lower. So what I see here, and we're talking southern Coyote 17
- Spring Valley, northern Garnet Valley, and then California 18
- Wash is there -- is a declining trend. 19
- 20 So my impression here and my conclusion is that
- the system, at least in these areas, has not attained the, as 21
- some people call, steady state condition, that water levels 22
- are still declining. 23

Min-U-Script®

If you go to the next page, I think I can maybe 24

1 basins.

5

- In California Wash, production from 2016 to 2018 2
- also declined from 200-acre-feet to 24. In Garnet Valley,
- peak production in 2016 at 2242, down in 2018 to 1751. 4
 - However, in Black Mountains area, there's a
- slight increase from 1434 in 2016 to about 200-acre-feet more 6
- at 1623 in 2018. I'll point out, though, the net production 7
- 8 between Black Mountains area and Garnet Valley, I think, has 9 actually gone down if you combine those two. And then Coyote
- Spring Valley in 2016, production at 1117 increased to almost 10
- 11 basically 1400 in 2017 and then almost 2,000, 2018 at 1,967.
- 12 So the point here is, well, while production --
- we see these water level declines coincident with groundwater 13
- production being reduced coincident with a period of time 14
- where we've had above normal winter season precipitation. 15
- 16 And so this tells me -- this is -- the response
- 17 is something different than you might expected. You had
- production lowered and higher that normal precipitation, you 18 might expect that the water levels are steady or even 19
- 20 increasing, perhaps, and that's not what I see.
- Q. Did you also review the EH-4 hydrograph with the 21 same questions in mind? 22
- A. Yeah, I took a look at EH-4 as well, EH-4 and 23
- EH-5B. Now, remember, EH-4 is just adjacent to the gradient

Capitol Reporters

775-882-5322

(16) Pages 924 - 927

Page 931

Page 928

- 1 Pederson Springs complex. E-5B is to the northeast of that or
- 2 basically north near the Arrow Canyon wells, production wells.
- 3 And so these wells on this next figure --
- 4 Q. Let me just, for the record, identify it. Is
- 5 this the document that's been submitted as SNWA Exhibit 81?
- 6 A. That's correct.
- 7 Q. All right. Go ahead.
- 8 A. Okay. So if we look at EH-4 and EH-5B, and
- 9 starting about 1998, we see a very linear decline to the end
- 10 of 2004. And we can look at the production at the bottom and
- 11 see that production had increased during that time frame.
- 12 Then 2005 is the extraordinary recharge year that kicked the
- water levels up. And then, of course, we see the test again,
- starting in 2011 and the water levels responding accordingly.
- Here, the recovery period, again, about the first
- quarter of 2016, I've applied the same process and it's very
- 17 simple of taking the maximum water level in each of those
- 18 years and using that to develop the trend lines. And in both
- of these cases, I see the trend declining.
- 20 Q. Okay.

13

15

16

17

18

19 20

21

22

23

24

- 21 A. Now, one thing I might note is in this period, I
- 22 just recited for you some of the production in this area. So
- in 2018, it was reduced by a little over 800-acre-feet.

that first quarter, it's actually a little higher than 2017

and 2019. And I attribute that to that change in pumping

on Exhibit 81, what would you expect to be happening at this

location if groundwater pumping was down and precipitation was

index or indicator, we actually don't see much in terms of --

in the hydrographs, we don't see much in terms of response to

these years where you're approximately normal or below normal,

But what I would expect to see with the decline

in groundwater production and these above normal years in 2017

and 2019, at least -- I would at least see that the water

described in EH-4, does it have implications on whether flows

at Warm Springs West will remain stable or will begin to

that the change in heads at EH-4 have proportional change in

flows at the Pederson Warm Springs complex. So I would expect

you know, 100 percent or even when it -- the signals that we

Q. So, again, at this EH-4 location that's depicted

above average in two of the last three years?

A. Well, frankly, with respect to the precipitation

see are these extraordinary events like in 2005.

levels are flat or no trend or perhaps even rising.

A. Well, earlier in our presentation, I established

Q. And does this declining trend that you've

And I think when we see -- when we look 2018,

operation at the Arrow Canyon wells.

- 1 a proportional change up in those flows or reduction in flows
- 2 if this -- if there's a declining trend from here to the
- 3 future.
- 4 Q. And I'd like to show you again Exhibit 5-7.
- 5 Would continued decline in the flow at Warm Springs West
- 6 potentially lead to the initial trigger of 3.2 at that gage?
- 7 A. Right. Absolutely. If the potentiometric
- 8 surface as measured by the water levels in EH-4 continue to go
- 9 down, of course, the discharge from this spring complex will
- 10 also go down.
- 11 Q. And could you describe that in relation to the
- solid line on that Figure 5-7, which is identified as the
- initial trigger level?
- 14 A. Okay. On Figure 5-7, the second from top
- 15 hydrograph is the Warm Springs West near Moapa Gage record,
- 16 and what you see here after a test, we encroached upon the 3.2
- initial trigger of 3.2 CFS. They recovered and then it looks
- 18 to me as it's declined, maybe sort of bouncing around as a
- 19 steady level around 3.4 max.
- 20 Q. Okay. And then this new last three-year decline,
- do you view that as a decline in this hydrograph as well?
- 22 A. From 2016 to first quarter of 2019, yes.
- 23 Q. Okay. So do you believe that current pumping
- 24 levels in the Lower White River Flow System, the gage record

Page 929

- at Warm Springs West could fall below 3.2?
- 2 A. Yes, I mean if what we see continues, we'll
- 3 continue to see declines in the head levels at the springs,
- 4 themselves, and as I said earlier, a proportional decrease in
- 5 flow.
- And so it's not -- you know, we're not there yet,
- 7 but I think if water levels continue to decline, we will be at
- 8 some point.
- 9 Q. Okay. Now, Ms. Drici, I want to ask you now
- about this question of steady state versus continuing to
- decline in the Lower White River Flow System.
- Can you turn to Figure 6-3 of the SNWA report,
- 13 Exhibit Number 7?
- 14 ANSWERS BY MS. DRICI:
- 15 A. Yeah, I'm there.
- 16 Q. And explain what we're looking at here?
- 17 A. Okay. So this -- to get to this analysis was to
- 18 approximately calculate where we're at in terms of the capture
- by the ongoing groundwater production from the carbonate
- 20 aquifer. So the way this was done is, again, going back to
- 21 that ratio between Warm Springs West and total discharge.
- So, again, we look at the historical record of
- 23 the Warm Springs West Gage and we looked at it from basically
- 24 the estimated start of groundwater production from the

1 ago 020

Min-U-Script®

decline?

Capitol Reporters 775-882-5322

(17) Pages 928 - 931

Page 935

Page 932

6

11

12

13

14

15

24

6

carbonate aquifer, which is like from 1991 to 2018 on usingannual data.

So if you take the decrease in the Warm Springs

- 4 West Gage from -- at the start, from 1991 and you go down
- 5 every year and you see how it's been decreasing, you can use
- 6 the ratio to calculate the corresponding decrease in the total
- 7 discharge of the MRSA. And that total -- the discharge in the
- 8 total MRSA discharge could be equated to the capture by the
- 9 groundwater production from the carbonate aquifer.

So this graph shows the cumulative MRSA discharge capture in green through the years. The total groundwater

capture in green through the years. The total groundwater production is the blue line -- is it blue or purple? Blue

13 line on top.

3

And so from there, you take the total groundwater

- 15 production for each year and you subtract the amount captured
- 16 from the spring discharge. You get -- the difference would be
- the volume of groundwater captured from storage of the
- 18 carbonate aquifer.
- So this basically -- that shows that by the time
- you get to 2018, we're -- we haven't reached steady state
- 21 definitely because we're still capturing groundwater from
- 22 storage.
- 23 We see the blue area is still going up, because
- 24 if you were getting close to a steady state, that line would

- 1 here. What's of interest to this analysis is the gage record
 - 2 at the Muddy River near Moapa Gage. But just to identify some
 - 3 of the other features, we have -- this area on your imagery,
 - 4 this is areas of evapotranspiration, whether it's irrigation
 - 5 or natural. That's the extent.

We have production wells in the area. We have

- 7 the Lewis well field to the northeast. We have LDS Central
- 8 east and west, alluvial wells, those are all production wells
- 9 that draw from the -- or have historically drawn from the 10 alluvial reservoir and then Perkins down to the south --

(Reporter interrupted proceedings.)

-- Perkins production well and Beamer production well below the gage to the south in your lower right-hand quadrant of the figure. And so that gives you a sense of the layout and you have Arrow Canyon production up in the

16 northwest corner.

And so what we -- I think not just we, I think
anyone who's looked at the gage record of the Muddy River near

19 Moapa Gage has observed that since about mid 1960's, there's

20 been a decline in flow. We have that in our report, the

21 hydrograph for that. But what we've seen is this decline has

persisted over time and we wanted to know what that was

23 attributable to.

The obvious factors include surface water

Page 933

- be flattening, signalling that there is no more change ingroundwater storage.
- So in my opinion, considering the approximation
- 4 of the ratio and the lack of production data before like 1990,
- 5 approximately I could say that was probably around 50/50, for
- 6 capturing 50 percent of the groundwater production from the
- 7 carbonate aquifer from the spring discharge and about
- 8 50 percent from groundwater storage.
- 9 Q. Thank you. Now, I'd like to move onto a new
- 10 topic. Mr. Burns, I'm going to ask you about the question of
- 11 the relationship between pumping in the Muddy River, carbonate
- 12 pumping in the Muddy River.
- So let's turn to Figure 7-1, 7-1. And with that,
- 14 could you -- I'm going to begin asking you about the Muddy
- 15 River depletion analysis that you conducted.
- But before we do, could you orient the State
- Engineer and his staff to the major points on this map that
- 18 we'll be talking about?
- 19 ANSWERS BY MR. BURNS:
- 20 A. Certainly. This is the aerial extent of the
- 21 Muddy River Springs area where the springs that we've been
- 22 talking about occur, Pederson Springs. This is the -- you
- need to go -- this -- there you go, there you go.
- Okay. Sorry about that. So Pederson Springs

- 1 diversions above the gage. What's not depicted here is that
 - 2 there's a Nevada Power Energy diversion right above the gage,
- 3 and there's some diversions from the springs in this system as
- 4 well. So those are obvious factors that could contribute to
- 5 this decline.
 - Others could be land use changes, perhaps, or
- 7 changes in ET or even long-term climate trends that have
- 8 reduced flows. And we looked at each of those and found that
- 9 they were not significant with respect to the magnitude of the
- 10 decline.
- And we attribute -- so what we did is we -- if
- you turn to the next slide, is if we were to assume
- predevelopment condition of 34,000-acre-feet in this area of surface water discharge, as the predevelopment condition, I'm
- 15 looking -- let me back up. I'm looking at a period 1992 to
 - 5 looking -- let me back up. Till looking a
- 16 2018 here.
- And if we assume that we can see that this bottom
- line, that we were substantially below that predevelopment
- 19 condition. So something, in our mind, has depleted the river
- 20 flows in this area of over this time period.
- This bottom line is what we refer to as a flood
- 22 adjusted flow. So it's a -- what we're interested in is the
- 23 base flow that's measured by the gage and we've adjusted that
- 24 flow to remove the overland flow and flash flooding events and

Min-U-Script® Capitol Reporters (18) Pages 932 - 935 775-882-5322

Page 936

that's what's represented there. 1

We derive a flood adjusted natural flow, so this 2

is the natural flow that would occur. We -- in doing so, we 3

- add the surface water diversion back to create this natural 4
- flow record. 5
- And on the next page, what we see then is we have 6
- 7 the bottom line, which is the record. We've added in the blue
- part, which is the Muddy River diversions. But we're still 8
- left with -- we're turning the Muddy River flow deficit. 9
- These are what we identify as the depletions in the river 10
- system as measured at the Moapa Gage. 11
- And so as I said earlier, we don't think ET, 12
- 13 which varied, as Warda's described earlier in a study from
- 2001 to 2012, varied around 800-acre-feet over that time 14
- 15 period, a decline. But that doesn't account for, you know,
- about 6 or 7,000-acre-feet in -- at its maximum here. 16
- 17 We looked at long-term trends. We look at the
- winter season precipitation pre- and post-1965 when experts 18
- began -- groundwater experts began and surface water 19
- diversions. 20
- We find that was actually slightly higher 1965 to 21
- present than it was pre-1965. So we rule out this being 22
- attributable to climate factors. That's not to say that 23
- there's some variability with flow record due to that -- those 24

- in the river system above the Moapa Gage.
- Underneath the line is a stacked bar chart and I 2
- stacked these based on proximity of the wells to the gage --3
- or to the river system. So we have the alluvial pumping on 4
- the bottom, arrow Canyon on top of that and then I only 5
- included the Coyote Spring production here. But this was 6
- 7 done -- this analysis was -- or this assessment was done prior
- to the MLR analysis. 8
- So in retrospect, I probably would've -- because 9
- the contributions from all these production wells in the 10
- basin, I probably would have just had this as a single blue 11
- 12 bar.
- 13 So at any rate, that is what we view as
- depletions over this period of time ranging from, you know, 14
- around -- max, around, you know, 7200 or so down to the 15
- current level of about 2300. And so these have been occurring 16
- 17 over time. This is what we've estimated for this period and
- these are what we view as the effect of pumping on this river 18 19 system.
- And, of course, I think most folks I've -- well, 20
- all the folks I've talked to believe that the alluvial pumping 21
- is -- occurs as the -- the impacts of alluvial pumping occurs 22
- 23 at a one-to-one basis. So one volume of -- one volume of
- pumped water from the alluvial reservoir is equivalent to one 24

Page 937

Page 939

- factors. But we all feel that that can attribute for this 1
- entire deficit. 2
- So what we did next is looked at this low 3
- deficit. So we attribute the deficit to groundwater 4
- production and here's a ground -- here's a figure, this is 5
- Figure 4-5 of our report. This is the inset that we just 6
- 7 showed earlier where groundwater production occurs. You have base -- alluvial reservoir pumping, you have Arrow Canyon 8
- 9 carbonate production in this Muddy River Springs.
- But outside this area, we have these other 10
- pumping centers. And Warda earlier mentioned about, in her 11
- MLR analysis, attributing some of the declines at EH-4 to 12
- these pumping centers. So in Coyote Spring Valley, we have 13
- the SNWA's MX-5 well, CSI production wells, there's a CSVRW-2
- that's not been operated. You have in California Wash, the 15
- Paiute ECP-1, 2 and 3 wells, and then you have a series of 16
- production wells in Garnet Valley as well. 17
- And, of course, at the far southern end is 18
- pumping the Black Mountains, EBM-4, 5 and 6. So all of those, 19
- 20 as Warda showed earlier, contribute to declines at the EH-4
- well site and the heads as measured by that well. 21
- And so if we go to the next page, what I'm 22
- presenting here is this red line is what is the actual Muddy 23
- River Flow deficit. These are what we view as the depletions

- volume depleted from the river. 1
- And then we have the same -- at least for when we 2
- look at the MRSA production from the carbonate system, if that
- were the sole contributor to the declines at EH-4, that would
- be the contribution and that would approach one to one.
- Q. And, Mr. Burns, do you agree with the opinion you
- just described that others have talked about, the one-to-one
- depletion rate? 8
- A. Yes.
- Q. Now, as a result of your Muddy River depletion 10
- analysis, you were able to determine in acre feet, the amount 11
- 12 of depletion from the river had occurred over this time
- period? 13
- 14 A. Yes.
- 15 Q. And did you then convert that depletion into ICS
- credits or intentionally created surplus credits on the Muddy 16
- River? 17
- 18 A. Right. So let me explain. So when these
- depletions occur, there's two systems that we -- that I think 19
- 20 of on this river with respect to how we derived ICS credits.
- 21 We have an upper Muddy River system where we have
- rights and those are unaffected because we had the river --22
- sufficient water in the river to make those demands or those 23
- obligations. 24

Min-U-Script® (19) Pages 936 - 939 Capitol Reporters 775-882-5322

Page 940

- The depletions really affect the water that's
- 2 delivered at Moapa -- or the Muddy Valley Irrigation Company
- 3 at wells sighting diversion down in Lower Moapa Valley. And
- 4 so if you look -- I guess I'll look at the figure real quick.
- 5 What I was describing here is sort of a delineation between an
- 6 upper and lower system. As I said, there's sufficient water
- 7 in the upper system to meet these right obligations, decreed
- 8 rights.
- The depletions actually are realized here at the
- 10 well sighting diversion in Lower Moapa Valley. What this
- analysis accounts for is just the effects of those depletions
- 12 above the Moapa Gage and their impact to the flows delivered
- 13 to the irrigation company at well sighting diversion. So just
- 14 as a demonstration for --
- 15 Q. Oh, just a second, please. Just a point of
- clarification, why is it that it's that water delivery at well
- sighting that it's where the depletion occurs? Is that a
- 18 hydrologic issue or is that something different?
- 19 A. Well, the depletion, itself, is a hydrologic
- 20 issue. It's called -- well, maybe it's a hybrid. The
- 21 depletion is caused by pumping operation that's depleted the
- 22 flow of the river, whether it's alluvial pumping or carbonate
- 23 pumping. The effect is realized by decreased flows at the
- 24 delivery point at the well site diversion.

- 1 depletion on the river, and so we assume this
- 2 34,000-acre-feet. And under -- we -- for a certified credit,
- 3 there's a natural flow condition that was observed in that
- 4 time. So, for example, 4983 in 2008 under a flow condition of
- 5 29,016-acre-feet, which happens to be about 86 percent of the
- 6 predevelopment base well.
- 7 So it's a simple calculation of what would our
- 8 potential ICS credit have been if we had 100 percent of the
- 9 river flow to 34,000, and that's simply computed by dividing
- the certified right by .86. And you get this in the 1, 2,
- 3 -- the fifth column, potential ICS credits under 100 percentpredevelopment base flow.
- So without these depletions, that's what we would
- have realized, that with our shares in the irrigation company.
- 15 The next column, the impact, I demonstrate here that the
- impact in this year is simply the difference between the
- potential and what was certified, 811-acre-feet. And for the
- 18 period of analysis here, it's about approximate
- 19 12,000-acre-feet.
- 20 Q. All right. A couple of follow-up questions
- there. I asked you about -- now, we are moving on to a new subject.
- I asked you about your opinion regarding the
- 24 capture ratio between alluvial pumping and river depletion and

Page 941

Page 943

- 1 Q. And is the well site diversion significant from a
- 2 decrease standpoint or from a water rights standpoint?
- 3 A. Well, it's my understanding that the irrigation
- 4 company there is entitled to the entire flow of the river, at
- 5 that point, less any amount used in the upper system. So to
- 6 the extent there's water unused in the upper system by those
- other decreed rights, the remaining water is assigned by
 decree to the Muddy Valley Irrigation Company at the well site
- 9 diversion.
- 10 Q. Okay. Thank you.
- 11 A. So if you look at the next slide, please,
- 12 Figure 7-2. What we list in here is our certified ICS credits
- 13 that we develop from our irrigation company shares. We have
- 14 purchased shares and leased shares in the Muddy River
- 15 Irrigation Company.
- The water that arrives at the diversion is
- 17 distribute based on those shares, so it can vary from year to
- 18 year. But in the first two columns, we have year from the
- 19 program's inception in 2008 to 2017, and these are certified
- 20 ICS credits listed for those years. And when I mean
- 21 certified, these are amounts certified by the State Engineer
- and the Bureau of Reclamation.
- What I want to demonstrate here is what the
- 24 potential ICS credits would have been if there was no

- 1 you indicated your opinion on that. What about pumping of
- 2 carbonate water versus river flow?
- 3 Could you describe what your view is on what the
- 4 rate of capture is from carbonate pumping?
- 5 A. Well, I can't tell you what the rate of capture
- 6 is. Warda has an analysis that shows you our estimation of
- 7 what's happened. But if we look out long term and we think
- 8 about -- when I say "long-term," it's not five years or
- 9 10 years from now. It's decades. It's what happens when you
- 10 pump this water, what are you capturing? What source of water
- 11 can you capture?
- The only discharge in this flow system is the ET
- and the spring flows and the river flows in this area. And at some point in the future, I think I would expect that
- 21 Some point in the fatale, I timik I would expect that
- 15 carbonate groundwater pumping would essentially be one for one
- and capture that flow.
- Now, how long that takes, I can't fathom a guess.
- 18 It is also possible that the carbonate production could
- 19 capture a boundary flow, perhaps some amount of -- some
- 20 limited amount of underflow or outflow to some other basin.
- But given the framework, I don't view that outflow is significant.
- One of the things that we've seen with our
- 24 qualitative and regression analysis is that throughout this

Min-U-Script® Capitol Reporters (20) Pages 940 - 943 775-882-5322

Page 944

- 1 system, we have very high degree of connectivity. These wells
- 2 are very responsive to pumping changes, and I just don't see
- 3 how -- where you could put a well, at least in the areas we've
- 4 examined, and pump that well without having some effect at
- 5 EH-4 and, of course, the proportional effect at springs.
- 6 Q. Mr. Burns, SNWA submitted a report after the 1169
- 7 pumping test. How does the inclusions in the report that you
- 8 submitted here relate to that and the conclusions in that
- 9 report? How does this report add to what was done in the
- 10 past?
- 11 A. Well, what adds to the analysis is the six or so
- 12 years of data that we've collected since the test is over and
- 13 since those reports, those first analyses were provided to the
- 14 State Engineer.
- What's changed is we've seen what the recovery
- 16 is. We stop pumping about 3,000-acre-feet from the MX-5 well,
- 17 and frankly, I was expecting more of a recovery. But I think
- 18 the recovery was suppressed by ongoing pumping. I think I
- 19 lost your question. What's your question?
- 20 Q. How does the analysis that's done in the report
- 21 that you're presenting to the State Engineer supplement what
- 22 was done in 2013?
- 23 A. Well, this report here is -- I would say is more
- 24 comprehensive view of the issues, using more data and more

- 1 the east.
- 2 If you compare CSVM-2 to UMVM-1, they look very,
- 3 very similar, identical in essence. And then further to the
- 4 east at EH-4 at the springs area, again, the same. And then
- 5 to the very far south is GB-1 and that one, as well, very
- 6 similar.

11

- 7 So what this shows me or tells me is that, first
- 8 off, between the CSVM-1 and these eastern -- easterly located
- 9 wells in the carbonate system, there is no real difference.
- 10 There's no attenuating effect by these faults.
 - I don't see any attenuating effect by the horse
- that sits there, the structural block that's much discussed
- the last couple days. I just don't see it. If it was there,
- 14 I would -- you know, we wouldn't see these responses from the
- 15 MX-5 pumping. And this shows the degree of connectivity in
- 16 this area
- 17 Q. All right. And could you turn to Figure 2-5 from
- 18 your rebuttal report, figure number 9 and describe what this
- 19 shows?
- 20 A. Let's go to a map first. Well, first off, what
- 21 this shows are the records for CSI-1, 3 and 4. And then below
- there is CSVM-1, again, next to MX-5. But if you could go to
- 23 the map. That's hard to see.
- But this map figure is the hydrogeologic map of

Page 945

5

10

Page 947

- 1 data analysis.
- 2 Q. All right. Now, I'd like to ask you some
- 3 questions about some of the testimony that's been offered
- 4 before your testimony here at this hearing.
- 5 In your rebuttal report, there's a Figure 2-4,
- 6 and let's put that up on the screen. And there was testimony
- 7 from Mr. Reich about the location of a fault in Coyote Spring
- 8 Valley and the -- and in his view, the fault being not
- 9 permeable or having limited permeability.
- Do you recall that?
- 11 A. I do.
- 12 Q. What's your opinion about the fault structure
- that he described and its level of permeability?
- 14 A. Well, what I demonstrate in this chart, what I
- 15 want to show you is a series of hydrographs. And you can see
- 16 for yourself that they all behave in the same manner as we
- confirmed in our regression analysis.
- But one well, this top one, CSVM-2 is located --
- 19 if you can go to the map, please. CSVM-2 is located in
- 20 southern Coyote Spring Valley.
- This is on the west side of the highway and you
- 22 can see how it responds to the various stresses during this
- period of record. And it's the same as CSVM-1, which is, as I said, next to MX-5 pumping well and in the same for UMVM-1 to

- 1 Rowley, 2011. And what I've done is posted the well locations
- 2 on this map to show -- just to orient you where these wells
- 3 are in proximity to MX-5 and some of the other structural
- 4 features that are prominent in this area.
 - First off, along Highway 168 is the CSI-1 well
- 6 and it's right here in the middle of the map. To the east of
- 7 that is CSVM-1 here, which is on -- within that structural
- 8 block, and then CSI-4, which is along the highway to the
- 9 north, and CSVM-3, which is in the middle of this structural
 - block that's been talked about.
- And so it extends -- I mean, CSMAT data has moved
- 12 this fault a little closer to the mountain -- the range front.
- But this structural block extends to the central part of the
- valley and that was characterized by Mr. Reich as an
- 15 impermeable boundary. Also, the same, I think, with the
- 16 faults that they mapped.
- So here -- I guess here's the story as I
- 18 understand it. They're purporting that CSI-4, CSI-1 and CSI-3
- are in a separate compartment, in essence, than the other
- wells to the east and to the springs area.
- So if I go back to the hydrograph, if we first
- 22 look at the bottom panel, which is CSVM-1, which is very --
- 23 like I said, right next to this MX-5 pumping well. If we just
- 24 focus on the test period, which is the gray area, we can see

Min-U-Script®

Capitol Reporters 775-882-5322

(21) Pages 944 - 947

Page 951

Page 948

that prior to 2011, they're starting the pump, getting it 1 ready for the test, and then it starts in 2011. 2

And then about at the end of the first quarter of

- the year, MX-5 shuts off and you see CSVM-1 respond
- accordingly, water levels come up. The pump is then turned 5
- back on, water levels decline. And then they shut off again, 6
- 7 the well shuts off and the water level recovers.

And then the remainder of the test continues and 8

you have this decline to the end, to the end of MX-5 pumping. 9

Now, when I look at CSI-1, I can see the same 10

sort of responses to this pump shut down at MX-5. I see the 11

water level come up when it's shut off. I see that it goes 12

- 13 down when it's turned on, and then come back up when it's
- turned off, and then for the remainder of the test, the 14
- 15 decline. So at this well, I see that there is no real feature
- that attenuates the well -- the drawdown response. 16
- 17 Incidentally, if you go from the beginning of the
- test, you can see it's -- I have a list in my table report, 18
- but you can see a decline over the period of the test of --19
- let's see, 1, 2, about 3 feet or so. 20

3

- Going to CSI-3, I think it's -- the record is a 21
- little, there's some missing data, I suppose, or missing 22
- measurements and -- but you can still see that when the pump's 23
- turned on, you have a decline. When the pump is shut off, an 24

1 A. I don't think that's the case.

- 2 Q. Okay. Moving on to your next slide, there's been
- some discussion about CSVM-5. Are you familiar with that
- monitor well?

13

14

15

21

22

23

24

- 5 A. I am familiar.
- 6 Q. And why are you familiar with that monitor well?
- 7 A. Well, that was a monitor well that was installed
- by SNWA. I was the contracted administrator for that. It was
- some time ago, I mean, 2003 time frame. But I think as Sue 9
- Braumiller said the other day, this well was sited by the TRP, 10
- is my recollection and it's about -- I think it's about 11
- 12 1800 feet, the water level is about 1080.

So it's deep, depth to water. In all these CSVM wells, we tried to have about 700-foot saturated thickness penetrated by the well as is the case with this one.

As she said and as we -- you can see when you 16 drive out there, this well is in -- at a site where there's 17 overturned beds -- not overturned, but near the vertical beds 18 and those are influenced by, I think, the Glendale. They're 19 the gas peak thrust fault. 20

But regardless, depth to water is deep here. It appears to me that -- well, the data shows that it's not connected as others have concluded to the structural base, the wells in the structural basin of the flow system.

Page 949

increase and then a decline. 1

Now, superimposed on here is -- are the pumping 2

- effects, responses of the well itself. And so the record is a 3
- little by complicated in that regard and the same for CSI-4. 4
- But what you can see here is the start of the test to the end 5
- of the test, there's certainly an effect. 6
- Now, CSI-4, same story, we're missing some 7
- important data here that might show what happened when the 8
- 9 pump was turned off in the early first quarter of 2011.
- But you can see 2012, when the pump was turned 10 on, the water level declined and it pops it back up when the 11
- pump shut off. And we just don't have much data after that, 12
- except for this little record of five points that is lower 13
- than it was. 14
- So what I see here are clear responses to the 15
- MX-5 production. The response is compounded by some of the 16
- production from the well itself, but you can see the signals 17
- of the MX-5 in this record. 18
- So I conclude here that the structural block is 19
- 20 not impermeable, nor are the faults on the west side of that
- block. 21
- Q. So do you believe production of water, it had 22
- significant levels, for instance, 4,000-acre-feet could occur 23
 - at CSI-1, 3 and 4 without impacting the Muddy River Springs?

- 1 However, you see this little blip in 2005 that
- we've seen in the other wells. So it is receiving recharge 2
- from the Sheep Range, it looks like. I don't know what else
- 4 you want to know. I mean, it looks to me like the materials
- are tight. 5
- They're not very -- it's not very responsive to 6
- recharge pulses unless they're extraordinary and that's sort 7
- of the case for all these wells.
- Q. Okay. And I think my last question is -- has to
- 10 do with a 2011 report that SNWA prepared and it -- are you
- 11 familiar with the 2011 report SNWA prepared that included
- 12 Darcy Flux equation calculations in the Lower White River Flow
- System? 13
- 14 A. Yes.
- 15 Q. And there's been some discussion of those
- 16 calculations in some of your reports that are submitted here.
- 17 Do you have a position on the role of that information in this
- proceeding? 18
- A. Well, we can't rule out that there is -- well, 19
- there's obviously flow throughout this system. The two 20
- calculations in this area that I recall was one was in the --21
- below the Muddy River springs and that was a calculation to 22
- estimate a flux to the Muddy Creek formation at that location 23
- just below the springs. 24

17

18

We also did another one here south of -- I think 1 it was south of CSVM-2. I forget the exact number, but it was 2

on the order of 8,000 or so acre feet. The previous one was 3 about 9900 and those were -- in our conceptual model, we --

- the issue with this area near CSVM-2 was that based on the
- isotopic composition of waters in Garnet Valley and California 6
- 7 Wash, we thought -- and I still I think that there's got to be
- some amount of water going into Garnet Valley. 8
- We don't know what that is. But based on that 9 isotopic composition, it couldn't just be local recharge. And 10 so we computed Darcy Flux just to try to get a sense of what 11
- it could be potentially and then we did the same thing over in 12
- 13 the Muddy Creek formation, south of the springs.
- Q. Has -- in your opinion, is there any evidence of 14
- 15 any wells being able to capture any of that water yet? A. Well, what we've seen is that because of the high 16
- 17 degree of connectivity in this area from -- at least from --
- extending from the wells that we've looked at and in between, 18
- 19 it's hard to imagine that you could put a well in this system without impacting EH-4, for example. 20
- So there might be underflow there, but I don't 21
- know -- I can't think of what means of finding the well 22
- location that would only -- it's only going to capture this 23
- outflow, wherever it occurs. 24

Page 954 production. Ratio analysis quantified potential changes and

total Muddy River discharge based on the changes in the Warm 2

Springs West discharge for the same period. 3

And then our main conclusion on this point, if 4

the conflicts with senior water right holders are adequately 5 addressed, these depletions we've talked about, the total 6

annual carbonate groundwater production should be banned

between 4 to 6,000-acre-feet over the long term to maintain

3.2 CFS at Warm Springs West Gage in order to protect the 9 endangered Moapa Dace. 10

Lastly, D, the effects of moving water rights

between alluvial wells and carbonate wells. Changing points 12 13 of diversion to move groundwater production on the Muddy River 14

Springs area alluvial reservoir to locations sourced by the carbonate aquifer will not mitigate impacts. It will only 15

delay their inevitable occurrence. 16

> Such changes would exacerbate issues associated with the already over appropriate carbonate aquifer by accelerating the timing of impacts to the high elevation springs due to the additional groundwater production.

> The timing of impacts, of course, will vary based on the magnitude, the duration and location of groundwater production. Detectable impacts may occur relatively quickly, within weeks or months, if additional groundwater production

Page 953

- 1 Q. All right. Now, let's turn to your next slide.
- And can you summarize your conclusions, please?
- 3 A. Sure. I'm just going to read these so it's
- clear. We have conclusions for each of the points of -- in
- the Order 1303. First item, A, Lower White River Flow System 5
- geographic boundary. 6

Our conclusion here is the boundary defined by 7

- the State Engineer is appropriate. However, any applications 8
- 9 or permits close to the boundary should be scrutinized, and
- this is a point that Colby elaborated on at the opening. 10
- B, the hydrologic responses to the cessation of 11
- Order 1169 aquifer test. The linear regression analyses that
- we completed confirmed hydraulic connectivity throughout the 13 system. 14
- The recovery of water levels blended by continued 15
- carbonate production. Carbonate water levels and high 16 elevation spring discharge have resumed a declining trend. 17
- Item C, groundwater production and the capture of 18
- the Muddy River springs and river flows. Linear regression 19
- 20 analysis confirmed high correlation and linear relationship between carbonate water levels at the Muddy River Springs area 21
- 22 and spring discharge.
- The Muddy River Flow deficit analysis quantified 23
- estimated impacts to river flows due to groundwater

were to occur in areas directly upgradient from the Muddy

River Springs area. 2

Detectable impacts of groundwater production in 3

areas farther away may take longer, but as we demonstrated, 4 the properties of the aquifer are such that these impacts will 5

eventually result in reduced spring discharge and depletions 6

of the Muddy River stream flow. 7

MR. TAGGART: Thank you, Mr. Burns. And that concludes our direct exam, and we'd like to reserve the remainder of our time for redirect.

HEARING OFFICER FAIRBANK: Okay. Thank you. So based upon today's presentation, we will go ahead and assign 14 minutes to each of the participants for questioning. And, similarly, as we've done in the previous days, if there's addition time, then after the State Engineer has their opportunity to ask questions, then we will go ahead and reopen that up for additional questions by the participants. And we will start this morning with Coyote Spring Investments.

MR. HERREMA: Good morning. My name is Brad 19 20 Herrema, and I represent Coyote Spring Investment in this fact gathering proceeding. 21

- **CROSS-EXAMINATION** 22
- BY MR. HERREMA: 23
- 24 Q. Initially, I had a couple questions on the

Page 955

Min-U-Script® Capitol Reporters 775-882-5322

(23) Pages 952 - 955

Page 956

- 1 July 3, 2019, report. It's labeled SNWA Exhibit 7. That
- 2 report is signed by two other folks who aren't at the table
- 3 today, Casey Collins and James Watrus. What did they do in
- 4 the preparation of the report?
- 5 ANSWERS BY MR. BURNS:
- 6 A. Casey Collins is a hydrologist that works for me
- 7 in my division. His main effort was in data compilation and
- 8 presentation. So all these fantastic hydrographs you see in
- 9 some of these charts and figures, he prepared.
- Jim Watrus, who also -- he's a senior hydrologist
- 11 for us. He and his staff helped compile some of the
- information in the report. He helped considerably on
- 13 Section 7, which is the depletion of Muddy River Spring flow
- 14 and impacts to SNWA.
- Did you ask about both reports or just this one?
- 16 Q. Yeah, I don't believe they signed the other
- 17 report.
- 18 A. Okay. So I don't know. That's correct.
- 19 Q. Did they draft any portions of the -- of your
- 20 July 2019 report?
- 21 A. I have a June -- okay. I've got dated June 2019,
- but it's the July submittal, you mean.
- 23 Q. Exhibit 7, yes.
- 24 A. Yes. Yes, they did parts, I would say primarily

- 1 that structural block and I showed a series of hydrographs
- 2 comparing that well with wells on the eastern side of that
- 3 structural block and faults.
- 4 Q. Did you compare pumping from the east side and
- 5 the west side or were you just looking at effects on the east
- 6 side versus the west side?
- 7 A. Both.
- 8 Q. Okay. I think you mentioned in response to -- or
- 9 your response to a question from Mr. Taggart about water
- 10 budgets was that they were not useful for determining
- 11 connectedness of an aquifer. Do you recall that?
- **12** A. I recall having a discussion on that.
- 13 Q. My recollection is that is what you said. Do you
- 14 agree with that?
- 15 A. Well, maybe, let me clarify. With respect to
- water budgets and volumes of water, I think that's less
- 17 important at this stage in the process than how pumping a well
- impacts other wells conditions in the aquifer and how those
- impacts or those effects manifest themselves at springlocations, and ultimately depletions on the spring discharge
- or the Muddy River.
 - So I think it's the pumping and response data
- that's more important than water budget analysis at this
- 24 point.

22

Page 957

Page 959

- 1 in Section 7. And Section 3, Jim Watrus assisted with the
- 2 discussion.
- 3 Q. Are any of the conclusions in those sections
- 4 their conclusions?
- 5 A. I think we share all of these conclusions.
- 6 Q. So you reviewed their work and came to similar
- 7 conclusions?
- 8 A. Yes, sir.
- 9 Q. Okay. If I could turn your attention to one of
- slides 6, 8 or 10 from your presentation this morning. The
- 11 carbonate groundwater production graphic that's at the bottom
- of each of these slides shows total annual pumping by basin.
- 13 Did you analyze groundwater level response in each basin based
- 14 on pumping in that basin as opposed to the total pumping?
- 15 A. No.
- 16 Q. Did you analyze impacts in individual basins
- 17 compared to pumping on the west side of Coyote Spring Valley
- 18 and then analyze it with the comparisons of pumping on the
- 19 east side?
- 20 A. I presented an analysis that it talked about
- 21 CSVM-2. So in that respect, I think so, the answer is yes if
- 22 I understand your question.
- 23 Q. Okay.
- 24 A. CSVM-2 is on the west side of these faults in

- 1 Q. For the purposes of managing a basin?
- 2 A. Yes.
- 3 Q. Okay. The administrative area is roughly a
- 4 thousand square miles and composed of six basins. Did you
- 5 describe the empirical test that you relied on -- that you
- 6 would rely on to manage the basin?
- 7 A. From which perspective from a water rights
- 8 perspective, an effects perspective, manage effects in the
- 9 system or how to manage water rights? I'm not sure what --
- 10 could you clarify it, please?
- 11 Q. Managing the total that could be sustained and
- pumped from the basin?
- 13 A. Okay. That might be a question for you. We
- 14 performed the ratio analysis, a portion of a ratio analysis
- and we concluded 4 to 6,000-acre-feet as a range to manage
- 16 this system.
- This is carbonate groundwater production we're
- 18 talking about that would maintain a level at the Warm Springs
- 19 West Gage at three point -- approximately 3.2 CFS. And the
- 20 biologists inform us that that's a level of flow that's needed
- 21 to maintain the current populations of the Moapa Dace.
- 22 Q. Are there other pump tests that you relied on
- other than the Order 1169 pumping test?
- 24 A. Not for this analysis.

Min-U-Script® Capitol Reporters (24) Pages 956 - 959 775-882-5322

Page 960

- 1 Q. Okay. There were no pumping tests from
- 2 California Wash or Garnet Valley?
- 3 A. Not for this analysis.
- 4 Q. Would pumping tests in California Wash or Garnet
- 5 Valley help you develop a better understanding of the basin?
- 6 A. California Wash and what was the other one, I'm 7 sorry?
- 8 Q. Garnet Valley?
- 9 A. Well, let me say this. If it's a pumping test
- 10 like Order 1169, certainly. What I see for this system is
- 11 that you need a significant stress imposed on the system to
- 12 elicit the response data that can be analyzed and done with
- 13 the Order 1169.
- So it would need to be something of that
- 15 magnitude to be more informative than what we've already
- 16 learned from response data we've observed and the regression
- analyses that we've performed that confirmed the
- interconnected nature of the system.
- 19 If it's just an aquifer test that's, you know, a
- 20 five-day or 72-hour test, that tells us a little bit of
- 21 something about the test, the material between the test well
- and the observation well. But I'm not sure it would be
- 23 meaningful for informing us any more than what we already
- 24 know.

- 1 A. In the long run, yes. When you get near steady
- 2 state conditions and steady state conditions.
- 3 Q. Is there an assumption of what that time frame
- 4 would be?
- 5 A. Well, we saw from the analysis I did on the
- 6 capture that thus far, I mean, we started production like
- 7 mid 80's up to 2018. We roughly captured about 50 percent of
- 8 the total production from the springs.
- 9 So -- and we know from doing simulations that you
- capture the first half a lot faster than you capture the
- second half. So it will take a much longer time to get to a
- new steady state, but I cannot tell you how long exactly.
- 13 Q. Okay. And in terms of a number of years, was
- 14 there an assumption that carbonate pumping anywhere in the
- 15 Lower White River Flow System would affect spring flow on a
- one-to-one basis? Do you have an estimate of the number of
- 17 years?
- 18 A. Oh, the effect? Well, from the Order 1169 test,
- 19 when we compared like the hydrographs from daily data at the
- 20 observation points where we have data, it looked like you got
- 21 there like within a day. They were all responding the same.
- 22 Q. And so this analysis assumes a one day response?
- 23 A. Which analysis?
- 24 Q. The analysis here on Table 6-2?

Page 961

Page 963

- 1 Q. Okay. If I could turn your attention to
- 2 Slide 25. This is Table 6-2, limits on carbonate aquifer
- 3 production based on selective discharge rates at Warm Springs
- 4 West Gage. I think you were just talking about this analysis.
- 5 Does this analysis assume that all pumping in the carbonate
- 6 aquifer affects the Warm Springs West Gage?
- 7 ANSWERS BY MS. DRICI:
- 8 A. Yes, it does.
- 9 Q. Does it account for flow paths from other areas,
- such as have been discussed over the past couple days
- 11 regarding the difference between Big Muddy Spring and Pederson
- 12 Springs
- 13 A. Well, implicitly, it does. As far as the Big
- 14 Muddy, in our conceptual model, it's a source is a carbonate
- 15 aquifer.
- 16 Q. So if there are flow paths, then this accounts
- 17 for them?
- 18 A. Yes, if there is water coming from somewhere
- 19 else, it wouldn't be accounted for. But I do not believe that
- 20 there is water coming from somewhere else based on the
- 21 analysis that I did.
- 22 Q. Does this analysis assume that carbonate pumping
- 23 anywhere in the Lower White River Flow System will affect
- spring flow on a one-to-one basis?

- 1 A. No. This would be -- this is kind of independent
- 2 of how long it takes. But we're assuming that, for example,
- 3 if you want to maintain the Warm Springs West at a given level
- 4 shown on the first column, you would have to be pumping the
- 5 volume on that last column kind of like on a continuing basis.
- 6 So at steady state, yeah, you would be getting
- 7 that much water and you would be maintaining the Warm Springs
- 8 West flow at that given level.
- 9 Q. Okay.
- 10 A. Discharge.
- 11 Q. I'll move on. Did you compare the results of
- your theoretical analysis to observe data like actual flows at
- 13 Warm Springs West or the -- in the Muddy River?
- 14 A. Yes, I did. I did not -- we did not put it in
- 15 the presentation, but there's a comparison in the report --
- you want to see what page that is, please. And it should be
- 17 right here after the figure. Yeah, if you look -- do you have
- 18 the report in front of you?
- 19 Q. I do, yes.
- 20 A. Okay. Like on page 610.
- 21 Q. Okay. I'll take a look at that later. I want to
- move onto Slide 27.
- 23 A. Okay. So the first paragraph right after the
- 24 figure that shows the capture analysis.

Min-U-Script® Capitol Reporters (25) Pages 960 - 963 775-882-5322

Page 964

- 1 Q. All right. Thank you. In regard to Slide 27,
- 2 Mr. Burns, could the water levels in the past four years on
- 3 the top three graphs on this page be declining due to climate?
- 4 ANSWERS BY MR. BURNS:
- 5 A. There's been a debate for a long time about
- 6 whether these effects are climate or pumping. The fact is the
- 7 responses are due to both because they're both implicit in the
- 8 water level measurement. So they would be a component of the
- 9 change that's observed.
- But I'll note that in 2017 and 2019, for those
- 11 years, the percent of average annual winter season
- 12 precipitation was greater than normal, not less than normal.
- 13 Q. Did you perform a rainfall recharge analysis to
- assess under what conditions recharge occurs?
- 15 A. I did not.
- 16 Q. And do you believe that groundwater recharge
- occurs every year there's rainfall?
- 18 A. I believe it does, but I believe in dry years,
- 19 like in 2002, it's probably very small amount. In this area
- 20 with the potential evapotranspiration rates, I wouldn't
- expects a lot of it to be -- to make it past the demands of
- 22 the plants and the soil for years like that, but I still think
- there's some that occurs. I have no measure of it, though.
- MR. HERREMA: Okay. Thank you.

- 1 Q. I get it. I'm trying to -- I'm just trying to
- 2 understand what I'm looking at. And you talked a little bit
- 3 about the residuals, and I assume that's some sort of error
- 4 estimation?
- 5 A. Usually, yes, if you can account for all the
- 6 explanatory variables, which, you know, I included all the
- 7 production -- well production from all the basins. But I
- 8 could not include the specific effect of recharge because I
- 9 don't know. I cannot quantify recharge like I can the
- 10 production, the groundwater production.
- 11 Q. Okay. If you had to say you were -- your
- 12 relative level of confidence in this estimation, where would
- 13 you put it? High in the confident, low, somewhere in the
- 14 middle?
- 15 A. Well, with all of them, if you look at the
- appendix, we did include all the statistics that resulted from
- the analysis, including the P values, and therefore, this one
- and all of them, except for Black Mountain area, the P values
- were below that .005. So it tells me that within 95 percent
- 20 confidence, the -- this is happening.
- 21 Q. But you're not considering recharge?
- 22 A. Recharge was left with the residuals because,
- again, I could not extract it.
- 24 Q. Okay.

Page 965

Page 967

- 1 HEARING OFFICER FAIRBANK: Okay. Next will be
- 2 the United States Fish and Wildlife Service.
- 3 MR. MILLER: No questions.
- 4 HEARING OFFICER FAIRBANK: Seeing no questions
- 5 from Fish and Wildlife Service, National Park Service.
- 6 MS. GLASGOW: No questions.
- 7 HEARING OFFICER FAIRBANK: Seeing no questions
- 8 from National Park Service, the Moapa Band of Paiute Indians.
- 9 CROSS-EXAMINATION
- 10 BY MS. BALDWIN:
- 11 Q. Good morning. This is Beth Baldwin for the Moapa
- 12 Band of Paiutes. If we could go to Slide 17, I believe it
- was. Okay. And this is for whoever can answer the question,
- 14 I'm not sure who the best person is.
- 15 If I'm not mistaken, the graph on the bottom is
- the California Wash results compared to EH-4; is that correct?
- 17 ANSWERS BY MS. DRICI:
- 18 A. Yes, it is.
- 19 Q. So, am I -- I don't know if I'm reading this
- 20 right. It suggests that there's a -- there's two feet in
- 21 drawdown at EH-4 that you're attributing to increased
- 22 production in California Wash?
- 23 A. Yes. It was not me personally, it's the numbers
- 24 in the analysis.

- 1 A. This, alone, should just show the effect of
- 2 production on the water levels at EH-4, if nothing else was
- 3 happening.
- 4 Q. So it assumes everything else is staying the
- same?
- 6 A. It assumes that -- it's basically like if you had
- 7 the level at EH-4 at the basic level, which was somewhere
- 8 around 18, 17, and you were only pumping California Wash that
- 9 much, that's what you would get. That's what you would see.
- MR. BURNS: If I could add?
- 11 BY MS. BALDWIN:
- 12 Q. Sure.
- 13 ANSWERS BY MR. BURNS:
- 14 A. If you turned you turn to Slide 11, you asked
- about the certainty of the relationship, and I think this
- 16 could help answer your question.
- The Paiutes TH-2 well versus EH-4 regression
- analysis, you can see that the correlation between that well
- 19 and EH-4 is extremely high.
- 20 Q. Okay.
- 21 A. And so that gives us certainty that the response
- 22 that's measured at EH-4 attributable to EH-42 is also high.
- 23 Q. All right. So now that we're on Slide 11,
- 24 Andrew, I do have a question about it. I think you said the

Min-U-Script®

Capitol Reporters 775-882-5322

(26) Pages 964 - 967

Page 968

- 1 wells were responding to the same stresses, whether that's
- 2 climate or pumping, the same stresses are applying throughout
- 3 the system?
- 4 A. That's correct.
- 5 Q. Okay. And in your opinion, that supports the
- 6 idea that the aquifer's all interconnected?
- 7 A. That does, yes.
- 8 Q. All right. If we try -- and I know that this is
- 9 difficult, but if we try and think about separating climate
- 10 out from pumping, could it be just a reflection that the wells
- are all sharing the same recharge area?
- 12 A. It could be that and all other factors that are
- influencing the water level record.
- 14 Q. Okay.
- 15 A. Now, when it comes to the pumping, itself, if you
- turn to page 11, in this analysis, we tried to isolate the
- pumping effect at MX-4. And we know that that's a pumping
- 18 effect because it's right next to the pumping well, a well
- that's pumping probably 3,000 gallons a minute.
- So we know that the response there is
- 21 predominantly from the pumping well. And so we do the same
- analysis with EH-4. We can see, again, a very, very high
- 23 correlation to that pumping response. So we can look at it
- both ways and that's how we looked at it.

- 1 What I can tell you, though, is I've been to the
- 2 spring. It's highly managed above the gage. I mean, there's
- a pool for one, I'm not sure that affects the long-term
- 4 record.
- 5 But there's also alluvial pumping around that
- 6 spring and it's the lowest elevation spring. And I think some
- 7 due diligence is owed to looking at all of those factors and
- 8 how they may or may not influence the record. I have not done
- 9 that.
- 10 Q. Okay. Does Big Muddy Spring contribute to Muddy
- 11 River flows?
- 12 A. It does.
- 13 Q. Do you have any guess of what percentage of the
- 14 flows it contributes?
- 15 A. As I recall, Big Muddy is about seven CFS, and if
- we assume a -- well, I think its flow at about 40, so seven
- over 40, whatever that percentage is.
- 18 Q. Is it greater than the contribution of Warm
- 19 Springs West?
- 20 A. It is.
- 21 Q. To the Muddy River?
- 22 A. Yes.
- 23 Q. But you -- but more work should be done in that
- area, looking at Big Muddy's contributions?

Page 969

- 1 Q. And I'm not sure exactly which slide this was,
- 2 but there's -- there are a whole bunch of slides where you
- 3 have the blue bars showing the carbonate pumping?
- 4 A. (Nodded head.)
- 5 Q. Did you look at alluvial pumping at all in those
- 6 analyses?
- 7 A. Well, in the location of these -- well, in these
- 8 areas where these wells are, there's not a lot or if any
- 9 alluvial pumping. The alluvial pumping any significant amount
- 10 is at the bedrock aimed to the northern Coyote Spring Valley
- 11 did not look at that, and I did not look at the alluvial --
- 12 pumping from the alluvial reservoir to Muddy River Springs
- area and its effect on these carbonate wells.
- 14 Q. Okay. And I would like to talk a little bit
- 15 about Big Muddy Spring. And we've heard the other experts
- 16 earlier in the week talk about how Big Muddy Springs seems to
- 17 respond differently or have a different hydrograph.
- Did you look at Big Muddy Springs hydrograph when
- 19 you were looking at the other spring discharges?
- 20 A. No, not in any detail. When this issue came up,
- 21 I looked at the -- you know, the trend the other day, but
- we've done no particular analysis to see what that spring is
- 23 doing and what it's responding to and what factors may
- 24 contribute to its record.

Page 971

- 1 A. To the extent someone really wants to understand
- it and be definitive about its source and how it responds to
- 3 pumping, wherever it occurs, I think for certain.
- 4 Our conceptual model is that even with these low
- 5 elevation springs with respect to Pederson Spring, we think
- 6 that they're connected to the same system, same carbonate
- 7 system, that Pederson Springs is, for example, and that any
- 8 diminished potential that's driving the spring discharge would
- 9 affect its discharge. But it'd be less -- it's less sensitive
- to these high elevation springs.
- 11 O. We've heard other experts express varying
- 12 opinions about whether there is a lag in hydrographs showing a
- 13 response to climate variability.
- Do you -- do either of you have an opinion about whether there is a lag, and if so, how it appears?
- 16 A. I didn't look, I didn't analyze any lag. The
- 17 only lags we looked at is how effects propagated to northern
- 18 Coyote Spring Valley and the impact or the attenuating effect
- of the Kane Springs Wash fault zone. With respect to
- 20 recharge, we did not look at time lags in the records.
- MS. DRICI: If you look at the 2005 extraordinary
- 22 precipitation event and you compare that to the hydrographs,
- you can see that the recharge from that -- from the local

24 mountains probably showed up in the hydrographs like probably

SE ROA 53358

Page 972

- 1 within a month. But as far as recharge from other areas
- 2 located farther, I can't tell you.
- I did a lot of theories about that. I think that
- 4 they come in pulses, like every year, you know, the
- 5 precipitation of the mountains infiltrates down and creates
- 6 like a recharge pulse and it moves down.
- 7 So this is probably a bunch of those coming down.
- 8 So people think like recharge from thousands of years ago, you
- 9 know, are coming down. So it's like a continuous and we
- 10 cannot really -- we can't see that from, identify them from
- 11 the record.
- 12 BY MS. BALDWIN:
- 13 Q. So water levels could be responding to all sorts
- 14 of climate variability going back tens, hundreds, thousands of
- 15 years?
- 16 A. It could be. But like in the analysis that I
- showed for the period since we've been pumping from the
- 18 carbonate aquifer, the effect of recharge during that time
- 19 period is much smaller than the effects of pumping.
- 20 It was probably like maximum 1.4 foot due --
- 21 changing the water level at EH-4 due to recharge changes
- versus four feet changed from like the early '90's to 2018 due
- to groundwater production to the carbonate aquifer.
- 24 Q. And that -- so that period, early 90's to 2018,

- 1 Q. All right. And you're aware of SNWA's
- 2 scientific, be it, geologic or geohydrological efforts that
- 3 resulted in the reports' conclusions?
- 4 A. Yes.
- 5 Q. And in between October 2018 and July 2019, did
- 6 SNWA conduct or contract to have conducted on its behalf any
- 7 geohydrological studies specific to boundary flows between
- 8 Kane Springs Valley and Coyote Springs Valley?
- 9 A. Not to my recollection, no.
- 10 Q. And SNWA didn't conduct or contract to have
- 11 conducted on its behalf any geohydrological studies in
- 12 northern Coyote Springs Valley?
- 13 A. No.
- MR. MORRISON: Okay. That's all I have. Thank
- 15 you.

19

- 16 HEARING OFFICER FAIRBANK: Lincoln County and
- 17 Vidler Water Company.
- 18 CROSS-EXAMINATION
 - BY MS. PETERSON:
- 20 Q. Good morning, panel. Karen Peterson here,
- 21 representing Lincoln County Water District and Vidler Water
- 22 Company.
- And, Mr. Burns, I just put in front of you a page
- 24 from Nevada State Engineer Exhibit 245, which is -- it's

Page 973

Page 975

- 1 that's only about 30 years?
- 2 A. Yeah.
- 3 Q. So the water levels could be responding to
- 4 something happening before that 30-year period?
- 5 A. Yeah, sure. In that recharge within the
- 6 residual, it's like the effects of all of it. I can't
- 7 separate it.
- 8 MS. BALDWIN: Okay. That's all. Thank you.
- 9 MS. DRICI: You're welcome.
- 10 HEARING OFFICER FAIRBANK: Next is the Moapa
- 11 Valley Water District.
- 12 CROSS-EXAMINATION
- BY MR. MORRISON:
- 14 Q. Morning, everybody. I'm Greg Morrison with Moapa
- 15 Valley Water District. I just wanted to follow up on a couple
- 16 questions regarding the efforts SNWA put into preparing its
- 17 Order 1303 report.
- So whoever would like to answer, feel free. I'll
- 19 direct these at Mr. Burns, but if there's someone better.
- So in your role as the water resources division
- 21 manager, did you oversee and/or coordinate SNWA's efforts in
- preparing the Order 1303 report?
- ANSWERS BY MR. BURNS:
- 24 A. Yes, I did.

- 1 page 36 of the SNWA June 27, 2013, Order 1169 report.
- 2 And do you have that in front of you, the
- 3 one-page document I gave you?
- 4 ANSWERS BY MR. BURNS:
- 5 A. Yes, ma'am.
- 6 Q. And at the top of the paragraph there, there is a
- 7 statement having to do with CSVM-4; do you see that?
- 8 A. Yes.
- 9 Q. And is it true that this report -- your report --
- 10 SNWA's report, sorry, lets everybody know that the transducer
- 11 in CSVM-4 has had a high failure rate due to the high water
- temperature in the well, so fluctuations of a foot or less
- should not be used to infer an absolute response.
- Do you see that?
- 15 A. I see that.
- 16 Q. And do you -- I'm going to show you the thick
- 17 document I gave you was State Engineer's Exhibit 115, which is
- 18 the water level data from that CSVM-4?
- 19 A. (Nodded head.)
- 20 Q. Do you have that?
- 21 A. Yes, ma'am.
- 22 Q. Okay. And if you could look at the second page,
- 23 it looks like the transducer was removed 10/14/2013; do you
- 24 see that?

Min-U-Script® Capitol Reporters 775-882-5322

(28) Pages 972 - 975

Page 976

- 1 A. Could you say the date again, please?
- **2** Q. 10/14/2013. It's on the second page.
- 3 A. Yes, I see that.
- 4 Q. All right. And that aquifer test, the 1169 test
- 5 was conducted between November 2010 and April 2013; is that
- 6 correct?
- 7 A. The test ended at the end of 2012, but MX-5
- 8 pumping continued into April of 2013.
- 9 Q. And the transducer was pulled after the end of
- all the pumping by about six months?
- 11 A. Are you talking from 10/14 to 5/6 -- what's your
- 12 reference again?
- 13 Q. I'm sorry. When did the MX-5 pumping end?
- 14 A. Oh, in April of 2013.
- 15 Q. Okay. So between April 2013 and when the
- transducer was pulled in 10 of 2013, we're still having the
- 17 suspect transducer or the error transducer taking those water
- 18 level measurements; is that correct?
- 19 A. Well, it looks to me -- yeah, there was a
- 20 failure. Failure could not connect the transducer. So for
- 21 the period -- I'm just looking at the measurements and there
- 22 is data.
- So it's likely that once it's failed, we've
- 24 installed a new transducer, but supplementing the transducer

- 1 A. No.
- 2 Q. And has anybody that you've heard testify earlier
- 3 this week indicated in any of their hydrographs that they've
- 4 accounted for this transducer error failure of a foot or so?
- 5 A. Not that I heard.
- 6 Q. All right. And the drawdowns that were -- or the
- 7 impacts, I guess, or the effects that everybody's been talking
- 8 about this week with regard to CSVM-4 are in that one-foot
- 9 range; aren't they?
- 10 A. Yes.
- 11 Q. All right. Directing your attention to Slide 11?
- **12** A. Okay.
- 13 Q. Was there an R-squared criteria that you were
- 14 using?
- 15 A. I'm not sure I understand your question.
- 16 Q. Was there any kind of target R-squared criteria
- that you were trying to get to?
- 18 A. Oh, for any -- for CSVM-4, the maximum.
- 19 Q. Which is?
- 20 A. Well, in this case, .82.
- 21 Q. All right. And I know you indicated in your
- 22 testimony that you thought maybe that was the maximum because
- of the Kane Spring Wash Fault, that there was lower
- 24 permeability; is that correct?

Page 977

Page 979

- 1 record are periodic measurements as well.
- 2 Q. Correct. But after 10/2013, it looks like
- 3 they're all sounder measurements; is that correct?
- 4 A. After -- well, I'm going the wrong --
- 5 Q. Yeah, you've got to go up?
- 6 A. Okay. All right. That makes more sense now.
- 7 Yes, they are E takes, yes.
- 8 Q. Okay. And has SNWA indicated in this page from
- 9 Nevada Power State Engineer Exhibit 245, what -- how long that
- transducer data is suspect for that CSVM-4?
- 11 A. It doesn't appear so.
- 12 Q. And did you take that transducer failure
- information into effect when you were analyzing your
- 14 hydrographs?
- 15 A. We use -- let me look at the hydrograph, just a
- sec. We have both reflected in the record, so there's a
- transducer and a periodic measurement.
- 18 Q. Right.
- 19 A. So --
- 20 Q. But there's no -- you know how sometimes you --
- 21 like you put on those hydrographs when the 1169 test was or
- there's a break because there's no data, that kind of thing.
- 23 You don't have anything in your hydrographs that explains this
- transducer area of a foot, is there?

- 1 A. Well, let me clarify, if you'll indulge me for
- 2 just a second.
- 3 Q. Just a second.
- 4 A. Okay. I'm sorry, as quick as possible. What I
- 5 was saying is that the effects that we see at CSVM-4
- 6 attenuated by the fabric of the Kane Springs fault structure
- 7 or some other lower permeability, relatively lower
- 8 permeability feature.
- 9 And we use this analysis to estimate what -- the
- 10 lag time that those attenuating features have on the response
- 11 measured at the well.
- 12 Q. And if there was an another new fault in that
- area, would your analysis still be the same with regard to the
- 14 attenuated effects?
- 15 A. Yeah, the fault -- I mean, what's there is there.
- 16 Q. (Nodded head.)
- 17 A. So whether we map two more faults, five more
- 18 faults, this would be the same response.
- 19 O. Okay.
- 20 A. You know, what's there is there, right.
- 21 Q. What -- is there a scientific reference or where
- 22 did you get this idea to do a regression analysis to determine
- 23 interconnectedness by comparing water levels between wells?
- 24 A. Well, if you remember at the start of our

Page 980

- 1 presentation, I walked through our general approach, and in
- 2 the first step in that approach was to look at these time
- 3 series data in a qualitative sense.
- 4 And when we review that information as a
- 5 professional hydrologist or geologists, we have a sense of
- 6 cause and effect relationship. And those cause and effect
- 7 relationships are what we test with this analysis.
- 8 And what we find, because of the high degree of
- 9 correlation, is that these wells all respond in the same way
- 10 as EH-4 does for the period of record and as does MX-4 for the
- 11 pumping period.
- 12 Q. Right. But -- I'm sorry, were you done?
- 13 A. I think so.
- 14 Q. Okay. But other than you, you and your team
- doing that, are there any -- are there any other scientists
- that agreed with this?
- I mean, for example, we looked at your reference
- that you have here on A-7 that's at the end of the section
- 19 with regard to your regression analysis, and we don't find --
- 20 we don't find any other, you know, like peer reviewed or any
- other scientific basis, I guess, or reference that uses
- 22 regression analysis comparing water levels?
- 23 A. Well, we may be talking two different things.
- 24 I'm trying to get to A-7. My apologies. I don't have A-7 --

- 1 principle?
- 2 MR. BURNS: Well, first, I think there's a
- 3 professional judgment. We're trained, as observers of data,
- 4 to understand what these responses are, what these -- what
- 5 factors would contribute to these responses.
 - And it's not difficult, you don't maybe need to
- 7 even be a hydrologist to see that these time series plots
- 8 behaved in a same way and in a linear fashion, as Ms. Drici
- 9 described, and that's what we tested with the analysis.
- 10 BY MS. PETERSON:
- 11 Q. Okay. So it's your professional judgment?
- 12 A. I think it's more than that. I think it's a
- 13 standard approach.
- 14 Q. But can you give me a site?
- 15 A. Well, not off the top of my head, but it's
- something professional hydrologists are trained to.
- MS. DRICI: Again, this reference has all kinds
- of examples in water resources.
- MS. PETERSON: Right. Which -- and we couldn't
- 20 find any that -- specifically in this application, that's what
- 21 I'm getting at.

22

- So let me move on, okay, because I don't have a
- lot of time. So looking at figure -- page 11 of your slides
- and page 12 of your slides where you did this analysis to

Page 981

Page 983

- 1 oh, this reference. So there's two things. The multilinear
- 2 regression analysis that Ms. Drici did and then there's this
- 3 simple linear regression analysis that I did. That one is
- 4 well chronicled in Dr. Mayer's testimony the other day.
- 5 Q. Right.
- 6 A. Perhaps you can answer for her, the other.
- 7 Q. Well, wait, do you mind -- well, go ahead. I'm
- 8 sorry. Go ahead.
- 9 MS. DRICI: Okay. Well, this reference is a USGS
- 10 reference describing statistical methods and it has basically
- every type of statistics you can apply to -- like it says
- here, water resources investigations, and it describes a
- 13 single linear regression, multiple linear regression and other
- 14 types of statistics. It has all kinds of examples, how you
- can relate, you know, to a time series.
- And the first thing when do you -- like he's
- 17 saying, is the quantitative analysis, if you look at two times
- series and they appear to be moving in parallel like these
- 19 hydrographs do, that's a strong indication that they are
- varying in a linear fashion.
- 21 Q. Right. But the concept that you can do a
- 22 regression analysis and compare water levels, and therefore,
- 23 conclude that there's some kind of connectivity between them,
- where -- who -- what scientific basis is there for that

- 1 CSVM-4 versus the MX-4 well, if your hydrographs are off by a
- 2 foot, are these -- your data is going to plot different on
- 3 these two graphs, charts; is that right?
- 4 ANSWERS BY MR. BURNS:
- 5 A. If they're off a foot? Well, if they're all off
- 6 a foot, I think the relationship would be the same if I
- 7 understand your question.
- 8 O. Right. But with the transducer --
- 9 A. Systematic error, I wouldn't expect the
- 10 correlation to change.
- 11 Q. Were you here for Dr. Mayer's linear regression
- testimony on Tuesday?
- 13 A. I was not here, but I viewed some of his
- 14 testimony.
- 15 Q. He said that his acceptable P value coefficient
- 16 was less than .05?
- 17 A. I did hear that.
- 18 Q. All right. And did you have an acceptable level
- 19 for your P value coefficient?
- 20 A. In fact, we did. I went -- we looked -- we
- didn't post it here on this chart, but there were .0000000
- something, so certainly below .05 threshold that he cited.
- 23 Q. But I'm going to go to -- I guess it's
- 24 Appendix A-4 and you've got your P values there for your

(30) Pages 980 - 983

DIVISION OF WATER RESOURCES Page 984 figures that Ms. Drici talked about? 1 ANSWERS BY MS. DRICI: 2 2 A. Yes. 3 3 HEARING OFFICER FAIRBANK: You can finish this 4 question and then we'll move on. 5 5 MS. PETERSON: Okay. Thank you. 6 6 7 BY MS. PETERSON: 7 Q. So I'm looking at your P values there in that 8 8 table. Do you have that figure A-1? 9 A. Yes. 10 10 11 Q. Okay. And Garnet Valley's the only low -- the 11 P value I see? 12 12 A. Well, the way I see it, all of them are below the 13 13 .05 threshold, except for Black Mountain area and the Muddy 14 14 15 15 River Springs area. 16 So for the Black Mountain area, it's 0.69, which 16 17 is larger than 0.05. But we already showed the results that 17 18 we think that Black Mountain area production wells probably 18 19 should not be within the Lower White River Flow System 19 20 boundary. 20 21 As for the Muddy River Springs area, I do not 21 just go by the statistical results. I have to use facts and 22 like what I know. Does anybody think that production from the 23 23 carbonate aquifer in the MRSA does not affect EH-4 water 24 24 Page 985 1 levels. So this value is a little bit higher than the 2 .05, but I still believe and I know that production in the 3 Muddy River Springs area does affect water levels in EH-4 4 because they're in the same basin. 5 MS. PETERSON: Thank you. Sorry. I'm out of 6

```
7
    time.
       MS. DRICI: Sorry. Bye.
 8
       HEARING OFFICER FAIRBANK: Okay. So we've
 9
    reached the noon hour and let's go ahead and reconvene at --
10
    let's go ahead and do five after 1:00, and we'll get back
11
    going after lunch. Thank you.
12
       (Lunch recess at 12:01 p.m.)

CARSON CITY
  I, MICHEL LOOMIS, a Certified Court Reporter, do
hereby certify;
   That on the 27th of September, 2019, in Carson
City, Nevada, I was present and took stenotype notes of the
hearing held before the Nevada Department of Conservation and
Natural Resources, Division of Water in the within entitled
matter, and thereafter transcribed the same into typewriting
as herein appears;
   That the foregoing transcript, consisting of
pages 864 through 985 hereof, is a full, true and correct
transcription of my stenotype notes of said hearing to the
best of my ability.
  Dated at Carson City, Nevada, this 28th day of
September, 2019.
   MICHEL LOOMIS, RPR
  NV CCR #228

- 4 HEARING OFFICER FAIRBANK: So we'll go ahead
- 5 and reconvene the hearing. And next up is the City of
- 6 North Las Vegas.
- ,
- 8 CROSS-EXAMINATION
- 9 BY MS. URE:
- 10 Q. Good afternoon. My name is Tracy Ure and I'm
- 11 representing the City of North Las Vegas. And I have a
- 12 few questions for you.
- In your presentation you had some values for
- 14 Garnet Springs Pumping, I believe they were on slide
- 15 28, and my question is where did you obtain the data
- 16 for these?
- 17 ANSWERS BY MR. BURNS:
- 18 A. These data were obtained from the NVWR website,
- 19 the pumping inventories.
- 20 Q. Okay. So, for the area between 1992 and 1995
- 21 for Garnet Valley, did you obtain those values from the
- 22 pumpage inventory as well?
- 23 A. Yes, ma'am.
- 24 Q. Okay. Are you aware of the facilities in

- 1 water levels at EH4 so, to the extent water levels
- 2 change effect EH-4, I would expect spring discharge to
- 3 also have a proportional decrease.
- 4 Q. Okay. Were you here when Mr. Waddell was
- 5 testifying?
- 6 A. I was not.
- 7 Q. Okay. Is it possible that there is flow from
- 8 Las Vegas Valley into Garnet Valley?
- 9 A. I don't believe so.
- 10 Q. Okay.
- 11 A. I'm sorry. I misunderstood. From Las Vegas
- 12 Valley into Garnet Valley?
- 13 Q. Correct.
- 14 A. It's possible but I guess I would caution on
- 15 that. I say that because there -- we found a new well.
- 16 We didn't find it. A new well was drilled in Las Vegas
- 17 Valley, just on the other -- it would be on the west
- 18 side of apex in Las Vegas Valley, carbonate well. And
- 19 the elevation of that well is higher than those wells
- 20 that we've measured in Garnet Valley. So that implies
- 21 there is a gradient. But then you have to figure out
- 22 from that where is water coming from. We had Las Vegas
- shear zone to the west of that well and, you know, two,
- 24 three kilometers of basin fill. So my question -- to

Page 992

Page 994

- 1 Garnet Valley in the 1980s and operating in the late
- 2 1980s to 1990s that were pumping in Garnet Valley?
- 3 A. I'm not wear.
- 4 Q. Okay. So then you are not aware by the mid
- 5 1990s, that there was approximately 1100-acre-feet of
- 6 certificated water rights in Garnet Valley?
- 7 A. No.
- 8 O. So, if this data was not or these data were not
- 9 included in your report, does that throw off your
- 10 regression analyses?
- 11 A. It would for the multilinear regression. But I
- 12 trust that this data is reliable.
- 13 Q. Okay. Has your -- or has the Garnet Valley
- 14 pumpage equilibrated and achieved a maximum capture at
- 15 this point in time?
- 16 A. It doesn't appear so.
- 17 Q. Okay. Would equilibrated pumping in Garnet
- 18 Valley achieve a one-to-one capture at some point?
- 19 A. Based on the correlation analysis that we did,
- 20 and given the framework around this area, and the sole
- 21 discharge part at Muddy River Springs area, I believe
- at some point in time. If you look at our figures you can see that this area, like other areas to the south
- 24 in Black Mountain areas of very highly correlated with

- 1 say -- I wouldn't say yes, but I would acknowledge
- 2 there is a gradient at that location.
- 3 Q. Okay.
- 4 A. At the boundary.
- 5 Q. So, assuming that there was a possibility that
- 6 there is some flow from Las Vegas Valley into Garnet
- 7 Valley, if there was capture of that flow, in part,
- 8 from a well in Garnet Valley, would that cause a
- 9 one-to-one capture from the Muddy River Springs area?
- 10 A. If that was part of the capture -- if that made
- 11 up part of the pumping from that well, then no, it
- wouldn't be one-for-one.
- 13 Q. Okay. Is it your position that the one-to-one
- 14 capture of the Muddy River Springs area is from any
- 15 pumping, anywhere, in the Lower White River Flow
- 16 System?
- 17 A. There's two -- I guess there's two things I
- 18 would say about that.
- 19 First the alluvial pumping. Certainly that
- 20 adds impacts, one-for-one impacts to the river. We
- 21 measured those of the those are the Muddy River flow
- 22 deficit depletion I mentioned. With respect to the
- 23 carbonate pumping, that's the only discharge in the
- 24 regional -- in this system, excepting for any amount of

SE ROA 53386

Page 995

- 1 outflow. So, over time, over a long time, as water
- 2 levels in EH-4 and carbonate system at the springs
- 3 decline, I would expect the proportional decline in the
- 4 spring flow.
- 5 Q. Okay. And so when you were talking about the
- 6 alluvium, it's the alluvium in that Muddy River Springs
- 7 area; is that correct?
- 8 A. Yes.
- 9 Q. Okay. And what are the main variables when you
- 10 are talking about this one -- I guess that go into this
- 11 one-to-one capture of spring flow? Like when you look
- at or when you opine that there is going to be a
- one-to-one capture of the spring flow from pumping in
- 14 the carbonate or in the Muddy River Springs area, what
- are some of the variables that you look at to assess
- 16 that one-to-one capture?
- 17 A. The first one is where is the water discharged.
- 18 Ultimately over time, a long period of time, I don't
- 19 know how long, but that is the water that would be
- 20 captured. At a point when capture, capture of storage
- 21 is complete.
- Now, it's possible that there is other water
- 23 that could be captured like outflow, could induce flow
- are a boundary outside the White River flow system that

- 1 ANSWERS BY MS. PELLEGRINO:
- 2 A. No.
- 3 Q. Just wanted to get set on the record.
- 4 To your awareness have the Southern Nevada
- 5 Water Authority and Center for Biological Diversity
- 6 ever coordinated?
- 7 A. No. No.
- 8 Q. Loud and clear.
- 9 I'm going to ask you about your criteria for
- 10 evaluation of some of the points in Order 1303.
- 11 Specifically, Order 1303, Section 6-2-C says we're
- trying to determine or offer input on the long-term
- quantity of groundwater that may be pumped from the
- 14 Lower White River Flow; does that sound right?
- 15 A. Yes.
- 16 Q. And would your say you ICS credits are a
- 17 constraint on the amount of water that can be pumped
- 18 out of the flow system?
- 19 A. I would say the capture of Muddy River flow is
- 20 a constraint. Because the decree appropriated the
- entire flow for Muddy River of which our ICS credits
- 22 are derived from.
- 23 Q. Understood. And what are the ICS credits used
- 24 for?

Page 996

Page 998

- 1 could also be captured.
- 2 Q. Okay. Does magnitude of pumping also play into
- 3 that?

9

- 4 A. Yes. Magnitude, duration, location. All have
- 5 some influence on how the drawdown cone propagates.
- 6 Q. Okay. Thank you.
- 7 HEARING OFFICER FAIRBANK: Center for
- 8 Biological Diversity.
- 10 CROSS-EXAMINATION
- 11 BY MR. DONNELLY:
- 12 Q. Thank you. Patrick Donnelly, Center For
- 13 Biological Diversity.
- Excuse me. I'm going to direct my first few
- 15 questions to Ms. Pellegrino. Given that you're a fact
- witness I will be asking you facts.
- I will refer to the Moapa dace, and the 3.2 CFS
- 18 level but only in reference to Southern Nevada Water
- 19 Authority's previous statements or interaction with
- 20 those entities.
- Just to start with to get on the record, did
- 22 the Southern Nevada Water Authority and the Center for
- 23 Biological Diversity coordinate in any substance
- 24 attached and prior to this hearing?

- 1 A. ICS is a program that was created by the Bureau
- 2 of Reclamation to allow water users essentially to
- 3 store water in Lake Mead year-to-year which was not
- 4 allowed under the operation guidelines before 2007.
- 5 So, water users take extraordinary measures to allow
- 6 additional water to flow into Lake Mead, and to get
- 7 credit for it.
- 8 It was a very large benefit to southern Nevada,
- 9 because it allowed us to take water that was on
- 10 tributaries like the Muddy and Virgin and instead of
- 11 having to construct very expensive pipeline to deliver
- 12 that water directly to Las Vegas, it allowed us to put
- 13 it into the Colorado River, account for it entering
- 14 Lake Mead and withdraw that water from our existing
- 15 facilities.
- 16 Q. And so the Southern Nevada Water Authority has
- 17 a substantial supply stored in Lake Mead right now from
- 18 ICS credits?
- 19 A. Yes. Roughly speaking we put about
- 20 30,000-acre-feet a year in, since the program started,
- 21 and to date we have not withdrawn that water.
- 22 Q. Is that supply intended for emergency use?
- 23 A. No.
- 24 Q. If it is flowing in an unimpaired condition, is

Min-U-Script® Capitol Reporters (3) Pages 995 - 998 775-882-5322

Page 999

- the Muddy River a reliable source of water for Lake
- Mead perhaps as compared to the Colorado River? 2
- MR. TAGGART: Objection; reliable and is vague. 3
- MR. DONNELLY: Withdrawn. 4
- BY MR. DONNELLY:
- Q. What is Southern Nevada Water Authority's 6
- interest in the Moapa dace?
- A. The Southern Nevada Water Authority I guess, as
- part of our operating regime, is to be a good steward
- of the environment where we are developing our water
- resources, because we cannot rely upon those resources
- in the long run if we are impacting endangered species. 12
- So, we've taken a myriad of actions, a lot of which the 13
- panel on Monday, much more qualified to talk about than
- me, to protect the Moapa dace, because of all of the 15
- water resources that we have in this area.
- Q. Would you say, in some ways, that the Moapa 17
- dace and the flow in the Muddy River are tied together?
- 19
- Q. Would you say then that in some ways that the
- fate of Moapa dace is tied to Las Vegas's drinking
- water supply?

water in Lake Mead?

A. No.

3 A. No.

Q. Thank you.

A. That's correct.

Dr. Burns.

Min-U-Script®

24 Q. Would you say that the fate of the Moapa dace

is, in some ways, tied to Las Vegas's ability to store

Q. Okay. In coming up with your assessment of the

long-term pumpage, were you focused your assessment on

A. As I mentioned today, we have a two-part answer of which Andrew and Ward are presented both sides of

that coin. Which is the amount of water that we think

can be developed in the long term without conflicting

is zero, assuming that those conflicts with senior

Moapa dace, and that's 4- to 6,000-acre-feet.

groundwater levels since 2016, correct?

water rights are mitigable. There is a finite amount

I'll have some more hydrologic questions for

Your data strongly suggests declining carbonate

with senior water rights by capturing Muddy River flow

that can be developed without adversely impacting the

Order 1303 6-2(c) question, of the sustainable

sustainable amount for the Moapa dace?

senior water rights and instream flows, or on the

- 1 despite increased precipitation levels during those
- times to some degree?
- 3 A. To some degree. To two of the four years.
- Q. Does this imply that current carbonate pumping
- is lowering groundwater levels?
- A. That's my observation.
- 7 Q. Based on figure 6-3, in your report, showing
- the relationship between storage and discharge capture,
- there appears to still be an ongoing decline in
- storage, correct? 10
- 11 ANSWERS BY MS. DRICI:
- 12 A. Accumulative storage is actually increasing.
- 13 So it's still capturing groundwater from storage.
- 14 Q. So, accumulative storage is increasing, yes,
- 15 thank you.
- 16 A. Yes.
- Q. Does that imply we are not in steady state yet?
- A. Yes, exactly.
- O. This may go back to Dr. Burns. Are you aware
- that yesterday USGS reported Warm Springs gage at 3.23
- CFS? 21
- ANSWERS BY MR. BURNS: 22
- A. I'm not aware of that. 23
- And just to clarify, for the record, I'm not a 24

Page 1000

1 Doctor Burns. I have a brother who's a Dr. Burns. I'm

Page 1002

- Mr. Burns.
- 3 Q. Mr. Burns. I apologize. Thank you for
- clarifying.
- At current pumping, is it likely the gage will
 - fall blow 3.2?
- 7 A. Yeah, I mean it looks that way. I think -- but
- I'm not certain of the time frame. And continued
- monitoring will let us know.
- Q. As far as an order of magnitude 110 or hundred 10
- years, can you get that close to an estimate?
- 12 A. Well, we're very close as it stands. When I
- looked in my report last value I had was about 3.4 as
- the max around this year. The data you're talking 14
- about is probably provisional, so I would hold on that 15
- number. I'd like it see what it says once its final; 16
- but, I think, based on what we see, there's two things. 17
- One, I see water levels continuing to decline. 18
- I don't see a prospect of a new -- of another 2005 19
- precipitation recharge event. That was the highest in 20
- the period of record. And that's the recharge that's 21
- sort of reset these trends at a higher level but those 22
- trends, to me, have continued to decline. And now 23
- we're near the 3.2 CFS. And it would not surprise me,

24 Q. And this is despite declining -- this is

Capitol Reporters

(4) Pages 999 - 1002

Page 1006

Page 1003

- within the next ten years or less, that we reached that 1
- value. 2
- O. Thank you. 3
- Referring to slide 25, the chart relating 4
- discharge and Warm Spring well, Warm Spring gage flows.
- As I understand it this chart, the data in this chart,
- are the basis for the determination of the 4- to
- 6,000-acre-foot recommendation. Is that correct, in 8
- part? 9
- ANSWERS BY MS. DRICI: 10
- 11 A. Yes.
- Q. Thank you. 12
- A. You're welcome. 13
- Q. I'm not sure who's going to answer this
- question. Given that we know that 3.2 is what the MOA
- sets forth for the Warm Springs dace, is 3.2 sufficient
- to meet senior water rights on the river? 17
- ANSWERS BY MR. BURNS: 18
- 19 A. No.

depletions.

- A. So let me elaborate.
- O. Sure. Thank you.
- A. I say no because, you know, I just went through
- some testimony and some demonstration of the impacts

The reduced discharge from the springs also has

least during the test. When we saw Pederson Springs

discernible in the Muddy River record. But we know

a contribution to the depletion, albeit much smaller

than the alluvial pumping. But, it's measurable, at

And Warm Springs about ten percent.

Those are small in terms of magnitude, not

Q. If we have any hope of reaching, excuse me.

If we have any hope of fulfilling senior water

rights on the river, am I hearing you saying it's going

pumping, did your data or analysis account for upward

flow from the carbonate into the alluvial subsequent to

A. That's part of our conceptual model. Maybe

Q. I'm speaking of the conceptual model that led

to this chart, ultimately, and the calculations of how

decline almost 60 percent or so.

that it's not going to the river itself.

to be necessary to stay above 3.2?

explain where you are speaking of.

Q. With regard to the question of alluvial

- 1 much carbonate water can come out while maintaining
- these levels at Warm Spring West, did that factor in,
- do these numbers factor in the loss of carbonate water
- to alluvial flow, upward flow?
- ANSWERS BY MS. DRICI:
- A. Yes, it does. In the measurements of the total
- 7 area.
- Q. Okay. Thank you. 8
- How would we know if steady state was reached
- at 4- to 6,000-acre-feet of pumping. What would be the 10
- indication that steady state has been reached? 11
- ANSWERS BY MR. BURNS: 12
- A. Well, one indication is to do what we've done 13
- the last 20 years is to monitor how these effects have
- 15 propagate under different pumping regimes. And to
- recess steady state, we would expect to see water 16
- levels flatten about, you know, there might be some 17
- variation, I suppose, due to recharge events over a
- year or two. But we'd expect those to flatten out. 19
- We'd expect the same for discharge of the springs. And
- we use, as I said and others have said, the Pederson 21
- Spring complex and Warm Springs West gage, as 22
- indicators, for conditions in the Springs area. 23
- 24 Q. How many years of flat data would we want to be

- that alluvial pumping has had on the river flows, these 1 certain that steady state has been reached, given that
 - a miscalculation could result in really catastrophic
 - impacts for endangered species among other resources?
 - 4 A. I'm not -- we would always want a period of
 - record that's longer.
 - 6 O. Sure.
 - 7 A. And I'm not sure I can answer your question. I
 - mean I wouldn't be the -- I'm not the management entity
 - who would make that decision. But as a professional, I
 - would think if we have, let's take now, for example, 10
 - last three years or four years. I think in the next 11
 - 12 two years, we'll have a pretty good indication of what
 - this system is really doing. Because there is --
 - apparently, there is still apparently some debate on 14
 - whether the system in steady state now or if it's not. 15
 - What I observe is declining water levels in some of the 16
 - these indicator wells. 17
 - And two years more of data or three or ten, 18
 - however much we need. But I think the more you have, 19
 - the better indication you will have of where you are at 20
 - with respect to steady state. And so if the State 21
 - Engineer decides to put a limit on the amount of total 22
 - overall pumping somewhere between 4- and 23
 - 6,000-acre-feet, we would then want several years of

Page 1004

Min-U-Script®

A. Yes.

alluvial pumping?

Capitol Reporters 775-882-5322

(5) Pages 1003 - 1006

Page 1007

- 1 data to determine if that was effective?
- 2 A. I think so.
- 3 Q. I believe I'm at 14 minutes. I have more
- 4 questions, but I'll come back.
- 5 HEARING OFFICER FAIRBANK: You have 18, 17, 16
- 6 seconds.
- 7 Georgia Pacific/Republic.
- 8
- 9 CROSS-EXAMINATION
- 10 BY MS. HARRISON:
- 11 Q. Good afternoon, panel. Sylvia Harrison for
- 12 George Pacific and Republic Environmental Technologies.
- 13 I guess I just want to pick up where CBD left off and
- 14 talk about the interaction between the alluvial and the
- 15 carbonate aquifer. I believe Mr. Burns, that you said
- 16 your conceptual model assumed there would be some
- 17 recharge from the carbonate aquifer into the alluvium;
- 18 is that correct?
- 19 ANSWERS BY MR. BURNS:
- 20 A. Yes. Maybe to clarify or to simplify, I
- 21 believe the source of water in that alluvial reservoir
- 22 is from the carbonate system.
- 23 Q. Do you have any direct evidence of that
- 24 conclusion?

- 1 would it be discrete area, where there may be the
 - 2 equivalent of underground springs, for example?
 - 3 A. It could be both.
 - 4 Q. What would be the mechanism for defuse flow
 - 5 from the carbonate into the alluvial aquifer?
 - 6 A. Well, if you have, let's say, a fault that runs
 - 7 along the boundary, you can have water that comes up
 - 8 along that fault and into the alluvial reservoir, for
 - 9 example.
 - 10 Q. But that would be a structural feature,
 - 11 correct?
 - 12 A. A fault is a structural feature.
 - 13 Q. Not necessarily just because there is a contact
 - 14 between the carbonate and the basin fill doesn't
 - 15 necessarily mean that there is water flowing from the
 - 16 basin fill to the -- I mean from the carbonate aquifer
 - 17 to the basin fill, correct?
 - 18 A. Could you repeat that?
 - 19 Q. If there is simply a contact between the
 - 20 carbonate and the basin fill, would you assume that
 - 21 there is necessarily assume defuse flow from the
 - 22 carbonate into the basin fill?
 - 23 A. Well, I mean --
 - 24 Q. Just to stratographic contact?

Page 1008

Page 1010

- 1 A. One is that I don't see that there is a lot of
- 2 recharge in that small basin that would contribute to
- 3 different source of water to that reservoir.
- 4 Q. What about a different source to the Muddy
- 5 Springs? Have you taken that into consideration?
- 6 A. Well, yeah. I think -- I guess what I'm trying
- 7 to say is that conceptually we have -- we can have some
- 8 defuse flow from the carbonate system into this
- 9 reservoir. We also have some discrete springs like
- 10 Pederson Springs, for example, directly from the
- 11 carbonate system that flow out into the ground. And I
- 12 suppose can contribute to the storage in that
- 13 reservoir. But I sort of view it all as the same
- 14 source of water from the carbonate system.
- 15 Q. Okay. But you don't have any temperature data,
- 16 or isotope data or anything like geochemical data that
- would demonstrate conclusively that water from the
- 18 carbonate system was being introduced into the aquifer
- 19 at least at this point in time?
- 20 A. Not in this report but that data is available.
- 21 I think it's widely recognized the in scientific
- 22 community that the source of water in the alluvial
- 23 system there is the carbonate aquifer.
- 24 Q. And you suggested that would be diffuse flow or

- 1 A. Well, maybe this will help. Another way to
- 2 look at it is the tension-metric surface of the
- 3 carbonate aquifer is higher than the elevation of the
- 4 basin fill, right? So there is however -- whatever
- 5 opportunities there are, whether it's through maybe a
- 6 cemented pipe in essence right into the basin fill or
- 7 whether it's through a contact, like you suggest, there
- 8 are different mechanisms by which that water can get
- 9 into that reservoir.
- 10 Q. But there is, at this point in time, no
- 11 quantification of that amount or where it actually
- 12 occurs within the lower Lower White River Flow; is that
- 13 correct?
- 14 A. I suppose you can quantify it by some of the
- 15 spring flow measurements.
- 16 Q. At the Muddy Springs you mean?
- 17 A. That could be one. And there's gaining reaches
- 18 along those small streams before they go to the river.
- 19 The main stem of the river. Those can be measured and
- 20 those gaining streams are in -- that source of water to
- 21 those streams are to the alluvial system. So, I guess
- 22 what I'm saying there is multiple sources that feed
- 23 these streams.
- 24 Q. Okay.

Min-U-Script® Capitol Reporters (6) Pages 1007 - 1010 775-882-5322

Page 1011

- 1 A. I'm not sure how else I can --
- 2 Q. Okay.
- 3 I want to pick up on a question that
- 4 Ms. Peterson asked you about the potential for doing a
- 5 pump test to evaluate the effects of Garnet Valley
- 6 pumping. On EH-4 or the MRSA. And you mentioned that
- 7 just before we broke that a significant stress would be
- 8 needed
- 9 Can you give me an idea of the values and
- 10 duration that would be necessary to make an effective
- 11 pump test or design an effective pump test with Garnet
- 12 Valley?
- 13 A. Well, first let me say we have established a
- 14 connection between Garnet Valley, and EH-4. We can see
- 15 that on the hydrographs, we can see that in our
- 16 regression analysis, or correlation analysis is really
- 17 what we're doing.
- 18 With respect to a pumping test, over some
- 19 period of time, we observe what happened with the Order
- 20 1169 test; and it's my opinion that you need something
- 21 on that order, some stress of that magnitude in
- 22 duration to have a discernible effect that separates it
- 23 from the other stresses that are ongoing.
- Does that make sense?

- 1 that may effect it.
- 2 Q. And that could make the well elevation appear
- 3 to be higher or yeah, than it actually is?
- 4 A. Perhaps.
- 5 Q. And would that effect the actual hydraulic
- 6 gradients?
- 7 A. From which point?
- 8 Q. From the wellhead to, for example, pumping
- 9 source or receptor?
- 10 A. It could. We think the pumping source would be
- 11 the controlling mechanism that creates the gradient if
- 12 it's close by.
- 13 Q. Okay. So, if -- in order to -- let's just take
- 14 GV-1, for an example. In order to conduct a pump test
- that overcomes that five-foot difference in gradient,
- does that suggest that you might need an even a larger
- 17 stress than was illustrated by the 1169 test, to see
- any kind of effect of the EH-4?
- 19 A. I think I'd have to see.
- 20 Q. So you can't say for sure that just even a pump
- 21 test of magnitude of 1169 would be a sufficient
- 22 stressor to detect the effect of pumping in Garnet
- 23 Valley?
- 24 A. I think a stress like 3000-acre-feet in Garnet

Page 1012

Page 1014

- 1 Q. Yes. I mean sort of.
- 2 The -- what is the elevation or the water level
- 3 elevation at EH-4?
- 4 A. It's 18 -- let me. Standby, I'll -- while I
- 5 look, I'll just mention that they are variable. EH-4
- 6 most recently is a little under 1812.
- 7 Q. And what's the elevation of GV-1? And these
- 8 are -- I was looking at figure 3.6, if that helps?
- 9 A. What page?
- 10 Q. It's figure 3 -- 3-6.
- 11 A. For this -- on this figure it's 1808.
- 12 O. So five-foot difference?
- 13 A. Yes.
- 14 Q. And there are nearby wells in Garnet Valley.
- 15 Do you know whether the water elevation in any of those
- wells is affected by the water quality? In other
- words, is there a significant salinity or are you aware
- 18 whether there is significant salinity in any of those
- wells that may effect the water level?
- 20 A. I'm not wear of any significant salinity in
- 21 those wells that would effect the water level.
- 22 Q. If there were, would it effect the water level
- 23 or could it?
- 24 A. I suppose there could be a density contrast

- 1 Valley, I think we would see that signal throughout.
- 2 Q. And does that consider the possibility of other
- 3 sources of flow? In other words, if there is inflow
- 4 from other sources, that make up some the volume that's
- 5 being pump amended, would that suggest you could get
- 6 and incorrect -- you could draw incorrect conclusions
- 7 or that the pumping test would not be as accurate as it
- 8 would otherwise be?
- 9 A. Well, for something like that, I would think we
- 10 would design a test with as many assurities that we
- 11 have those factors monitored. And by that I mean, to
- 12 the extent you would induce groundwater flow to the
- well from another area, you would probably want to put
- a monitor well between that boundary and the pumping
- 15 well. So, you could see how that -- you can see what's
- 16 going on there.
- 17 Q. So potentially, without more data or
- 18 information, you are not confident that you could
- 19 design a reliable pump test at Garnet Valley just based
- 20 upon her conceptual model at this point in time?
- 21 A. I haven't thought -- I haven't thought about
- 22 that.
- 23 Q. Does it follow that it's a bit speculative to
- 24 assume that any pumping at Garnet Valley is going to

Min-U-Script®

Capitol Reporters 775-882-5322

(7) Pages 1011 - 1014

Page 1018

Page 1015

- 1 effect the MRSA area?
- 2 Q. I didn't catch the last part?
- 3 A. I said isn't -- would you agree that it's still
- 4 a bit speculative to assume that any pumping at Garnet
- 5 Valley is going to effect the MRSA? The Muddy Spring
- 6 area?
- 7 A. Well, I think what multi letter regression
- 8 analysis shows is that we have monitored -- we have
- 9 measured those affects at EH-4.
- 10 Q. Going backwards from the well, okay?
- 11 A. Yeah.
- 12 Q. Just this is kind of an open-ended question.
- Can you look at figure 5 point or 5 dash --
- 14 five- what's five -- I don't have my glasses on.
- 15 Figure 5-4? Sorry.
- 16 A. I could not hear.
- 17 Q. I'm sorry, 5-4.
- 18 A. Okay. I'm there.
- 19 Q. This isn't any fancy statistical analysis or
- 20 anything. But would you agree that there is at least a
- 21 strong visual correlation between the alluvial pumping

1 Q. And if you were to remove the alluvial pumping

would you see a similar decline or deficit?

7 Q. Yes. So I'm saying if you -- if you simply

4 A. You would see like you see in 2018, that the

and simply look at the amount of carbonate pumping,

deficit would be going down. You see in 2018, there is

removed the alluvial pumping from that, and you look

deficit and the amount of carbonated pumping, would you

simply at the relationship between the Muddy River

A. Well, you'd have to -- I'm not sure how -- this

A. Okay. Certainly is, no doubt about that word.

A. But not to this magnitude. You would have to

would see more water in the river. You're not

recompute this deficit because you would be -- you

pumping, we would see something similar I would think.

- and the Muddy River deficit that's illustrated in that
- 23 figure?

6

17

18

19 20

22

24 A. I would agree with that.

alluvial pumping?

is a hypothetical.

A. Right? And --

Q. Yeah, it is.

see such a strong correlation?

16 Q. That's why I said it was open-ended.

capturing it from the basin fill.

If we pretend that there is no alluvial

- 1 Q. Okay. You are assuming that the -- that the
 - 2 carbonates would somehow -- the amount of carbonate on
 - 3 the blue bars would be larger, is that what you are
 - 4 saying?
 - 5 A. I'm not sure what we're assuming at this point.
 - 6 Q. Okay.
 - 7 A. Honestly.
 - 8 HEARING OFFICER FAIRBANK: All right.
 - 9 Ms. Harrison, you're out of time.
- 10 MS. HARRISON: Thank you.
- 11 HEARING OFFICER FAIRBANK: You can go ahead and
- 12 move on.
- Nevada Cogeneration.
- 1415 CROSS-EXAMINATION
- 16 BY MR. FLANGAS:
- 17 Q. Good afternoon. My name is Alex Flangas. Just
- 18 a couple of questions. And I really mean that.
- 19 A. I appreciate that.
- 20 Q. I'm focussed on your rebuttal report for a
- 21 moment, which is SNWA Exhibit 9. At Page 16 and 17,
- 22 there is a statement that is made, that was summarized
- a couple times here today by Ms. Drici that the current
- 24 production wells in the Black Mountains area are

Page 1016

- 1 probably not within the Lower White River System, and
- 2 the boundaries should probably be adjusted. So, in
- 3 some ways I would focus this to Ms. Drici.
- 4 But my first question is the report was signed
- 5 by Mr. Burns and Ms. Drici. Did you both reach that
- 6 same conclusion?
- 7 MR. TAGGART: Objection, that mischaracterizes
- 8 the evidence. And witness's name is Drici.
- 9 MR. FLANGAS: I'm sorry.
- MR. TAGGART: You mischaracterized the
- 11 testimony.
- 12 HEARING OFFICER FAIRBANK: The objection --
- 13 just so I can make it clear so that those that are
- 14 attending or viewing the hearing remotely, so the
- 15 objection is that it mischaracterizes the testimony.
- MR. TAGGART: Yes. The question was that the
- 17 testimony was that the boundaries should change. I
- 18 don't think that's what the testimony was.
- 19 BY MR. FLANGAS:
- 20 Q. Let me ask Ms. Drici.
- Ms. Drici, earlier today didn't you say the
- 22 boundary was not accurate?
- ANSWERS BY MS. DRICI:
- 24 A. I said it may not be. The analysis I performed

r ago roro

Min-U-Script®

Q. Okay.

Capitol Reporters 775-882-5322

(8) Pages 1015 - 1018

Page 1019

- 1 indicates that the production from the Black Mountain
- 2 area, according to the analysis, it appears not to
- 3 effect water levels at EH-4.
- 4 To make that determination that production
- 5 should not be in the Lower White River Flow System, I
- 6 think we would need some additional lines of evidence.
- 7 Q. Well, the exact statement you made, and just so
- 8 we're clear, the exact statement you made in the
- 9 rebuttal report, I'm reading the last -- this is the
- 10 last paragraph on Page 16, first paragraph, first
- 11 portion of the paragraph on Page 17 of the rebuttal
- 12 report.
- "This indicates that while well BM-DL2 is
- 14 undoubtedly within the carbonate aquifer of the LWRFS.
- 15 The current production wells, figure 2-8, are probably
- 16 not."
- Now, that means "are probably not" within the
- 18 carbon aquifer of the LWRFS; isn't that correct?
- 19 Isn't that what that means?
- 20 ANSWERS BY MS. DRICI:
- 21 A. Yes, it is. But, the word probably has some
- 22 meaning there. It means I'm not sure. The analysis
- 23 indicates that it may not be in there. But I cannot
- say, you know, with hundred percent certainty that it

- 1 process?
- 2 A. Yeah, it was basically Warda and myself and Jim
- 3 Rogers
- 4 Q. Ms. Drici, in reaching part of that conclusion
- 5 I believe you talked about the P values earlier that
- 6 were shown on Exhibit A-1 to that report. I think its
- 7 in appendix A-1.
- 8 ANSWERS BY MS. DRICI:
- 9 A. Yes.
- 10 Q. Was that some of what led you to that
- 11 conclusion?
- 12 A. Yes. The P value is larger than the 0.05. But
- 13 you can also look at the graph. You know, as compared
- 14 to the others, it appears that in figure A-3, despite
- 15 the production from those production wells, it appears
- that if it causes any water level decline at EH-4, it's
- 17 small to none. But I cannot say with certainty,
- 18 because there is a certain level of uncertainty in all
- 19 the numbers that we have.
- 20 Q. Okay. And just so that we're clear for the
- 21 State Engineer, the production wells we're talking
- about are EB-2, -5 and -6, correct?
- 23 A. Yeah, I believe so.
- 24 Q. Those are the wells that are operated by Nevada

Page 1020

Page 1022

- 1 is true. I mean to demonstrate things like this, you
- 2 would need to look at it from different angles. So,
- 3 this analysis indicates that maybe they are not in
- 4 there, it's probably other things that we need to look
- 5 at to confirm it, and honestly, I did not. The only
- 6 thing I looked at was like the completion of the wells.
- 7 Like the observation well, BMDL-2, was quite a bit
- 8 deeper than those production wells, a little bit south
- 9 of there. Does that have -- is that the explanation?
- 10 I'm not sure. Maybe there is a structure in between
- 11 there, somehow. I did not look into it in any more
- 12 detail than this.
- 13 Q. So back it my first question, Mr. Burns, did
- 14 you concur in that analysis.
- 15 ANSWERS BY MR. BURNS:
- 16 A. Yes. Yes. We did. Yeah, this is our
- 17 analysis.
- 18 Q. And were there any other hydrologists that
- 19 reviewed this report besides you and Ms. Drici that
- 20 came to that same conclusion?
- 21 A. Well, my staff reviewed this. We didn't go
- 22 through an external review process, no.
- 23 Q. I don't mean outside the area. I'm talking
- 24 about your staff of hydrologists that worked on this

- 1 Cogeneration Associates?
- 2 A. Yeah, just south of BMDL-2. The observation
- 3 well.
- 4 Q. But the production wells that you referred to
- 5 that you say are not -- those are the production wells
- 6 we're referring to, those are Nevada Cogeneration
- 7 Associates' wells?
- 8 A. I believe so. I mean I lumped all the
- 9 production from the portion of the Black Mountain area.
- 10 That has been included in the Lower White River Flow
- 11 System by the definition of the boundary there by the
- 12 State Engineer.
- 13 Q. Okay. Mr. Burns, do you know that we're
- 14 talking about EB-5 and -6 and EB-2?
- 15 ANSWERS BY MR. BURNS:
- 16 A. I believe so. But, I'd have to maybe --
- 17 A. (Ms. Drici) It's over there in the appendix.
- 18 Q. I'm just trying to clarify when we refer to the
- 19 production wells we're not referring to any other
- production wells in the Black Mountains area?A. (Mr. Burns) Well, let's take a look.
- 22 A. (Ms. Drici) I think be in Appendix A.
- 23 A. (Mr. Burns) Here we go.
- It looks like the pumping that was EVM-4.

Min-U-Script® Capitol Reporters (9) Pages 1019 - 1022 775-882-5322

Page 1023

- 1 Here.
- 2 A. (Ms. Drici) I think in the first. So, Black
- 3 Mountain area. We have these three right here. Yeah.
- 4 EVM. What's this?
- 5 A. (Mr. Burns) 62 and -3.
- 6 Q. Thank you.
- 7 HEARING OFFICER FAIRBANK: Can you say that
- 8 again, a little more loudly. Difficult to hear what
- 9 you said.
- 10 A. (Mr. Burns) EBM-6, EBP-2, EGB-3. Is that
- 11 right? I'm sorry, I got it wrong. EBM-5.
- 12 A. (Ms. Drici) here, we have an indication of
- which ones are the pumping wells. These three. So
- 14 EBM-4. Sorry. Getting old, can't see.
- 15 EBM-5, EBM-6, and EBP-2.
- 16 Q. Thank you.
- 17 A. (Ms. Drici) you're welcome.
- 18 Q. You didn't work with anyone from Nevada Co
- 19 General. This was an independent analysis; isn't that
- 20 correct?
- 21 ANSWERS BY MR. BURNS:
- 22 A. That's correct.
- 23 Q. There was entirely your analysis, Southern
- 24 Nevada Water Authority; isn't that correct?

- 1 Q. And what areas would those be?
- 2 A. The only area I'm aware of is to the north, a
- 3 portion of Coyote Springs Valley where Bedrock has some
- 4 wells. I think pumping those won't impact the
- 5 carbonate system.
- 6 Q. Okay. Thank you.
- 7 HEARING OFFICER FAIRBANK: Nevada Energy.
- 8 Nevada Energy.
- 9
- 10 CROSS-EXAMINATION
- 11 BY MS. CAVIGLIA:
- 12 Q. So we started looking at some of your analyses,
- and tried to look at how they work together. Starting
- on slide 17, this is for Ms. Drici, please.
- And Justina Cavaglia on behalf of NV Energy?
- So, when we look at slide 17, we focused on
- 17 2015 and it looks like there was a 1.7-foot drawdown
- 18 forum and EH-4 from pumping that year. Is that about
- 19 accurate?
- 20 ANSWERS BY MS. DRICI:
- 21 A. Which figure?
- 22 Q. Oh, I'm sorry. On the lower one. So the lower
- one where California Wash is pumping, it looks like
- 24 there is about a 1.7-foot drawdown from 2015?

Page 1024

Page 1026

- 1 A. That's correct.
- 2 Q. You don't have any contractual relationship as
- 3 far as working on this, with any other engineers or any
- 4 outside consultants working with Nevada Cogen; is that
- 5 correct?
- 6 A. That's correct.
- 7 MR. FLANGAS: I have no further questions.
- 8 Thank you.
- 9 HEARING OFFICER FAIRBANK: Muddy Valley
- 10 Irrigation Company.
- MR. KING: No questions.
- 12 HEARING OFFICER FAIRBANK: Seeing no questions.
- 13 Bedrock?
- 14
- 15 RECROSS-EXAMINATION
- 16 BY MS. URE:
- 17 Q. Hello again. So I'm Tracy Ure representing
- 18 Bedrock. And I just have a few quick questions for
- **19** you.
- 20 Do you believe that it is possible to pump from
- 21 an alluvium aquifer within the proposed Lower Whites
- 22 River Flow System boundary without causing a one-to-one
- 23 impact on the Muddy River?
- 24 A. In certain areas.

- 1 A. Yeah, approximately.
- 2 Q. Okay. And it looks like on Page 28, there is
- 3 probably about 400 acre-feet of pumping that year,
- 4 based on the information that you've provided?
- 5 A. Okay.
- 6 Q. Now, looking at Page 16, looking at the effects
- 7 of EH-4 on discharge at Moapa gage, with this level
- 8 1.57. Yeah that's it. And it looks like if you
- 9 compare the two if you multiply the 1.57 by the 1.7,
- 10 you get roughly .267 CFS at the Warm Springs West gage,
- 11 if we do the math correctly. Is that correct, roughly?
- MR. TAGGART: Objection as to clarity. I don't
- 13 think the question's clear.
- 14 HEARING OFFICER FAIRBANK: The question, I
- 15 guess is do you understand the question that is being
- 16 asked?
- MS. DRICI: No, I don't.
- 18 BY MR. CAVIGLIA:
- 19 Q. Okay. So, we'll go back it 17.
- So you would agree that there is a 1.7-foot
- 21 decline?
- 22 ANSWERS BY MS. DRICI:
- 23 A. Yes, approximately.
- 24 Q. -- vertically?

Min-U-Script® Capitol Reporters 775-882-5322

(10) Pages 1023 - 1026

Page 1027

- 1 Q. Okay. So when we use that number based upon
- 2 your curve on Page 16 with your trend line, so, a
- 3 1.7-foot drop times by the 1.57 slope would
- 4 approximately be about a .267 CFS in decline if we used
- 5 the numbers from that, that you used in this graph?
- 6 A. Okay. I can't calculate in my head but I trust
- 7 you. You used a calculator?
- 8 Q. We did.
- 9 A. Okay.
- 10 Q. We used a calculator.
- So looking at that and then looking at the
- 12 total contribution to the Warm Springs decline and
- 13 looking at Page 22 or slide 22, it looks like with the
- 14 ratios that are in there, which is a .78 on average,
- and that's the ratios from Warm Springs West flow to
- 16 total Muddy Springs discharge.
- 17 A. Okay.
- 18 Q. When we look at that if you apply that ratio to
- 19 .267 CFS?
- 20 A. Okay.
- 21 Q. You get 3.42 CFS in discharge from California
- 22 Wash or from --
- So you get a total discharge, or so the total
- 24 Muddy Springs recharge discharge for that figure would

- 1 answer it, fine. But I have no idea what this question
- 2 is.
- 3 HEARING OFFICER FAIRBANK: I believe the
- 4 witness understands the question, but I --
- 5 MS. DRICI: So far.
- 6 HEARING OFFICER FAIRBANK: But I observe --
- 7 your objection is duly noted.
- 8 ANSWERS BY MS. DRICI:
- 9 A. Can you say that again?
- 10 Of the 1.7 --
- 11 Q. So back on Page 17 it looks like there is --
- 12 according to your numbers in your multiple linear
- 13 regression model, there is a 1.7-foot reduction from
- the 2015 pumping in EH-4.
- 15 A. Okay.
- 16 Q. If we take that 1.7-foot reduction, and we
- apply it to the trend line that you've provided on Page
- 18 16, our math shows that that would -- result in a 0.267
- 19 CFS?
- 20 A. Yes.
- 21 Q. Reduction?
- 22 A. That's correct.
- 23 Q. Okay. And then looking at Page 22 or we'll do
- 24 24. And we're looking at the ratio 0.76 from Warm

Page 1028

Page 1030

- 1 be three point, sorry looking back at our math. 3.42
- 2 CFS. Would that be approximate, correct?
- 3 MR. TAGGART: Objection, again, not clear what
- 4 the question is. Whether it's a statement or a
- 5 question.
- 6 HEARING OFFICER FAIRBANK: I agree. I was
- 7 having a difficult time following the question as well.
- 8 Ms. Caviglia, please restate the question.
- 9 BY MS. CAVIGLIA:
- 10 Q. So if we compare on Page 17 to 16 with the
- 11 1.7-foot decline, and we use your numbers, and there is
- 12 -- would you agree that that would -- if we used your
- 13 numbers it would be a .267 CFS decline. Decrease in
- 14 what Warm Springs West if we compare the two charts,
- 15 for the same.
- 16 A. The correlation between the Spring and EH-4?
- 17 Q. Yes.
- **18** A. -- the one with the correlation. 17 is it.
- 19 That one.
- Okay. Just taking 1.7. I have to use a
- 21 calculator.
- MR. TAGGART: Again, we're going to object
- 23 because I have no idea what the question is. If the
- witness understands the question, she might want to

- 1 Springs West to Muddy River Spring area. Okay. And if
- 2 you apply that ratio to .267 CFS?
- 3 A. Okay.
- 4 Q. We get approximately 3.42 CFS of Muddy River
- 5 reduction.
- 6 A. Yeah, I get that about 2.5. But close enough.
- 7 Q. Okay. So that would be equivalent to
- 8 2450-acre-feet of Muddy River reduction; is that
- 9 correct?
- 10 A. Conversion 2.5 CFS to acre-feet. Yeah.
- 11 Q. Okay. So, according to your analysis,
- 12 400-acre-feet of pumping in 2015 in California Wash has
- 13 caused 2400-acre-feet of depletion in total Muddy
- 14 Spring River discharge in that year only, is that
- 15 possible in reality?
- 16 A. Well, the only way I have to tell you whether
- 17 it's possible or not, is the analysis I did.
- MS. CAVIGLIA: No further questions.
- 19 HEARING OFFICER FAIRBANK: At this time I'll go
- 20 ahead and open up questions to the State Engineer and
- 21 Water Resources, Division of Water Resources staff.
- 22 EXAMINATION
- BY MS. COOPER:
- 24 Q. Hi. Christy Cooper for the record.

Min-U-Script® Capitol Reporters (11) Pages 1027 - 1030 775-882-5322

Page 1031

- 1 Could you go to slide 35, please. And maybe
- 2 you said this, and I missed it, but, for some
- 3 clarification.
- 4 Where are you getting your values for, your
- 5 Muddy River diversions?
- 6 Is that like a table, was it table B-1.
- 7 ANSWERS BY MR. BURNS:
- 8 A. Yeah.
- 9 Q. C-3?
- 10 A. B-1. Surface water diversions above the Moapa
- 11 -- Muddy River Moapa gage in the Muddy River Springs
- 12 area.
- 13 Q. Okay. So, to follow up, just so I understand,
- 14 if its B-1, and say in 2017 cumulative between Nevada
- 15 Energy diversions and the Moapa Valley Water District
- 16 diversions was 126. Is that why the line is flat, are
- 17 you saying none, or how is that?
- 18 A. It may be typographical. Because it looks --
- 19 maybe the line might be on top of a little sliver of
- 20 blue. If I think I understand what you are saying.
- But, there should be blue in 2017 on this chart.
- 22 Q. Okay. Yeah, it's small. And then subsequently
- after that like in 2018, when it went up to 802, that's
- 24 why you see it opening up a bit more?

- 1 A. Yes.
- 2 Q. What transmissivity value did you use in your
- 3 MLR analysis?
- 4 A. The MLR does not require any transmissivity
- 5 analysis.
- 6 Q. Okay.
- 7 A. It's just a tool to break down a response to
- 8 several stressors. And because the carbonate aquifer
- 9 behaves like a confined which means the linear
- 10 behaviors you can just like take different stressors,
- 11 calculate their effects and then add them up, and you
- 12 get the composite response. In this case we're doing
- 13 that but in reverse. So we start from the EH-4 water
- 14 levels time series rears and we break it down into
- 15 responses from different stresses.
- 16 Q. Okay. And table 6-1, let me see what page that
- was in there. It was where you came up with all the
- 18 ratio numbers. Thank you.
- 19 Is there a reason that you only went through
- 20 2012 in the analysis?
- 21 A. Yes. The reason was that those were the only
- 22 years for which we had estimates of ET. Because ET is
- 23 a loss above the gage. And it needs to be added back
- 24 into the reading of the Moapa gage, along with the

Page 1032

Page 1034

- 1 A. Correct.
- 2 Q. Okay. Just because I was trying to count on
- 3 the Y axis and the secondary. If there was some kind
- 4 of -- I couldn't really follow which one that you were
- 5 saying was in the presentation if I were to --
- 6 A. At this scale, 15,000-acre-feet, that that
- 7 126,000, I'm sorry, 126-acre-feet is hard to see.
- 8 Q. Okay. I did have another question. Thank you
- 9 for clarifying that one.
- Specific to the basin fill monitor wells in
- 11 Coyote Spring Valley, have you seen the decline that
- 12 you've observed from -- in the carbonate wells from
- 13 2016 to present?
- 14 A. There is -- I haven't looked recently. I
- 15 remember Rick Waddell, yesterday, brought up CSV-3, is
- my recollection, and thought he saw a decline or some
- 17 influence, is my recollection. I did not look at those
- 18 wells, so, to observe this decline.
- 19 Q. Okay. So you are not sure if they are actually
- 20 going down?
- 21 A. I'm not prepared to say. I'd have to look.
- 22 Q. Okay.
- And Ms. Drici?
- 24 ANSWERS BY MS. DRICI:

- 1 diversions, and the carbonate -- I mean the alluvial
- 2 production upstream to recompose the total water volume
- 3 that's coming up below the springs area. Because we
- 4 don't have any other way to measure how much water
- 5 total is coming into the MRSA discharge area except
- 6 from the reading at the Moapa gage on the river. And
- 7 like I said before, under predictable conditions, it
- 8 was easier because you didn't have any of these losses
- 9 except for ET. So if you took the January measurement
- when ET is low negligible, then the total discharge to
- 11 the MRSA area would be equal to the measurements at the
- 12 Moapa gage. Does that make sense?
- 13 Q. Uh-hum. So, maybe hypothetically, if you were
- 14 to assume like an average ET or something similar, that
- 15 has been since 2012, do you think that if you did the
- 16 calculation with the pumpage from 2013 to 2018, would
- 17 your ratio change?
- 18 A. I think the ratio stays the same as long as you
- 19 know you have flow at Warm Springs West. It's --
- 20 because there is a linear relationship between that
- 21 spring discharge and the total discharge. It's the
- 22 slope of that line. Unfortunately, you know like I
- said, I had to estimate the total discharge.
- So, if you plot, if you plot those values on

Min-U-Script® Capitol Reporters (12) Pages 1031 - 1034 775-882-5322

Page 1035

- the X axis, one on the Y axis you do see a linear trend
- but the scatter is significant that you cannot figure 2
- out what that slope is exactly. That's why I went back
- to the measurements made by Eakin. And used that ratio
- as an approximation. Because that's the cleanest data
- point that we have along that line.
- MS. COOPER: That's all. Thank you. That's
- all for me. Maybe. 8
- 9
- **EXAMINATION** 10
- BY MR. BENEDICT: 11
- O. Jon Benedict for the record. 12
- I'd like to go to the slide 10, please, from 13
- your presentation. 14
- 15 So if we back up to CSVM-4, there was some
- discussion about the quality of those data with respect 16
- to the transducer. 17
- I just want to make sure I understand what 18
- those data are and how they were used, if possible. I 19
- know that on this plot of CSVM-4, I think the blue dots
- are manual measurements and the green lines are
- transducer? 22
- ANSWERS BY MR. BURNS: 23
- 24 A. That's correct.

- 1 know?
- 2 A. Off the top of my head, generally all of our
- wells that we monitor have are equipped with
- transducers. Now, I should say when we set the
- transducer, we know set depth, we make a manual
- measurement at that time. And from that point on, we
- 7 can account for a drift in the transducer and we can
- account for any stretch in the cable, adjust that
- record to those manual measurements, which are good to
- about a hundredth of a foot. 10
- 11 With respect to our wells, I don't have a count
- for you, but, it's our practice to install transducers 12
- 13 in all of them.
- O. But can you use the manual measurements to
- correct any drift or error in those? 15
- A. If it needs it. 16
- O. Okay. 17
- A. They are really used almost as a calibration in
- some respects. You have a manual measurement but
- calibrated E tape, and that is -- so we can compare 20
- that measurement with what the transducer is reading. 21
- 22 And if we find that it's maybe the cable slipped, maybe
- it's stretched when it's new, those are instances which 23
- aren't frequent but those are instances, where you

Page 1036

Page 1038

- 1 Q. So in the correlations and various analyses
- that were done, which were used? Were the quota
- fusion. Could you describe which data were used and
- how?
- A. For the -- yes, so for correlation analysis, 5
- both were used. So for a given month you will have a
- mean daily value. You will have maybe a periodic
- measurement as well. And those are averaged. So value
- for that month. And these are correlated with either
- in our report, EH-4, or MX-4.
- O. Do you have a sense of which are likely to be
- more accurate or less accurate, based on those issues
- that have been described? 13
- A. I believe the periodic measurement would be
- more accurate. But I see really that they plot --
- better put on my spectacles. They plot pretty much on 16
- top of each other. So I wouldn't expect that one would 17
- -- I think they'd be approximately the same. 18
- Q. Do -- and this is another question I don't have 19
- an answer to and maybe you can help me with because I 20
- haven't looked at all the data recently. But were all 21
- the wells employing transducers or were there some that 22
- were only water level measurements? What was of the
- distribution of those data that were collected? Do you

- might correct that continuous record. To get it back
- on the observed, what we call the observed periodic
- measurement.
- Q. Okay. Thank you.
- And another question, then on the actual data 5
- for CSVM-4. The response in this hydrograph has been
- suggested to be attenuated, and maybe to have lags in
- it based on some of the work that's been done here.
- And I wonder if you would provide an opinion on -- if
- that tells us anything about the recharge and/or the
- pumping in connection with respect to the fact that 11
- recharge may be coming from somewhere else rather than
- where the pumping comes from, and yet what I think I'm 13 hearing you saying based on the statistics is that the 14
- recharge lag and the lag in the pumping are similar. 15
- Is that wrong, or is that --16
- A. I think they are similar because when we look 17
- at, for example, regression analysis for that well, 18
- which is on the next slide, we see that CSCM-4 or EH-4. 19
- EH-4, you know, represents the recharge in that record 20
- that represents pumping in that area or elsewhere as we 21
- find out now. So to the extent that that well is 22
- correlated with the other well, we find that 23
- connection.

Min-U-Script® Capitol Reporters 775-882-5322

(13) Pages 1035 - 1038

Page 1039

- When we have a correlation factor of maybe .85, 1
- I'm sure. I'd have to calculate but this is R Squared, 2
- but it's significant. 3
- And I guess maybe, you asked about the lag. 4
- Q. I was just curious because if the lags are
- similar between recharging and pumping, it suggests
- that those sources are coming from a similar vector, I
- guess, if you will, potentially. Maybe that's
- simplifying things too much. I'm trying to get some
- sense out of what that attenuation might be telling us.
- A. Well, because we don't know the exact location
- of the recharge source, the closest is probably the 12
- Delamar Mountains to the north. 13
- But, with respect to the pumping part, we did 14
- 15 the same analysis, and correlated with MX-4, compared
- those two variables CSVM-4 to MX-4 and we found lesser 16
- 17 correlation but still significant. Here it's in
- R squared of .78. So the square root of that would be 18
- our so correlation coefficient. And that's still good, 19
- and significant I would say. 20
- Of course, that's applying a three -- let's 21
- see, our lag here was three months. 22
- Q. Okay. Fair enough. 23
- Let's see, I'd like to go to slide, I'd say 24

- conservative, or maybe overestimate drawdown. Either
- way, I don't know. But I'm trying to kind of reconcile
- this concept between not being at steady state
- therefore water levels would continue to go down with a
- certain amount of pumping and correlationships that
- show predictive water levels that remain stable with a
- constant amount of pumpage.
- A. I think what this particular slide is telling
- us, is that these particular, the production in this in
- the MRSA would be causing this level of decline, and if 10
- 11 you keep pumping at this level, it could be stabilizing
- 12 what with respect to this production.
- But, to look at the whole, the effects of all 13
- the other basins, then, you have to look at the next I 14
- 15 think it's the next slide where we put everything
- together. And it doesn't look like it's stabilizing, 16
- still going down. In slide 20. 17
- No, I'm sorry. Page 19. Slight -- okay. When 18
- you put all of them together, their combined effects is 19
- making the water level at EH-4, causing it to go down. 20
- And if you look at 2017, 2018, you know, you might see, 21 oh, maybe it's stabilizing or going up. But, you 22
- cannot base that, you know, equilibrium, just like on a 23
- year or two. You have to go, I would just use like

Page 1040

Page 1042

- maybe slide 19 is a good one. 1
- So we had some discussion about reaching 2
- equilibrium or steady state. And separate from looking
- at these correlations, I'm trying to piece these two
- things together. I note it is that in a lot of these 5
- graphs where pumpage is uniform and doesn't change over 6
- a period of time, the water levels as well don't show a 7
- change, suggests -- and maybe this is common sense, but
- that relationship which is empirical is really set up
- so that it's time independent. So in other words, 10
- basically you are describing I think a correlationship 11
- which is almost like steady state.
- Correct me if I'm wrong. But the way I kind of 13
- envision this, at least I look at years from 1999, for
- example, 2005 wherein the pumping based on this graph 15
- is very similar, and the water levels remain pretty 16
- much the same. 17
- Would you agree with that? At least on this 18
- plot? 19
- ANSWERS BY MS. DRICI: 20
- A. Yeah on this plot. Yeah. 21
- Q. So I just wonder how that fits with the concept 22
- that equilibrium isn't recently reached. And whether
- that suggests that is these results are either

- longer term or longer periods to figure it out. 1
- Like in here, I'm not looking at, you know, 2
- daily or, you know, earlier we were saying Oh, did you
- know that Warm Springs West went down to 3.2 yesterday.
- You have to look at it in bigger terms of time for
- quite a while before you can say it has stabilized.
- 7 A. (Mr. Burns) And I might add, if that's okay.
- That this is a single point EH-4 in the system, so
- whereas it might look like it's declining or it's
- stable here, we observe elsewhere in the system that 10
- it's not. Like Garnet Valley, for example, some of the 11
- 12 other locations we talked about. When you look at
- figure 19, I'm sorry, page 19, you can see that the 13
- production in this area, the Muddy River Spring area 14
- actually declined -- I mentioned this earlier -- about 15
- 850 acre-feet or so. And so we see a response here at 16
- EH-4 of some higher value than 2017. 17
- So I wouldn't -- I'd caution to use a single 18
- for whether or not the flow system is in equilibrium. 20

point in a system of 1100 square miles as the indicator

- We need to look at the body of evidence, the body of 21
- the data that explains other areas and what's happening 22
- 23

19

24 Q. Okay. Thank you.

(14) Pages 1039 - 1042 Min-U-Script® Capitol Reporters 775-882-5322

Page 1043

Another question about I guess maybe this is aGarnet Valley question.

3 It's been suggested there may be -- there could

- 4 be some other source of capture, and that was one that
- 5 was pointed to, and in thinking about the results of
- 6 the 1169 test would, you had mentioned, well, if
- 7 another test were to be done down there, you'd want to
- 8 have monitoring wells that were between that pumping
- 9 well, and a given boundary so that you could see that.
- 10 Would the Garnet Valley well represent such a
- 11 monitoring well for the 1169 test?
- Would you expect to see it drawdown in Garnet
- 13 Valley well where it would show you something about
- 14 whether there was a boundary nearby you could capture
- 15 water from?
- 16 ANSWERS FROM MR. BURNS:
- 17 A. If I'm following your question, I don't know if
- 18 -- if that was the production well or a monitor well.
- 19 Q. If it was a monitoring well. I guess what I'm
- 20 thinking of is a lot of times when you've got that a
- 21 monitoring site close to boundary condition you can
- 22 induce flow from, the water levels tends to be muted or
- 23 unless, for example, you got a well next to a river,
- 24 you pump from an area away from that, that water level

- 1 rather than Muddy River Springs discharge. And first
- 2 off, what we see based on these correlations is this
- 3 connection between these areas and the springs. But
- 4 there is some that think you can also capture a large
- 5 percentage of this groundwater flow, underflow let's
- 6 say or flow to somewhere outside the basin.
- 7 And those are thoughts. I think what is owed
- 8 to you, is an explanation for where that water is
- 9 coming from, and where is it going to, through which
- 10 rocks is this water flowing, to what point is it
- 11 discharging, is there a commitment on that water if
- 12 it's leaving the basin. And I didn't see those
- 13 discussions in any of the stakeholder reports. For
- 14 those folks that have offered this concept of capturing
- 15 outflow as opposed to Muddy River Springs flow, that's
- 16 the extent of conversation -- the extent of the
- analysis as far as I can tell, just a postulate that
- 18 it's there, and their wells could capture it. I think
- 19 you would need to have some at least initially, an
- explanation for where that water's coming from, like I said, through which is rocks if it's going along what
- 22 gradient to where, which point, where is it
- 23 discharging. And then we can really have a sense of
- 24 how to design the test to see.

Page 1044

Page 1046

- 1 will be relatively fixed because you're drawing water
- 2 from the river. Similarly, if you had a boundary
- 3 condition where you could induce flow, and may be
- 4 Garnet Valley one would be an example. If you had a
- 5 boundary condition somewhere down there that you could
- 6 induce flow, maybe the water levels might not be as
- 7 large there, compared to other places.
- 8 So I'm just wondering, if there is anything in
- 9 the data that suggests whether or not there are other
- 10 boundary conditions that exist out there, that you
- 11 could derive flow from based on data we currently
- 12 have?
- 13 A. I'm not sure I know the answer.
- 14 Q. Okay.
- 15 A. I don't think so. But if we're designing a
- 16 test, and we had a boundary that we're -- we thought
- was a boundary, maybe the idea is you put a well on the
- 18 other side of that boundary, and then that would be
- 19 more definitive on whether or not -- it would be more
- 20 definitive about it's character, on whether or not it's
- 21 a permeable or impermeable. When it comes to
- 22 groundwater flow in these areas, I'm not sure if that
- 23 was some of the commentary. There's been some
- 24 discussion about being able to capture groundwater flow

- 1 If you are going to capture that outflow.
- 2 What we've shown today, what we've
- 3 demonstrated, is there is a hydraulic connection
- 4 throughout this area, strong hydraulic connection. And
- 5 we feel if you'll pump in those areas, it will impact
- 6 the conditions underlying the springs, and therefore,
- 7 have a proportional effect on the discharge there.
- 8 MR. BENEDICT: Okay. Thank you.
- 9
- 10 EXAMINATION
- 11 BY MR. SULLIVAN:
- 12 Q. Earlier, Mr. Burns, you mentioned an estimate
- 13 that SNWA had done several years ago about 10,000
- 14 acre-feet bypassing the Muddy River Springs area.
- 15 Based on the description that you just gave, do you
- 16 think that -- what is your feeling about that estimate
- 17 now?
- 18 ANSWERS BY MR. BURNS:
- 19 A. Let me make sure we're clear on what the
- 20 estimate was.
- 21 It's in, as I recall, Appendix D of our report,
- 22 issued in 2011 for that hearing.
- That was a boundary or a Darcy flux
- calculation, and I don't have the report here.

Min-U-Script® Capitol Reporters 775-882-5322

Page 1050

Page 1047

- 1 With my recollection, just south of the spring,
- 2 the spring area in California Wash, and what we're
- 3 trying to look at is what is the flux in the basin fill
- 4 there. So the properties we used for the
- 5 transmissivity, for example, were derived from what we
- 6 could find for the Muddy Creek formation.
- 7 Sadly, I guess, none of the those estimates
- 8 were in that area. So, I'd say the estimate is pretty
- 9 uncertain.

year.

discharge.

- But there was a flux to calculate or there was
- 11 calculation to determine or estimate the flux through
- 12 that material at that location.
- With respect to capturing that water, I think
- 14 Nevada Power Company back years ago in the early '90s,
- 15 maybe late '80s, tried to -- they had a well field they
- 16 put in south of their I guess it'd be south and east of
- 17 the springs, in the Muddy Creek formation, trying to
- 18 capture some of that water.
- And my recollection was that water levels
- 20 declined over a period of years, and then water quality
- 21 decreased and they abandoned well field. So I don't
- 22 think production from that area promising.
- Elsewhere, in the basin we find because of this
- 24 connection, I find it would be hard to construct a well

in carbonate system in these locations we've looked at

that would not have some impact to the Garnet system

and water levels in the spring area. And as we've

So, I can't think of a well location that that

shown there is that proportional effect to the

outflow or a large percentage of it.

Q. I have a question for Mr. Burns.

Q. Okay. Thank you.

EXAMINATION

- 1 with those questions. But I do think demonstrating the
- 2 impact of depleted flows at the Muddy Valley Irrigation
- 3 Company is important. One of the -- I can't remember
- 4 which letter, but, I believe it was -- actually I can
- 5 tell you. One of the letters about capture of Muddy
- 6 River flows, and spring flows. I think it relates to
- 7 that to that.
- 8 C. It's actually C. C as I paraphrased here
- 9 in conclusions Groundwater Production and Capture of
- 10 Muddy River Springs and River Flows.
- The costs, impacts in terms of cost don't
- 12 relate to this. But the analysis, that illustrates the
- 13 depletion on this river as result of capture of Muddy
- 14 River and spring flows I think is pertinent.
- 15 Q. So I guess just as a quick follow up, so based
- 16 upon that, is that an inference that SNWA may be
- 17 amenable to financial mitigation of conflicts if SNWA
- 18 decreed Muddy River surface water rights are depleted.
- MR. TAGGART: I'm going to object. I thought
- this case was about facts and not about management.
- 21 HEARING OFFICER FAIRBANK: You presented the
- 22 evidence, Mr. Taggart.
- MR. TAGGART: You specifically told us this was
- 24 not a conflicts hearing. And we submitted that

Page 1048

- evidence before you made that clear.
- 2 HEARING OFFICER FAIRBANK: The evidence was
- 3 presented today, Mr. Taggart. Thank you.
- 4 ANSWER BY MS. PELLEGRINO:
- 5 A. I'll answer the question.
- 6 We are one shareholder in the Muddy Valley
- 7 Irrigation Company and we cannot speak on behalf of
- 8 what is appropriate mitigation to the Muddy Valley
- 9 Irrigation Company.
- There are many options which we think would be
- 11 amenable to us, the least favorable of which would be
- 12 financial mitigation. Because this is one of the most
- valuable resources to Nevada and Southern Nevada,
- 14 considering that our water supply is there for seven
- 15 out of every ten Nevadans and about three-quarters of
- 16 the economic output of our state.
- 17 HEARING OFFICER FAIRBANK: Thank you.
- 19 EXAMINATION

18

775-882-5322

- 20 BY ACTING STATE ENGINEER WILSON:
- 21 Q. Tim Wilson for the record.
- I think my staff asked most of the questions as
- 23 usual, which is great. But I do want some
- clarification on the Black Mountains area.

Min-U-Script® Capitol Reporters

(16) Pages 1047 - 1050

Page 1051

- One of your recommendations is that you felt 1
- the Nevada State Engineer's recommendation on the Lower 2
- White River Flow System boundary was appropriate. Is 3
- that still your testimony today?
- ANSWER BY MR. BURNS:
- A. It is. I think it is appropriate. But, what
- I'm also saying or what we're also saying is that it's,
- as Colby mentioned this morning, if there is prospects
- of moving production from one part of an adjacent basin
- to the boundary of Lower White River Flow System, and 10
- particularly this boundary which I think a little 11
- uncertain, we think those applications to change those 12
- points of diversion in that regard should be 13
- scrutinized. And by that I mean some sort of analysis,
- or more definition about the boundary itself and what 15
- the impacts of new points of diversion would be. I 16
- 17 suspect that's part of your process anyway.
- But we think that circumstances like that are 18
- concerning to us. And I think it should be to others 19
- in the basin, in the flow system. 20
- THE STATE ENGINEER: Thank you. I appreciate 21
- that answer. 22
- I think I'm going to let the rest of my 23
- questions go, let you off the hook.

- about alluvial pumping. And I wanted to ask about the
- red line here, which shows the MR flow deficit. And
- when I look at that line from 1993 through roughly
- 2003, it appears to me that that red line tracks the
- total production in the Muddy River Springs area wells.
- But then after Coyote Spring Valley pumping was
- initiated 2005, and then on through 2018, the deficit
- continues to track the non Coyote Spring Valley
- pumping. 9
- Would you agree? 10
- 11 ANSWERS BY MR. BURNS:
- 12 A. I'm sorry. Last tracking part I didn't catch.
- 13 Q. Red line is the Muddy River flow deficit?
- 14 A. Got that.
- 15 Q. Okay from 1993 to 2003. That line roughly
- tracks the same way that the total red line alluvial 16
- 17 and carbonate pumping does. Then in 2005, Coyote
- Springs production, Coyote Springs Valley production
- begins in the carbonate. But that line to me, the red 19
- line looks like it continues to track the non Coyote 20
- Springs Valley production. Would you agree? 21
- A. I agree. 22
- 23 Q. Doesn't this suggest that groundwater pumping
- of Coyote Springs Valley is not tied to pumping from

Page 1052

Page 1054

- 1 MR. BURNS: Thank you. It's Friday.
- HEARING OFFICER FAIRBANK: Okay. Let's go 2
- ahead an take a ten-minute break. We'll get back on
- the record at about five minutes to 3:00
- So, lets take a ten-minute break we can get 5
- back on the record. 6
- Thank you. 7
- (Recess.) 8
- HEARING OFFICER FAIRBANK: Okay. So let's go 9
- ahead and get back on the record. 10
- Mr. Herrema, you asked how much time you would 11 have. 12
- Six minutes. So we're going to go ahead and 13
- open it up for the participants for additional
- questions. Participants will have six minutes. 15
- 16
- **RECROSS-EXAMINATION** 17
- BY MR. HERREMA: 18
- O. Brad Herrema on behalf if CSI, for the record. 19
- And Ms. Harrison was asking some questions 20
- about slide 37. Would it be possible to bring that 21
- back up? That is figure 54, from the Water Authority's 22
- Exhibit Number 7. Thank you. 23
- So Ms. Harrison was asking some questions, 24

- the Muddy River Springs area, to the Muddy River
- Springs area?
- 3 A. No. When I presented this slide earlier
- mentioned when you create a stacked bar chart like
- this, you have to pick an order. I picked it in four
- areas that are closest in proximity and that sequence.
- But really, this would infer that. But our MLR 7
- analysis indicates that Coyote Spring pumping is indeed
- cause and affects at least EH-f which in turn had a 9
- proportional effect as I said to the spring discharge. 10
- And that effect was measured during and after 11 12 the test.
- Q. Okay.
- A. Pederson Springs and Warm Springs West.
- Q. If Coyote Springs Valley pumping affected the
- flow deficit, wouldn't you have expected it to peak in
- 2012 and 2013? Wasn't there up to 5000 acre-feet per 17
- year of pumping in Coyote Springs Valley at that time? 18
- A. Right. I mean, yeah, if you reached steady
- state in that quick a time, you would expect that. 20
- But, Warda presented earlier, we have not captured all 21 of that, the equivalent volume of discharge from the 22
- springs or ET in that area. 23
- 24 Q. Okay. So then doesn't that mean that there is

Min-U-Script®

Capitol Reporters 775-882-5322

(17) Pages 1051 - 1054

Page 1055

- 1 not a one-to-one relationship between pumping and
- 2 Coyote Springs Valley and spring flow into the Muddy
- 3 River?
- 4 A. It doesn't mean that. It means in the future,
- 5 so when we talk about one-to-one from the carbonate
- 6 system, we're talking about a long time from now. What
- 7 we've measured are influences at Pederson and Warm
- 8 Springs.
- 9 Q. Okay. But is there then a time lag between the
- 10 pumping and the impacts at the springs?
- 11 A. There is a response lag.
- 12 Q. Do you have an estimate of how long that is?
- 13 A. Well, it's how quickly the signal from a
- 14 pumping center affects EH-4. Well, affects the
- 15 groundwater conditions at the spring locations.
- 16 Q. Do have you an estimate of what that time is?
- 17 A. Well, Warda mention earlier --
- MR. TAGGART: Object as to vagueness. In
- 19 carbonate or alluvial, lag of carbonate or alluvial or
- 20 a lag in any pumping.
- 21 HEARING OFFICER FAIRBANK: Your objection was
- 22 objection as to vagueness, as between carbonate and
- 23 alluvial or the combination there.
- 24 BY MR. Herrema:

- 1 A. When does it start?
- 2 Q. Yes.
- 3 A. I can tell you when I think it ends, which is
- 4 about 2016. But it starts -- recovery starts when the
- 5 well stops, the well stops pumping, recovery starts.
- 6 Q. And you think that this hydrograph shows the
- 7 recovery starts at that red line?
- 8 MR. TAGGART: Objection to red line. Which
- 9 one
- 10 BY MR. HERREMA:
- 11 Q. There is a red dashed line on EH-4 hydrograph,
- somewhere right after 2013.
- 13 A. I think the recovery started, let's see.
- 14 What's complicated about 2013 record recovery started
- when the seasonal decline starts. And so the seasonal
- 16 decline after, you know, the small -- here. You can
- 17 see that the magnitude of that decline is less than in
- 18 other years, so I think what's happened here, is that
- 19 the actual recovery has muted the seasonal decline.
- 20 And then on the way up to the seasonal high, you can
- 21 see it keeps going and it resumes this larger amplitude
- in subsequent years to about 2016, first quarter is
- 23 what I estimate.
- MR. HERREMA: Thank you.

Page 1056

Page 1058

- 1 Q. Carbonate.
- 2 ANSWERS BY MS. DRICI:
- 3 A. Okay. Well, what I can tell you is from the
- 4 Order 1169 pumping test --
- 5 Q. I'm sorry, ma'am. I don't have a lot of time.
- 6 Do you have estimate of what the time is, in
- 7 either days or months or years?
- 8 A. The response gets everywhere really quickly,
- 9 within a day, but not to the full extent of the effect
- 10 of pumping. That's what takes time. At first when you
- 11 are producing from a well, your mostly picking up water
- 12 from storage, and it takes a while for the cone of
- 13 depression to extend and grow, and get deeper, and
- 14 start capturing water from the springs, for example.
- 15 Q. So you are saying there's immediate impact but
- 16 not a one-to-one impact right away?
- 17 A. Yeah. The one-to-one then --
- 18 Q. Can I ask a question then, about if there is
- 19 this time lag if we look at -- or it's not yet a
- 20 one-to-one relationship if we look at slide 8, the
- 21 hydrograph of the EH-4 well.
- 22 When do you think the recovery starts on this
- 23 particular hydrograph?
- ANSWERS BY MR. BURNS:

- 1 HEARING OFFICER FAIRBANK: Fish and Wildlife
- 2 Service?
- 3 Seeing no questions.
- 4 National Park Service.
- 5 MS. GLASGOW: No questions.
- 6 HEARING OFFICER FAIRBANK: Seeing no questions.
- 7 Moapa Band? Seeing no questions.
- 8 Moapa Valley Water?
- 9 No questions.
- 10 Lincoln County/Vidler?
- 11 MS. PETERSON: Yes, sir.
- 12
- 13 RECROSS-EXAMINATION
- 14 BY MS. PETERSON:
- 15 Q. Thank you.
- 16 Karen Petersen again. This question is I
- 17 believe for the Ms. Pellegrino and/or Mr. Burns, since
- 18 both of you have talked about what your recommendation
- 19 is to the State Engineer, your request the State
- 20 Engineer. And I had heard Ms. Pellegrino state this
- morning that there should be continuing management of adjacent basins, and a jointly managed boundary, and
- 23 that that should be in the next phase.
- And then I heard -- or on the slides we just

Min-U-Script® Capitol Reporters (18) Pages 1055 - 1058 775-882-5322

Page 1059

- 1 talk about applications on the adjoining basins should
- 2 be scrutinized. So i want to know what exactly SNWA's
- 3 position exactly, what the proposal is, because I don't
- 4 understand it.
- 5 ANSWERS BY MS. PELLEGRINO:
- 6 A. We're trying to be very respectful of the fact
- 7 that there is at least two phases of this process. The
- 8 first, which is technical fact-gathering phase,
- 9 specific to these four questions. And the next phase
- 10 which we're told is where all of the water management
- 11 decisions will be discussed.
- The question of what the boundary should be,
- 13 the point I was trying to make is that from a
- 14 hydrologic connectivity standpoint, and the range of
- 15 effects and the degree of connectedness is very
- 16 technical in nature. But making a recommendation on
- 17 the boundary implicates a lot of water management
- 18 decisions and to put a finer point on it. Sort of the
- 19 rules for how water can move around within the jointly
- 20 managed basin, have a very real and immediate impact to
- 21 what that boundary should be.
- Because there are areas where there is a degree
- 23 of connectivity. And if water is allowed to move
- 24 freely through the basin, you could potentially

- 1 impacts within the basin.
- 2 So I guess my point was, prudent management
- 3 would suggest that the boundary doesn't matter as much
- 4 as the way the five basin area and the adjacent basins
- 5 are managed.
- 6 Q. And would one the adjacent basins you're
- 7 talking about be Kane?
- 8 A. Yes.
- 9 Black Mountains.
- 10 Q. And I don't know exactly who this question goes
- 11 to. But, it relates to page 4.2 of Exhibit 7, SNWA
- 12 Exhibit 7.
- And you're talking about precipitation data
- 14 from Winograd, 1998, on that page. Is that you,
- 15 Mr. Burns?
- 16 ANSWERS BY MR. BURNS:
- 17 A. I'll take it. Would you point me to that.
- 18 Q. Yes, it's page 4-2. And then like the second
- 19 paragraph, annual precipitation data, do you see that?
 - 20 A. Yes.
- 21 Q. Okay. The next line down says winter
- 22 precipitation in the Lower White River flow System is
- 23 understood be dominant source of local recharge,
- 24 Winograd. Do see all that?

Page 1060

Page 1062

- 1 accelerate impacts by taking it from somewhere that's
- 2 less connected and putting it somewhere that's more
- 3 connected.
- So, what we were saying is, for now, we've
- 5 presented the hydrologic evidence, and we think the
- 6 boundaries should stay the same pending the water
- 7 management decisions that will come in the next phase,
- 8 presumably about how water moves among and throughout
- 9 this jointly managed area.
- 10 Q. Is the jointly managed area, just the Lower
- 11 White River Flow System?
- 12 A. Area that the State Engineer has drawn --
- 13 Q. Yes?
- 14 A. -- a boundary around today.
- 15 Q. Okay. You are not saying like Kane should be
- 16 jointly manage with the Lower White River Flow System,
- 17 if for some reason Kane doesn't say in the Lower White
- 18 River Flow System?
- 19 A. Well, and that's where the scrutiny on the
- 20 boundary occurs that we talked about. The boundary of
- 21 the Lower White River Flow System doesn't necessarily
- 22 need to encompass anything that has any degree of
- 23 hydrologic connectivity. And wherever we choose to
- 24 draw that line, there is the potential to negative

- 1 A. I do.
- 2 Q. And then winter precipitation is defined as
- 3 October through June by Winograd for the Spring
- 4 Mountains in Southern Nevada, right?
- 5 A. Correct.
- 6 Q. Okay. And then later on, in the next
- 7 paragraph, on the next paragraph after that, when you
- 8 talk about the winter months, you've changed it to
- 9 October to March, October through March as the winter
- 10 season.
- 11 A. Okay.
- 12 Q. So decreased the winter precipitation, and
- 13 increased the summer precipitation. Do you see that?
- 14 A. The decrease -- I'm sorry. Say again.
- 15 Q. If you go to the next paragraph?
- 16 A. Right. I'm on Division for winter season
- 17 precip?
- **18** Q. Go down to the bottom, closer to the bottom?
- 19 A. Figure 42.
- 20 Q. And even above that you are defining winter
- 21 months as October through March?
- 22 A. Yes.
- 23 Q. Do you agree?
- So you deviated from Winograd?

Min-U-Script®

Capitol Reporters 775-882-5322

(19) Pages 1059 - 1062

Page 1063

- 1 A. Correct.
- 2 Q. The source that you referenced?
- 3 A. Correct.
- 4 Q. What was the reason for doing that?
- 5 A. The reason is based on these temperatures, what
- 6 we -- let's see, April, it's basically what we've
- 7 observed here or at least recognize the high
- 8 temperatures in the previous sentence, for April
- 9 through September. And I think others have used
- 10 October through March. But I can't recollect who that
- 11 reference was.
- 12 Q. And --
- 13 A. Rick Waddell brought it up the other day. But
- 14 I don't have a reference here for it.
- MS. PETERSON: Thank you.
- Thank you, panel, too.
- 17 HEARING OFFICER FAIRBANK: City of North Las
- 18 Vegas
- MS. URE: We have no additional questions.
- 20 HEARING OFFICER FAIRBANK: Saying no further
- 21 questions. Center for Biological Diversity.
- 22 RECROSS-EXAMINATION
- BY MR. DONNELLY:
- 24 Q. Thank you. Patrick Donnelly with the Center

- 1 A. Yes.
- 2 Q. Have we seen significant drought trends over
- 3 the past 20 years spring discharge in the Muddy River?
- 4 A. I don't think so. The drought -- I think
- 5 because it's a regional spring discharge, it's less
- 6 sensitive to immediate changes, because of drought.
 - 7 Q. Thank you.
 - 8 Ms. Pellegrino, you said the water for the dace
- 9 and the in water river are related, correct?
- 10 ANSWERS BY MS. PELLEGRINO:
- 11 A. Yes.
- 12 Q. Thus isn't it true the fate of the dace is tied
- 13 to your ability to store Muddy River ICS flows in Lake
- 14 Mead?
- 15 A. I think you've tried to ask this question
- 16 twice. Our activity related to ICS has no impact on
- 17 the dace.
- 18 Q. I guess I'm asking the reverse question.
- Does the dace and its thriving in the Muddy
- 20 River Spring area have an impact on your ability to
- 21 store ICS?
- 22 A. Not tributary conservation ICS. Because that's
- 23 the surface flow of the Muddy River making it to Lake
- 24 Mead, which is unimpacted by the status of the dace.

Page 1064

Page 1066

- 1 For Biological Diversity.
- 2 Ms. Pellegrino, just to restate, would you say
- 3 ICS credits are an important component of SNWA's water?
- 4 ANSWERS BY MS. PELLEGRINO:
- 5 A. Yes.
- 6 Q. Does Lake Mead's storage help insure Colorado
- 7 River Compact define delivery of lower basin water?
- 8 A. I'm going to help you out because I don't want
- 9 to get into the law of the river.
- 10 Q. Indeed.
- 11 Nor do I.
- 12 A. But the compact does not define delivery in the
- 13 State of Nevada, the decree does.
- 14 Q. Thank you.
- 15 A. But having more water in Lake Mead keeps us out
- of shortage, which makes more water available to all of
- 17 the lower basin water users.
- 18 Q. Thank you.
- In a general sense are flows in the Colorado
- 20 River based on among other factors drought?
- 21 A. Yes.
- 22 Q. Mr. Burns, in a general sense are flows in the
- 23 Muddy River variable based on drought?
- 24 ANSWERS BY MR. BURNS:

- 1 It's impacted by the amount of water in the Muddy
- 2 River.
- 3 Q. Which is related to the dace?
- 4 A. Correct.
- 5 Q. Okay. We can leave it at that?
- 6 A. Okay.
- 7 Q. Mr. Burns, you stated that alluvial pumping has
- 8 a one-to-one relationship with river flows?
- 9 ANSWERS BY MR. BURNS:
- 10 A. That' my opinion, yes.
- 11 Q. And I believe you said carbonate is approaching
- 12 one-to-one or will approach one-to-one over a long
- 13 period of time?
- 14 A. I believe over a long period of time.
- 15 Q. In your questioning from City of North Las
- 16 Vegas earlier, is it true that you said over time as
- 17 waters levels in EH-4 carbonate system decline, I would
- 18 expect a proportional decline in spring flow?
- 19 A. Yes.
- 20 Q. And as you said in my questioning earlier,
- 21 declining spring flow results in a decline of river
- 22 flow, correct?
- 23 A. Yes.
- 24 Q. And you also said that we have to stay above

Min-U-Script®

Capitol Reporters 775-882-5322

(20) Pages 1063 - 1066

Page 1067

- 1 3.2 to maintain river flows, correct?
- 2 A. I guess by -- depends on what your datum is,
- 3 what your reference point is. We want to -- if it's
- 4 acceptable. If conflicts are acceptable, these impacts
- 5 are acceptable, then yes. Could you repeat the
- 6 question. You lost me.
- 7 Q. Yeah. I believe --
- 8 A. Lost myself.
- 9 Q. I believe earlier questioning, you stated we
- 10 need to keep flows Warm Springs West at 3.2 or higher
- 11 in order to maintain river flows and fulfill senior
- water rights on the Muddy River?
- 13 A. What I mean to say is to make sure that the
- 14 senior rights are in full, we can't have depletions on
- 15 the river flow. Now, if the spring flows are reduced
- by pumping, then by definition the river flows will be
- 17 too.
- 18 Q. Okay.
- 19 A. I don't know if that helps you --
- 20 Q. I think that's what I was trying to get at.
- And then so given that we're at 3.2 now, or
- 22 close to I think we'll say, somewhere in the ballpark
- 23 of that. I understand the daily variations and so
- 24 forth. But and you say carbonate withdrawals will in

- 1 question?
- 2 Q. Are the actions or activities that you describe
- 3 which would be necessary in to order make 4- to 6000
- 4 the sustainable level, are those happening right now or
- 5 are those new things we would have to start doing?
- 6 A. I think that's the point of this hearing is to
- 7 figure out what those actions are. But I think there
- 8 is also an opportunity among stakeholders to
- 9 potentially solve a problem.
- 10 MR. DONNELLY: Thank you.
- 11 HEARING OFFICER FAIRBANK: Georgia Pacific?
- MS. HARRISON: I'm thinking about it. But
- 13 Friday afternoon.
- 14 So no.
- 15 HEARING OFFICER FAIRBANK: Seeing no questions,
- 16 thank you.
- 17 Nevada Cogeneration?

18

- 19 RECROSS-EXAMINATION
- 20 BY MR. FLANGAS:
- 21 Q. Folks. I just to clarify of just one point.
- 22 Mr. Wilson asked whether the boundary of the Black
- 23 Mountains area should be changed. I think after
- 24 listening to Ms. Pellegrino, I'm very clear on your

Page 1068

Page 1070

- 1 the long term result in discharge capture. Don't we
- 2 needed to probably cease carbonate withdrawals in order
- 3 to insure long-term flows stay above 3.2?
- 4 A. No, I don't think we need to cease carbonate
- 5 production. I think we can manage the head levels at
- 6 EH-4 such that the 3.2 CFS flow can be realized over
- 7 the long term as we said. And that's the 4- to
- 8 6,000-acre-feet that we think is manageable.
- 9 Q. I'm sorry, go ahead?
- 10 A. We also caveat, that with if the impacts that
- 11 are existing potential future impacts that we expect, I
- 12 guess, if those are addressed, then we think the 4- to
- 13 6,000-acre-feet is a manageable amount of water.
- 14 Q. So it's a manageable amount of water contingent
- on other actions and other activities?
- 16 A. That's correct.
- 17 Q. Have you all defined what those actions and
- 18 activities are?
- 19 A. Well, we have not. But they relate to the
- 20 depletions on the river.
- 21 Q. Are those actions or activities ongoing right
- 22 now, or are they new things that need to happen in
- order to make 4- to 6000 a sustainable level?
- 24 A. I think these will be -- can you repeat the

- 1 position, boundaries shouldn't be changed. But if we
- 2 could clarify certainly we can understand,
- 3 hydrologically, you don't believe the production wells
- 4 are hydrologically connected to the Lower White River
- 5 flow system that we're talking about here, is that a
- 6 correct statement?
- 7 MR. TAGGART: Objection as to what production?
- 8 MR. FLANGAS: Well, I'm sorry.
- 9 BY MR. FLANGAS:
- 10 Q. The production wells in the Black Mountain area
- 11 that we talked about earlier that Nevada Cogeneration
- 12 owns?
- 13 A. We think that those -- I think what we're
- 14 saying is that boundary's uncertain. And more work is
- 15 needed to figure out if production -- we think if there
- 16 is connection --
- 17 Q. Connection. I'm sorry, I didn't hear that?
- **18** A. Limited. Based on the MLR analysis.
- 19 O. Okay.
- 20 A. But we also recognize that the boundary there
- 21 is uncertain. And we don't -- we haven't investigated
- 22 the possible factors that would -- that cause that is a
- 23 structure, is it the completion of the well. Those are
- things we haven't looked at in detail. That we think

Min-U-Script®

Capitol Reporters 775-882-5322

(21) Pages 1067 - 1070

Page 1074

Page 1071

- 1 when we talked earlier about scrutinizing points of
- 2 diversions and changes, those are the types of things
- 3 that we would -- I would expect to want better
- 4 understanding of.
- 5 Q. Okay. That's all. Thank you.
- 6 A. Thank you.
- 7 HEARING OFFICER FAIRBANK: Muddy Valley
- 8 Irrigation Company.
- 9 MR. KING: No questions.
- 10 HEARING OFFICER FAIRBANK: Seeing no questions.
- 11 Bedrock
- MR. TAGGART: No additional questions?
- 13 HEARING OFFICER FAIRBANK: No additional
- 14 questions.
- 15 Nevada Energy?
- MS. CAVIGLIA: No additional questions.
- 17 HEARING OFFICER FAIRBANK: Seeing no additional
- 18 questions, I'll open up to Division of Water Resources
- 19 staff and State Engineer.
- 20
- 21 EXAMINATION
- BY MS. COOPER:
- 23 Q. Christy Cooper for the record. All right.
- 24 Almost over. Hang in there.

- 1 that the carbonate and the alluvium pumping, both, have
 - 2 a one-to-one effect?
 - 3 ANSWERS BY MR. BURNS:
- 4 A. The alluvial for certain. Within the year,
- 5 that year.
- 6 Q. On the river, right?
- 7 A. On the river.
- 8 The carbonate system, as Warda just said, it's
- 9 not one-to-one right now. But we think out in the
- 10 future it will be. Because that's the only discharge
- 11 in the system to capture. And we -- I guess we'll have
- 12 future debates on what the outflow that could be
- 13 captured but that's the other source. My opinion is
- 14 that there is not a lot of -- there is not significant
- 15 outflow from this system around these pumping centers.
- Mainly. I think mainly thinking of Garnet
- 17 Valley, California Wash and across the Glendale thrust.
- 18 Dr. Waddell mentioned yesterday about what he feels
- 19 could be contributing to the discharge at Rogers and
- 20 Blue Point. But I don't think there is much more than
- 21 that, honestly.
- MS. COOPER: Okay. Thank you. No more
- 23 questions.
- HEARING OFFICER FAIRBANK: Thank you.

Page 1072

- 1 I was going over this 4- to 6,000-acre-feet of
- 2 carbonate pumpage number in my head. And looking in
- 3 our order, and appendix B we put this table.
- 4 Groundwater pumping. Lower White River Flow System and
- 5 we haven't divvied out alluvial pumping in Coyote
- 6 Spring and Garnet Valley, but in 2017 there was just a
- 7 little between Lower White River Flow System Basin
- 8 pumping 9090 acre-feet total.
- 9 So, if you could give an estimate as from your
- 10 4- to 6,000 of carbonate, total, would you say the rest
- 11 could be alluvial, or do you agree that 9,000 may be a
- 12 little bit much? Give me your opinion on this total
- 13 pumpage value.
- 14 ANSWERS BY MS. PELLEGRINO:
- 15 A. I think the answer that we made is what is
- pumped in the carbonate, because that was based on
- 17 protecting the dace. So, the total amount alluvial and
- 18 carbonate together that could be pumped is a conflict
- 19 question. We were trying to avoid the conflict
- 20 discussion. But, if the alluvium is conflicting
- 21 one-to-one, you pump whatever you want in alluvium as
- 22 long as you make the senior hold. Doesn't effect the
- 23 dace.
- 24 Q. Okay. So, in the testimony did you guys say

- 1 EXAMINATION
- 2 BY MR. BENEDICT:
- 3 Q. Jon Benedict for the record. I've got two
- 4 questions. First one, Page 20. Back on the
- 5 presentation. I apologize for having to go back to
- 6 that. Just want to make sure I got this.
- 7 So, residuals are equal to observed minus
- 8 calculated?
- 9 ANSWERS BY MS. DRICI:
- 10 A. Yes.
- 11 Q. So it's really the difference between the blue
- and the orange curve, right?
- 13 A. Yes, it is.
- 14 Q. They don't look the same. I'm just curious
- about that. It looks like the residuals are about half
- 16 of what that distance is. Is that -- am I misreading
- 17 that? If you look at like 2006, it looks like maybe
- 18 one foot of residual, but the difference between the
- 19 two curves looks like about two?
- The relationship looks good. I'm just curious
- 21 about the -- I think it's reading residual is.

A. I think it's a scale issue on the axis.

- ANSWERS BY MR. BURNS:
- MS. DRICI: And --

23

Min-U-Script® Capitol Reporters 775-882-5322

(22) Pages 1071 - 1074

Page 1075

- 1 A. So the elevation, on one hand, is two feet; the
- 2 other, on the residuals is four feet.
- 3 Q. Oh, okay. I see.
- 4 A. Probably different case.
- 5 Q. Okay. Thank you. That clarifies that. Okay.
- 6 Last question that I have is about these linear
- 7 relationships. I mean at some point it seems like
- 8 these relationships can't hold. You've said that, for
- 9 example, in Warm Springs West, when it flows zero you
- 10 wouldn't expect Muddy River to have a flow of zero?
- 11 A. Correct.
- 12 Q. I mean what's your opinion on how -- to what
- 13 extent you can apply that relationship to the spring
- 14 flow? Does it go down to .1 CFS or is it like in the
- 15 two and three range or what is that curve look like?
- 16 Is it really linear with a -- so it's like MX plus
- 17 B-type linear or is it just linear over segments or how
- 18 does that relationship work at different -- how do you
- 19 think it works I guess at different ranges or can you
- 20 apply it?
- ANSWERS BY MS. DRICI:
- 22 Q. I think it's linear as long as all the springs
- 23 are flowing. And I didn't include that in the report
- because I didn't think of it until later. But if you

- 1 total, so I would put the elevation at the Warm Springs
- 2 West as long as we have flow there, the relationship
- 3 should hold.
- 4 Q. How about for the relationship between water
- 5 levels and pumping within the various basins. I mean
- 6 just -- do you feel like that linear relationship has a
- 7 limit with which you could apply it?
- 8 A. You mean the multiple linear regression?
- 9 O. Yeah.
- 10 A. (Mr. Burns) A limit.
- 11 A. (Ms. Drici) I'm not sure I understand.
- 12 Q. Well, for example, one of the curves that was
- 13 looked at was California Wash, and it was shown that
- 14 400-acre-feet of pumpage caused X amount of drawdown.
- 15 Would 4000-acre-feet of pumpage there create 10 times
- as much drawdown, that would be linear relationship?
- 17 Would that apply?
- 18 A. I think it should, because drawdown is
- 19 proportional to pumping, right. So the greater the
- 20 production from the well, the larger the drawdown.
- 21 Q. Okay. Thank you.
- 22 A. You're welcome.
- 23 ///
- 24 ///

Page 1076

Page 1078

- 1 plot, for example, Pederson Spring discharge versus
- 2 Warm Springs West, you will see that it is linear. And
- 3 that relationship between those two. Pederson Spring
- 4 and the gage is similar to the relationship between
- 5 Warm Springs West and the total discharge to the MRSA.
- 6 And the reason they behave that way is because
- 7 they are all connected to the carbonate aquifer, which
- 8 will, you know, give them the same, the same head, the
- 9 same water level. Potentiometric surface goes above
- 10 the springs orifices all over.
- And spring discharge is proportional to the
- 12 head difference, right. And because the difference in
- 13 elevation in the big scheme of things, is not really
- 14 that different if you looking at like the total
- 15 discharge of the MRSA. You could approximate it like
- one average elevation, to get an idea of how much might
- 17 be flowing into that area.
- 18 Q. Okay. So then I think what I'm hearing is your
- 19 answer would be is it would be linear up into the point
- 20 when the highest altitude spring went dry. At that
- 21 point any further losses on any springs it would not be
- 22 linear. Is that about right?
- 23 A. Yes, in general. But in this case, because I'm
- 24 doing the correlation between Warm Springs West and the

- 1 EXAMINATION
- 2 BY MS. BARNES:
- 3 Q. Michelle Barnes for the record.
- 4 Maybe I missed it so if I did please let me
- 5 know. Were any aquifer parameters beyond connectedness
- 6 considered within the evaluation?
- 7 ANSWERS BY MR. BURNS:
- 8 A. I think they are implied by that analysis. So
- 9 by that I mean how they are connected is represented in
- 10 the water level record and response between this well
- and that well. And so, whatever the properties are
- 12 between those wells were represented. I'm not sure if
- 13 you follow or not. But, I guess how a well responds to
- 14 a stress, implicit in that response are the high draw
- 15 properties. So if very tight material you have a lot
- 16 of drawdown. Big change. If it's -- if it's high
- 17 transmissivity, or lesser drawdown.
- 18 Q. I guess to further elaborate on that question.
- 19 I understand what you are saying about inferring the
- 20 properties based on the connectedness and the
- 21 relationships. Do you think there is anything to be
- 22 gained by considering the geology or the aquifer
- 23 properties in tandem with your analysis, going beyond
- just your tighter empiricals maybe looking or at some

Min-U-Script®

Capitol Reporters 775-882-5322

(23) Pages 1075 - 1078

Page 1079

- the other analyses we've seen this week combined
- together? 2
- A. Well, yes. I mean our conceptual model is
- heavily based on what we understand about the
- geological framework. What these data show is how that
- framework influences groundwater response or one-level
- responses to whatever the stress is. And, for example,
- CSVM-5 bandied about this week versus other wells in
- the structural basin. So I forgot what your question
- was. Sorry. 10
- Q. I think you're getting there. It was more 11
- focus is there anything to be gained by considering
- your analysis and interpretation, and kind of over with
- the geology and some those aquifer properties that were
- 15 talked abut?
- A. Yeah, that's, I guess, what I was going to say.
- 17 So, when we look at the framework in some of which has
- been postulated in permeable boundaries, we receive 18
- across those boundaries a response. And so, that 19
- informs us on the character of those features in the
- geologic framework of whether or not they are
- influencing flows. So, when I looked at CSVM-1, that's
- the pumping well at MX-5 and the response is CSVM-2,
- which is across the structural block in Coyote Springs

- MS. PETERSON: No. 1
- 2 HEARING OFFICER FAIRBANK: All right. Well,
- then let's go ahead and turn it back over to
- Mr. Taggert on behalf of Southern Nevada Water
- Authority in Las Vegas Valley water district.
 - REDIRECT EXAMINATION
- BY MR. TAGGART: 8
- Q. Good afternoon. Let's get this over with. All 9 right. 10
- 11 Couple questions, Ms. Drici. You were asked by
- 12 Ms. Pederson about using statistics with the data
- regarding water resource. Do you recall that? 13
- ANSWERS BY MS. DRICI: 14
- 15 A. Yes, I do.
- Q. And she asked you about what's been marked SNWA
- Exhibit 13 and that's a USGS publication that's
- entitled statistical methods in water resources?
- 19 A. Yes.

7

- 20 Q. Okay. And is it true that that document
- contains a chapter on the obligation of multilinear
- regression to water resource data?
- 23 A. Yes, it does.
- 24 Q. Okay. Does that publication also include a

Page 1080

Page 1082

- Valley, which is across several faults we see these
- identical responses to open endogenous stress or
- natural stress. So for us the geologic framework is
- very basic part and fundamental part of our assessment
- of these conditions. But how to use that numerically,
- I think you need like a groundwater flow model to 6
- represent the framework in that regard. And then you
- can test these features of that boundary. But frankly
- I think the analytical data we have is pretty
- informative already. 10
- MS. BARNES: Thank you. 11
- HEARING OFFICER FAIRBANK: Okay. So we have
- about nine minutes left for the three and-a-half hours
- for cross-examination. And there is time left that was
- reserved by the Southern Nevada Water Authority out of
- their time this morning. So, I can offer up three 16
- minutes. Two to three participants who I think still
- have questions if they want it take it. That would be 18
- Coyote Spring Investments, Lincoln/Vidler and Center 19
- for Biological Diversity. I see a shaking of the head 20
- from Center for Biological Diversity. 21
- Did we have any interest for an additional 22
- three minutes? CSI shaking their head no. 23
- Ms. Peterson.

17

- 1 discussion of using simple linear regression with
- 2 hydrologic data?
- 3 A. Yes, it does.
- 4 Q. Mr. Barker, would you mind bringing up slide 39
- please.
- I'm sorry. That wasn't the -- I have it wrong 6
- there written down so let's just move on there. 7
- And Mr. Burns, you were asked about the record
- of water levels at CSVM-4 and the transducer in that
- hole. Do you recall that? 10
- ANSWERS BY MR. BURNS: 11
- 12 A. I recall questions on that, yes.
- Q. Okay. Does the -- does the indication that --
- of changing of the transducer in that hole, that 14
- information that was provided to you, does it change 15
- any of your opinions regarding the reliability of the 16
- data you relied upon at CSVM-4? 17
- A. No, it doesn't change my conclusion, which is 18
- that that well has measured affects from the pumping at 19
- MX-4 and the data fall all, the periodic measurement, 20
- alone, can demonstrate that. 21
- Q. Okay. A quick question about the big Muddy 22
- Springs. Can you please explain the magnitude of flow 23
- at that particular spring and whether the level of

Min-U-Script® Capitol Reporters 775-882-5322

Page 1083

- 1 change that you see at Warm Spring West, for instance,
- 2 could turn up in the flow record for Muddy, for big
- 3 Muddy Spring? You understand that my question?
- 4 A. Not really.
- 5 Q. Okay. I'm going to try again.
- There's been a lot of questions about why isn't
- 7 the same hydrograph showing up at the big Muddy Spring
- 8 versus EH-4, right?
- 9 A. Yes.
- 10 Q. Okay. And is there anything about the -- well,
- 11 I'll just say it this way. Because of the magnitude of
- 12 flow at Big Muddy Spring, wouldn't it be hard to see
- 13 the kind of change that we're measuring at Warm Springs
- 14 West?
- 15 A. Yes, and for Pederson Springs as well. I
- 16 already spoke, I think at length, about how sensitive
- 17 those springs are, and how detectable responses can be
- 18 at those springs. They are higher elevation, they are
- 19 more sensitive. Big Muddy Spring is down on the basin
- 20 floor and it has much more -- the driving force on that
- 21 is much greater in proportion in relation to Pederson
- 22 Springs so you might have five or six feet at Pederson
- 23 Springs, you might have 80 feet or so at Big Muddy.
- 24 Those are just estimates, I wouldn't say those are the

- 1 visual correlation that I heard described, I mean if
- 2 you changed which pumping was just plotted on this
- 3 chart to be, you know, the Coyote Springs Valley
- 4 carbonate pumping was the block down at the bottom of
- 5 each bar and then it would change how things looked,
- 6 visually, to what's underneath the red line?
- 7 A. Yeah.
- 8 Q. And isn't that just an artifact of -- that's my
- 9 question. Should you draw anything from the fact that
- 10 the red line seems to track with the dark blue lines or
- anything other than just that's the way it looks
- because of how the bars are?
- 13 A. That's the way it was assembled. Now what I
- would say, we're better off relying on this multilinear
- 15 regression because it forms of the total response
- 16 measured EH-4 what contribution to the other pumping
- 17 center throughout this basin, throughout the flow
- 18 system is. I would put emphasis on that rather than
- 19 depiction of this based on this chart.
- 20 Q. Okay.
- Now, back to Ms. Drici. Could you bring up
- 22 figure A-3. Thanks.
- I have a quick question for you here,
- 24 Ms. Drici. We've looked at this a number of times.

Page 1084

Page 1086

- 1 numbers, but that's what I mean by that.
- 2 Q. Okay. And could we bring up on the screen
- 3 figure 5-4, please?
- 4 Okay. There's been a number of questions about
- 5 this, I think, from CSI as well as someone else, I
- 6 don't recall.
- 7 And the questions centered around this notion
- 8 of a visual correlation.
- 9 And so I wanted to nail this down. Obviously,
- 10 if you look at the red line on that bar chart and then
- 11 you look the dark blue or the darkly-shaded bars that
- are the third set of bars up, I think that is the MRSA
- 13 pumping, it looks like, you know, the red line is
- 14 tracking along with those dark blue blocks. Is that
- 15 the proper way to interpret that?
- 16 A. It could be. But I would just caution based
- on, as I said before, with the multilinear regression
- 18 analysis that Warda did, we see contributions of the
- 19 water level response from that pumping in the
- 20 decomposed water level at EH-4.
- So, and I would add, what we've measured -- so
- 22 I guess this carbonate pumping could be -- let me
- 23 rephrase it.
- 24 Q. Let me ask first again. It's simple. Is this

- 1 I just want to ask if although you've given the
- 2 testimony you have about Black Mountain pumping and the
- 3 decomposition of that stress at the EH-4 water level.
- 4 But isn't it true that on this particular figure A-3,
- 5 when pumping begins in 1996, there is a noticeable 6 change in the decomposed PH-4 water level. That's
- 7 caused by the Black Mountain pumping. It's small but
- 8 there is a change in the line there, yeah?
- 9 ANSWERS BY MS. DRICI:
- 10 A. Yeah, this looks like there is a small change.
- 11 But, I would same it's simply significant. It might be
- 12 within the level of error so that's why I couldn't say
- 13 yeah, this does not absolutely does not effect DH-4.
- 14 It is uncertain.
- The Black Mountain production, can I add a
- 16 clarification?
- 17 Q. Yes.
- 18 A. So, earlier, I said that the production wells
- 19 there were EBM-6, RBM-5 and EBP-2. Before 2015, there
- 20 were two additional wells that have since been promoted
- 21 to monitoring wells and those are EBM-4 and ETV-4.
- 22 Q. Okay. I have just two more questions.
- One is you were asked about the table with the
- 24 proportional flow analysis, and -- and I -- and the

Page 1087

- 1 question that came from State Engineer staff about
- 2 whether the linear relationship between the Warm
- 3 Springs West flow and Muddy River flow might break down
- 4 at some point, right?
- 5 I guess my question is through the flows rates
- 6 that are analyzed in your analysis particularly like
- 7 2.6 CFS in Warm Springs up to 3.4, do you agree that
- 8 the linear relationship survives in that range?
- 9 A. Yes, it's 2.7, the lower range.
- 10 Q. Okay.
- 11 A. I think so.
- 12 Q. Okay.
- 13 A. Yes.
- 14 Q. Now, Mr. Burns, there's been some presentations
- 15 regarding what I might call compartments that some
- 16 parties believe they can pump from without causing
- 17 impacts to others or to the Muddy River or to the Muddy
- 18 River Springs.
- And so my question to you is, first of all, do
- 20 you think such compartments exist?
- 21 ANSWERS BY MR. BURNS:
- 22 A. They can, yes.
- 23 Q. Okay. And what would be necessary, in your
- 24 opinion, for someone to prove that they can pump from

- 1 MR. TAGGART: All right. No further questions.
- 2 HEARING OFFICER FAIRBANK: All right. Well,
- 3 thank you very much.
- 4 We will go ahead and complete today's meeting.
- 5 But before we do that, actually, let's go ahead and go
- 6 over a little bit for -- get ready for next week.
- 7 So, Monday morning Southern Nevada Water
- 8 Authority's going to continue their presentation of
- 9 biological panel then we'll do cross-examination. Then
- 10 once they're completed we will go ahead and follow with
- 11 the Moapa Valley Water District. And then basically
- our plan is within the dace where there is multiple
- 13 parties scheduled in a day then we'll just go ahead and
- 14 tail one another right after one another other than the
- 15 one exception of the Muddy Valley Irrigation Company,
- who's agreed to go ahead and switch to December 3rd to
- 17 go earlier or, excuse me, what year is it, what day is 18 it? October 3rd.
- We will not be moving parties between dace.
- 20 So basically, if we get done early because
- 21 everybody's super efficient as we have seen as a common
- 22 thread this week. Which we encourage for the following
- 23 week. Then we'll just end early and we'll start with
- 24 the party that's scheduled for the following day.

Page 1088

Page 1090

- 1 one of these compartments, if they exist, without
- 2 causing harm to others or to the river or to the Moapa
- 3 dace?
- 4 A. I think pumping tests on something like Order
- 5 1169, that can demonstrate that that possibility
- 6 exists.
- 7 Q. And so, it would have to be at same magnitude
- 8 and extent as 1169?
- 9 A. Or someone looking at the data, that would be
- 10 preferable.
- 11 O. And just for folks to remember, how large was
- 12 that pumping stress from Order of 1169? And I ask you
- 13 that because I would like you put in contrast to
- 14 aquifer test that might be done at a well, a 72-hour
- 15 aquifer test. How much bigger was this than just a
- 16 simple 72-hour aquifer test?
- 17 A. Well, it depends on how you view the test,
- 18 itself. If you view it as a total production from the
- 19 flow system then it's on the order of ten, over
- 20 10,000-acre-feet for couple of years almost. If you
- 21 are looking at a single well as part of that pumping,
- 22 like MX-5, then it was about 3,000 or so acre-feet --
- 3,000 or so acre-feet over those two years of the
- 24 pumping test.

- 1 So, my -- I guess the long and short of it is,
- 2 if you're somebody who's scheduled after an earlier
- 3 party in those dace, be prepared to go before the
- 4 little time slot in the matrix that was intended to
- 5 kind of be a rough idea.
- 6 Otherwise, have a great weekend. We'll see
- 7 everyone 8:30 on Monday morning.

(End of Proceedings.)

- 1 CARSON CITY, NEVADA, MONDAY, SEPTEMBER 30, 2019, A.M. SESSION
- **2** -00o-
- 3
- 4 HEARING OFFICER FAIRBANK: Good morning. Welcome
- 5 back
- 6 This is the time and place set for the --
- 7 regarding the Lower White River Flow System and Order 1303
- 8 hearing in the proceedings arising out of that particular
- 9 order.
- And so this morning we want to go ahead and
- 11 just -- we're going to have a continuation of the Southern
- 12 Nevada Water Authority's presentation, and then we're going to
- 13 go ahead and proceed with our next -- with the Moapa Valley
- 14 Water District, and then this afternoon Lincoln County and
- 15 Vidler Water Company.
- Just as a quick reminder, these proceedings,
- 17 again, are with respect to those four questions, and kind of
- 18 that fits with regards to the solicitations of information
- 19 from the State Engineer in Order 1303.
- 20 And so how I'm going to go ahead and do these
- 21 this morning is Southern Nevada Water Authority has been
- 22 allocated time for two hours this morning, and so they'll be
- 23 given an hour for the presentation of their biologic panel,
- 24 and then there will be one hour for questions of the

- 1 just wanted to go ahead and also introduce. So today we have
- 2 a different member of our staff with us from our Las Vegas
- 3 office, John Guillory, and Christi Cooper will be observing
- 4 from afar this week.
- 5 And so go ahead and swear in the witnesses.
- 6 Thank you.
- 7 (Panel sworn.)
- 8 MR. TAGGART: And also for the record, both
- 9 witnesses have been qualified in this proceeding through our
- 10 prequalification procedure that we developed.
- Mr. Marshall in the area of biological resources,
- 12 including conservation biology, environmental compliance, and
- 13 environmental monitoring.
- Mr. Williams with respect to environmental
- 15 resources in the Lower White River Flow System conservation
- 16 efforts to protect the Moapa Dace and ongoing compliance with
- 17 the MOA and Endangered Species Act; and also both will testify
- 18 about the report that they prepared.
- So, I'm going to start with you, Mr. Williams.
- 20 Good morning.
- 21 DIRECT EXAMINATION
- 22 ANSWERS BY MR. WILLIAMS:
- 23 A. Good morning.
- 24 Q. Could you -- could you just briefly describe for

Page 1097

- 1 participants and the State Engineer's office, then we'll go
- 2 ahead and move right into the Moapa Valley Water District.
- And so this week is going to be a little bit more
- 4 fast pace with respect that we're going to have multiple
- 5 parties on any given day, and on that particular day when
- 6 we're completed with the party, then we're going to move right
- 7 next into the next participant.
- 8 And so with that, we will go ahead and get
- 9 started with the Southern Nevada Water Authority.
- 10 Mr. Taggart?
- 11 MR. TAGGART: Thank you.
- Good morning. Paul Taggart for the Southern
- 13 Nevada Water Authority and the Las Vegas Water District.
- 14 For the record, on Friday we did an errata to our
- 15 Exhibit 7, and we provided a copy of that over on the stand
- 16 over there. And that's Figure 6-2, page 6-7 of that document.
- And so we -- we presented our hydrology experts
- 18 on Friday. This morning we'll be talking to our biological
- 19 resource experts.
- 20 So with that, I'm going to call our witnesses,
- 21 Mr. Bob Williams and Mr. Zane Marshall and -- and ask them to
- 22 be sworn.
- 23 HEARING OFFICER FAIRBANK: All right. Thank you.
- And real quick before we swear the witnesses, I

- the State your background and experience with respect to the
- 2 Endangered Species Act, compliance with that act, and also
- 3 with the Moapa Dace in the Lower White River Flow System?
- 4 A. Yes. Thank you. I'd like to begin telling you
- 5 about my career as it unfolded over the last four years. I
- 6 started in 1979 after graduating from Brigham Young University
- 7 with a degree in fisheries and aquatic ecology.
- 8 I was hired that same year by the U.S. Fish and
- 9 Wildlife Service in the Salt Lake City endangered species
- office as their Section 7 biologist -- Section 7 fishing
- 11 biologist.

13

- I worked there for a couple of years specifically
 - working on Section 7 consultation with the Bureau of
- 14 Reclamation. I was in the process of completing the Central
- 15 Utah Project, as well as operation of main stem Colorado River
- 16 Project, such as Flaming Gorge, Glen Canyon Dam, and the way
- 17 and Aspen and all that.
- The requirements of Section 7 and the regulations
- that accompanied Section 7 that were finalized in 1978
- 20 required the federal agencies to fund research and to conduct
- or basically go through the consultation process to ensure
- that their actions and their funding of actions did not
- 23 jeopardize the species that were occurring in the Colorado
- 24 River and Duchesne River; that being the pikeminnow, humpback

Min-U-Script®

Capitol Reporters 775-882-5322

(2) Pages 1096 - 1099

Page 1103

Page 1100

- chub, bonytail chub, and razorback sucker. 1
- I worked for the Fish and Wildlife Service in 2
- that capacity, and then transferred to the Bureau of 3
- Reclamation and was the point of -- working for the Bureau of 4
- Reclamation I became the point person in developing the Upper
- Colorado Recovery Implementation Program, which is a 6
- 7 three-state and multi-federal agency program to basically
- continue research on the Colorado River system to better 8
- understand the needs of the species, come up with in-stream 9
- flow requirements for the species, and formalize the 10
- 11 consultation process.
- 12 In 1992, I moved through the bureau and became
- 13 the State supervisor for the Fish and Wildlife Service in
- 14
- 15 In that capacity, I continued to work on
- 16 implementing the Endangered Species Act in Utah, completing
- 17 the Washington County HCP for dessert tortoise, initiated the
- development of Upper Virgin River Implementation Program, and 18
- 19 working with the State of Utah on developing conservations --
- 20 species conservation agreements under Section 6 of the act for
- species such as Bonneville cutthroat and leagues chub. 21
- In 1997, I moved from Utah, became the State 22
- supervisor here in Nevada, and I supervised an office in Reno. 23
- I supervised the National Fish Hatchery in Gardnerville --24

- 1 I continued to work on endangered species implementation and
- compliance. I went to work for a consulting company in 2
- California, ICF International, and have my own individual
- company, Conservation Solutions LLC. And I have a -- I work 4
- with National Wildlife Refuge Association in that capacity, as
- well as a contract with Texas A&M National Resource Institute 6
- 7 working on compliance for EOD on desert tortoise issues in
- Southern California. 8
- Q. Thank you, Mr. Williams. 9
- So, just quickly from '97 -- 1997 to 2011, you 10
- were the head of the Fish and Wildlife Service office for 11
- 12 Nevada, and you worked and oversaw environmental compliance,
- 13 and specifically with the Endangered Species Act?
- A. That's correct. 14
- Q. Okay. Mr. Williams, could you -- I mean, Mr. 15
- Marshall, could you also describe a brief background of your 16
- 17 experience with respect to the Moapa Dace in the Lower White
- 18 River Flow System?

19

5

- ANSWERS BY MR. MARSHALL:
- 20 A. Yes. Thank you, and good morning.
- I have a master's of arts and science in biology 21
- and statistics from UNLV, which I received in 2006. 22
- 23 I have 27 years of experience in my field working
- 24 for the Southern Nevada Water Authority and Las Vegas Valley

Page 1101

- Lahontan National Fish Hatchery in Gardnerville. That was 1
- responsible, and still is, for the recovery of Lahontan 2
- cutthroat trout. 3
- I had an office also in Las Vegas, and I quickly 4
- became acquainted with the issue of Moapa Dace and groundwater 5
- 6 pumping.
- Again, as I said, I moved here in 1997. I was 7
- here in 1998 when Fish and Wildlife Service filed protests for 8
- 9 pumping in Arrow Canyon wells, and was the supervisor in
- charge during the period of time from '97 to 2011, when I 10
- retired. 11
- 12 During that process, I -- or during that time, I
- was very much engaged with the issues of the Moapa Dace Fish 13
- and Wildlife Service filing protests for Coyote Springs 14
- pumping and then working on stipulated agreements to work with 15
- parties to come up with ways to mitigate those programs and 16
- those processes. 17
- I was in charge when the MOA was developed. I 18
- signed the MOA for the regional manager in Sacramento, and I 19
- 20 was responsible for developing the biological opinion. By
- working with staff, we completed the programmatic opinion, as 21
- 22 well as the tiered consultations for Coyote Springs Investment
- and Southern Nevada Water Authority. 23
- Again, as I said, I retired in January of 2011. 24

- Water District for the past 24 years. 1
- In my capacity there, I have worked as a 2
- biologist, supervising biologist, environmental manager, and 3
- department director. 4
 - I have participated in field surveys for
- threatened endangered species, worked in the development of 6
- 7 Endangered Species Act compliance programs, like the Lower
- Colorado River Multispecies Conservation Plan and the Clark 8
- 9 County Multispecies Habitat Conservation Plan.
- 10 I participated in the development of Section 7
- consultation documents, which included the biological 11
- 12 assessment and working with the Fish and Wildlife Service on
- the BO for the memorandum agreement and the tiered Section 7 13
- consultation. 14
- I sat on the technical team that worked and 15
- developed the triggers and mitigation measures that are 16
- 17 embedded within the memorandum of agreement and the biological
- opinion. 18
- I've also worked in a team to acquire the Warm 19
- 20 Springs Natural Area. And since 2010, as the department
- director, I've overseen the staff that had worked on the 21
- biological advisory committee, which is the biological team 22
- that's embedded within MOA and BO. 23
 - I've worked on the management of the Warm Springs

(3) Pages 1100 - 1103 Min-U-Script® **Capitol Reporters** 775-882-5322

24

Page 1104

- 1 Natural Area, which my team oversees, and the overall
- 2 implementation of the conservation measures that are included
- 3 in the memorandum of agreement and the biological payment.
- 4 Q. Thank you. Thank you.
- 5 Did each of you also work on a report that was
- 6 submitted to the State Engineer involving the Moapa Dace?
- 7 MR. WILLIAMS: Yes.
- 8 MR. MARSHALL: Yes.
- 9 BY MR. TAGGART:
- 10 Q. And did you each also work on a revolved report
- 11 that was provided to the State Engineer involving that same
- 12 topic.
- MR. WILLIAMS: Yes.
- MR. MARSHALL: Yes.
- 15 BY MR. TAGGART:
- 16 Q. Okay. And through the hearing, officer, we
- offered Exhibit 7, 8 and 9 into evidence. We've now presented
- 18 all of our witnesses who are available for cross-examination,
- and those are the three reports that we submitted.
- 20 HEARING OFFICER FAIRBANK: And those reports will
- 21 be admitted. And also just for purposes of clarification, Mr.
- 22 Williams was proffered as an expert and without objection.
- 23 He's not previously been qualified by the State Engineer, and
- 24 so for the purposes of these proceedings and limited to these

- 1 from the beginning -- in my beginning working on the species
- 2 at issue back in 1998 to today, the issue has been the same:
- 3 What can we develop in the carbonate aquifer that doesn't
- 4 jeopardize, you know, the continued existence of Moapa Dace.
- 5 And I have to say that I think the State
- 6 Engineer's office has taken a very good and cautious approach
- 7 towards that issue. You know, the Order 1169 came out of the
- 8 conflict between, you know, the parties trying to say how much
- 9 was available. The State Engineer at that time said, well,
- 10 let's have a pump test. Let's see what's available.
 - You know, in 2013 after the pump test, reports
- 12 were developed and, again, you know, trying to -- each party
- trying to express what they thought is available.
 - The question still stands, and it's all about
- 15 protecting the endangered species while coming up with a
- 16 volume.

11

14

- 17 Q. And, Mr. Williams, could you also describe in
- 18 your view what the role of the Endangered Species Act is with
- 19 respect to the groundwater pumping in the Lower White River
- 20 Flow System?
- 21 A. Well, the Endangered Species Act being very broad
- 22 in its scope and requiring, you know, federal agencies, and
- 23 pretty much everybody -- I mean, the Endangered Species Act,
- as it was crafted, involved states, involved private

Page 1105

Page 1107

- 1 proceedings he will be admitted as an expert.
- 2 MR. TAGGART: Great. Thank you.
- 3 BY MR. TAGGART:
- 4 Q. And have you also -- the two of you also provided
- 5 documents as part of the record for the State Engineer to
- 6 consider that support your reports?
- 7 MR. MARSHALL: Yes.
- 8 MR. WILLIAMS: Yes.
- 9 MR. TAGGART: Okay. And for the record, those
- documents have been identified as SNWA's Exhibit 38
- 11 through 57.
- BY MR. TAGGART:
- 13 Q. Okay. Now, Mr. -- Mr. Williams, I'd like to ask
- 14 you, what is the, in your view, relevance of the Moapa Dace to
- the State Engineer's question about the long-term annual
- 16 quantity of groundwater that can be pumped in the Lower White
- 17 River Flow System?
- 18 ANSWERS BY MR. WILLIAMS:
- 19 A. I think the relevance of the Moapa Dace has --
- 20 with respect to the question of the long-term annual pumping
- 21 that's available, has been around a long time, as we all know,
- and it -- because it's a listed -- federally listed species.
- And -- and actions that would cause jeopardy to
- 24 the species being something considered, I think, you know,

- 1 individuals, federal agencies to basically preserve sensitive
- 2 endangered species.
- Nobody has allowed the opportunity to take a
- 4 species, that be killing it or harming it or harassing it, and
- 5 "harassing" being defined as, you know, limiting habitat, if
- 6 you will, you can't do that. You have to be prudent. You
- 7 can't just go out and take it, take a species.
- 8 So, the Endangered Species Act, I think, has
- 9 driven the processes that we're in to try to understand, you
- 10 know, what can be developed in the carbonate aquifer without
- 11 endangering a species, so -- without impacting the Moapa Dace
- and its habitat. So I think it's played, you know, a pivotal
- 13 role where we are today.
- 14 Q. Now, in your experience with the Fish and
- 15 Wildlife Service, were there examples of when the State
- 16 Engineer of Nevada took the Endangered Species Act into
- 17 account or when the Endangered Species Act affected decisions
- 18 of the Nevada State Engineer?
- 19 A. Yes, and three in particular come to mind. The
- 20 first was -- that I recall was in 1991 when the State Engineer
- 21 protected in-stream flow rights on Summit Lake on Mahogany
- 22 Creek for spawning and recreational purposes for Lahontan
- 23 Cutthroat trout recovery and protection.
- Another was in 1998 when the State Engineer

Min-U-Script® Capitol Reporters (4) Pages 1104 - 1107 775-882-5322

Page 1111

Page 1108

- 1 appropriated -- or basically granted the unappropriated rights
- 2 on the Truckee River to the Pyramid Lake tribe for the
- 3 protection of Lahontan cutthroat trout and cui-ui, a sucker
- 4 that only -- a species -- fish species sucker that only occurs
- 5 in Pyramid Lake.
- The State Engineer said to do otherwise would
- 7 have jeopardized -- or would have violated the Endangered
- 8 Species Act.
- And the third one, of course, is the Devil's Hole
- 10 pupfish case, where, you know, a quantity of water has to be
- 11 protected over the shelf of Devil's Hole pupfish, and that was
- 12 the first Keeper versus in the United States. And it -- you
- know, it basically has caused groundwater irrigation
- 14 development to be curtailed in the years when there's drought
- to maintain the Devil's Hole spawning and feeding areas for
- 16 Devil's pupfish.
- 17 Q. Thank you.
- Mr. Marshall, do you have anything to add to Mr.
- 19 Williams' testimony regarding the relevance of the Moapa Dace
- 20 to the question of the long-term annual quantity of
- 21 groundwater that could be pumped in the Lower White River Flow
- 22 System?
- ANSWERS BY MR. MARSHALL:
- 24 A. Yes. I think it's important to understand that

- 1 describing the biological requirements of the Moapa Dace.
- 2 Q. Okay. I want to ask you a couple specific
- 3 questions, but I'm going to put up on the screen a picture of
- 4 a Moapa Dace.
- 5 Is that -- is that what we're looking at right
- 6 now?

14

- 7 A. Yes, it is.
- 8 Q. Okay. And could you briefly, in your view,
- 9 describe the Dace, and specifically the thermal or temperature
- 10 requirements in water at the spring heads for this fish?
- 11 A. Right. So just physically, Dr. Schwemm mentioned
- that this fish gets up to approximately 120 millimeters.
- 13 We're finding smaller fish in the system in recent years.
 - It's readily identifiable so that the data that
- we collect in the field through similar surveys is through
- visual observation of these animals. And like I said, they're
- distinct and easily to identify in the stream.
- They are thermophilics, and they're unique, like
- Dr. Schwemm mentioned. They require warm water to reproduce,and that range of temperature is between 30 and 32 degrees
- and that range of temperature is between 30 and 32 degrees.
- 21 Celsius. And so they reproduce in the upper portions of the
- 22 Muddy River tributaries.
- But the later life stages may use a broader range
- of habitat. The larger adults, they are more -- they have

Page 1109

- the Moapa Dace depends on flows in the upper portion of the
- 2 Muddy River, particularly the Pederson Unit.
- And to the extent that groundwater pumping in the
- 4 Lower White River Flow System has the potential to impact
- 5 those flows, the State Engineer should be concerned and should
- 6 take that into consideration.
- 7 I think it's also important to know that the
- 8 State has been involved in the conservation and recovery
- 9 actions of Moapa Dace for a very long time.
- And in recent years, since we entered into the
- 11 memorandum agreement, Nevada Department of Wildlife has been a
- key player in the actions that we implemented and sets a
- 13 precedence for -- for I think the State Engineer to consider
- 14 potential impacts of groundwater pumping on the Moapa Dace and
- 15 its habitat.
- 16 Q. Mr. Marshall, were you present or did you hear
- 17 Dr. Schwemm's testimony last week?
- 18 A. Yes, I did.
- 19 Q. And I'm going to ask you some questions briefly
- 20 about the Dace itself.
- Do you agree generally with his testimony
- 22 regarding the Dace and the -- the biological requirements of
- 23 the Dace
- 24 A. Yes, I do. I think Dr. Schwemm did a good job in

- 1 more reproductive potential and will use cooler water down
- 2 into the main stem.
- They are restricted to habitats above the Warm
- 4 Springs -- I'm sorry -- yes, the Moapa Gage. And I'll show a
- 5 map in a little bit in terms of where most of the species are.
- 6 Q. All right. Let's go to that right now. I think
- 7 that's Figure 3-1 in your report; is that right?
- 8 A. Yes, it is.
- 9 Q. Okay. Can you describe what is shown on that
- 10 particular figure? I think Dr. Schwemm used this as well, but
- can you describe this figure in your view?
- 12 A. So this figure comes from the Warm Springs
- 13 Natural Area's stewardship plan. And there is an error on
- 14 this figure that I would like to correct.
- On the scale to the left, there are temperatures
- that are correlating with the colors of the map. The last two
- temperatures should be 28 degrees Celsius and 27 degrees
- 18 Celsius. So that's the scale on the far left.
- 19 And --
- 20 Q. So just to be clear, where it says 27 degrees, it
- 21 should be 28 degrees, and where it says 22 degrees, it should
- 22 say 27 degrees?
- 23 A. Yes, that's correct.
- 24 Q. All right.

Min-U-Script® Capitol Reporters (5) Pages 1108 - 1111 775-882-5322

Page 1112

- 1 A. We've also drawn a box around the Apcar,
- Pederson, Plummer and Refuge streams to indicate that this is 2
- where 95 percent of the Moapa Dace population occurs. 3
- This is approximately one-third of the historical 4
- habitat. So it's about two miles of stream length, and the 5
- historical habitat was approximately six months. 6
- We've also added the Moapa Gage, which you can
- see on the lower right-hand corner of the figure, and the Warm 8
- Springs West Gage, which is about center and lower third of 9
- the figure, which shows where that Gage is located, and it 10
- measures the combined flow of the Pederson Unit Springs. 11
- And then the colors represent the different 12
- 13 temperatures.
- And, again, Moapa Dace breed in temperatures 14
- 15 32 degrees C to 32 degrees C.
- Q. Can you describe the recovery goals for the Dace 16
- 17 and the progress that's been made towards those goals?
- A. So the recovery goal -- so there's a recovery 18
- 19 plan for the aquatic species of the Muddy River. In that plan
- it lays out what the goals are for -- for recovery of the 20 species. 21
- The primary goals are to get the population of 22
- adult fish to 6,000 animals for five consecutive years 23
- to protect, maintain 75 percent of the historical habitat, and 24

- report and describe what is shown there. 1
- 2 A. So this figure shows a history of the Moapa Dace
- population and the occurrence of tilapia. So tilapia were
- originally introduced in the system. I can't see this number.
- I can show it here. 5

6

10

- So the blue line is -- is pre-tilapia, and I
- 7 think that number is in the 1995-'96 time frame when tilapia
- were introduced. And you can see that once tilapia were
- introduced, the Moapa Dace population fell precipitously. 9

And Gary Scapatoni produced -- or published a

paper in the mid-1990s found that tilapia not only competed 11

12 with Moapa Dace for habitat, but they also predate Moapa Dace,

13 or they eat them. So this is pretty obvious impact here from 14

tilapia regarding Moapa Dace population.

15 They sort of stabilized and bounced around into

the 2000's. And then by about 2012 through major efforts 16

17 regarding the MOA and efforts of Nevada Department of Wildlife

and Fish and Wildlife Service, the tilapia were removed by 18

19 building fish barriers in the system, poisoning sections of the stream with -- with a pesticide called Rotenone, and then 20

deconstructing those fish barriers to allow fish passage to 21

occur later. 22

And so the effect of that was a significant 23

24 increase in Moapa Dace population after 2012.

Page 1113

- to have five spring complexes that are providing habitat for
- 1 the species, and to also remove non-native species and 2
- parasites from the system to the extent that the conservation 3
- recovery of the species are not impeded. 4
- To date, through efforts of the Fish and Wildlife 5
- Service, Nevada Department of Wildlife, and the activities of 6
- 7 the signatories of the memorandum of agreement, we have
- tripled the population from 2008 from 500 fish to 1,500 fish. 8
- 9 And that's a total count, not an adult count. But we're on a
- trajectory to move towards recovery. 10
 - We have -- approximately 87 percent of the
- historical habitat is now in ownership by either the Fish and 12
- Wildlife Service, the Southern Nevada Water Authority, the 13
- Warm Springs Natural Area acquisition. We've done significant 14
- habitat restoration in the Plummer, Pederson, Apcar Refuge 15
- streams. And we also have dedicated flows as part of the MOA 16
- and water development and water district dedicated one CFS in 17

the Jones Springs, which provides flow to the Apcar system.

- And, finally, and probably one of the most 19
- 20 important things that's been accomplished is the removal of
- the non-native species tilapia from the system, which has had 21
- 22 a significant positive impact on the population of the Moapa
- 23

11

18

Q. Mr. Marshall, let's look at Figure 3-2 of your

- 1 Q. And what -- in your opinion, Mr. Marshall, what
- is the biggest threat to the Dace now?
- 3 A. Well, over time there have been a number of
- significant threats to the Moapa Dace. But after the removal
- 5 of tilapia from the system, the restoration of habitat today,
- I think, impacts to the flows in the upper streams are the 6
- major, primary threat to the existence of Moapa Dace. 7
- Q. Again, I want to show you a picture up on the
- 9 screen that's entitled "Pederson Spring." What is this 10 showing?
- 11 A. So this is one of the five springs in the
- 12 Pederson complex, and it's one of the smaller ones.
 - But the point of this picture is just to
- demonstrate that these systems are small, and that small, 14
- incremental impacts to flows and Moapa Dace habitat can have a 15
- significant long-term impact to its ability to reproduce and 16 17 maintain itself in the system.
- Q. Okay. And on the next page, what's there? 18
- What's that a photograph of? 19
- 20 A. This is one of the Plummer spring heads in the
- 21 Plummer system, which is on the Refuge, and just -- just east
- of the Pederson system. And, again, it's to demonstrate the 22
- small size of -- of habitat that this species depends on. 23
- 24 Q. Okay. Now, I'm also going to show you what's

Page 1115

13

Page 1119

Page 1116

- been marked as Figure 5-7 in SNWA Exhibit 7. 1
- Do you see that document? Specifically the 2
- hydrograph for the Warm Springs West near Moapa, Nevada 3
- hydrograph? 4
- A. Yes. And I understand that Warm Springs West is
- the second table from the top, the second graph from the top,
- and this demonstrates the flows at Warm Springs West prior to,
- during, and after the Order 1169 pump test. 8
- And I think what's important here is that soon 9
- after the pump test was completed, that the flows in Warm 10
- Springs West got down to a point just above 3.2 CFS, which is 11
- one of the triggers in the memorandum of agreement. So just 12
- 13 above that.
- And then in the last few years, the flows have 14
- 15 been bouncing around 3.3 to 3.4 CFS. So, we're close to that
- first trigger in the memorandum of agreement. 16
- 17 Q. And are you -- are you familiar with the expert
- reports that were submitted by CSI? 18
- A. Yes, I am. 19
- Q. And to the extent those reports refer to
- conditions for the Dace in the Muddy River at the Moapa Gage, 21
- what is your view regarding focusing on that location for
- addressing the condition of the fish? 23
- 24 A. So, the Moapa Gage, as I showed earlier, is at

- far left column, and -- and then there are the associated 1
- actions or pumping restrictions that are tied to those 2
- 3
- Q. Now, how would you characterize the pumping
- restrictions? Are they voluntary, or are they mandatory?
- A. These triggers and pumping restrictions were
- included in the programmatic biological opinion and the tiered
- biological opinions for SNWA, the water district, and the
- Moapa band of Paiutes. And because the compliance documents 9
- depend on these triggers and the protection of in-stream flows 10
- for Moapa Dace, they are mandatory. 11
- 12 If we didn't follow these triggers, we would be
- 13 out of compliance with the Endangered Species Act.
- ANSWERS BY MR. WILLIAMS: 14
- 15 Q. And to you, Mr. Williams, could you describe in
- your view what the purpose of the MOA was and who the parties 16
- 17 to that MOA are?
- A. Yes. The purpose of the memorandum of agreement 18
- 19 that was signed by the Moapa Valley Water District, Coyote
- 20 Springs Investment, Southern Nevada Water Authority, Moapa
- Band of Tribe as Fish and Wildlife Service was to provide a 21
- mechanism for the pump test, the 1169 Order, 1169 pump test. 22
- The MOA was basically again the vehicle or the 23
- mechanism by which Fish and Wildlife Service could enter into 24

Page 1117

- the bottom end of the historical range in occurrence of Moapa an agreement under Section 7A-1. It'd be more voluntary, but
- Dace. It measures the combined flows of the North Fork, South 2
- Fork, Big Muddy, Apcar, Pederson, Plummer Refuge streams. And
- in my opinion it does not provide sufficient resolution to 4
- understand how impacts to those higher elevation springs might 5
- have on Moapa Dace population. 6
- 7 That's why the MOA focuses on the Warm Springs
- West Gage, which measures the flows of the Pederson complex 8
- 9 where those numbers matter to Moapa Dace and its ability to
- reproduce in the system. 10
- Q. Now, Mr. Marshall, I want to ask you about 11
- Table 5-1, and I've heard you talk about the Warm Springs West 12
- Gage. Can you describe how that Gage is included in this 13
- table and also what this table is showing generally?
- A. Right. So there are two main components of the 15
- memorandum of agreement. One is a set of triggers that are 16
- intended to protect and maintain in-stream flows in Moapa Dace 17
- habitat, and that is this table here. 18
- But the other component, or the conservation 19
- 20 measures or conservation package, we'll talk about a little
- later. 21
- So, as you can see here, this table shows the 22
- signatories to the memorandum of agreement. That is the 23
 - parties that have water rights. And the triggers are on the

- it's supposed to be contributing toward conservation of 2
- 3 species.
- So the MOA basically was a way for us to design a 4
- pump test with triggers that allow temporary take, if you
- will, of the Moapa Dace and habitat. 6
- 7 Q. And what are the key components to that
- memorandum of agreement?
- 9 A. Well, the key components for the MOA is really
- the conservation measures. And then the triggers and the 10
- pumping restrictions are actually after we identified all the 11
- conservation measures that would basically offset any impacts
- to the Dace. 13
- The key to the -- one of the key conservation 14
- measures was the dedication of Jones Springs for the Apcar 15
- unit on the Refuge. It was, you know, a big part of the 16
- recovery effort for the species at that time. 17
 - There were restoration as part of the
- 18
- conservation measures. I know removal of, you know, 19
- 20 non-natives' funding for recovery implementation program, that
- was supposed to be designed for continuing the conservation 21
- 22 action after the pump test, with the parties, you know,
- 23 working together for long-term species recovery and management

of the system.

Page 1120

1

6

11

17

18

- 1 Q. And was a biological opinion completed by the
- Fish and Wildlife Service as part of the approval of the MOA?
- A. Yes. It was primarily crafted in the Las Vegas
- office by staff, and I oversaw it and signed it. It was
- programmatic in nature; that meaning that we analyzed in the
- programmatic opinion the full impact of pumping 6
- 16,100 acre-feet as ordered or the existing rights. 7
 - So the programmatic nature of it allowed us to do
- a full analysis, look at the impacts of what the triggers 9
- would have on the species and its habitat. 10
- 11 From there we were able to then do what they
- called tiered biological opinions for Southern Nevada Water 12
- 13 Authority. Their tiered opinion was about 9,000 acre-feet at
- that part of the sixteen one, and then they were able to 14
- 15 initiate construction of the pipeline from the Coyote Springs
- Valley down to the Muddy River area. 16
- 17 The other programmatic that was done during my
- time as supervisor was the tiered consultation for Coyote 18
- Springs Investment that allowed them to develop their 19
- 4,100 acre-feet. 20
- Q. So, does the MOA provide Endangered Species Act 21
- compliance for the parties to that agreement?
- A. Yes. 23

8

24 Q. What about parties who are not -- who did not

- ANSWERS BY MR. MARSHALL:
- 2 A. Yes, there was.
- I think it's important, though, to recognize the 3
- two modeling efforts that were done during the consultation 4
- period and then the two that were done afterwards. 5
 - So Fish and Wildlife Service contracted Otis Bay
- to do a head grass modeling effort to model changes in flow --
- how changes in flow impact the habitat quantity. Desert
- Research Institute was also contracted to do a thermal load 9
- model, and so they evaluated how changes in flow impact 10
 - temperatures in the system.

And then after the biological opinion was 12 13

- completed and as part of the funding commitments in the memorandum of agreement, the USGS was contracted to do an 14
- 15 ecohydrologic model by Dr. Hatten, and that's the model that
- Dr. Schwemm mentioned. 16

And there was also a stochastic population model that was completed as part of that effort and done by USGS.

Those four models together create the evidence 19 that shows that changes to flow impact habitat quantity and 20

quality, which impacts the biological success in Moapa Dace, 21

and it also impacts the carrying capacity of the stream. 22

So we have a full connection of flows to carrying 23 capacity of the system with those four studies. 24

Page 1121

- sign the agreement? Is there ESA compliance for those parties
- if they affect the Dace? 2
- A. No. Not as part of the MOA or the biological 3
- opinions that have been issued to date.
- Q. Did the analysis in the biological opinion
- evaluate the triggers themselves? 6
- 7 A. Yes. From 3.2 down to 2.7.
- Q. In the MOA, are the triggers flexible or are they
- fixed in terms of how the MOA is intended to be implemented?
- A. Well, the MOA structure has fixed the triggers, 10
- but the pumping restrictions can be modified. That was the 11
- purpose of the technical review team, is to look at what was 12
- going on hydrologically, maybe even after the pump test, and 13
- then adjust the restrictions appropriately based on new
- information. 15
- Q. And did the analysis in the biological opinion 16
- evaluate the 3.2 CFS flow at Warm Springs West Gage and 17
- whether that is a requirement for the Dace? 18
- A. Yes. 19
- 20 BY MR. TAGGART:
- Q. And to you, Mr. Marshall, was there additional 21
- 22 modeling done after the MOA was executed to evaluate the
- requirement of 3.2 CFS for the Dace? 23
- 24

Page 1123

- 1 Q. And, Mr. Marshall, I'm going to read you a
- statement out of an Exhibit that's been provided by CSI and 2
- was drafted by Stetson Engineers, which states, "Although the 3
- interim order aims to protect existing senior rights in the 4
- public interest in endangered species, objected data linking 5
- the survival of the Moapa Dace to the flow in Pederson spring 6
- has not been provided." 7
- Do you agree with that statement? 8
- A. No, I don't, and because of what I just
- mentioned. Those four studies build that linkage from the 10
- quality -- or the quantity of flows to the success of Moapa 11
- Dace in the system. 12
 - There's also a couple decades of research that
- has been done by Gary Scapatoni and other researchers which 14
- have found what -- what Moapa Dace need in terms of resources, 15
- temperature of water and those type of things to support 16
- the -- and end up resulting in the recovery of Moapa Dace in 17
- 18 the system.

13

- Q. Mr. Marshall, in your view, was the MOA and the 19
- 20 biological opinion that -- that was analyzed -- analyzed the
- MOA, was it structured to allow for a temporary reduction in 21
- 22 flow below 3.2 or for a permit reduction of flow below 3.2?
- A. So the MOA does two things. It allows for the 23
- development of 16,100 acre-feet of water rights in Coyote

Min-U-Script® (8) Pages 1120 - 1123 Capitol Reporters 775-882-5322

Page 1124

- Springs Valley and California Wash. It provides for the Order 1 1169 pump test. 2
- And there are a couple provisions in there that 3
- are temporary, particularly to the Arrow Canyon well within
- its operation. And then the MOA provides for the long-term
- development of that 16,100 acre-feet in the associated 6
- biological opinion. 7
- The way that the triggers are set up and the 8
- actions under those triggers, I believe that the intent of the 9
- MOA was to maintain 3.2 CFS in the system. It allows for 10
- flows to drop down to 2.7, and the tiered biological opinions 11
- allow the flows to drop to 2.78, but the intent was to get the 12
- 13 system back to 3. 2.
- Q. And, Mr. Williams, from the services perspective, 14
- 15 do you agree with that statement?
- ANSWERS BY MR. WILLIAMS: 16
- 17 A. Yes, I do. At the time, the MOA and the writing
- of the MOA and the biological opinion that facilitated the 18
- pump test was critical to the Fish and Wildlife Service at 19
- that time. 20
- And I think that the -- the conditions below 3.2 21
- to allow the pump test to fully -- for the parties to 22
- basically more fully understand what's available was -- was 23
- the key, along with all the mitigation of the conservation 24

- set up, if flows go below 3.2 CFS -- and so that triggers 1
- actions by the signatories. 2
- If, as I understand it in the analysis of the 3
- results of Order 1169, the -- the flow volumes that are 4
- included in the actions under the triggers are not sufficient 5
- in returning flows to 3.2 CFS, then the HRT is required to 6
- 7 convene and to begin modifying those actions or making
- recommendations to modify those actions under the triggers, 8
- which include, potentially, additional restrictions to 9 pumping. 10
 - The HRT, if they don't come to agreement, there's
- provision in the MOA that they will obtain a third party to 12
- 13 essentially make a decision.
 - Through this entire process, the Fish and
- 15 Wildlife Service also has the discretion to call for a
- reconsultation of the opinions and reevaluate those -- those 16
- pumping restriction actions that are identified under the 17
- triggers. 18

11

14

- Q. And do the pumping restrictions apply to 19
- permanent uses of water rights?
- 21 A. Yes, they do.
- Q. And, Mr. Marshall, I want to ask you, what is 22
- your recommendation to the State Engineer to protect the Moapa 23
- 24 Dace in the long-term quantity of groundwater pumping in the

Page 1125

Page 1127

- measures that came with it. 1
- I think the -- the intent of the MOA was to get 2
- more information to make better decisions. It was not the 3
- intent of the MOA to go on in perpetuity. 4
- The -- the information for the -- from the pump 5
- test, in my view, should be, you know, evaluated in today's 6
- time and, you know, potentially, you know, modify the MOA. 7
- MR. TAGGART: Thank you. Just I want to ask the 8
- 9 hearing officer, I want to make sure I save five minutes for
- redirect, if I can. 10
- HEARING OFFICER FAIRBANK: You're at 40 minutes 11
- and 20-something seconds. 12
- MR. TAGGART: Okay. Thank you. 13
- BY MR. TAGGART:
- Q. Mr. Marshall, in your view what will happen under 15
- the MOA if flows fall below 3.2 given the current hydrologic 16
- condition with pumping? 17
- ANSWERS BY MR. MARSHALL: 18
- I'm not sure I understand the question. 19
- Q. Well, do you have an understanding of the -- of 20
- the components of the MOA and the committees that are 21
- 22 developed under the MOA and how those committees are supposed
- to react depending on triggers? 23

Min-U-Script®

24 A. Okay. So, the way the MOA and the opinions are

- Lower White River Flow System? 1
- ANSWERS BY MR. MARSHALL: 2
- 3 A. So my recommendation to the State Engineer is to
- protect 3.2 CFS in -- at the Warm Springs West Gage. 4
- It's my understanding from the research that our 5
- hydrologists have done and others that a lesser volume in 6
- 7 pumping than was contemplated in the MOA may have a greater
- impact on the springs. 8
- 9 And so my recommendation is -- like our
- hydrologists, is to restrict pumping in the Lower White River 10
- Flow System to 4,000 to 6,000 acre-feet per year. 11
- And I also think additional hydrologic or pumping 12
- studies might benefit our understanding of how long-term 13
- pumping in the Lower White River Flow System could impact 14
- Moapa Dace habitat in that 3.2 CFS. 15
- Q. And if groundwater pumping is authorized that 16
- leads to reduction below 3.2 CFS, what are your concerns about 17
- what could happen at that point? 18
- A. So, the memorandum of agreement and the 19
- 20 biological opinions contemplate flexibility, they require
- flexibility, in terms of pumping restrictions. 21
- My concern would be permanent uses, like 22
- industrial residential uses, are established and that that flexibility is essentially taken away, where we cannot reduce 24

Capitol Reporters

775-882-5322

23

(9) Pages 1124 - 1127

Page 1128

- 1 pumping the impacts that flows and results in something less
- than 3.2 CFS at the Warm Springs West Gage and causes a 2
- significant conflict with the Endangered Species Act and the 3
- 4 Lower White River Flow System.
- ANSWERS BY MR. WILLIAMS:
- Q. Mr. Williams, same question to you is what's your 6
- recommendation to the State Engineer regarding protection of
- the Moapa Dace and how it relates to the long-term quantity of
- groundwater pumping in this area?
- A. Well, my recommendation would be to continue to 10
- investigate what is a long-term annual amount. I think that 11
- maintaining -- and I agree with Mr. Marshall -- that 12
- 13 maintaining 3.2 or above avoids not only jeopardizing the

avoid a conflict with the National Wildlife Refuge as they

- Moapa Dace and adversely modifying its habitat, but you also 14
- have a 3.5 to divert for a water right for the refuge, and 16
- 17 they, you know, can't arbitrarily, you know, give up a water
- right. They have reserved that in the MOA to basically, you 18
- 19 know, I guess challenge or, you know, ask for a determination
- on that refuge water right. 20
- So, I listened to testimony last week with 21
- respect to the hydrologic analysis information. I 22
- specifically listened to Tim Mayer, who over the time -- I met 23
- Tim Mayer in 1998 when we were negotiating with Moapa Valley 24

- **CROSS-EXAMINATION** 1
- BY MR. HERREMA: 2
- 3 O. Good morning. My name is Brad Herrema, and with
- me is -- I thought Kent was here. Sorry.
- I'm Brad Herrema. I represent CSI, and I just 5
- have a handful of questions. 6
- 7 BY MR. HERREMA:
- 8 Q. Mr. Williams, I believe you said you retired from
- U.S. Fish and Wildlife Service in 2011; is that correct?
- ANSWERS BY MR. WILLIAMS: 10
- 11 A. That's correct.
- 12 Q. So the opinions that you've given today are not
- 13 the opinions of U.S. Fish and Wildlife Service, but your own;
- is that correct? 14
- 15 A. That's correct.
- 16 Q. All right. Mr. Marshall, in regard to the 3.2
- CFS and the amount of carbonate pumping in the Lower White
- River Flow System that would keep flows at Warm Springs West 18
- 19 Gage above that trigger, did you do any hydrologic analysis of
- your own to determine that volume? 20
- 21 A. No. I'm not a hydrologist, so I did not do that.
- Q. Okay. So you're just relying on the folks who
- testified on Friday for what that quantity is; is that 23
- correct? 24

Page 1129

Page 1131

- 1 Water District over Arrow Canyon, and his position has not
- changed. 2

15

- I think that being conservative, going slowly 3
- with respect to this decision, is by far in the interests of 4
- the public and the species, not -- or not putting yourself in
- the situation where violating ESA would be critical to, you 6
- know, the decision. 7
- O. Thank you. 8
- 9 MR. TAGGART: We have no further questions.
- HEARING OFFICER FAIRBANK: Okay. So that leaves 10
- you about 13 minutes. 11
- MR. TAGGART: Thank you. 12
- HEARING OFFICER FAIRBANK: And so we will go 13
- ahead and open it up for questions. And, again, similar as we
- did last week, we're just going to go ahead and cycle through. 15
- We have an amount of time that's allotted. 16
- And this week we're going to be a little bit more 17
- condensed -- or a lot more condensed on our time frame, so 18
- efficiency, then, is going to be of the utmost importance. 19
- 20 And for today we have allotted four minutes per
- participant, and so we will go ahead and start with Coyote 21
- 22 Springs Investments.
- 23

24

- 1 A. Yes, that's correct.
- 2 Q. Mr. Marshall, you said that the Moapa Dace
- depends on flows in Pederson Springs. Do you recall saying
- that? 4
- 5 A. Yes, I do.
- Q. Table A2, which is on page A3 of Appendix A to
- your June 2019 report, that shows the Dace counts in Reach 5 7
- over the last 11 or 12 years. 8
- 9 What that shows, when I read it, is that there's
- been an increase in the Dace counts over the last couple 10
- years, while at the same time the water authorities hydrology 11
- 12 panel testified last Friday that groundwater levels at EH-4
- have been declining. 13
- This seems to indicate as Dace population has 14
- increased during that period, there's been a decline at the 15
- same time in EH-4 groundwater levels. 16
- Are there successful mitigation measures that 17
- were being used that can explain this inverse relationship? 18
- A. I'm sorry. I'm going to need you to restate the 19
- time period that you're referencing. 20
- 21 Q. 2017 winter through 2019 winter, Reach 5, which
- is under Pederson; do you see that? 22
- 24 Q. Okay. The Dace counts have steadily increased

Page 1135

Page 1132

- 1 during that period at the same time the EH-4 groundwater level
- 2 was declining.
- 3 So are there mitigation measures that have been
- 4 successfully implemented that can explain the fact that the
- 5 Dace count has been increasing while EH-4 pumping levels have
- 6 been -- or I'm sorry -- groundwater levels have been
- 7 decreasing?
- 8 A. So these numbers that you're talking about --
- 9 just so that I am sure what you're saying -- winter of 2017
- 10 was 29 animals?
- 11 Q. Yes.
- 12 A. And then 32 and then 49 and then 51 and then 88.
- 13 Q. Yep, you got them.
- 14 A. Yeah. So, since 2017, I'm not aware of any
- specific restoration efforts, but I do know that Fish and
- 16 Wildlife Service is actively doing management in terms of the
- 17 removal of non-native plant species in that system from one
- year to the next. And I would submit that this is a
- 19 relatively small variation in numbers in that specific area.
- I also want to caution that comparing summer to
- 21 winter numbers is not appropriate because the summer numbers

HEARING OFFICER FAIRBANK: United States Fish and

HEARING OFFICER FAIRBANK: Seeing no questions,

MR. BURLEY: Thank you. For the record, I'm

Richard Burley, attorney for the Moapa Band of Paiutes.

Q. Mr. Williams, I guess and Mr. Marshall, you were

both involved in helping to formulate and -- the 2006

MR. BURLEY: And at the time it was done, you

prepared -- Mr. Marshall, you were involved in preparation of

the biological opinion, which indicated that the MOA was

19 20

- 1 period of time when we reviewed and commented on Fish and
- 2 Wildlife Service -- the Fish and Wildlife Service biological
- 3 opinion, but the final opinion was a Fish and Wildlife Service
- 4 product.
- 5 MR. BURLEY: Right. Mr. Williams, this was done
- 6 13 years ago, 2006. In your opinion, is the MOA still
- 7 protective of the Moapa Dace?
- 8 MR. WILLIAMS: Yes.
- 9 MR. BURLEY: Mr. Marshall, would you agree?
- MR. MARSHALL: Yes, I do, as long as we maintain
- 11 those flows in Pederson. The 3.2 CFS.
- 12 BY MR. BURLEY:
- 13 Q. So you view the MOA as something of a success in
- terms of the purposes for which this was developed?
- 15 ANSWERS BY MR. MARSHALL:
- 16 A. Yes, I do.
- 17 Q. Are you familiar with an annual process by which
- 18 the mitigation measures, the pumping restrictions, are
- 19 reviewed by a hydrologic review team?
- 20 A. Yes, I am.
- 21 Q. And that team includes representatives of the
- 22 Fish and Wildlife Service and SNWA and the Moapa Band of
- 23 Paiutes and Coyote Springs?
- 24 A. Yes.

Page 1133

- MR. HERREMA: I think I heard my buzzer. Thank 1 Q. Are you aware that every year, annually, there
 - 2 have been no suggestions thus far to change the mitigation
 - 3 measures and pumping restrictions within -- by the HRT?
 - 4 A. Yes, I am aware that there have been no
 - 5 recommendations so far. There has been significant -- a
 - 6 significant amount of lively discussion within that team,
 - 7 though, each year.
 - 8 Q. Fair enough.
 - Are you aware that the mitigation measures, the
 - 10 pumping restrictions are different in -- for Coyote Springs
 - 11 than for California Wash?
 - 12 A. Yes, I am.
 - 13 Q. The proportionalities are different, just the
 - 14 general rates of reduction are different?
 - 15 A. Yes.
 - 16 Q. Do you think that was a rational choice by the
 - 17 MOA parties?
 - 18 A. It was based on the understanding of the
 - 19 hydrology of the system at the time. And so, again, I'm not a
 - 20 hydrologist, but it does seem to be a rational approach.
 - 21 Q. Do you know the status of temperature monitoring
 - in the springs these days?
 - 23 A. No. No, I don't.
 - 24 Q. Do you know if there is any temperature --

r ago i roo

21 sufficiently protective of the Dace at that time; is that

- 22 accurate?
- MR. WILLIAMS: So I was involved in the preparation of the biological assessment, and there was a

Min-U-Script®

Capitol Reporters 775-882-5322

(11) Pages 1132 - 1135

Page 1136

- 1 ongoing temperature monitoring in the springs?
- 2 A. I'm not aware of Fish and Wildlife Services
- 3 conducting temperature monitoring.
- 4 I know that SNWA is looking at installing a
- 5 network of publications through the system to begin monitoring
- 6 temperature.
- 7 Q. What about chemical or isotopic monitoring?
- 8 A. I'm not aware.
- 9 Q. Okay. So the only active monitoring that you
- 10 know about is flow monitoring; is that -- is that fair?
- 11 A. Flow monitoring and monitoring of the Moapa Dace
- 12 population.
- 13 Q. Okay. Were either of you involved in the design
- of the 1169 pump test?
- 15 A. I was not.
- MR. BURLEY: Is that my time being up?
- 17 HEARING OFFICER FAIRBANK: That is your time, but
- 18 if we have time --
- MR. BURLEY: Okay.
- 20 HEARING OFFICER FAIRBANK: -- at the end, we'll
- 21 circle back around. Thank you.
- MR. BURLEY: No more questions. Thank you.
- HEARING OFFICER FAIRBANK: Next is the Moapa
- 24 Valley Water District.

- 1 important to the conservation of Moapa Dace.
- 2 MR. MORRISON: Thanks a lot.
- 3 HEARING OFFICER FAIRBANK: Next is Lincoln
- 4 County, Vidler Water Company.
- 5 CROSS-EXAMINATION
- 6 MS. PETERSON: Good morning. Karen Peterson
- 7 representing Lincoln County Water District and Vidler Water
- 8 Company.
- 9 BY MS. PETERSON:
- 10 Q. Mr. Williams, I had a couple questions for you.
- 11 I'm showing you -- or I had provided to you Fish and Wildlife
- 12 Service Exhibit 59. It's a biological opinion dated October
- 29th, 2008 for Kane Springs Valley.
- Do you see that in front of you?
- 15 ANSWERS BY MR. WILLIAMS:
- 16 A. Yes, I do.
- 17 Q. And it was signed on page 50 by Robert D.
- 18 Williams, Field Supervisor?
- 19 A. Yes.
- 20 Q. Do you see that?
- 21 A. Yes.
- 22 Q. Was that you?
- 23 A. That was me. Still is me.
- 24 Q. Okay. And do you -- sorry. Do you remember --

Page 1137

Page 1139

- 1 MR. MORRISON: Good morning. Greg Morrison for
- 2 Moapa Valley Water District.
- 3 CROSS-EXAMINATION
- 4 BY MR. MORRISON:
- 5 Q. Mr. Marshall, I just want to clarify one thing.
- 6 I wasn't sure if I heard it correctly.
- 7 Did you say that the MOA was or was not intended
- 8 to apply in perpetuity?
- 9 ANSWERS BY MR. MARSHALL:
- 10 A. I believe the MOA was intended for the long-term
- 11 development of the 16,100 acre-feet of water rights that --
- 12 that -- that the parties that signed the MOA had identified at
- 13 the time.
- So, I believe it was for the test. There were
- 15 elements of the MOA that were specific to the test, but I
- believe the MOA overall was intended for the long-term
- development of the -- of the -- of those water rights.
- 18 Q. All right. And you're aware of the Moapa Valley
- 19 Water District's dedication of its join springs water right
- 20 pursuant to the MOA?
- 21 A. Yes.
- 22 Q. Was that dedication intended in any way to be
- 23 temporary or is that a permanent dedication?
- 24 A. It's a permanent dedication, and it's very

- 1 or if you could turn to page 37, there -- there was a
- 2 statement there regarding the Dace.
- 3 Do you see that?
- 4 A. In the middle of -- in the middle of the page?
- 5 Q. Yes.
- 6 A. Yes.
- 7 Q. And it was the service's biological opinion that
- 8 the action as proposed and analyzed the Kane Springs Valley
- 9 Groundwater Development Project is not likely to jeopardize
- 10 the continued existence of the endangered Moapa Dace.
- Do you see that?
- 12 A. Yes.
- 13 Q. And then also implementation of the project's
- 14 conservation action will minimize any potential impacts.
- Do you agree with that?
- 16 A. Yes.
- 17 Q. And then directing your attention to the other
- 18 document I provided to you, it's an amended stipulation for
- withdrawal of protests. It's Fish and Wildlife Service
- 20 Exhibit 57 and Lincoln County-Vidler Exhibit 16.
- Do you see that in front of you?
- 22 A. Yes, I see the Exhibit.
- 23 Q. Do you remember the negotiations regarding the
- 24 monitoring, management, and mitigation plan for this

Min-U-Script®

Capitol Reporters 775-882-5322

(12) Pages 1136 - 1139

Page 1140

1

- 1 stipulation?
- 2 A. Yes, I do. I do remember those negotiations with
- 3 Vidler and Lincoln County.
- 4 Q. And you were involved in those?
- 5 A. Yes, I was.
- 6 Q. And there's a trigger that set forth the action
- 7 criteria under page 3 and 4 of Exhibit A to the amended
- 8 stipulation.
- 9 Do you see that?
- 10 A. Yes.
- 11 Q. And under paragraph 2, do you see that the
- trigger for the -- for the flows is 3.2 CFS?
- 13 A. Yes, I believe that's correct.
- 14 Q. And then in paragraph 1 it indicates it's for
- 15 flow measurements at the Warm Springs west flume.
- Do you see that?
- 17 A. Yes.
- 18 Q. All right. Would you agree -- I think you had a
- 19 question from your attorney that indicated that signatories to
- 20 the MOU were compliant, I think -- I think -- I believe you
- said, with the Endangered Species Act.
- Is that what you said?
- 23 A. Repeat your question, please.
- 24 Q. Did -- you indicate in response to a question

- CROSS-EXAMINATION
- 2 BY MR. DONNELLY:
- 3 Q. I'll start with Mr. Williams.
- The definition of "Take" in Section 3 of the ESA
- 5 is to "harass, harm, pursue, hunt, shoot, wound, kill, trap,
- 6 capture or collect or attempt to engage in any such conduct";
 - 7 is that accurate?
 - 8 ANSWERS BY MR. WILLIAMS:
 - 9 A. That sounds very accurate.
- 10 Q. And regulation in 50 CFR Section 17-3 defines
- 11 that harm includes habitat, modification, or degradation where
- it kills or injures wildlife by significantly impairing
- 13 essential behavior patterns, including breeding, feeding, or
- sheltering; is that accurate?
- 15 A. That's correct.
- 16 Q. Is it true that Section 9 of the ESA prohibits
- 17 unpermitted take?
- 18 A. Yes.
- 19 Q. Might individuals or agencies taking action which
- result in unpermitted take be in violation of Section 9?
- 21 A. Yes.
- 22 Q. That you are aware of, are citizens able to file
- lawsuits to enforce the ESA, including Section 9, suits
- 24 against entities responsible for an unauthorized take?

Page 1141

Page 1143

- 1 from Mr. Taggart that signatories to the MOU and on the basis
- 2 of the biological opinion, that those signatories were
- 3 compliant with the Endangered Species Act?
- 4 Is that what you said?
- 5 A. I think Mr. Taggart's question was asking me if
- 6 parties outside of the MOU did not have Endangered Species Act
- 7 compliance, and I think I said yes.
- 8 I would like to correct that statement by saying
- 9 that the parties of the Kane Springs agreement and
- 10 stipulation, the biological opinion, are clearly covered under
- 11 ESA.
- MS. PETERSON: Okay. Thank you. No further
- 13 questions.
- 14 HEARING OFFICER FAIRBANK: City of North Las
- 15 Vegas?
- MS. URE: No questions.
- 17 HEARING OFFICER FAIRBANK: Thank you.
- Seeing no questions, Center for Biological
- 19 Diversity.
- MR. DONNELLY: Good morning. Patrick Donnelly
- 21 with the Center for Biological Diversity. I'll try to be
- quick here because I do have a number of questions.
- 23 24

- 1 A. Yes.
- 2 Q. We heard testimony that carbonate pumping in the
- 3 Lower White River Flow System causes spring flow declines,
- 4 including on reports you were apart of from the Southern
- 5 Nevada Water Authority; is that correct?
- 6 A. Yes.
- 7 Q. And spring declines cause a loss in habitat,
- 8 correct?
- 9 A. Yes
- 10 Q. And a loss in habitat can cause a loss in overall
- 11 Dace numbers; is that correct?
- 12 A. Yes.
- 13 Q. Therefore, can we make the connection that
- 14 carbonate pumping causes take of Moapa Dace?
- 15 A. Yes.
- 16 Q. And, thus, carbonate pumping would be a violation
- of Section 9 of the Endangered Species Act if it was not
- permitted through MOA's and other agreements?
- 19 A. If it was not permitted, that's correct.
- 20 Q. Would entities authorizing water withdrawals
- 21 causing take that is not permitted take be in violation of
- 22 Section 9?
- 23 A. Potentially. But I'm not an attorney, nor do I
- 24 do law enforcement. I've never --

Min-U-Script® Capitol Reporters 775-882-5322

(13) Pages 1140 - 1143

Page 1147

Page 1144

- 1 Q. Absolutely. Just asking within your capacity.
- 2 A. Within, yes, potentially they could.
- Q. Thank you. I guess this will be a question for
- Mr. Marshall. You stated that the MOA allows for flows to get
- as low as 2.78; is that accurate?
- ANSWERS BY MR. MARSHALL: 6
- A. The MOA has triggers down to 2.7.
- Q. Uh-huh.
- A. The tiered biological opinions allow flows to get 9
- to 2.78 under the incidental take statements that are in those 10
- 11 tiered opinions.
- 12 Q. Given what we know now, might flows as low as 2.7
- have severe impacts on overall Dace numbers? 13
- A. So that analysis was done in the biological 14
- opinions and -- and is supported by the modeling efforts that 15
- I mentioned that were done as part of the BOs and as part of 16
- 17 the mitigation package or conservation package in the MOA, and
- those -- that analysis stands today. 18
- O. So, there would be significant impacts on Dace 19
- numbers at that pumping level? 20
- A. So, the -- the opinions don't speak to specific 21
- numbers. They speak -- they use habitat and habitat reduction

But changes in flows are expected to impact

A. I -- off the top of my head, I do not know where

Q. You're not aware of a specific statement, then?

MOA. I mean, I was part of the development of the MOA and I

understand it to apply to the long-term development of -- of

the water rights that are contained or addressed in the MOA.

HEARING OFFICER FAIRBANK: Thank you.

HEARING OFFICER FAIRBANK: Seeing no questions,

A. I -- I am not, but I -- I do understand the

Q. Does the MOA explicitly state that it applies

as a proxy for take and for Dace numbers.

A. -- in the population numbers.

the specific statement is.

Nevada Cogeneration?

habitat that's important for the Dace.

beyond the duration of the pump test?

MR. DONNELLY: Thank you.

Next, Georgia Pacific-Republic?

MS. HARRISON: No questions.

24 Q. Okay.

6

7

10

13

15

16

17

18

19

20

21

- HEARING OFFICER FAIRBANK: Seeing no questions, 1
- Bedroc? 2
- MS. URE: No questions. 3
- HEARING OFFICER FAIRBANK: Seeing no questions, 4
- Nevada Energy? 5
- MS. CAVIGLIA: Justina Caviglia on behalf of NV 6
- 7 Energy, and I just have a quick one.
- **CROSS-EXAMINATION** 8
- BY MS. CAVIGLIA: 9
- 10 Q. Do you consider the MOA alone to be adequate
- 11 enough to protect the Dace?
- 12 ANSWERS BY MR. MARSHALL:
- 13 A. Where is the question going?
- Q. I'm just asking do you believe the 3. -- well,
- 15 I'll rephrase it.
- Do you believe the 3.2 in the MOA alone to be 16
- adequate to protect the Dace? 17
- A. Are you talking to Bob or myself?
- Q. Either one of you.
- 20 A. So the MOA is protective of the Dace as it
- relates to the signatories. 21
- There are other water right holders in the Lower 22
- White River Flow System that are not signatory to the MOA, and 23
- so it is -- well, it doesn't address those other -- those 24

Page 1145

- 1 A. And so I can't speak to what the changes in flows other entities, so it could potentially be insufficient in
 - would specifically result in -terms of protecting the Moapa Dace. 2
- 3 Q. Sure.
 - MR. WILLIAMS: Well, I guess if I could add a 3
 - little bit to what Zane -- or Mr. Marshall said. The -- if 4
 - you look at, I think, Section 8 of the MOA, it talks about a 5 comprehensive type of a program amongst the parties, and I 6
 - 7 think that the intent of the MOA was for primarily the period
 - for the pump test, but it was looking for the parties of the 8
 - 9 MOA to expand and to -- and to look outside just those parties
 - to bring in other, you know, parties that may be impacting the 10
 - Dace. 11
 - So I don't believe that MOA in and of itself, by 12
 - itself, is enough to achieve recovery or protect the Dace 13
 - long-term. 14
 - MS. CAVIGLIA: Thank you. That answered my 15
 - question. 16
 - HEARING OFFICER FAIRBANK: I will now open it up 17
 - to questions from the State Engineer Division of Water 18
 - Resources staff. 19
 - Okay. We will go ahead and open it back up for 20
 - the participants to ask additional questions and go ahead and 21
 - offer three minutes. 22
 - And we'll start with Coyote Spring Investments. 23
 - MR. HERREMA: Thank you. Brad Herrema again for 24

MR. KING: No questions. 24

Seeing no questions, Muddy Valley Irrigation 22 Company? 23

Page 1148

- 1 the record.
- 2 RECROSS-EXAMINATION
- 3 BY MR. HERREMA:
- 4 Q. Mr. Marshall -- excuse me -- isn't it true that
- 5 under the MOA, CSI got two restoration and recovery
- 6 obligations.
- 7 Namely, under Section 3A to dedicate
- 8 460-acre-feet per year in water rights for survival on
- 9 recovery of the Dace; and, number two, under Section 4E of the
- 10 MOA, to pay \$200,000 for restoration of a Dace habitat?
- 11 ANSWERS BY MR. MARSHALL:
- 12 A. Yes, that's true.
- 13 Q. And isn't it true that CSI has fully completed
- 14 these obligations dedicated to 460 acre-feet per year in water
- rights in paying the \$200,000?
- 16 A. Yes, that is my understanding.
- 17 Q. Figure A-1 of your June 2019 report shows a
- 18 diagram of the streams and reaches that are accounted for the
- 19 Moapa Dace, and you talked a few minutes ago about Reach 5,
- which is the upper Pederson reach.
- In your opinion, is the upper Pederson stream
- 22 good habitat for the Dace to spawn?
- 23 A. The upper Pederson?
- 24 Q. Yes.

- 1 has had some discussion about the potential for removing that
- 2 gage as in order replacing it, as -- or with another gage that
- 3 would allow fish movement up into the upper Pederson.
- 4 There is potential by increasing that fish
- 5 movement upstream to the upper Pederson to improve total
- 6 numbers of fish in that area.
- 7 MR. HERREMA: Thank you.
- 8 HEARING OFFICER FAIRBANK: United States Fish and
- 9 Wildlife Service? Seeing none.
- 10 National Park Service.
 - MS. GLASGOW: No questions.
- 12 HEARING OFFICER FAIRBANK: Seeing no questions.
- Moapa Band of Paiutes?
- MR. BURLEY: Richard Burley for the record for
- the Moapa Band of Paiutes.
- 16 RECROSS-EXAMINATION
- 17 BY MR. BURLEY:
- 18 Q. I think, Mr. Williams -- or maybe it was Mr.
- 19 Marshall -- you made a recommendation that the State Engineer
- 20 looked particularly hard at permanent uses that might affect
- 21 the springs.

11

- Do you have any similar opinion regarding
- 23 temporary uses? I assume they're just -- you have just less
- 24 of a concern?

Page 1149

Page 1151

- 1 A. Yes, it is.
- 2 Q. Are you aware of any impediments to that
- 3 particular reach, such as the Warm Springs West Gage?
- 4 A. Yes, I am.
- 5 Q. Do you know what the drop is at that gage that
- 6 causes the impediment to reach in that area?
- 7 A. No, I do not.
- 8 Q. Would 18 inches sound about right?
- 9 A. I have no idea.
- 10 Q. Are you aware whether a Dace can get through
- 11 that -- that gage?
- 12 A. It's my understanding from discussions of the
- 13 biological advisory committee that the Warm Springs West Gage
- is a barrier to upstream movement from Moapa Dace.
- 15 Q. Okay. And are there other impediments in that
- area, such as the outflow from a culvert under the road or
- 17 fast-moving water upstream of the gage? Any other impediments
- to Dace reaching that spawning habitat?
- 19 A. Not that I'm aware of.
- 20 Q. In regard to the gage itself, in your opinion if
- 21 flows remained constant, what would happen to the population
- of the Dace if the -- that gage impediment was removed or
- 23 remediated?
- 24 A. Well, the -- the biological advisory committee

- 1 ANSWERS BY MR. MARSHALL:
- 2 A. I do have less of a concern. I think the
- 3 important thing is that the MOA and the opinions assume that
- 4 there is some flexibility; that the pumping restrictions can
- 5 be implemented to return flows back to 3.2 CFS at the Warm
- 6 Springs Gage.
- 7 Q. And do you agree with that? Do you think that
- 8 assumption regarding flexibility is appropriate and correct --
- 9 A. I do
- MR. BURLEY: Thank you. No further questions.
- 11 HEARING OFFICER FAIRBANK: Moapa Valley Water
- 12 District?
- MR. MORRISON: No.
- 14 HEARING OFFICER FAIRBANK: Seeing no questions.
- Lincoln County-Vidler? Seeing no questions.
- 16 City of North Las Vegas? No questions.
- 17 Center for Biological Diversity?
- MR. DONNELLY: Thank you. Patrick Donnelly,
- 19 Center for Biological Diversity.
- I would just offer to the State Engineer's office
- 21 that I think this section is supposed to go till 10:30. It
- 22 looks like there will be a little bit of extra time, and this
- 23 is pretty important to why we're here, so we'd appreciate a
- 24 few extra minutes after this.

Min-U-Script® Capitol Reporters 775-882-5322

(15) Pages 1148 - 1151

Page 1155

Page 1152

- 1 RECROSS-EXAMINATION
- 2 BY MR. DONNELLY:
- 3 Q. Mr. Marshall, to the best of your knowledge, are
- 4 there groundwater withdrawals from the carbonate aquifer
- 5 occurring right now at parties not -- by entities not party to
- 6 the MOA?
- 7 ANSWERS BY MR. MARSHALL:
- 8 A. I don't know for sure.
- 9 Q. What were the parties to the MOA?
- 10 A. The CSI, SNWA, Moapa Band of Paiutes, Fish and
- 11 Wildlife Service, and Moapa Valley Water District.
- 12 Q. So there may be other users of water who are not
- party to the MOA?
- 14 A. There may be, but I'm not aware of the
- specific -- you know, to your question, I'm not aware of
- parties that are -- that might be or not.
- 17 Q. Okay.
- **18** A. Signatory to the MOA.
- 19 Q. At 3.2 CFS, what happens?
- 20 A. The MOA and the opinions call for the parties to
- 21 convene, the HRT to convene, and to assess the -- the cause of
- 22 the decline of flows in the spring.
- They are -- if decline continues beyond 3.2, the
- 24 parties are -- are thought to begin discussing involuntary

- 1 The biological opinion and the stipulated
- 2 agreement while -- for Kane Springs Valley was tied to the --
- 3 you know, the conditions, basically, that were going to
- 4 happen, you know, after the pump test, or, you know,
- 5 information from the pump test.
- 6 I don't -- I'm not a hydrologist, and I don't
- 7 know if the -- the theory, if you will, the Kane Springs water
- 8 could still be delivered and be counted at Warm Springs West
- 9 Gage. I don't know if that -- that connection has been proven
- 10 or disproven, so...

11

14

- MR. DONNELLY: May I finish the question?
- 12 HEARING OFFICER FAIRBANK: We're going to go
- 13 ahead and circle back around --
 - MR. DONNELLY: Okay.
- 15 HEARING OFFICER FAIRBANK: -- if we have
- 16 additional time.
- MR. DONNELLY: Thank you.
- 18 HEARING OFFICER FAIRBANK: Georgia Pacific?
- MS. HARRISON: No questions.
- 20 HEARING OFFICER FAIRBANK: Seeing no questions.
- Nevada Cogeneration. Not seeing any questions.
- 22 Muddy Valley Irrigation Company.
- MR. KING: No questions.
- 24 HEARING OFFICER FAIRBANK: Seeing no questions.

Page 1153

- 1 actions to return the flows back to 3.2.
- 2 Q. In some ways, given that all the MOA participants
- 3 are in this proceeding and we're having discussions about
- 4 those very topics, in some way have we commenced the 3.2
- 5 action? Not formally but in spirit?
- 6 MR. TAGGART: Objection. Calls for speculation
- 7 and a legal conclusion.
- 8 HEARING OFFICER FAIRBANK: I'll sustain the
- 9 question, if you want to ask the question differently.
- 10 BY MR. DONNELLY:
- 11 O. The intent of the MOAs was to commence a
- 12 discussion about the topics you just elucidated among the
- parties once 3.2 is reached.
- Have we commenced a discussion here similar in
- scope to that which would have been commenced under the MOA?
- MR. TAGGART: Same objection. And relevance.
- MR. DONNELLY: I'll just withdraw it.
- BY MR. DONNELLY:
- 19 Q. With regard to Kane Springs, Mr. Williams, would
- 20 you say that the pump test provides new information now that
- wasn't available at the time of that biological opinion?
- 22 ANSWERS BY MR. WILLIAMS:
- 23 A. The pump tests clearly provide new information
- 24 for the parties of the MOA.

- 1 Bedroc? No questions.
- 2 Nevada Energy, any additional questions? Okay.
- 3 No questions.
- 4 And I'll open it up to State Engineer and
- 5 Division of Water Resources staff.
- 6 EXAMINATION
- 7 MR. WILSON: Good morning, gentlemen. Tim Wilson
- 8 for the record. I just have one quick question.
- 9 Is there any type of expiration date within the
- 10 MOA that you're aware of?
- MR. MARSHALL: No. I'm not aware of any
- 12 expiration date.
- MR. WILLIAMS: And I concur with him.
- 14 HEARING OFFICER FAIRBANK: Mr. Donnelly, I will
- 15 give you an additional three minutes, and then we need to take
- 16 a -- send it back to Las Vegas Valley Water District and
- 17 Southern Nevada Water Authority and then have time for a
- 18 break.
- MR. DONNELLY: I appreciate your indulgence.
- 20 Patrick Donnelly, for the record.
- **21** FURTHER RECROSS-EXAMINATION
- BY MR. DONNELLY:
- 23 Q. I'm just going to finish that question, Mr.
- 24 Williams, but in a more general sense.

Min-U-Script® Capitol Reporters (16) Pages 1152 - 1155 775-882-5322

Page 1156

- 1 In general, when substantial new information is
- 2 available, does that trigger a reconsultation?
- 3 ANSWERS BY MR. WILLIAMS:
- 4 A. It's called reinitiation --
- 5 O. Reinitiation.
- 6 A. -- consultation, but, yes, that's correct.
- 7 Q. Thank you.
- 8 This is for either of you. The term
- 9 "conservation reliance species" is defined as a species that
- 10 requires continuing species-specific wildlife management
- interventions to survive. Does that sound right, Mr.
- 12 Williams?
- 13 A. Yes, I think that's correct.
- 14 Q. Do you think that the Moapa Dace is a
- 15 conservation-reliant species?
- 16 A. Very much so.
- 17 Q. Would Moapa Dace numbers fall if ongoing
- 18 conservation actions were terminated?
- 19 A. I would say yes to that.
- 20 Q. Is there any point at which the Moapa Dace
- 21 conceivably, in your expert opinion, could be no longer a
- conservation-reliant species?
- 23 A. I think if it reaches -- if we attain the
- recovery goals, I think at that point it would become, you

- 1 particularly.
- 2 A. Yes. Throughout the system, yes.
- 3 Q. All right.
- 4 MR. DONNELLY: Thank you. I have no further
- 5 questions.
- 6 HEARING OFFICER FAIRBANK: Thank you. So we'll
- 7 go ahead and open it back up to Southern Nevada Water
- 8 Authority and Las Vegas Valley Water District. And you have
- 9 just shy of 13 minutes remaining.
- 10 REDIRECT EXAMINATION
- 11 BY MR. TAGGART:
- 12 Q. Okay. Again for the record, Paul Taggart for the
- 13 Water Authority and the District.
- Mr. Marshall, do you have your report in front of
- 15 you?
- 16 A. Yes, I do.
- 17 Q. And could you turn to Figure 3-3?
- MR. TAGGART: And I'm not sure, Mr. Bailey. Get
- that up on the screen, please.
- BY MR. TAGGART:
- 21 Q. This should be a bar chart that shows fish counts
- over a series of years; is that right?
- 23 A. Yes.
- 24 Q. Okay. There were some questions asked regarding

Page 1157

Page 1159

- 1 know, a species that would rely on constant, you know,
- 2 management or co-conservation. I think that's what, you know
- 3 recovery plans are trying to --
- 4 Q. Sure.
- 5 A. -- to gather.
- 6 Q. I'm going to just ask you a straight-up question
- 7 instead of a number of questions to get there since my time is
- 8 short.
- 9 Is 3.2 CFS a sufficient amount of flow and
- 10 habitat to meet recovery goals, in particular of 75 percent of
- 11 historic habitat? Restore it to full function?
- 12 A. I think, in my opinion, maintenance and
- protection of 3.2 for that area, or that portion of -- for the
- 14 high-elevation springs is sufficient for that area, for
- that -- for the Pederson Springs.
- But to reach conservation goals or the recovery,
- it requires, you know, a broader look at where the species
- 18 historically was. At least bring in, you know --
- 19 Q. So the bottom-line question is there would need
- 20 to be more --
- 21 A. Yes.
- 22 Q. -- water flowing to meet your recovery goals?
- 23 A. There would be more -- yeah. Well --
- 24 Q. Throughout the system. Not at Warm Springs West,

- 1 the counts in a segment of Pederson between 2017 and 2019.
- 2 Could you describe, using this figure, the change
- 3 in fish counts as a result of conservation activities? And
- 4 specifically whether conservation can lead to benefits in fish
- 5 counts in subsequent years to those activities.
- 6 A. Right. So, the figure -- the bars show different
- 7 colors, and there is a table in the far right-hand corner
- 8 which shows the stream reaches that are associated with those
- 9 colors.

10

13

775-882-5322

And the period of time that I would like to focus

- on is soon after the signing of the MOA 2006-'7
- 12 through 2015-'16.
 - During that period, there was significant work
- 14 being done in the Pederson and Apcar stream reaches which did
- result in some disturbance to the stream, short-term
- 16 disturbance, and -- and also there was construction of fish
- barriers and -- and also poisoning of certain reaches of
- stream to remove tilapia out of the system.
- And I believe during the 2008 through 2012 time
- 20 period that the amount of disturbance that was occurring
- 21 related to those activities might be the cause of the drop in
- 22 population numbers.
- But as that restoration matured and the habitat
 - 4 matured in the system and we removed -- or successfully were

Min-U-Script® Capitol Reporters

(17) Pages 1156 - 1159

Page 1160

- 1 moving tilapia out of the system, we then saw the population
- 2 rebound.
- And the Apcar strain, the pink in the lower
- 4 portion of each bar, is -- provides a good example of that.
- 5 When there was significant restoration, there were a lot of
- 6 tilapia in that stream, and by doing that restoration and
- 7 removing the tilapia, we had a significant improvement in the
- 8 total numbers of Moapa Dace in the system.
- 9 Q. And could those conservation efforts have
- assisted in fish populations between 2017 and 2019?
- 11 A. Yes.
- 12 Q. There was also some questions about the HRT
- 13 meeting. I think this was from the Moapa Band and. And, Mr.
- Marshall, is it true that you are not part of the hydrologic
- 15 review team and you did not participate in the determination
- 16 at Southern Nevada Water Authority participates in with that
- 17 HRT?
- 18 A. Yes, that is correct.
- MR. TAGGART: Okay. And just -- just for the
- 20 record, the State Engineer's files have the most recent annual
- determination report in it. It was filed in July of 2019.
- 22 And in that document there is an appendix which is provid---
- each party can provide an appendix to the determination.
- And in that appendix the water district indicated

- ANSWERS BY MR. MARSHALL:
- 2 A. I'm sorry, Paul. I don't -- Mr. Taggart, I
- 3 don't --

1

- 4 Q. Okay. Let me ask it a different way.
- 5 You provided testimony that when the MOA was
- 6 developed, there was an understanding that it would
- 7 accommodate 16,000 acre-feet of pumping; correct?
- 8 A. Yes.
- 9 Q. Okay. And you heard all the hydrologic testimony
- 10 regarding reaction at the hydrologic system to the 1169
- 11 pumping test; right?
- 12 A. Yes.
- 13 Q. And I know you're not a hydrologist so I just
- want you to rely on what you understand their opinions to be,
- and specifically the SNWA hydrologist.
- Does it appear that there's -- you know, that --
- that there's less ability to restrict pumping than was
- anticipated when the parties developed the triggers in the
- 19 MOA?
- 20 A. Yes, I think there's -- that our hydrologic
- analysis calls into question the -- the -- the volumes of
- 22 allowed pumping under the triggers and whether or not those
- 23 changes in pumping volumes will have the intended result of
- 24 restoring flows back to 3.2 CFS at Warm Springs West.

Page 1161

Page 1163

- that the annual 2019 termination does not recommend
- 2 adjustments to the pumping restrictions, but recovery data
- 3 collected from the State Engineer 1169 aquifer test and
- 4 analysis presented in this appendix indicate the pumping
- 5 restrictions may have to be adjusted in future years to
- 6 maintain the corresponding trigger ranges.
- 7 BY MR. TAGGART:
- 8 Q. Mr. -- Mr. Williams, you were asked by Mr.
- Donnelly regarding 3.2 CFS and its relationship to recovery ofthe fish.
- And I just wanted to clarify that the analysis of
- 12 3.2 and the biological opinion, the focus of that analysis is
- on whether take is occurring as opposed to whether recovery of
- the fish can occur; is that a fair statement?
- 15 ANSWERS BY MR. WILLIAMS:
- 16 A. Yes, I think that's a fair statement.
- MR. TAGGART: And the -- the last question -- I
- 18 think I'll probably ask both of you this -- but would you --
- do you believe that the options that are available to the
- parties and to the service, if flows go below 3.2, are more
- 21 restricted now than they were when the MOA was developed?
- And specifically the pumping -- the ability to restrict pumping below 16,000.
- 23 24

- 1 Q. And, I mean, I guess the obvious point I'm asking
- 2 about is that the MOA anticipated 16,000 acre-feet of water
- 3 could be pumped and then pumping restrictions would cut back
- 4 16,000. We don't have 16,000 acre-feet of pumping now, right?
- 5 A. Right. I think it's important to know that the
- 6 MOA was entered into prior to order 1169, right? And so the
- 7 results of Order 1169 is what we're here, I think, partially
- 8 talking about.
- 9 And so the MOA was -- you know, was based on that
- 10 understanding of the aquifer and how it would respond to that
- 11 pumping prior to Order 1169.
- 12 Q. And so the uncertainty of reaching 3.2 and going
- below it, now without those pumping restrictions, is it -- is
- 14 that the type of uncertainty you're talking about trying to
- 15 avoid?
- 16 A. Yes. I think particularly in the situation where
- 17 the State Engineer were to approve permanent uses, there is
- 18 significant uncertainty in terms of how you would mitigate
- 19 impacts from those permanent, that permanent pumping to Warm
- 20 Springs West to the Pederson Unit.
- 21 Q. Okay. Thank you.
- Well, Mr. Williams, do you have anything to add
- 23 to that?
- MR. WILLIAMS: Yeah. I -- listening to your

Min-U-Script® Capitol Reporters 775-882-5322

(18) Pages 1160 - 1163

Page 1167

Page 1164

11

- 1 question, I clearly believe that the results of -- and
- 2 listening to the hydrology reports from the last week -- I
- 3 clearly believe that the available water is much less than
- 4 sixteen one in Coyote Springs that were in the carbonate.
- 5 So the analysis, and then in looking at the MOA
- 6 in today's life, I think there needs to be, you know, more
- in today's fire, I think there here's to be, you know, in
- 7 done to really look at how to -- you know, look at the finite
- 8 amount, I think it's 4,000 to 6,000 -- how, basically, to
- 9 distribute that amongst the parties.
- 10 I think a key element of the MOA was a
 - development of the recovery implementation program, and I
- 12 think that the language in the MOA around -- in Section A that
- 13 talks about the collaborative, you know, development of the
- 14 parties to solve problems is -- is kind of what's lacking
- 15 right now.

11

- I think that there -- you know, there clearly
- 17 needs to be, you know, a 3.2 minimum to protect the Dace, and
- 18 I think that, you know, it's incumbent on the State Engineer
- 19 to really look hard at the numbers and the hydrology and
- 20 really try to come up with a plan for assessing what's really
- 21 available and distribution of that. So --
- MR. TAGGART: Great. Thank you, very much.
- HEARING OFFICER FAIRBANK: Is that it, Mr.
- 24 Taggart?

1

- 1 and go back on the record. And we will go ahead and proceed
- 2 with the Moapa Valley Water District.
- And Mr. Morrison, you may go ahead and proceed.
- 4 MR. MORRISON: All right. Good morning,
- 5 everybody. I'm Greg Morrison. I represent the Moapa Valley
- 6 Water District. With me today are Joseph Davis, general
- 7 manager at the district, and Jay Lazarus, our expert witness.
- 8 As a preliminary matter that I think is very
- 9 important, somebody left a really nice pen up here probably10 want to come back and get.
 - Thank you to the State Engineer and staff for
- 12 allowing us this opportunity to present our testimony today.
- We do want to start with a little corrective
- matter, and we've addressed it before, but it bears repeating.
- The State Engineer Exhibit marked as NSE244, a
- 16 graph representation of the triggers from the 2006 MOA is not
- an accurate Exhibit.
- It shows that the district must cease pumping in
- 19 Earl Canyon if flow levels drop below a certain threshold. In
- 20 fact, that trigger only applied to the district during the
- pendency of the Order 1169 pump testing.
- I also wanted to state that it seems to us the
- point of Interim Order 1303 and this hearing is to provide the
- 24 State Engineer with guidance relevant to the management of the

Page 1165

- MR. TAGGART: It is. Thank you. And that is all
- 2 that we have as well.
- 3 HEARING OFFICER FAIRBANK: Thank you. And I'll
- 4 go ahead and open it up lastly for any questions from Division
- 5 of Water Resources staff and the State Engineer.
- 6 And just before we take a break, I wanted to go
- 7 ahead and let everyone know that we have made the video
- 8 recordings of these proceedings publicly available on our
- 9 website.
- And so if you go to this water.nv.gov, and then
- in our "Lower White River Flow System" tab, under the "News"
- tab, there's a subfolder that is Order 1303 hearing documents,
- and within that, there is a link to a PDF document that
- contains the links to the video recordings of these
- 15 proceedings.
- So if there's people that weren't able to observe
- all the dates or all the hearing proceedings thus far, they
- are currently available, and then we will update that when we
- 19 get the additional recordings published to us.
- And with that, we'll go ahead and take a break.
- Let's go ahead and take about a 15-minute break, and then we'll come back at 10:25. Thank you.
- 23 (Recess.)
- HEARING OFFICER FAIRBANK: Okay. Let's go ahead

- 1 carbonate aquifer that spans multiple basins.
- 2 And although there could be some unique
- 3 characteristics within that carbonate aquifer, we do not
- 4 believe that proper management of that basin in any way,
- 5 shape, or form involves segmenting any of those basins into
- 6 even smaller sub-basins.
- With that, I would like to start our direct
- 8 examination of Mr. Davis.
- 9 DIRECT EXAMINATION
- BY MR. MORRISON:
- 11 Q. Will you introduce yourself for the record?
- 12 State your title?
- 13 A. I'm Joseph Davis with the Moapa Valley Water
- 14 District. I'm the general manager. Last name is D-A-V-I-S.
- 15 Q. How long have you been at the Moapa Valley Water
- 16 District and in what capacities?
- 17 A. I've worked at Moapa Valley Water District for 35
- 18 years, 20 years in a supervisory role, and the last eight as a
- 19 general manager.
- 20 Q. All right. We want to talk really briefly --
- 21 HEARING OFFICER FAIRBANK: Mr. Morrison, if I may
- 22 just interrupt. I apologize. If we can go ahead and have the
- 23 witnesses sworn.
 - And then also I'm going to Mr. Davis and Mr.

Min-U-Script® Capitol Reporters (19) Pages 1164 - 1167 775-882-5322

24

Page 1171

Page 1168

- 1 Lazarus if you'll make sure that you speak into the
- 2 microphone. There are people who are listening and observing
- 3 remotely. And if you're soft-spoken or sitting too far back,
- 4 it becomes difficult for those remote user or participants to
- 5 hear what is being said.
- 6 (Witnesses sworn.)
- 7 MR. MORRISON: Thank you.
- 8 All right. So we're going to talk really
- 9 briefly, just some basic points about the district.
- I understand at least one party to this hearing
- 11 has already objected to Mr. Davis's testimony as beyond the
- 12 scope of the hearing, but we do believe that these points are
- crucial to get on the record now, and Mr. Davis's testimony
- 14 should take under ten minutes.
- 15 BY MR. MORRISON:
- 16 Q. With that, if you would please go to your first
- 17 slide, Slide No. 3.
- 18 A. (Complies.) This is not projecting.
- 19 Q. Mr. Davis's testimony may now take about
- 20 12 minutes.
- All right. Please tell everybody what this slide
- 22 shows.
- 23 A. This is the service territory for the Moapa
- 24 Valley Water District. It includes the Warm Springs, Moapa,

- 1 total of 3,147 acre-feet annually.
- 2 Q. All right. Now, 2006 -- if you'll go to your
- 3 next slide, please -- the district entered into a series of
- 4 agreements with several properties. It's dual goals of
- 5 restoring and protecting Moapa Dace habitat and allowing water
- 6 development for human use.
- 7 You'll tell us quickly about those agreements,
- 8 starting with the 2006 MOA, which we've already discussed at
- 9 length here.
- 10 A. The MOA supplied funds for conservation efforts.
- 11 The district agreed to dedicate the Jones Springs water right.
- 12 There was dedication of CSI groundwater and habitat
- 13 restoration and the protection of in-stream flows through the
- 14 Warm Springs West Gage trigger levels.
- 15 Q. All right. So the trigger levels in the 2006
- 16 MOA, do those require any action or cessation of pumping on
- 17 the part of the district?
- 18 A. No. Those only apply to CSI, SNWA and Moapa Band
- 19 of Paiutes.
- 20 Q. All right and 2006 MOA is still binding on all of
- 21 the parties thereto; is that correct?
- 22 A. Yes.
- 23 Q. All right. Talk about the other agreements that
- were executed coincidentally with the 2006 MOA.

Page 1169

- 1 Moapa Band of Paiutes, Logandale, and Overton communities. We
- 2 have a population of 8,500 with a service area territory of 79
- 3 square miles.
- 4 We're situated between the headwaters of the
- 5 Muddy River and the Lake Mead National Recreation area.
- 6 Q. All right. Next slide, please.
- 7 You're just going to give us a brief history and
- 8 water development in the area.
- 9 A. The Moapa Band of Paiutes is the oldest community
- in our service territory, and then the European settlements
- began in January of 1865, and the first recorded water supply
- gage was completed in May of 1865.
- 13 Q. Your next slide? We have one missing. Looks
- 14 like we have one missing. That's okay. It's just where the
- district evolution stands today as far as service connection.
- 16 A. Currently there are 3,250 service connections
- serving 8,500 people in the Moapa Valley communities.
- 18 Q. All right. Give us a brief overview of the
- 19 district's water rights portfolio.
- 20 A. The MX-6 is the district's oldest permitted
- carbonate aquifer right from 1983. In 1988 was the first
- 22 Arrow Canyon permit was filed, and the last filing was done in
- 23 1992
- Proofs of beneficial use have been filed on a

- 1 A. The Jones Springs agreement was the dedication of
- 2 the district's oldest water right from increasing water flows
- 3 in the Apcar stream.
- 4 The water settlement agreement, it transferred
- 5 the Las Vegas Valley Water District to the Moapa Band of
- 6 Paiutes. There was withdrawal of protest. There were 70 --
- 7 or 3,700 acre-feet of -- or the acknowledgement of
- 8 3,700 acre-feet of Moapa Band of Paiutes Federal Reserve,
- 9 Muddy River Water Rights, and a cap the Moapa Band of Paiutes
- 10 claimed to reserve groundwater rights at 14,400 acre-feet
- 11 underneath the 1980 edition.
- The water settlement agreement was dedication of
- 13 Las Vegas Valley Water District's 2,500 acre-feet to the Moapa
- 14 Band of Paiutes in California Wash.
- NVAC, Muddy River surface water rights to Moapa
- 16 Band of Paiutes, and the NVWD dedication of 520 acre-feet of
- 17 Muddy River rights to Moapa Band of Paiutes in the abandonment
- 18 of curtailment.
- 19 Q. Your next slide. The district has taken steps to
- address threats to Moapa Dace habitat, hasn't it?
- 21 A. Yes. Contribution of water to provide additional
- 22 direct in-stream flows to critical Moapa Dace habitat. That
- was equivalent to 724 acre-feet from the Jones Springs. It's

24 the district's most single right, and it's basically a quarter

SE ROA 53450

(20) Pages 1168 - 1171

Page 1175

Page 1172

- 1 of the district's certificated water rights.
- 2 Q. Okay. To wrap it up, I want to ask you quickly
- 3 about the district's legal obligations. You have a legal
- 4 obligation to provide water to your customers, do you not?
- 5 A. Yes.
- 6 Q. And where does that legal obligation arise from,
- 7 and what does it require of the district?
- 8 A. It arises out of the 1983 Nevada legislature when
- 9 it created the district under Chapter 477, and it declared
- that adequate and efficient water service is vital to the
- 11 economy and well-being of the Moapa Valley area and empowered
- 12 the district to secure water resources necessary to serve its
- 13 communities. The Moapa Valley Water community was founded on
- the resources of the Muddy River.
- 15 Q. All right. You have a final slide. Just wraps
- up your legal obligation?
- 17 A. Yeah. The district has a legal obligation to
- supply a reliable water resource that is beneficial to the
- 19 economy and well-being of its community.
- 20 Curtailment of water resources of a district
- 21 would prove detrimental to the public safety of the Moapa
- 22 Valley community.
- MR. MORRISON: Thank you, Mr. Davis.
- We will move on to Jay Lazarus.

- 1 Before that -- I did contract work previous to
- 2 that. So I have more than 40 years' experience in the areas
- 3 of geology, hydrology, geomorphology, and related fields.
- 4 Q. And you prepared, along with Mr. Davis, both the
- 5 initial report and the rebuttal reports the District submitted
- 6 in response to State Engineer Interim Order 1303?
- 7 A. Yes, sir.

14

- 8 Q. Will you quickly talk us through the process you
- 9 used in creating your reports?
- 10 A. Well, from the very beginning, Mr. Davis made it
- 11 very clear to me that we didn't have the kind of budget to do
- 12 original work like a lot of my other colleagues have had.
- And so our work was restricted to looking at and
 - evaluating existing data and statements from the other
- 15 stakeholders and evaluating their data and conclusions, and at
- 16 the same time looking at the data and coming up with some of
- 17 our own conclusions.
- 18 Q. And in your opinion, is that an appropriate
- methodology for the preparation of an expert report?
- 20 A. In this case with a limited budget, absolutely.
- 21 Q. Okay. Let us start walking through some of the
- 22 conclusions from your report. Let's go to Slide 3, please.
- 23 What are we looking at here?
- 24 A. So, what we've got here is the current boundary

Page 1173

- 1 And thanks to everyone for the indulgence. I
- 2 understand that line of questioning wasn't directly in Order
- з 1303.
- 4 Jay, while he's loading that up -- Mr. Lazarus,
- 5 while he's loading that up --
- 6 A. I was trying to make sure it was working.
- 7 Q. Would you introduce yourself for the record?
- 8 ANSWERS BY MR. LAZARUS:
- 9 A. Good morning. My name is Jay Lazarus, and I'm
- 10 president and senior geohydrologist of Glorieta Geoscience.
- 11 Q. Perhaps get closer to the microphone so we can
- 12 hear you.
- 13 A. No one's ever accused me of speaking softly.
- My name is Jay Lazarus, L-A-Z-A-R-U-S, Like in
- the Bible. I am president and senior geohydrologist of
- 16 Glorieta Geoscience, and I am here today presenting testimony
- 17 on behalf of the Moapa Valley Water District on State Engineer
- 18 Interim Order 1303.
- 19 Q. Would you just describe how long you've been
- 20 doing what you do and some of your areas of expertise?
- 21 A. I've been -- well, I've been consultant to the
- Moapa Valley Water District since, I think, 2011. Next
- 23 month -- I founded the Glorieta Geoscience in November of
- 1979, and next month is our 40th year in business.

- of the 1303 super basin as proposed by the State Engineer in
- 2 the Interim Order 1303. And it's a six-basin super basin,
- 3 which we believe another basin should be added to it, but we
- 4 can go on.
- 5 Q. Okay. Next slide, please. What do you think's
- 6 wrong with the State Engineer's proposed management area?
- 7 A. It's my professional opinion that Kane Springs
- 8 Valley should be included in the Lower White River Flow System
- 9 connected groundwater basin and administered as such.
- 10 Q. Going to our next slide. Do all the stakeholders
- 11 participating in this matter agree with the State Engineer's
- 12 proposed geographic boundary?
- 13 A. No. The following entities, as we have up here
- 14 on the slide, recommend the inclusion of Kane Springs Valley
- 15 basin. We did the park service, fish and wildlife, Center for
- 16 Biological Diversity, and Las Vegas Valley Water District, and
- 17 SNWA.
- 18 CSA recognizes the hydrologic connection between
- 19 Kane Springs Valley and Coyote Springs Valley. You know
- 20 there's the specific reference of 4,200 acre-feet of
- 21 groundwater flowing into Coyote Springs basin from Kane
- 22 Springs Valley basin.
- But despite that, despite CSI recognizing the
- 4 hydrologic connection between Kane Springs Valley and Coyote

Min-U-Script®

Capitol Reporters 775-882-5322

(21) Pages 1172 - 1175

Page 1176

- 1 Springs Valley, they did not suggest including it in the super
- 2 basin.
- 3 Q. I want to circle back a little bit. I'd like
- 4 your statement to be as accurate as possible.
- 5 You say SNWA, Las Vegas Valley Water District
- 6 recommended addition of Kane Springs, is that true for this
- 7 hearing?
- 8 A. Las Vegas Valley Water District and SNWA
- 9 recommended inclusion of Kane Springs Valley in an October
- 10 letter from Ms. Colby Pellegrino to Jason King and the report
- 11 accompanying that letter.
- So at that time in October, SNWA strongly stated
- that Kane Springs Valley should be included in the super
- 14 basin.
- 15 Q. We didn't want to misrepresent their position
- 16 today.
- Go ahead.
- 18 A. And in term- -- so these next -- the bulk of
- 19 these next slides has to do with geographic boundary of Lower
- 20 White River Flow Systems. Multiple reports have cited
- 21 differences in heads in Coyote Springs basin valley and
- 22 northern Coyote Springs Valley, and wells in the southern
- 23 Coyote -- CSV is a hydrologic barrier. It will flow. And we
- 24 disagree with this assertion.

- 1 shockingly flat to us. Okay? And we really don't see these
- 2 kinds of flat gradients almost anywhere we work in the western
- 3 U.S., especially in highly fractured areas.
- 4 And based on the work that other parties have
- 5 done, based on what we've got here, we're seeing this flat
- 6 continuous gradient from KMW-1 down to EH-4, and continuing
- 7 these ten to the minus four gradients, working our way to the
- 8 south, and then back east towards EH-4.
- 9 And the most -- I would say the most important
- 10 thing here is the uninterrupted, continuous, exceptionally
- 11 flat gradient.
- 12 Q. Now, it's not just the hydraulic gradient that
- 13 shows the hydrologic connection with Kane Springs to the rest
- of the flow system, is it?
- 15 A. That's correct. There are other factors.
- 16 Q. All right. Let's go to your next slide.
- Miss Braumiller of the Fish and Wildlife Service
- in her testimony expressed a need for some additional
- 19 information regarding Kane Springs. You believe you've
- 20 located some additional information that might help her out;
- 21 is that accurate?
- 22 A. That's correct. And, Mr. Davis, could you please
- 23 go back one slide? My lovely assistant Joe will go back one
- 24 slide, please.

Page 1177

Page 1179

- 1 Q. You don't believe that's a valid conclusion based
- 2 upon the evidence.
- 3 A. That's correct.
- 4 Q. So I think this slide goes a long way towards
- 5 explaining why you don't believe that's accurate. What are we
- 6 looking at here?
- 7 A. We're looking at a slide of a hydraulic gradient
- 8 that we calculated sort of similar to how the park service
- 9 calculated it. And we're looking at the hydraulic gradient
- 10 from KMW-1. KMW-1 up here at the north, down to EH-4, and
- 11 from CSVM-4 to M -- to CSVM-1, which is a proxy for MX-5, and
- 12 from CSVM-1 over to EH-4.
- And previous experts, Andrew Burns and Rick
- 14 Waddell referred to EH-4 sort of as one of the sentinel or
- 15 index wells.
- So what we did was calculate a groundwater
- 17 gradient from these -- 1, 2 -- 3 wells to EH-4 right by the
- 18 Warm Springs area, and the gradient is remarkably flat. And
- other folks have said there's a lot of structure and faulting
- and fracturing in the area.
- Well, based on how flat these gradients are, the
- 22 structures have no significant impact on these gradients, and
- we're looking at gradients of ten to minus four feet per feet.
- This is an incredibly flat water table. It was

- 1 What we're seeing here -- you know, if I
- 2 remembered Ms. Braumiller's testimony correctly, she was
- 3 looking for pumping test data in the vicinity of the boundary
- 4 between Kane Springs Valley basin and Coyote Springs basin.
- 5 And KMW-1 here was an observation well in a long-term pumping
- 6 test that Lincoln-Vidler conducted adjacent to it in KPW.
- 7 Next slide, please.
- 8 So, in 2006, URS Corporation under contract to
- 9 Lincoln County conducted -- drilled and tested KPW-1. They
- 10 conducted a seven-day pumping test at 1,800 gallons a minute
- 11 showing very highly transmissive aquifer without any limiting
- 12 boundaries.
- 13 Q. Do you generally recall who signed that well
- 14 completion report as both hydrologist and geologist?
- 15 A. I believe it was Mr. Red Bushner.
- 16 Q. In both capacities?
- 17 A. Yes.
- 18 Q. Okay. Let's go to your next slide. That URS
- 19 well completion report, did it make any statements about the
- well locations in Kane Springs Valley?
- 21 A. Whoever located this well, or if Mr. Bushner
- located this well, they did a great job. Okay?
- This well is a really high producer. It's got a
 - 4 specific capacity on the order of ten gallons per minute per

Min-U-Script® Capitol Reporters 775-882-5322

(22) Pages 1176 - 1179

Page 1183

Page 1180

foot, which is very acceptable for production a well, 1 especially for municipal purposes. 2

You know, when we locate wells anywhere, we're always trying to find a fracture intersection because that's where the rock is theoretically more broken up and more transmissive and will transmit water generally or hopefully in higher quantities and at faster rates.

So they located -- so URS did a really great job of locating this well. And these are direct quotes from the report. The well was cited in close proximity to the Willow Springs fault and Kane Springs Wash fault zone in area of extensive tectonic activity leading to significant fracture in the carbonate-rock aquifer.

By locating the well in a highly fractured geologic terrain, the well is drilled in rocks with a 15 secondary permeability that has been enhanced by faulting and 16 17 fracturing. And like I said, they did a really great job locating this well. It's really in a great location. 18

Q. Let's go on to the next slide. I think you show 19 that location. 20

What are we looking at here? 21

A. So what we're looking at here is just a cut out 22

of the URS2006, report Figure 4, and what this shows is the 23

Willow Spring fault, Kane Springs Valley fault, the 24

such as it is or isn't, the KPW-1 seven-day pumping test 1

summary was the carbonate aquifer behaves as a force media and 2

can be analyzed as such, and we agree. 3

4 We located, drilled and completed and tested

wells in fractured Bedroc environments where the fracturing 5

was so extensive that the fractured aquifer system really 6

7 behaved as an equivalent porous media. Okay? And, once

again, kudos to the folks who located this well from URS. 8

And they also pointed out that hydraulic barriers to groundwater flow were not encountered during the seven-day aquifer test, and we agree with that.

12 Q. But you don't agree with everything in that

report. Point out a few of the issues you found. 13

A. Well, actually a couple -- the major issue that 14

15 we disagreed within the report was that when we assess the

seven-day pumping test, we determined that a leaky confined 16

17 aquifer solution, or Hantush-Jacob in this instant, isn't an

appropriate method to analyze aquifer characteristics 18

character. 19

9

10

11

Q. Mr. Lazarus, can I slow you down for one second

just for our reporter's sake? Would you spell Hantush-Jacob?

A. H-A-N-T-U-S-H, hyphen, J-A-C-O-B.

23 Q. Thank you very much. Sorry to interrupt.

24 A. Okay. So, URS used a leaky confined aquifer

Page 1181

intersection, the location of KPW-1, which was the production

well that was tested, and the location of KMW-1, which was the 2

observation well. And for scale on here, these wells are 3

located either 143 or 144 feet from each other. 4

So KMW-1 was drilled specifically as the

monitoring well for KPW-1 pumping test. 6

Q. The information on this slide, did you alter it 7

in any way other than to blow it up to increase the 8

resolution?

A. No, sir. 10

5

3

6

7

8

10

11

12

13

14

Let's go on to your next slide. 11

That URS report, that had a -- some seven-day 12

pump test results described within it, didn't it? 13

A. It had a seven-day pumping test result. 14

Just for a matter of semantics, we conduct 15

pumping tests to test the aquifer. We conduct the pump test 16

to test the pump. So this is a seven-day pumping test to try 17

and determine aquifer characteristics. 18

Q. And you pulled a couple of statements directly 19

20 out of that report leading to the results of that pumping

test. 21

22 A. That is correct.

Talk us through them.

24 A. So, for the first portion of this, or paragraph,

1 solution saying that there was leakage coming from the fault

2

8

18

24

Well, Hantush-Jacob leaky confined solution isn't 3

appropriate for a fracture flow fault zone like this. It's 4

appropriate if you have a confining bed above or below your 5

producing zone and you're getting leakage from above those 6

confining beds, above or below. 7

The way to determine whether or not you really

9 have a leaky confined aquifer situation in any type of

incident is to complete a well test where you've got an upper 10

zone, middle-producing zone, say, or a lower zone, or some 11

12 combination thereof isolated from each other, and then your

pumping well in your screen solely in the production zone and 13

conduct a pumping test on that production well and observe a 14

drawdown in any of the zones that you've done with your nested 15

piezometer, P-I-E-Z-O-M-E-T-E-R. 16

And that way you can determine if there is 17

leakage occurring from overlying beds or underlying beds into

your producing zone. 19

So, we did a quick calculation of transmissivity, 20

came up with a T of between 200,000 and 380,000 gallons per 21

acre foot. Not unexpected or out of line for this kind of 22

super highly fractured aquifer system. 23

An average T in between them is reasonable.

Min-U-Script® **Capitol Reporters** 775-882-5322

(23) Pages 1180 - 1183

Page 1184

- 290,000 gallons per day per foot is reasonable to represent
- the aquifer. And a lot of the aquifers I work in, my clients 2
- would kill to have transmissivities this high. These are 3
- 4 really high T's.
- Q. Let's move on to your next slide. What is this
- slide? What does it show?
- A. So, this slide came directly from the Figure 4.4
- of the Lincoln-Vidler report. All we modified on this was
- blowing it up for better ease of reading and looking at the scale. 10
- 11 So, what we're seeing here, this stippled zone
- here, Lincoln-Vidler has in as the Kane Springs Wash fault 12
- 13 zone. You can see that this Kane Springs Wash fault zone, the
- way they have this right here is the basin boundary -- excuse 14
- 15 me -- between Kane Springs Valley basin and the Coyote Springs
- Valley basin. 16
- 17 This is the basin boundary. Right here in really
- small font you can see this is KMW-1, which was monitored 18
- 19 during the 1169 pumping test as well as being the observation
- well for the KPW-1 pumping test. 20
- Once again, you can see it's located right at the 21
- intersection of the Kane Springs fault and the Willow Springs 22
- fault. 23

1

12

Now, and then CSVM-4 is located right here. 24

- conclusions.
- 2 A. Well, first of all, for a broad-blanket
- statement, we ago agree with the four conclusions that are on
- this slide, and I'll read them as quickly, but slowly enough 4
- for the court reporter to get it. 5
- So URS concluded its evident, then, from the 6
- 7 aquifer testing of well KPW-1 that the residual recovery data
- represents fault-induced, high transmissivity. We agree. 8
- The carbonate rock aguifer behaves as a porous 9
- media similar to an alluvial aquifer system, and thereby can 10
- be analyzed as such. We agree it behaves as an equivalent 11
- 12 force media.

14

- 13 Residual draw-down data demonstrate that
 - hydraulic barriers, the groundwater flow, were not encountered
- during the seven-day aquifer test. We agree. 15
- And S values are on the order of 1.9 times ten to 16
- the minus four, which we agree with, and it is a confined S. 17
- And it is also two orders of magnitude less than the S value 18
- used by Ms. Moran of Stetson when she did her simplified Theis 19
- analysis. 20
- Ms. Moran, representing the whole area, used an 21
- undefined storage coefficient of .03, or maybe perhaps -- yep. 22
- It's a specific yield. 23
- 24 This is a very large, extensive, connected,

Page 1185

- Now, what this slide shows is that this fault 1 confined aquifer system that is very system to -- very
- zone knows no administrative basin boundary. Okay? 2
- You know, the fault zone extends, if we go from 3
- southwest to northeast, you know, parallel to the strike of 4
- Kane Springs Valley itself. 5
- This fault zone extends from the northeastern 6
- portion of Coyote Spring Valley up into Kane Spring Valley and 7
- goes right underneath the basin boundary. 8
- 9 So, what this shows to us is that the carbonate
- aquifer, which is highly transmissive -- and URS's study for 10
- Lincoln County showed no limiting boundaries during their 11
- seven-day pumping test, it shows that this fault zone, which is highly transmissive, is continuous across the basin 13
- boundary now going from northeast to southwest. 14
- Now, coming from -- going back in the opposite 15
- direction from south to north, this portion here in Coyote 16
- Springs -- Coyote Spring basin and in Kane Spring Valley, this 17
- is a continuation of the regionally extensive, highly 18
- fractured, confined aquifer system that extends from Kane 19
- Spring Valley down to the Muddy River Spring area. 20
- Q. All right. Thanks. 21
- Let's go to your next slide. URS report draws 22
- some conclusions from the work it did in the well completion 23
- report, and I'd like to hear your opinion of those 24

- Page 1187
- sensitive to pressure changes and pressure responses within 2
- the system, as evidenced by the drawdowns at some distance 3
- from the MX-5 pumping well during that time. 4
 - So an S value -- a storage coefficient value of
- ten to the minus four is a much more appropriate value to use 6
- than an unconfined specific yield of ten to the minus three. 7
- Q. Thanks. Let's go onto your next slide here.
- We've seen this slide a few times in different forms, but will
- you talk us through what this is? 10
- 11 A. Everybody wants to see this slide again. I know
- 12 that.

16

18

24

5

- Yeah. So you could probably do the testimony for 13
- me. This really is -- these are hydrographs of KMW-1, CSVM-1 14
- and CSVM-4 before, during, and after the 1169 pumping test. 15
 - I think the salient -- the thing that we know is
- 17 that we know their locations. CSVM-1 is located very close to MX-5.
- And you can see its response to when MX-5 was 19
- 20 turned on and off and there's an instantaneous response in the
- hydrograph during the pumping test of CSVM-1 when the water 21
- level was -- when the pump was shut off in MX-5, water level 22
- jumps up. Pump shut off, water level drops, and then it 23
 - repeats itself.

Min-U-Script® **Capitol Reporters** 775-882-5322

(24) Pages 1184 - 1187

Page 1188

- Now, what we see here is that, you know, other than the, you know, 2004-2005 significant recharge event,
- 3 water levels before the pumping test were fairly flat. Water
- 4 levels after the pumping test were somewhat -- they recovered
- 5 after the pumping test and fairly flat since. The steepest
- 6 portion of the hydrograph in CSVM-1 occurred during the MX-5
- 7 pumping test.
- 8 Why do we have these other wells on here? KMW-1
- 9 located in Kane Springs Valley, fairly flat hydrograph before
- 10 the pumping test, some recovery after the pumping test, and a
- 11 fairly flat hydrograph afterwards. The steepest portion of
- the hydrograph of KMW-1 occurs during the 1169 pumping test.
 CSVM-4 located at the north end of Coyote Spring
- 14 Valley, fairly flat hydrograph before the pumping test, taking
- out the recharge event in 2004-2005, some recovery after the
- 16 1169, fairly flat hydrograph afterwards, and the steepest
- portion of the hydrograph occurring during the 1169 pumping
- 18 test.
- So we've got all three of these wells, regardless
- 20 of any other stresses, are showing the steepest portion of
- 21 their hydrographs during the 1169 pumping test.
- 22 Q. All right. A few of the people testifying here
- over the last week have suggested that a lot of these
- 24 responses are directly due to climate influences.

- 1 occurred during the 1169 pumping test. And it mimics the
- 2 drawdown pattern in CSVM-1 during and after the Order 1169
- 3 pumping test.
- 4 Q. But do you see any evidence of seasonal
- 5 fluctuations on these hydrographs?
- 6 A. You know, before and after the pumping test there
- 7 are some seasonal fluctuations in these hydrographs, yes.
- 8 And, you know, if there are any seasonal fluctuations during
- 9 the pumping test, the pressure response -- the pressure
- 10 response from the MX-5 pumping test throughout the highly
- 11 confined aquifer system, you know, had overridden any type of
- 12 climate response.
- 13 Q. Moving up. So, talk us through what we have
- 14 here. This is CSVM-4 and the PDSI curves.
- 15 A. So what we have here -- and this was taken from
- 16 Mr. Umstock, Umstock (phonetic) -- I don't now how to
- 17 pronounce it -- from Daniel E. Stevens as part of the Lincoln
- 18 County-Vidler report, you know, asserting that water level
- 19 changes in CSVM-4 are solely climate driven and don't reflect
- 20 pumping during the Order 1169 pumping test. We disagree with
- 21 that.
- You know, during 2008 to 2010, before the pumping
- 23 test, you know, water levels were stable despite drought.
- 24 And -- there we go. That one looks better. It contradicts

Page 1189

- 1 Do you agree with that conclusion?
- 2 A. No, I do not.
- 3 Q. Why is that?
- 4 A. I think we'll get to that in the next couple
- 5 slides.
- 6 Q. Okay. So let's move on.
- 7 A. So this next slide, just for ease of correlation
- 8 and sort of making it easier on the eyes, is just KMW-1 and
- 9 CSVM-1. CSVM-1, I say, is very close proximity to MX-5.
- Once again, you can see the steepest portion of
- 11 the hydrographs in KMW-1 in Coyote Springs valley located in
- this highly fractured, very transmissive portion of the
- aquifer, and CSVM-1 have the same slope -- or the steepest
- 14 portion of their hydrographs are during the 1169 pumping test.
- Next slide, please.
- 16 Q. Talk us through what we have here.
- 17 A. So, this one, once again for ease of
- 18 visualization on this, you know, is comparing CSVM-4 to CSVM-1
- 19 hydrograph.
- Once again, the highest rate of sustained
- 21 drawdown in CSVM-4, you know, located in this area of highly
- 22 fractured Bedroc as shown in the URS and shown in the Lincoln
- 23 County report -- Lincoln-Vidler report, the highest rate of
- 24 drawdown, the highest sustainment of drawdown in both of them

- Page 1191
 the idea that the declining water levels during the test were
- 2 normalizing after 2004-2005.
- And during the 1169 pumping test, you know, we
- 4 had rapid drawdown in CSVM-4 despite normal or near normal
- 5 Palmer Drought Severity Index climate indicators here.
- 6 So while we're seeing the PDSI rise, we're seeing
- 7 the most -- you know, the first portion of the most rapid
- 8 drawdown in the CSVM-4 hydrograph, and that's during the
- 9 pumping test.
- 10 Q. What about since the pumping test has concluded?
- 11 A. Well, so since the pumping test has concluded,
- we're seeing portions of -- I think this more yellow or sort
- 13 of yellowish-colored line is Region 3 and the black is Region
- 4, we're seeing the Palmer Drought Severity Index drop while
- 15 levels in CSVM-4 are increasing, and we're seeing water levels
- 16 dropping while the drought severity index was -- was showing
- 17 less severe drought.
- 18 Q. So what does that data lead you to conclude?
- 19 A. There's no direct correlation between the drought
- 20 index and water levels in CSVM-4, especially during the
- 21 pumping test.
- 22 Q. Next slide, please?
- 23 A. So this is pretty much the same slide as the
- 24 previous one except we have the hydrograph for CSVM-4 -- I'm

Min-U-Script® Capitol Reporters 775-882-5322

(25) Pages 1188 - 1191

Page 1192

- 1 sorry -- for KMW-1 compared to the Palmer Drought Severity
- 2 Index
- Once again, the 2008 to 2010 water levels were
- 4 stable despite drought, and rapid water level declines above
- 5 normal or near normal occurred, despite having normal or near
- 6 normal moisture conditions during the 1169 pumping test.
- 7 Q. So, this leads you to the same conclusion about
- 8 the other well?
- 9 A. Yes, sir.
- 10 Q. Which was?
- 11 A. That drought cannot be identified as the single
- 12 driver for water level declines in any of these wells during
- the 1169 pumping test.
- 14 Q. All right. I think you summed that up for us in
- 15 your next slide.
- 16 A. So, once again, the title is self-explanatory.
- 17 You know, the drought severity was less during the entirety of
- the 1169 pumping test than from 2008 to 2010, but yet the
- water levels declined more rapidly during any other time.
- Really, I think what we have bolted here is that
- 21 the drawdown observed during the 1169 pumping test cannot be
- 22 explained solely by drought severity. And water levels began
- to recover before the drought severity lessened, and that contradicts the assertion that climate is the sole driver.
 - Dono

- 1 objection if you're restating your question like that.
- I think there needs to be a foundation laid as to
- 3 what this witness knows about the evidence in that proceeding,
- 4 since you and your client were not parties in that proceeding.
- 5 BY MR. MORRISON:
- 6 Q. Mr. Lazarus, have you read Ruling 5712 in its
- 7 entirety?
- 8 A. I have read Ruling 5712 in its entirety and the
- 9 stipulation between Lincoln County and Fish and Wildlife
- 10 Service.
- 11 Q. Do you understand the facts in that ruling that
- 12 the State Engineer relied upon in issuing the conclusions of
- 13 fact in that ruling?
- 14 A. I believe I do.
- 15 HEARING OFFICER FAIRBANK: So we will go ahead
- and allow the line of questions just under the recognition
- 17 that the State Engineer is the one who offered the particular
- 18 ruling and understands the bases of the State Engineer's
- 19 determination, and we'll take it in the weight of the evidence
- 20 in light of the State Engineer's own determinations.
- MR. MORRISON: That's fair.
- BY MR. MORRISON:
- 23 Q. I just want to ask you what data from Ruling 5712
- 24 indicates to you that it isn't, per se, exclusion of Kane

Page 1193

5

Page 1195

- 1 Q. Thank you. Next slide, please. We've heard a
- 2 few people talk about State Engineer Ruling 5712 as support
- 3 for the exclusion of Kane Springs. Does Ruling 5712, when
- 4 read in it's entirely, really support that conclusion?
- 5 A. No, it does not.
- 6 MS. PETERSON: Objection. Calling for a legal 7 conclusion.
- 8 HEARING OFFICER FAIRBANK: I'm sorry, Ms.
- 9 Peterson, will you speak up? I could not hear the basis for10 your objection.
- MS. PETERSON: The question was whether the
- 12 witness agreed with what the State Engineer's opinion says and
- 13 the ruling, and I don't know -- I'm objecting based on it
- 14 calls for a legal conclusion. So please restate.
- MR. MORRISON: I'd be happy to answer that objection.
- 16 Objection.
- 17 Actually, I didn't ask for a legal conclusion. I
- asked if the data that was relied upon in Ruling 5712
- 19 supported the conclusions of fact within that ruling. Not any
- 20 conclusions of law.
- 21 HEARING OFFICER FAIRBANK: Go ahead and answer
- 22 the question to the extent you understand the question.
- MR. LAZARUS: Thank you, Madam Hearing Officer.
- MS. PETERSON: Actually, I do have another

- 1 Springs from the management area?
- 2 A. Well, you know, what I'm look at here really is
- 3 the stipulation, and the stipulation is between Fish and
- 4 Wildlife -- Fish and Wildlife Service and Lincoln-Vidler.
 - And that stipulation includes a requirement for
- 6 preparation and implementation of a 3M plan using the
- 7 discharge at the Warm Springs West Gage. Somewhat as the
- 8 canary in the coal mine, if you may.
- 9 Now, Lincoln-Vidler agreed to trigger levels in
- 10 the Muddy River Springs area being the guidance for when
- 11 Lincoln-Vidler would cut back on their pumping.
- So one can only infer that if Lincoln-Vidler has
- 13 applications in the Kane Springs Valley and has agreed to
- 14 subjecting their pumping to limits based on spring
- 15 discharge -- or lowering of spring discharges in the Muddy
- 16 River Springs area, one can only infer that Kane Springs
- 17 Valley is hydrologically connected to the Muddy River Springs
- 18 area, or otherwise why would a prudent individual or a prudent
- 19 group agree to limit their pumping based on impacts to spring
- 20 flow in the Muddy River Springs area?
- And they agreed to the following trigger levels,
- 22 which I think might have been discussed earlier and we don't
- have to go through all of them, but I think everyone is
- 24 familiar with these, and we'll take a minute or so for -- to

Min-U-Script®

Capitol Reporters 775-882-5322

(26) Pages 1192 - 1195

Page 1196

- 1 make sure the people have read this and see what the numbers
- 2
- Q. Let's move on. This is all going to be on the 3
- record. 4
- So, you wanted to quickly summarize your
- conclusion on Kane Springs. Did you find someone else who 6
- summed it up real nicely for you?
- A. Actually, I really have to thank Colby Pellegrino 8
- because I couldn't have written this better. I wished I would
- have written it like this. Okay? But Colby won't read it for 10
- 11 me, so I guess I will.
- So, in her October 23rd, 2018 letter to Jason 12
- 13 King, which was a letter of transmittal for a SNWA assessment
- of aquifer conditions in the Lower White River Flow System, 14
- 15 page 1, conclusion from SNWA's letter to Jason, was that Kane
- Springs Valley should be included as part of the LWRFS 16
- 17 administrative unit because the carbonate aquifer extends
- beneath the basin, recharged derived local within the basin 18
- 19
- flows in the Coyote Springs Valley, and responses to natural
- 20 and anthropogenic stresses observed in monitor wells located
- in northern Coyote Spring Valley, parentheses CSVM-4, end 21
- paren, and southwest Kane Springs Valley, parentheses KMW-1, 22
- end paren, indicate there is hydraulic continuity within the 23
- aquifer system between this area and production wells in 24

- the conclusion of that testing?
- A. You know, the water levels and spring discharge,
- you know, have remained fairly constant since the cessation of
- the 1169 pumping, but the water levels and spring discharge
- haven't recovered the pre-1169 water levels or levels of -- or 5
- discharge -- or discharge. 6
- 7 It's possible, and we're not saying -- we're not
- putting probability on it, but it's possible that the
- carbonate aquifer system is reaching somewhat of a steady
- state condition at current pumping rates, but additional data 10
- are required to verify this conclusion. 11
- 12 Q. And your next slide kind of indicates where
- you -- what you relied upon to reach that conclusion. 13
- A. So what we looked at was the discharge from the 14
- 15 Pederson -- or Pederson -- and Pederson East Springs.
- You know, we can -- we can see here that, you 16
- 17 know, somewhat sort of flat discharge between .2 and .3 CFS at
- Pederson, and then bouncing around .2 at Pederson East. 18
- Before the pumping test, we do see some seasonal 19
- fluctuations in these hydrographs, but -- and then after the 20
- pumping -- cessation of the pumping test, fairly flat 21
- hydrograph in Pederson, fairly flat hydrograph in Pederson 22
- 23 East with seasonal fluctuations.
- 24 And -- but both of these springs showing the

Page 1197

- southern Coyote Spring Valley. 1
- And the Moapa Valley Water District agrees with 2
- this statement from SNWA. 3
- Q. Let's go on to your next slide. So what are we 4
- looking at here?
- A. So, what we're looking at really is the summation 6
- 7 of my testimony regarding the geographic boundary of the Lower
- White River Flow System, and the water district proposes, and 8
- we believe we have sound science to back it up, that Kane
- Spring Valley basin should be included as part of a 10
- seven-basin super basin and be part of the administrative 11
- basin regulated by the Department of Water Resources State 12
- Engineer. 13
- Q. So just because there's a little bit of confusion
- in at least one rebuttal report, how many basins are within
- the management area that we're proposing? 16
- A. We're proposing a seven-basin management area. 17
- That wasn't a typo? 18 Q.
- That wasn't a typo. 19
- 20 Q. Okay. Let's move on to the next topic the State
- Engineer asked for information on, and that would be the 1169 21
- aquifer test and recovery. 22
- What does the data you've reviewed tell you about 23
- Order 1169 pumping tests and the recovery of the aquifer since

Page 1199

steepest water level declines in their hydrographs during the

- 1169 pumping test.
- Q. Okay. So the next slide, the data you've
- reviewed tells you that the State Engineer's current
- understanding of post-1169 recovery is pretty accurate?
- A. Yes. We agree with the statements that the State 6
- Engineers made in the Interim Order 1303. 7
- 8 O. Please go through those statements briefly.
- A. Okay. Moapa Valley Water District agrees with
- DWR IO 1303, parentheses, P10, end paren, quote, the current 10
- amount of pumping corresponds to a period of time in which 11
- 12 spring flows have remained relatively stable and have not
- demonstrated a continuing decline. 13
- Although water levels and spring discharge have 14
- remained fairly constant since the cessation of the Order 1169 15
- pumping test, water levels and spring discharges have not 16
- recovered the pre-1169 test levels or discharges. 17
- Q. Next slide. We can move on. 18
- A. So we're discussing here the annual groundwater 19
- 20 that may be pumped in relationship between pumping location
- discharge, the MRS, and capture the Muddy River flow. 21
- We concur with SNWA and Dr. Johnson that the 22
- alluvial wells are in direct hydrologic communication with the 23
- Muddy River and directly capture Muddy River flows. 24

Min-U-Script®

Capitol Reporters 775-882-5322

(27) Pages 1196 - 1199

Page 1203

Page 1200

7

We also believe that additional carbonate pumping in excess of current diversions in the Lower White River Flow

3 System will accelerate spring depletions.

4 Q. Okay. Next slide. What conclusions did you

5 reach about the State Engineer's fourth question posed in

6 Interim Order 1303?

7 A. Regarding movement between alluvial and carbonate

8 wells. I think all the parties in the room agree that

9 carbonate aquifer discharge provides Moapa -- provides water

10 for Moapa Dace habitat. Alluvial pumping does not affect

11 Muddy River's spring discharge which is discharging from the

12 carbonate aquifer.

We believe that -- it's our professional opinion that transfer of alluvial rights to the carbonate aquifer will increase and accelerate spring depletions.

Our opinion is that pumping from a carbonate aquifer in greater than current volumes will increase and accelerate spring depletions, and the transfer of carbonate water rights to the alluvial aquifer will reduce flows in the Muddy River.

21 Q. All right. So we're going to move on to the

22 fifth question the State Engineer posed, which is somewhat of

a catch-all on the information relevant to the previous

24 questions.

1

13

1 planning that the district has conducted, we did their 50-year

2 water resource plan, it's all having to do with acquisition of

3 water rights and maintaining those water rights and making

4 sure that they've been put to beneficial use.

So ruling 6259 and 6261 were denied, and they caused the district to seek alternative sources to accommodate

the growth scenarios from the integrated water resource plan.

8 And then curtailment of district's water rights

9 will not only have an effect on the non-Indian communities

that Mr. Davis pointed out in his slideshow in the districtservice area, but curtailment of the water rights will have an

12 adverse effect on the Moapa Band of Paiutes, which in addition

to the non-Indians, we have a legal obligation to serve and

14 provide water to.

15 Q. All right. The next slide is one more thing that

you believe the State Engineer needs to know?

17 A. Yeah. I think, you know, we can't stress enough

18 how much the district has sacrificed to help maintain habitat

19 for the Moapa Dace.

So, you know, in the 2006 MOA, you know, and this was described -- and I forget if it was Mr. Marshall or Mr.

22 Williams who was saying MOA's in perpetuity. You know, that

we've dedicated 724 acre-feet, or 1 CFS, 25 percent of our

24 district's water use, for Moapa Dace habitat protection and

Page 1201

And you were offered as a witness on water

2 rights, so as an expert on water rights, what other

3 information do you think the State Engineer needs to properly

4 analyze Lower White River Flow System?

5 A. Well, I think it's really important that the

6 State Engineer and the other parties and stakeholders to this

7 hearing recognize that the district has spent many dozens of

8 years doing water resource planning and acquiring and

9 developing water rights to provide for the health, safety, and

welfare of the customers it serves within the district

boundaries that Mr. Davis showed, and in responding to

enabling legislation that Mr. Davis referred to.

And we also agree and appreciate that the State

Engineer in Interim Order 1303 recognizes that we need a

reasonable -- reasonably certain supply of water for future

pertinent uses without jeopardizing economies, and we are the economy in the area right now in the communities we serve, and

18 the State Engineer IO 1303 recognizes that we need to protect

19 the health and safety of those who rely on that water supply.

20 Q. Below that you've cited a law that authorizes a

21 mechanism. I don't think we need to discuss it at length. I

22 think the slide speaks for itself. So we can go to the next

23 slide

Min-U-Script®

24 A. So, as part of the over -- overall water resource

1 enhancement.

2 And that's a really big deal to the district.

3 It's 25 percent of our water supply. It's our senior right.

4 Infrastructure is already in place to divert it, and the

5 district took a big hit with that. Okay?

6 You know, and it's our professional opinion and

7 the district's stance that dedication of the pipeline, Jones 1

8 CFS for base habitat, mitigated any effects we have to Dace

9 habitat 13 years ago, and we have met any obligations to

protect the Dace habitat and the senior water rights.

11 Q. Let's go to our next slide. You talk about what

12 the district needs are in order to comply with its statutory

mandate to provide water. Can you talk us through those

14 needs?

15 A. Right. Yes. And so, you know, the district

16 needs to have a sustainable water supply to provide for the

17 health, safety and well-being of our customers.

Well, you know, right now the district is pumping

19 from the Arrow Canyon wells. We need redundancy in the

20 system. We need additional points of diversion if Arrow

21 Canyon for any reason goes down, or both Arrow Canyon well

22 goes down.

One of my clients in the last couple

One of my clients in the last couple weeks lost a lot of their main producing wells to a lightning strike, you

A. 50, as part of the over -- overall water resource

Capitol Reporters

(28) Pages 1200 - 1203

Page 1207

Page 1204

know, and we're very sensitive to all of our water suppliers

needing redundancy and backup in their systems.So additional wells are needed as part of the

- 4 district's long-term plans. You know, we need to protect the
- 5 communities we serve, you know.
- 6 We believe that -- you know, it's really
- 7 important as we -- outcome of this hearing and the ruling
- 8 and -- ruling and final order that comes out of this is that,
- 9 you know, municipal -- current -- current municipal uses of
- 10 water should be preferred use and most protected and highest
- 11 use of water in seven-basin flow systems, seven-basin
- 12 administrative system, recognition of municipal water that's
- been currently put to beneficial use.
- The district requests 6,791 acre-feet for
- municipal and related uses. Preferred use designation is as
- we talked about.
- And we don't know exactly what this looks -- this
- 18 last bullet looks like, but we do need and want support for
- 19 transfers of carbonate water rights from Arrow Canyon to other
- 20 basins not in the Lower White River Flow System as currently
- 21 defined.
- 22 Q. Okay. So we're getting pretty close to our
- one-hour limit, so can you briefly talk us through your last
- 24 few slides, which are just a summation of your conclusions?

- 1 increase or accelerate, which would cause adverse impacts to
- 2 today's habitat as a result of transfer of alluvial water
- 3 rights to the carbonate aquifer or pumping from carbonate
- 4 aquifer wells involving use greater than currently being
- 5 pumped
- 6 Q. We wanted to leave with a couple of
- 7 recommendations and then we'll turn it over to cross.
- 8 So -
- 9 A. This is our last slide. So, we recommend that
- 10 the Kane Springs Valley basin should be included in the super
- basin to form a seven-basin administrative area.
- Existing municipal use should be designated as
- 13 the most protected and highest use of water in the seven-basin
- 14 administrative area.
- 15 Carbonate pumping should not exceed current rates
- 16 of diversion.
- The State Engineer should recognize water put to
- 18 beneficial use by the district from its wells and springs and
- 19 grant the district the right to divert 6,791 acre-feet of
- 20 water per year.
- MR. MORRISON: Thank you. That ends my direct
- 22 testimony.
- HEARING OFFICER FAIRBANK: Thank you. So we'll
- 24 go ahead and open up to cross-examination. And based upon our

Page 1205

- 1 A. You know, our conclusions, the hydraulic gradient
- 2 of ten to minus four feet per feet is effectively flat and is
- 3 continuous from Coyote Springs Valley to Muddy Springs, Big
- 4 Muddy Springs area.
- 5 KMW-1, CSVM-4 responded to the 1169 pumping test,
- 6 as well as springs in the Muddy River Springs area responded
- 7 to 1169 pumping test.
- 8 Lincoln-Vidler is willing to curtail Kane Springs
- 9 Valley carbonate pumping if trigger levels are met or exceeded
- 10 in the Warm Springs West Gage in the Muddy River Springs area.
- 11 Residual drawdown collected during
- 12 Lincoln-Vidler's KP1 pumping test demonstrate hydraulic
- barriers to groundwater flows were not encountered during the
- 14 seven-day pumping aquifer testing.
- Water levels and spring discharges have remained
- 16 fairly constant since the end of the pumping test but have not
- 17 recovered to pretest discharges of water levels.
- You know, additional data required to verify what

state or steady state condition that the carbonate aquifer may

20 be reaching.

19

- Alluvial wells are in the direct hydrologic
- 22 communication with the Muddy River and directly capture Muddy
- 23 River flows.
- And Muddy River spring area spring flows may

- 1 calculations, we have -- we'll go ahead and start out with
- 2 seven minutes for each of the participants for
- 3 cross-examination.
- 4 MR. MORRISON: Madam Hearing Officer, before we
- 5 start cross, I neglected to offer our reports into evidence,
- 6 so if I may please offer those.
- 7 HEARING OFFICER FAIRBANK: Mr. Morrison has
- 8 offered his exhibits -- his expert reports into evidence, and
- 9 those reports will be so admitted.
- MR. MORRISON: Thank you.
- 11 HEARING OFFICER FAIRBANK: Okay. Coyote Spring
- 12 Investment?
- 13 CROSS-EXAMINATION
- 14 BY MR. HERREMA:
- 15 Q. Thank you. Brad Herrema for Coyote Spring
- 16 Investment.
- Good morning, Mr. Lazarus and Mr. Davis.
- Mr. Lazarus, you testified that faults don't
- 19 cause any impact to the occurrence and movement of groundwater
- 20 in the Lower White River Flow System based on relatively flat
- 21 water levels; is that correct?
- 22 ANSWERS BY MR. LAZARUS:
- 23 A. I believe I stated that faults do not change the
- very flat ten to minus four gradient.

Min-U-Script® Capitol Reporters 775-882-5322

(29) Pages 1204 - 1207

Page 1208

- 1 Q. Do changes in groundwater levels indicate the
- 2 presence of faults?
- 3 A. Changes in groundwater elevations just indicate a
- 4 change in potentiometric head from higher to lower
- 5 potentiometric head.
- 6 Q. So can water levels themselves be used to
- 7 identify faults?
- 8 A. Water levels would be something one would
- 9 consider to identify if faults were or were not present.
- 10 Q. Can water levels by themselves to be used to
- 11 identify faults?
- 12 A. It all depends how far the water is to a fault.
- 13 The faults that we have here and the series of faults that I
- believe Mr. -- that Mr. Reich -- I don't know if it's Dr.
- 15 Reich, Mr. -- Steve --
- Let's make it clear. You know, everyone -- a lot
- 17 of people have been talking about faults as barriers to flow.
- 18 Q. And I just have a very simple --
- 19 A. Let me just please finish. We don't have --
- 20 these faults, we don't have a 30-foot-wide drought curtain
- going down to 3,000 feet where there's a
- 22 barrier-to-groundwater flow. Okay?
- All the places where faults have been mapped or
- 24 inferred are showing that the water is being transmitted

- 1 A. I don't remember those. I haven't looked at it
- 2 in a long time.
- 3 Q. If I told you that the 2012 report indicated
- 4 specific storage was E to the minus five expressed in terms of
- 5 one divided by number of feet, would that sound right to you?
- 6 A. You refer to specific storage, and I was talking
- 7 about a storage coefficient and specific yield. Those are two
- 8 different numbers and two different calculations.
- 9 Specific storage, I believe, is a storage
- 10 coefficient provided by the thickness of the aquifer, but I
- would have to check my reference on that.
- 12 Q. Okay. Would you agree that if the aquifer was
- 13 assumed to be a thousand feet, the storage value would be .01
- 14 or H to the minus two?
- 15 A. I don't understand the question.
- 16 Q. Okay. In regard to the Pederson Spring water
- level data, did you try to determine the impact of Arrow
- 18 Canyon pumping as opposed to pumping from other carbonate
- wells in the Lower White River Flow System?
- 20 A. No, I did not.
- 21 Q. Turning to page 2 of your July 1, 2019, report,
- 22 right under "Post-Testing water level recovery," there's a
- 23 statement there. It says: "NVWD agrees with DWR statement in
- 24 Interim Order 1303 that the current amount of pumping

Page 1209

Page 1211

- 1 across the structures.
- 2 I believe it was Rick Waddell said that the
- 3 faults are transmissive enough to transmit heat flow, and
- 4 Andrew Burns said that the faults are transmitting both
- 5 anthropogenic and natural changes in the aquifer system across
- 6 the faults themselves.
- 7 Q. Okay. My question was, can water levels by
- 8 themselves be used to identify faults?
- 9 A. And as I said before --
- 10 Q. -- you have -- the question --
- 11 A. -- it depends on the location of the wells
- 12 relative to the faults.
- 13 Q. Okay. In reviewing the work that was done on
- behalf of CSI, did you realize that CSI's expert, Ms. Moran,
- 15 provided a comparative analysis of impacts to an observation
- 16 point based on pumping in one well compared to pumping in
- 17 another well?
- 18 A. I believe so.
- 19 Q. If she had used a lower storativity value, what
- would have been the results of that analysis?
- 21 A. The drawdown would have been greater than she had
- 22 shown.
- 23 Q. Okay. Were you aware of the values of
- storativity used in the tetradic model?

- 1 corresponds to a period of time in which spring flows have
- 2 remained relatively stable and have not demonstrated a
- 3 continuing decline."
- 4 Did you do any independent analysis in
- 5 preparation of your report?
- 6 A. No.
- 7 Q. So what was the basis for your agreement?
- 8 A. Well, I'll rephrase that. This com- -- we
- 9 prepare an annual report for the hydrology review team.
- So all of the hydrographs for Pederson and
- 11 Pederson East were something that we've been preparing and
- 12 looking at for several years now.
- 13 Q. Page 4 of your report, the first paragraph under
- 14 heading C: "Moapa Valley Water District agrees with DWR
- 15 statement in Interim Order 1303." Do you see that paragraph?
- 16 A. Yes, sir.
- 17 Q. What additional data is required to determine
- whether the system is in a steady state?
- 19 A. Can I have an unlimited budget?
- You know, many more years of measuring water
- 21 levels, spring discharges, pump- -- pumping. You know,
- 22 really -- and I think Ms. Braumiller referred to it earlier,
- 23 you know, you really want to look at long-term pumping in
- different portions of the super basin where wells, some are,

Min-U-Script®

Capitol Reporters 775-882-5322

(30) Pages 1208 - 1211

Page 1212

- 1 and where wells, you know, could be drilled.
- You know, for instance, in the stipulation that
- 3 was attached Ruling 5712, you know, there was a technical
- 4 review team that was supposed to have been formed there and
- 5 two wells were supposed to have been drilled.
 - One well, I think it was substituted. SNWA
- substituted. I forget which well it was. But the second
- 8 well, as part of that stipulation, wasn't drilled, and that's
- 9 the kind of information that we'd like to see. That would be
- 10 more additional data.
- MR. HERREMA: Did I use my time up?
- 12 HEARING OFFICER FAIRBANK: Yes. That was your
- 13 timer.

6

- MR. HERREMA: Thank you.
- 15 HEARING OFFICER FAIRBANK: Thank you.
- Next we'll go to Fish and Wildlife Service.
- MS. BRAUMILLER: We don't have a solicitor here
- today, otherwise we have two questions.
- 19 HEARING OFFICER FAIRBANK: Okay. So then
- 20 we'll -- as counsel's not here, we'll move to National Park
- 21 Service and then Moapa Band of Paiute.
- MR. BURLEY: Rich Burley, for the record, for the
- 23 Tribe.

24

- 1 specific reference.
- 2 Q. Do you think the 9,000 acre-feet goes to the
- 3 Muddy River or does it bypass -- is there any water that
- 4 bypasses the river and the springs?
- 5 A. I don't know.
- 6 Q. Ordinarily do you think it makes sense to move
- 7 well withdrawals further from a sensitive area if you wanted
- 8 to do less direct harm to the sensitive area? As a general
- 9 matter.
- 10 A. I was going to say "ordinarily" doesn't describe
- all the different kinds of aquifer systems I would do it in.
- So, it may just slow down the time that it takes for the
- impacts to hit the sensitive area.
- 14 Q. You pointed out looking northward that things
- were relatively non-heterogeneous, I guess, if you want to
- 16 talk about gradients between Kane Springs through Coyote
- 17 Springs and then down to the Muddy Springs complex.
- Do you see any relevant heterogeneity anywhere
- within the super basin, or do you think it makes sense to treat the super basin as somewhat analogous to just a bathtub
- 20 treat the super basin as somewhat analogous to just a bathtut
- where it really doesn't matter where you take water out of?
- 22 A. You have heterogeneities in the system that have
- 23 been discussed. Previous testimony have to do with structural
- 24 geologic features.

Page 1213

Page 1215

- 1 CROSS-EXAMINATION
- BY MR. BURLEY:
- 3 Q. Mr. Lazarus, do you believe that all of the
- 4 carbonate flow that is being taken out of pumps comes out at
- 5 the Muddy Springs area?
- 6 A. I don't understand the question.
- 7 Q. Do you think there's any water from the carbonate
- 8 aquifer that bypasses the Muddy Springs complex?
- 9 A. Based on previous investigations, and I haven't
- verified any of these numbers, but, yes.
- 11 Q. Where do you think it goes if it doesn't go to
- 12 the springs?
- 13 A. South.
- 14 Q. South towards Lake Mead? Towards Las Vegas?
- 15 A. I can't really break those. I haven't looked at
- 16 it.
- 17 Q. Okay. Do you have a sense of how much water we
- 18 might be talking about within the carbonate aquifer that might
- 19 bypass the springs?
- 20 A. I would have to go back and look at some of the
- 21 State Engineer numbers, or numbers from SNWA. I'm going to
- say -- and I want to qualify this by saying I have to check
- 23 the reference -- specific reference, but possibly as much as
- 9,000 acre-feet, in that ball park, but I have to check the

- 1 I think what's been overlooked in this hearing in
- 2 terms of heterogeneities in this really regionally expensive
- 3 hunk of aquifer system is you've got K flow in certain areas,
- 4 and you have Karst flow.
 - And the Karst flow is so important that the park
- 6 service hired a guy name Gary Carson to come to this hearing.
- 7 So we -- we've got all sorts of heterogeneities that move
- 8 water around within the limestone aquifer, the regional
- 9 carbonate aquifer.
- 10 Q. Okay. If there were carbonate water available
- 11 within the super basin that had bypassed the springs and that
- does bypass the river, would that be water that you think
- could be safely withdrawn?
- 14 A. I'd have to look to see what the results were of
- 15 aquifer tests in those areas and then draw conclusions based
- 16 on that.

775-882-5322

5

- 17 Q. When you talk about that it wouldn't help to move
- 18 alluvial pumping to ground- -- to the carbonate or carbonate
- 19 pumping to the alluvium, those are fairly general statements
- 20 and kind of ignore some of these heterogeneity questions that
- 21 we're talking about. Isn't this true?
- 22 A. The gradients that we calculated from KMW-1 to
- EH-4 and the other gradients are very flat. Whatever
- 24 heterogeneities might be there aren't affecting the

Min-U-Script® Capitol Reporters

(31) Pages 1212 - 1215

Page 1219

Page 1216

- 1 groundwater gradient in these areas.
- 2 Q. So you were focused on the particular issues
- 3 relating to Kane Springs and whether it should be included in
- 4 the super basin when you made those recommendations and came
- 5 to those conclusions.
- 6 Is that fair?
- 7 A. Our focus was on Kane Springs, yes.
- 8 Q. So you might have a different focus if the
- 9 question was whether moving an alluvial right that's very
- 10 close to Muddy Springs to a carbonate right in a far portion
- 11 of California Wash, just as an example, would you have to look
- at the specific questions that might come into play before
- reaching a conclusion along those lines?
- 14 A. No.
- 15 Q. Why not?
- 16 A. You know, as I stated in my direct, any increase
- in carbonate pumping will result in increased depletions on
- the Muddy River Springs area.
- So it's a matter of location of your pumping
- 20 center, and then what you are doing is just something
- becomes -- the magnitude and the timing of the effects are
- 22 specifically guided or -- magnitude and timing of the effects
- 23 is based on the distance from the Muddy River Spring area that
- a new carbonate well would be located.

- 1 to alluvium and alluvium to carbonate, is it a recommendation
- 2 that goes throughout the entire Lower White River Flow System?
- 3 A. The entire seven-basin flow system, yes, sir.
- 4 Q. Okay. You were also asked about underflow. And
- 5 I think Mr. Burley on behalf of the Tribe asked you some
- 6 questions about that.
- 7 Do you recall that?
- 8 A. He didn't use the term underflow, but I believe I
- 9 understand what you're saying.
- 10 Q. Bypass flow is maybe the term that he used, but
- 11 water that went past the springs. And my question is, have
- 12 you seen any wells in the Lower White River Flow System that's
- 13 captured this underflow without impacting the springs or the
- 14 river?
- 15 A. I don't know if I have or haven't.
- 16 Q. Okay. You have reviewed hydrographs for
- 17 groundwater levels in the Lower White River Flow System in
- 18 California Wash, Garnet Valley, Coyote Spring Valley. Is that
- 19 true?
- 20 A. I'd say I've reviewed the hydrographs from the
- 21 1169 pumping test and whatever wells are in our annual
- 22 reports.
- 23 Q. Okay. So, do you know or have an opinion on
- 24 whether or not groundwater levels in other locations in the

Page 1217

- 1 Q. If the water had bypassed the sensitive area,
- 2 though, if it was in effect down-gradient, wouldn't some of
- 3 those answers be different? At least in -- in light of the
- 4 time that it might take for the effects to show up?
- 5 A. I don't know. That's why we wanted -- that's
- 6 what we said in one of our requests that we wanted the ability
- 7 to move carbonate water rights from Arrow Canyon to other
- 8 basins outside the super basin.
- 9 And I said -- in my direct I said I don't know
- 10 exactly know what it looks like yet, and to add to that, more
- 11 testing would need to be done.
- MR. BURLEY: Okay. Thank you, very much.
- 13 HEARING OFFICER FAIRBANK: Las Vegas Valley Water
- 14 District, Southern Nevada Water Authority.
- 15 CROSS-EXAMINATION
- BY MR. TAGGART:
- 17 Q. Good morning. For the record Paul Taggart for
- 18 the water authority and district.
- Mr. Lazarus, there was just some questions asked
- 20 about your opinion regarding moving carbonate to the alluvium,
- 21 moving alluvium to carbonate, and the question I thought was
- 22 whether your recommendation regarding that type of movement
- was restricted to Kane Springs only.
- Is your recommendation regarding moving carbonate

- 1 Lower White River Flow System, specifically Garnet Valley,
- 2 California Wash and Coyote Spring Valley, whether those
- 3 groundwater levels are declining currently?
- 4 A. I'd have to go back and look at the data.
- 5 Q. Okay. There was testimony from CSI regarding
- 6 some resistivity data.
- 7 Do you recall that?
- 8 A. Yes, sir.
- 9 Q. And do you believe that that resistivity data can
- 10 be used to identify an impermeable fault in the Coyote Spring
- 11 area?
- 12 A. I'm not a geophysicist. I don't see -- based on
- the work we've done, I don't see those faults interrupting
- 14 groundwater flow.
- 15 Q. And in -- when you make that conclusion, are you
- relying on certain lines of evidence?
- 17 A. Of course.
- 18 Q. Okay. And I'd like to kind of compare the
- 19 evidence you're relying upon versus that resistivity evidence.
- 20 Are you relying on water level data when you make that
- 21 conclusion?
- 22 A. We're relying on water level data that has been
- 23 collected before, during and after the 1169 pumping test, and
- 24 spring discharges also.

Min-U-Script® Capitol Reporters 775-882-5322

(32) Pages 1216 - 1219

Page 1220

- 1 Q. So do you think that information is more reliable
- 2 and more probative to the question of whether a fault in the
- 3 Coyote Spring area can be impermeable?
- 4 You sounded pretty confident about a grouted
- 5 3,000-foot structure?
- A. I don't see any of those.
- 7 Q. Okay. So, do you think there are any
- 8 compartments in Coyote Spring Valley that can be pumped
- 9 without impacting the Muddy River Springs?
- 10 A. Based on data available to date, no.
- 11 Q. Do you think carbonate pumping should be
- increased in the Lower White River Flow System?
- 13 A. I stated in my direct it shouldn't be increased
- beyond what's being pumped now.
- 15 Q. And did you state in your opinion on page 4 in
- 16 your report that no new subdivision parcel maps should be
- 17 approved?
- Was that you, Mr. Davis, that said that?
- MR. DAVIS: No, it wasn't me. I don't remember
- 20 making that statement.
- MR. MORRISON: Do you need your report to help?
- MR. DAVIS: On what page of the report?
- MR. TAGGART: Page 4. I can move on to another
- 24 question.

- 1 Is that a fair statement?
- 2 A. Yes, sir.
- 3 Q. Okay. When -- are you aware that in recent
- 4 years, pumping at Arrow Canyon declined, and it probably fell
- 5 by a third of its pumping previously to that. Are you aware
- 6 of that?
- 7 A. I believe so. I'd have to look at the data. But
- 8 go ahead.
- 9 Q. And if it -- if Arrow Canyon pumping had
- 10 continued at the same rate, do you think that would affect
- 11 your conclusion about whether there's declining trends at the
- 12 Warm Springs West Gage?
- 13 A. We'd have to look at those data.
- 14 O. Okay.
- MR. TAGGART: Thank you.
- 16 HEARING OFFICER FAIRBANK: Lincoln County,
- 17 Vidler.
- MR. FREHNER: Dylan Frehner for the record for
- 19 Lincoln County Water District and Vidler Water Company.
- 20 CROSS-EXAMINATION
- BY MR. FREHNER:
- 22 Q. You just stated that your focus was on Kane
- 23 Springs Valley with regards to the boundaries?
- 24 A. Not the southern portions. Yes.

Page 1221

Page 1223

- 1 BY MR. TAGGART:
- 2 Q. And back to you, Mr. Lazarus. I'm sorry. Is it
- 3 Dr. Lazarus?
- 4 A. Mister.
- 5 Q. Mister. Okay.
- There has been discussion of water budgets and
- 7 the use of water budgets in determining what the long-term
- 8 quantity of groundwater that should be pumped in this area is.
- 2 Can you describe your view of the ability to use
- 10 water budgets in this flow system versus the other type of
- empirical data you've been describing?
- 12 A. You know, I forget whether it was Rick Waddell or
- 13 Ms. Braumiller who said we are past the point of relying on
- water budgets to do these kind of analyses. I agree with
- **15** that.
- MR. TAGGART: Is it -- is it possible to put up
- 17 slide 26? I'm sorry. Maybe it's the one with the -- could
- 18 you go up one more? Yeah. Right there.
- BY MR. TAGGART:
- 20 Q. And my question again for you, Mr. Lazarus, it
- 21 just involves your opinion regarding whether we're in a
- declining trend or a steady trend in water levels in the area,
- and I think you mentioned you'd like to see more data, that
- that would be of assistance to make a final conclusion.

- 1 Q. Just the northern portions?
- 2 A. Correct.
- 3 Q. Now, in your report -- let's go back -- you --
- 4 you also stated that you didn't do any independent data
- 5 gathering with regards to Kane Springs?
- 6 A. That is correct.
- 7 Q. So you pick and choose from other people's
- 8 information and supplied that here today?
- 9 A. Well, given the limited budget we have, that's
- 10 what we are allowed to work with, was what was out there.
- 11 Q. And given the slides that you've presented today
- and gone over, those were not submitted in the report,
- 13 correct?
- Those hydrographs that you referenced and the
- other data have not been supplied in the report?
- 16 A. That's correct, but hydro- -- the hydrographs are
- out there in the public record, and we've taken, like I said,
- 18 information from other reports. Yes, sir.
- 19 Q. With regards to the Figure 1 from your -- or from
- your rebuttal report, it goes with -- I believe it's your
- 21 Slide 7.
- Now, the area depicted in this Figure 1, you
- would agree that this is a geologically complex area?
- 24 A. It's geologically complex, but the geology really

Min-U-Script®

Capitol Reporters 775-882-5322

(33) Pages 1220 - 1223

Page 1227

Page 1224

- 1 doesn't seem to have a huge effect on groundwater flow.
- 2 Q. So one of the previous questions, I believe it
- 3 was on the Tribe, had indicated that you're indicating this is
- 4 like a flat bathtub, then?
- 5 A. I would say it's sort of a remarkably flat.
- 6 Q. And so you would agree that your figure is
- 7 showing that this would be more appropriate in a uniform-like,
- 8 sandy aquifer?
- 9 A. If I remember my direct testimony correctly, it
- 10 was a report for Lincoln-Vidler says that it be -- the aquifer
- 11 behaves as an equivalent porous media, which a sandy aquifer
- 12 would be.
- 13 Q. And you're saying this is for the entire super
- 14 basin?
- 15 A. I'd say for the areas that we have depicted here
- on the map, yes. The rest of the super basin, I'd have to do
- 17 other calculations.
- 18 Q. So the area from the map, you've shown a line
- 19 from KMW-1 down to I believe it's EH-4; is that correct?
- 20 A. Yes, sir.
- 21 Q. And you're aware that that line goes directly
- over the Meadow Valley mountains?
- 23 A. Yes.

3 A. Yes, sir.

6

10

13

16

17

18

Springs Valley?

A. I haven't looked at it.

Valley Water District?

A. Yes, I have.

flow system?

24 Q. Now, you've indicated that a part of your focus

Q. Now, you also agree that there's flow from the

7 A. Based on testimony from other parties, they

11 Q. You haven't prepared a water plan for the Moapa

Q. And so did you look at the flows from the Lower

A. When we were doing the report, the Lower White

River Flow System administrative boundary area wasn't anything

White River Flow System all the way from the upper right river

seemed to be in agreement on that.

Q. You're not in agreement with that?

on Kane Springs was because there's, I believe, flow from Kane Springs into the northern Coyote Springs basin; correct?

Pahranagat Valley and Delamar Valleys into the northern Coyote

- 1 HEARING OFFICER FAIRBANK: I don't recall that
- 2 being part of his testimony today, or was that an analysis in
- 3 the reports?
- 4 MR. FREHNER: They have supplied in the reports
- 5 their water plan, which does include -- indicate the flows in
- 6 those areas.
- 7 And if we're looking at the overall basin and
- 8 they want to include flows from one area, we believe it's
- 9 appropriate to ask questions of flow from all of the areas.
- 10 HEARING OFFICER FAIRBANK: I think his testimony
- 11 was, though, that the water report did not -- wasn't inclusive
- 12 of the Lower White River Flow System as a joint administrative
- unit, hadn't been designated at that time.
- So I guess I'm trying to wonder what the
- 15 relevancy to this particular line of questions are to those
- 16 questions set forth in Order 1303.
- MR. FREHNER: Thank you. We'll move on.
- 18 BT MR. FREHNER:
- 19 Q. So you haven't requested any other basins besides
- 20 Kane that may flow into this area be included?
- 21 A. That is correct. And we limited it to Kane
- because that's as far out as observation well data were
- available for order 1169 pumping test effects.
- So we went as far as out the data took us, and it

Page 1225

- took us into Kane Springs Valley.
- 2 Q. I believe it's Slide 33. That's not the one.
- You make specific reference that you make a
- 4 recommendation to the State Engineer's office that you be
- 5 allowed to take the Arrow Canyon wells and move them to basins
- 6 outside of the Lower White River Flow System; is that correct?
- 7 A. Yes, sir.
- 8 Q. What basins are you inferring?
- 9 A. I have no idea.
- 10 Q. So that can include the Las Vegas Valley?
- 11 A. I -- it could, but I doubt we would build a
- 12 pipeline from there.
- 13 Q. Delamar Valley?
- 14 A. As I said in my direct testimony, you know, and I
- believe I was very specific on it, that we like -- we would
- 16 request that, but we don't know what it looks like yet. We
- 17 want to have the flexibility.
- 18 Q. So you don't know how far you could go to
- 19 possibly pump those wells if you wanted to move them outside
- of the basins?
- 21 A. That is correct.
- 22 Q. If Kane Springs was excluded from this as
- 23 Lincoln-Vidler have requested, would you consider Kane as a
- 24 potential spot?

Ü

20 Q. L

- that was conceptualized administratively.Q. But you would agree there is flow coming in from
- 21 Delamar?
- MR. MORRISON: I object because I don't believe
- 23 he testified in either of his reports or in his testimony
- today about flow from Delamar.

Page 1228

1 A. I can't speak for the district on this, but I'd
2 say my opinion is that, no, I would not do it from Kane
3 because that would just accelerate the drawdowns at the Muddy
4 River Springs area and accelerate the point at which trigger
5 levels would be hit.
6 MR. FREHNER: Thank you.
7 HEARING OFFICER FAIRBANK: City of North Las

- 8 Vegas.9 CROSS-EXAMINATION
- 10 BY MS. URE:
- 11 Q. Good morning, Therese Ure, representing the City 12 of North Las Vegas, and I have more of a point or a question
- of North Las Vegas, arfor clarification.
- In -- in one of your slides, you requested as
- part of your recommendation that the State Engineer grant the
- right to the district to divert 6,791-acre-feet per year; is
- 17 that correct?
- 18 A. Yes.
- 19 Q. Would that 6,79 -- or 6,791-acre-feet constitute
- 20 an increase of carbonate pumping than what the district is
- 21 currently pumping?
- 22 A. Yes.
- MS. URE: Okay. Thank you.
- 24 HEARING OFFICER FAIRBANK: All right. We'll go

Page 1229

- ahead and take a break for lunch. So, let's go ahead and
 we'll be pack at 1:00 p.m.

I, MICHEL LOOMIS, a Certified Court Reporter, do hereby certify;

That on the 30th of September, 2019, in Carson City, Nevada, I was present and took stenotype notes of the hearing held before the Nevada Department of Conservation and Natural Resources, Division of Water in the within entitled matter, and thereafter transcribed the same into typewriting as herein appears;

That the foregoing transcript, consisting of pages 1092 through 1230 hereof, is a full, true and correct transcription of my stenotype notes of said hearing to the best of my ability.

Dated at Carson City, Nevada, this 1st day of October, 2019.

MICHEL LOOMIS, RPR NV CCR #228

1 INDEX (Continued) 2 3 WITNESS 4 5-WITNESS PANEL 5 Cross-Examination by Mr. Herrema 6 Cross-Examination by Ms. Glasgow 7 Cross-Examination by Mr. Berley 8 Cross-Examination by Mr. Morrison 10 Cross-Examination by Ms. Ure 11 Cross-Examination by Ms. Caviglia 12 Examination by Mr. Benedict 13 Examination by Mr. Kryder 14 Examination by Mr. Sullivan 15 16 17 18 19 20 21 22 23 24	PAGE 1323 1327 1332 1336 1343 1347 1349 1351 1360 1362	decline in groundwater levels. But I would have to go back and look at the data. Q. If there was a decline in groundwater levels would that indicate that the system is out of steady state? An ongoing decline, I should say. A. Can you repeat that? Q. If there were an ongoing decline in carbonate groundwater levels would that imply that the system was not in a steady state? A. Yes. Q. And would that then imply that current pumping is too high for a steady state to be achieved? A. It all depends on the location. Q. You based your recommendation for pumping on the State Engineer's recommendation. I believe you quoted text from actually Order 1303. Are you saying that the number you've provided is contingent on location as much as the actual number? MR. MORRISON: I object. I don't (The court reporter interrupts) MR. MORRISON: Greg Morrison, Moapa Valley Water District's attorney. Mr. Lazarus didn't provide a number in his report, so I object to the implication that he did. MR. DONNELLY: I'll restate.
	Page 1236	Page 1238

- 1 Q. (By Mr. Donnelly) The report implied that the 1 CARSON CITY, MONDAY, SEPTEMBER 30, 2019, P.M. SESSION
 - number from the State Engineer was agreed with. There was an
 - implication in the report that the finding in Order 1303 that
 - groundwater levels were stable and that pumping, current
 - pumping, is sustainable was implied in the report. Is that
 - true? 6
 - 7 A. Additional data is needed. That is true, but I
 - also said additional data is needed.
 - Q. So do you have sufficient data to know whether
 - 10 the current groundwater rights of the water district are a
 - sustainable pumping amount or is additional data needed to 11
 - 12 even know if that's a sustainable amount?
 - 13 A. The hydrographs we showed of Pederson and
 - Pederson East showed a flat -- no decline in discharge 14
 - significantly since the end of the pumping test. And the 15
 - district has been pumping since then. We use those to make 16
 - our presentation today. 17

 - Q. What do you think about the potential for 18
 - carbonate monitoring wells declining, given what you just 19
 - 20 said?
 - Well, we would have to look at each well. 21 A.
 - Q. So static levels, relatively static levels, at 22
 - Pederson is the justification for I believe it was 6700 23
 - acre-feet of carbonate water rights? 24

- ---oOo---2
- HEARING OFFICER FAIRBANK: Okay. Let's go ahead 3
- 4 and go back on the record. And next up will be the Center
- for Biological Diversity.
- **CROSS-EXAMINATION** 6
- By Mr. Donnelly: 7
- ANSWERS BY MR. REICH: 8
- Q. Thank you. Patrick Donnelly, Center for
- Biological Diversity. I will be brief. Mr. Lazarus, if you 10
- could take a look at the exhibit I've put there. It is 11
- Exhibit 3-3 from SNWA's rebuttal report. It's a series of 12
- hydrographs for CSVM-1. I have it written down on my 13
- computer which one is there. CSVM-1, Paiute TH-2 and GV-1. 14
- There we go. And SNWA put a trend lane on from 2016 until 15
- current showing a decline in levels in those wells since 16
- then. Do you agree with that trend line and that assessment? 17
- A. I would have to have time to look at this because 18
- there's continuous monitoring and periodic measurements. So 19
- I would have to look at the individual measurements. 20
- Q. So you're not able to look at this and say 21
- whether those charts show a decline in groundwater levels as 22
- measured and displayed there? 23
- 24 A. As you have -- As someone drew on there, it shows

(2) Pages 1235 - 1238 Min-U-Script® Capitol Reporters 775-882-5322

Page 1239

- MR. MORRISON: I'll object again. He never 1
- stated a number. 2
- Q. (By Mr. Donnelly) Of the existing Moapa Valley 3
- Water District carbonate water rights which were detailed in
- the presentation just given and it was asserted that that's a
- sustainable amount of pumping. Is the basis of that 6
- statement that there are stable water levels at Pederson East
- over a given period of time?
- A. I believe that inaccurately characterizes my
- testimony. 10
- Q. Okay. Please recharacterize it for me. 11
- A. At current levels of pumping in the seven basin,
- super basin, it appears that Pederson and Pederson East have 13
- pretty much stable flows for the last several years. 14
- 15 MR. DONNELLY: Thank you.
- HEARING OFFICER FAIRBANK: Georgia Pacific and 16
- 17 Republic.
- **CROSS-EXAMINATION** 18
- 19 By Ms. Harrison:
- ANSWERS BY MR. LAZARUS: 20
- Q. Good afternoon. Sylvia Harrison for Republic 21
- Environmental Technologies and Georgia Pacific. Just a
- question for Mr. Lazarus. Mr. Lazarus, were you present 23
- during the presentation of US Fish and Wildlife Service last 24

- 1 Q. Sure. Would you agree that it's important for
- the district to understand the sources of water to the Muddy
- River?
- 4 A. I think it's important for all of the
- stakeholders.
- 6 Q. Has the district evaluated the possibility of any
- other sources to the Muddy River other than the alluvial and
- carbonate aquifers?
- A. A long time ago the district had a cost estimate
- for a surface water diversion. 10
- 11 O. But as far as actual natural sources there hasn't
- been any investigation other than the carbonate aquifer and 12
- alluvial aquifer sources; correct? 13
- To the best of my knowledge that is correct. 14
- 15 MS. HARRISON: Thank you. That's all I have.
- HEARING OFFICER FAIRBANK: Nevada Cogen? Seeing 16
- 17 no questions.
- Muddy Valley Irrigation Company. 18
- **CROSS-EXAMINATION** 19
- By Mr. King: 20
- Q. Good afternoon, Mr. Davis, Mr. Lazarus. I'm 21
- Steve King for Muddy Valley Irrigation Company. Just several 22
- questions and for either one of you who should answer. Are 23
- you aware that Muddy Valley Irrigation Company, my clients, 24

Page 1240

3

Page 1242

- week?
- 2 A. Yes, I was.
- 3 Q. Do you recall Ms. Braumiller's testimony
- regarding her hypothesis about a separate source for the Big
- Muddy Springs which would be or which could be different from
- the Pederson Spring source or the Pederson Springs area 6
- source? 7
- 8 A. Vaguely.
- Q. I'll refresh your memory. I believe that she
- testified that there was a significantly different hydrograph 10
- for Big Muddy Springs and that she thought the water was 11
- notably hotter and testified that there was a potential 12
- source from deep carbonates possibly from Lower Meadow Valley 13

Wash. Does that sound correct based on your recollection?

- A. My memory is not as good as yours, but I'll take
- your word for it. 16
- Q. All right. Would you agree that the estimate of 17
- about 15 percent of the Muddy River flow being contributed by 18
- Big Muddy Springs sound accurate to you? 19
- 20 A. I don't know.
- Q. If that were the case would you agree that 21
- investigating a possible source for that spring would be a 22
- very potentially significant undertaking for the district?
- 24 A. Can you maybe simplify that question?

- interest in this proceeding is to protect the senior decreed
- water rights that were adjudicated in the Muddy River Decree? 2
 - MR. DAVIS: Joseph Davis. Yes.
- MR. LAZARUS: Jay Lazarus. Yes. And we also are 4
- shareholders in the MVIC. 5
- MR. KING: Thank you. That was my next question 6
- for the record to show that the Moapa Valley Water District 7
- is a shareholder in Muddy Valley Irrigation Company. 8
- 9 Then there's been as part of the presentation and
- the reports that Moapa Valley Water District has filed 10
- discussion on the Jones Spring and how important that 11
- 12 resource is to the Moapa Valley Water District and that
- that's been dedicated to support the Moapa case under the 13
- memorandum of agreement. Do you recall that discussion? 14
- MR. LAZARUS: Yes. 15
- MR. KING: And then just to, for the record, 16
- isn't it also accurate that that Jones Spring right, the base 17
- right for that, actually emanates from the Muddy River 18
- decreed senior rights that the Muddy Valley Irrigation 19
- 20 Company was awarded in the decree; is that correct?
- MR. DAVIS: Joseph Davis. Yes. 21
- MR. KING: Those are my questions. Thank you, 22
- 23
- HEARING OFFICER FAIRBANK: Bedroc. 24

Min-U-Script® (3) Pages 1239 - 1242 **Capitol Reporters** 775-882-5322

Page 1243

- CROSS-EXAMINATION 1
- MS. URE: Good afternoon. Therese Ure 2
- representing Bedroc. Did you make any independent analysis 3
- of the alluvium water rights in Coyote Springs Valley and
- their effect on the Muddy River Springs area? 5
- MR. LAZARUS: No. 6
- MS. URE: Thank you. 7
- HEARING OFFICER FAIRBANK: Nevada Energy. 8
- MS. CAVIGLIA: No questions. 9
- HEARING OFFICER FAIRBANK: Seeing no questions, 10
- I'll go ahead and open it up to Division of Water Resources 11
- staff and the State Engineer. 12
- **EXAMINATION** 13
- By Mr. Benedict: 14
- Jon Benedict for the record. I would like to go 15
- back to the gradient slide, I think it's slide number seven, 16
- 17 if you wouldn't mind. So there's relatively limited data
- with respect to water levels between the various wells out 18
- there. And I guess I just want your opinion. You've 19
- indicated that the gradients are relatively consistent, 20
- suggesting that Coyote Spring Valley is part of this system. 21
- And I'm just curious would additional data -- I mean, is it 22
- possible that additional data could show gradients that are 23
- steeper if you had those data? 24

- earlier in the hearing. And do you recall US Fish and 1
- Wildlife Service's recommendation for the inclusion of the 2
- Lower Meadow Valley Wash in the Lower White River Flow System
- basins? 4
- A. I think so.
- Q. And did you do any analysis or do you have an
- opinion regarding the inclusion of the Lower Meadow Valley

11

19

- A. I did not. And so, no, I don't. 9
- HEARING OFFICER FAIRBANK: Okay. Thank you. 10
 - All right. Given that we have additional time,
- we'll go ahead and open it back up for additional questions. 12
- 13 Coyote Spring Investments, do you have any additional
- questions? 14
- MR. HERREMA: We just have one topic we want to 15
- hit. 16
- HEARING OFFICER FAIRBANK: Okay. So what we'll 17
- do is we'll go ahead and given the amount of time that we 18
 - have left, we'll limit you to not more than five minutes.
- **CROSS-EXAMINATION** 20
- By Mr. Herrema: 21
- ANSWERS BY JAY LAZARUS: 22
- Q. Brad Herrema again for the record for CSI. 23
- Mr. Lazarus, on page five of your report under the section 24

Page 1244

Page 1246

- MR. LAZARUS: Well, it's going to be hard to get 1
- a flatter gradient. But even if -- Yes, it is possible that 2
- gradients could be steeper. But, like I said, there's not a 3
- 30-foot drop there in 3,000 feet deep. It just means that 4
- that flow might be a little slower but it's all connected. 5
- MR. BENEDICT: Okay. All right. Thank you. 6
- **EXAMINATION** 7
- MS. BARNES: Michelle Barnes for the record. 8
- 9 Just to follow up on this slide. I'm just curious if you say
- the gradients were consistent if you looked at multiple times 10
- of year, multiple years, or is this average or a snapshot in 11
- time? 12
- MR. LAZARUS: It's a snapshot in time. 13
- MS. BARNES: Do you know for, I guess, what 14
- season are all the wells on the same measurement? 15
- MR. LAZARUS: I would have to go back and look. 16
- MS. BARNES: Okay. Thank you. 17
- **EXAMINATION** 18
- By Hearing Officer Fairbank: 19
- ANSWERS BY MR. LAZARUS: 20
- Q. Mr. Lazarus, Micheline Fairbank. I have one or 21
- two questions for you. Do you recall -- Previously you 22
- stated that you were present or you were listening to the 23
- testimony by the United States Fish and Wildlife Service

- 1 regarding movement of water rights, it's that top paragraph
- that I'll just read so we have it on the record. It says, 2
- the timing and magnitude of carbonate pumping effects on 3
- spring discharge is dependent on the volume of water pumped 4
- and the proximity of a pumping center to the springs. The 5
- closer it is, the sooner it will occur. The further away it 6 is, the longer it will take to show effects. But in any 7
- case, all cumulative carbonate pumping in the seven 8
- 9 inter-connected basins will eventually cause depletions on
- 10 the Muddy River Springs.
- When you refer here to the magnitude of the 11
- 12 effects of carbonate pumping on spring discharge being
- dependent on proximity of the pumping center to the spring, 13
- does the concept of magnitude here suggest that there's a 14
- level of pumping that will not affect spring flow? 15
- 16 A. I don't know. As I said earlier, I would like to
- see more data so that we can suss that out. 17
- Q. Okay. Are there other forms of discharge from the Lower White River Flow System? We've heard that water 19
- 20 from the carbonate aquifer supports flow from the Muddy River
- through the alluvium downstream of the springs. Would you 21
- agree that the impacts of the carbonate pumping might be 22
- downstream of the springs? 23
- 24 A. Could you give me the first part of that? Can

Min-U-Script® (4) Pages 1243 - 1246 **Capitol Reporters** 775-882-5322

18

Page 1250

Page 1247

- you repeat the question, please?
- Q. Are there also other forms of discharge out of
- the Lower White River Flow System beyond just the spring
- flow? 4
- A. Such as?
- Q. Evapotranspiration.
- A. Yes. Well, limited.
- Q. Subsurface flow out of the Lower White River Flow
- System? 9
- 10 A. Yes.
- 11 Q. Could pumping affect those forms of outflow as
- 12
- A. I guess it would depend on the location of the 13
- pumping center. 14
- MR. HERREMA: Okay. Thank you. 15
- HEARING OFFICER FAIRBANK: United States Fish and 16
- Wildlife Service. Seeing no questions. 17
- National Park Service. 18
- MS. GLASGOW: No questions. 19
- HEARING OFFICER FAIRBANK: Moapa Band of Paiutes? 20
- MR. MORRISON: No questions. 21
- HEARING OFFICER FAIRBANK: No further questions. 22
- Las Vegas Valley Water District and Southern 23
- Nevada Water Authority. 24

- Vidler. 1
- **CROSS-EXAMINATION** 2
- By Mr. Frehner: 3
- ANSWERS BY MR. LAZARUS: 4
- Q. Dylan Frehner for Lincoln County Water District
- and Vidler Water Company.
- 7 Mr. Lazarus, wouldn't you agree that the greatest
- threat to the Moapa dace is the pumping at the Arrow Canyon 8
- 9 wells?
- 10 A. No.
- 11 Q. You've been asked with regards to whether the
- 12 Lower Meadow Valley Wash should be included and you said you
- 13 had no opinion?
- A. That is correct. 14
- 15 Q. Isn't it true that the district has applications
- in the Lower Meadow Valley Wash? 16
- A. That were denied. 17
- Q. Do they have new applications pending? 18
- MR. DAVIS: There is three applications that are 19
- pending? 20
- MR. FREHNER: In the Lower Meadow Valley Wash? 21
- MR. DAVIS: Yes. 22
- MR. FREHNER: But no analysis has been done as to 23
- 24 the impact of Lower Meadow Valley Wash on the Muddy River

Page 1248

- **CROSS-EXAMINATION**
- By Mr. Taggart: 2

1

- ANSWERS BY MR. LAZARUS: 3
- Q. Good afternoon. Again for the record Paul 4
- Taggart on behalf of the District and the Water Authority.
- Mr. Lazarus, there's been some talk about bypass 6
- flow, underflow. You were just asked about it as well. Are 7
- you familiar with the 2011 work by the water district and the 8 9 water authority that conducted some Darcy flow calculations
- for flow in the Lower White River Flow System? 10
- **11** A. No, I'm not.
- Q. Okay. So that's -- those analyses are not part 12
- of the support for your opinion about that -- the occurrence 13
- of underflow if there is any?
- A. Correct.
- Q. Okay. And then I just wanted to ask again if you 16
- stated in your report that to maintain carbonate diversions 17
- at current volumes no new subdivision parcel maps should be 18
- approved that will require increased pumping. Did you say 19
- 20 that in your report?
- A. Yes, that is in there. 21
- MR. TAGGART: All right. Thank you. No further 22
- 23
- HEARING OFFICER FAIRBANK: Lincoln County, 24

- Springs area? 1
- MR. DAVIS: Not to my knowledge. 2
- 3 Q. (By Mr. Frehner) Thank you. Going back to your
- testimony with regards to KPW-1 in the aquifer test. Is it
- your only evidence that the KPW-1 aquifer test showed no
- boundaries the conclusion that is set forth in the URS 2006 6
- 7 report?
- 8 A. (By Mr. Lazarus) No. Can you please repeat
- that? I want to make sure I got that.
- 10 Q. Is your only evidence that the KPW-1 aquifer test
- showed no boundaries the conclusion set forth in the URS 2006 11
- report? 12
- A. The URS 2006 report states there were no 13
- boundaries encountered. And I would sort of back that up by
- looking at the drawdown in KMW-1 during the 1169 pumping 15
- test. So no boundaries as a result of pumping stresses from 16
- the south or from the north. 17
- Q. When you updated your estimates of transmissivity 18
- and storativity for the KPW-1 aquifer test did you evaluate 19
- for the presence of faults? 20
- 21 A. No. Because there were none encountered during
- the pumping test or recovery. 22
- 23 Q. Did you use the CSVM-4 data available during the
- KPW-1 aguifer test to evaluate the presence or absence of

Min-U-Script® (5) Pages 1247 - 1250 **Capitol Reporters** 775-882-5322

Page 1254

Page 1251

1

14

22

- boundaries?
- A. No. 2
- O. What distance from the KPW-1 well were you able
- to evaluate with the KPW-1 aguifer test for the presence of
- boundaries?
- A. Well, specifically 143 feet away. But based on 6
- the maps that were submitted by Lincoln-Vidler, the fault
- zones that these wells were completed into was expansive and
- in to the Coyote Springs Valley. 9
- Q. How long did it take for the effects of pumping 10
- at MX-5 well to reach the CSVM-1 well? 11
- 12 A. I would have to go back and look.
- Q. You didn't evaluate that? 13
- A. I know we looked at it. I said I would have to 14
- go back and look. 15
- Q. How long did it take for the effects of the 16
- cessation of the pumping at MX-5 well to reach the CSVM-4 17
- 18
- 19 A. We would have to go back and look at the
- hydrographs. But, you know, in the system like this, and 20
- it's straightforward in any system that behaves like this, 21
- the further you are from the pumping center, the longer it's 22
- going to take for the effects to hit it. 23
- 24 Q. Any time estimates that you calculated were they

- MS. CAVIGLIA: No questions.
- HEARING OFFICER FAIRBANK: Again, I'll open it up 2
- to the State Engineer and staff. All right. Seeing that we 3
- 4 don't have any questions, Mr. Morrison, you have some
- additional time left if you wanted to do any more redirect. 5
- MR. MORRISON: I don't think we need it. Thank 6 7 you.
- HEARING OFFICER FAIRBANK: Okay. Then we will go 8
- ahead and conclude the presentation by the Moapa Valley Water 9
- District and we'll move on to Vidler. To allow them a little 10 bit of time to get themselves situated, let's go ahead and
- 11
- 12 take about a five-minute break and we'll go back on the
- 13 record at 1:30.
 - Actually, let's go back on really quick. One
- 15 thing I wanted to provide clarification is Mr. Lazarus was
- proffered as an expert in these proceedings and he was not 16
- 17 objected to. He's not -- Mr. Lazarus has not previously been
- qualified by the State Engineer's office, so his 18
- 19 qualification will be limited to these proceedings based upon
- the absence of any objection. Thank you. 20
- (Break was taken) 21
 - HEARING OFFICER FAIRBANK: Let's go ahead and go
- back on the record. So this is a continuation of the 23
- hearing. And next up is the Lincoln County and Vidler Water 24

Page 1252

- consistent with your estimates of transmissivity and 1
- storativity from the KPW-1 aquifer test? 2
- 3 A. I didn't calculate any time estimates.
- Q. Why don't KMW-1 and CSVM-4 wells respond to
- fluctuations in pumping at the MX-5 well?
- A. They did. 6
- MR. FREHNER: Thank you. 7
- HEARING OFFICER FAIRBANK: City of North Las 8
- Vegas? Seeing no further questions. 9
- Center for Biological Diversity. Seeing no 10
- further questions. 11
- Georgia Pacific Republic. 12
- MS. HARRISON: No further questions. 13
- HEARING OFFICER FAIRBANK: No further questions. 14
- Nevada Cogeneration? Seeing no questions. 15
- Muddy Valley Irrigation Company. 16
- MR. KING: No questions. 17
- HEARING OFFICER FAIRBANK: No additional 18
- questions. 19
- Bedroc? 20
- MS. URE: No. 21
- HEARING OFFICER FAIRBANK: No additional 22
- questions. 23
- And Nevada Energy? 24

- 1 Company.
- MS. PETERSON: Thank you. Karen Peterson and 2
- Dylan Frehner representing Lincoln County Water District and 3
- Vidler Water Company. And we have a panel of the five 4
- experts that have submitted reports to the State Engineer's 5
- office, either initial reports and/or rebuttal reports. And 6
- I'm going to have -- We are going to present our witnesses as 7
- a panel because we are very concerned that we want to get all
- 9 the information in in the allotted time that we have. We
- 10
 - would like to reserve 15 minutes at the end of our
- presentation for redirect. 11
- HEARING OFFICER FAIRBANK: Okay. Let's go ahead 12
- and have the witnesses sworn in if we may. 13
- (Five witnesses were sworn in) 14
- MS. PETERSON: Gentleman, I'd ask each of you to 15
- state your full name and spell your last name for the record. 16
- MR. BUSHNER: Greg Bushner, B-u-s-h-n-e-r. 17
- MR. UMSTOT: Todd Umstot, T-o-d-d U-m-s-t-o-t. 18
- MR. CARLSON: Norman Carlson, C-a-r-l-s-o-n. 19
- MR. BUTLER: Thomas Butler. Butler B-u-t-l-e-r. 20
- MR. MOCK: Peter Mock, M-o-c-k. 21
- MS. PETERSON: And I'll just briefly go through 22
- and indicate the witnesses that have been qualified as 23
- experts before by the State Engineer and the areas that 24

Min-U-Script® **Capitol Reporters** 775-882-5322

Page 1255

- they're being offered in today. So Mr. Bushner has been 1
- qualified by the State Engineer as an expert in hydrogeology 2
- and obviously that would be the qualification we would ask 3
- for today. And nobody objected. 4
- Dr. Mock we seek to have qualified by the State
- Engineer as an expert hydrologist and geologist with a 6
- specialty in groundwater modeling in computational hydrology.
- And no one has objected to that designation as an expert. 8
- Mr. Butler has been qualified by the State 9
- Engineer in previous proceedings as an expert in geology and 10
- geochemistry. And we would ask for that same designation in 11
- this proceeding. 12
- 13 Mr. Umstot has not been qualified by the State
- Engineer, but we proffered him as an expert in hydrogeology, 14
- 15 Beto zone processes, groundwater recharge, and geostatistical
- techniques. And there's been no objection to his designation 16
- 17 in those expert areas.
- And Mr. Carlson has been qualified by the State 18
- Engineer as an expert in geophysics and testified before the 19
- State Engineer near last Monday, I believe. 20
- Gentlemen, I ask you if you prepared reports that 21
- have been marked as Lincoln County Vidler Exhibits 1 and 2 in 22
- this proceeding? If you could each just state yes or no on 23
- the record. 24

- point presentations were submitted to the State Engineer's 1
- office on September 6th. So those have been admitted as 2
- exhibits, LCV 08 through 12. 3
- Mr. Bushner is not going to give his presentation 4
- today, just in the interest of time, but he is available for 5
- cross-examination. 6
- 7 And we are going to go ahead and start then with
- Mr. Carlson. And so, Mr. Carlson, I would ask you to then 8
- please proceed. 9

11

13

14

17

18

19

5

10

- Excuse me. Sorry. Sorry. We do have some 10
 - demonstrative exhibits, slides. And those -- copies of those
- 12 have been put on the slide desk over there.

NORMAN CARLSON

- 15 Called as a witness on behalf of
- Lincoln County/Vidler, having been first duly sworn, 16
 - Was examined and testified as follows:

DIRECT EXAMINATION

- By Ms. Peterson: 20
- Q. Thanks, Mr. Carlson. Can you proceed? 21
- A. Yes. Thank you. Well, we can just go ahead and 22
- start with slide two, actually. This is the overview of what 23
- 24 we were contracted to do by Lincoln County and Vidler Water.

Page 1256

Page 1258

- MR. BUSHNER: Yes. 1
- MR. UMSTOT: Todd Umstot. Yes. 2
- MR. CARLSON: Norman Carlson. Yes. 3
- MR. BUTLER: Thomas Butler. Yes. 4
- MR. MOCK: Peter Mock. Yes. 5
- MS. PETERSON: And I should have asked the other 6
- one that goes along with that. Were those reports prepared 7
- by you or under your direction? 8
- 9 MR. BUSHNER: Greg Bushner. Yes.
- MR. UMSTOT: Todd Umstot. Yes. 10
- MR. CARLSON: Norman Carlson. Yes. 11
- MR. BUTLER: Tom Butler. Yes. 12
- MR. MOCK: Peter Mock. Yes. 13
- MS. PETERSON: Thank you. And I would move that
- Lincoln County Vidler 1 and 2 be admitted in to evidence. 15
- HEARING OFFICER FAIRBANK: They'll be admitted. 16
- And also just for Mr. Mock and Mr. Umstot, for 17
- the purposes of their qualification as they have not 18
- previously been qualified before this office, but their 19
- proffering was not objected to by any party. They'll be 20
- qualified in the proffered expertise for the limited purpose 21
- of these proceedings. 22
- MS. PETERSON: Thank you. So we presented our 23
- case a little bit differently than everybody else. Our power

- We're looking at the Rowley map again draped on to the USGS
- digital elevation model. This just gives you a perspective 2
- view like you're looking down towards the north on the valley
- from a high-flying airplane. 4
 - And on this, Kane Springs Valley, which we've
- talked a lot about, is in the upper right. You'll see 6
- numerous solid red lines running across that and then one 7
- long one running down Kane Springs. Those are geophysical 8
- 9 lines that we ran in 2012.
 - Our main topic today is the lines from 2019,
- March and April, I think. And those are labeled lines ten, 11
- 12 11, and 12. And those are a less dark red line with little
- dots on them for some of the stations. 13
 - And as I said, Kane Springs is trending to the
- 14
- northeast in that upper right corner. Coyote Spring Valley 15 is the center of the map. It's shaded sort of a very light 16
- tan. That's because that's all paternery basin fill. That's 17
- covering up all of the bedrock. 18
- The colors on the sides of the valley there in 19
- 20 the Meadow Valley range and down in the Arrow Canyon range,
- 21 those colors represent the bedrock that outcrops in those
- areas, various limestones and dolomites. A lot of it is the 22
- carbonate, the carbonate aquifer, that we're talking about 23
 - and some of it is volcanics. So this is just to give you a

Page 1259

1 very big overview of what we're talking about.

- 2 If we go to slide three -- Well, actually with
- the State Engineer's permission, I presented these slides
- 4 last Monday with CSI. It's just the background of CSAMT, so
- 5 I'll skip over those if that's okay with everybody up there.
- 6 HEARING OFFICER FAIRBANK: That's fine.
- 7 THE WITNESS: That saves time.
- 8 Slide seven is the layout of the survey lines on
- 9 an aerial view. The main things that we want to point out
- 10 here are Kane Springs Valley is in the upper right. It's
- aiming towards the northeast. Coyote Spring is the center of
- the aerial view. And, as I mentioned, the red lines crossing
- 13 Kane Springs we did in 2012. I'll touch on those just for
- 14 background so you can see what we've seen in this area before
- and for comparison to lines ten, 11, and 12 there in the
- 16 center
- Other things just to note, you'll hear us talking
- 18 multiple times about an outcrop of dolomite near the up --
- 19 the center upper right of the map. You can just barely make
- 20 it out in the aerial view. But that's an outcrop of dolomite
- 21 right at the mouth of Kane Springs Valley. It's sort of a
- little island sticking up there of outcrop.
- 23 Q. (By Ms. Peterson) And, Mr. Carlson, can you just
- 24 give another depiction on the map of where that is located?

- You'll notice in sort of the lower center right
- 2 there's a big green area labeled MD. That has black faults,
- 3 blue faults. Some of the blue faults are at perpendicular
 - angles.

1

4

10

11

24

- 5 So, anyway, it's a heavily-faulted area, very
- 6 complex geology. And that's the whole reason that we do
- 7 geophysics is to try and understand what's out here in the
- 8 basin fill where we can't see all the faults that are -- that
- 9 must be in the bedrock out there.

Another point on this slide that is a good place to point out is the orientation of our lines. We have line

- ten and line 11 that are in the center of this image.
- 13 They're oriented from southeast towards northwest. They're
- 14 two parallel lines. Line ten is right at the very mouth of
- 15 Kane Springs. Line 11 is further out in the Coyote Spring
- 16 Valley. But the orient of those lines like that because most
- 17 types of geophysics give the best resolution of subsurface
- 18 features if you cross that feature perpendicular to the way
- 19 it's trending.

And you'll see that all of these faults in Kane

- 21 Spring Valley, all of these blue solid lines that are drawn
- by Rowley and by the previous geological maps, those are
- 23 mostly all trending southwest towards northeast along the
 - valley. And that makes sense. It's faulted up and these

Page 1260

Page 1262

- 1 A. Yes. On the map it's in between the label that
- 2 says 2012 line one and the 2019 line ten. And it's -- being
- 3 in the desert, it's just sort of a change in color from tan
- 4 to gray. But that's where a knob of dolomite sticks out of
- 5 the ground. It's very close to KSPW-1, the well there. And
- 6 then CSVM-4, that well was located just to the southwest end
- 7 of that knob.
- 8 So the point to get from -- Well, let's go ahead
- 9 and go to line eight and we'll make those points. Slide
- 10 eight is the same image basically, but in this case we've
- overlaid the Rowley geological map. The important things
- there are, as I mentioned earlier, the bulk of the map is
- this light tan background being basin fill. So bedrock in
- 14 the faults and the folds and whatever else is down there is
- 15 all covered up.
- Out in the outcrop, the colorful rocks out on the outside of Coyote Spring, dolomites, limestones, things like
- 18 that. You'll notice in all of that outcrop there are
- 19 numerous fault stone. The faults on the Rowley map are drawn
- as heavy dashed -- heavy black lines or heavy blue lines.
- 21 And you can see that anywhere you're in outcrop you're not
- very far from a fault. It's a heavily faulted-up area,
- 23 different types of faults, different faults running in
- 24 different directions.

- 1 faults are along the valley.
- 2 So since we are trying to resolve faults, we ran
- 3 our lines perpendicular to those to give us the best
- 4 resolution. If we put the faults, if we put a survey line
- 5 directly on top of a fault and running parallel with it, the
- 6 image is distorted. You get very ambiguous data. You can't
- 7 really resolve it. So if we know what direction faults are
- 8 running. We usually run our lines perpendicular to those
- 9 faults. So that's why those two, lines ten and 11, are
- 10 oriented the way they are.

And line 12 is an east/west flow right in the

- 12 center of the image. And we orient that east/west because we
- 13 wanted a good high resolution of the faults that Rowley draws
- out underneath the basin fill. Because he's drawn numerousblack dashed lines which indicates a concealed fault.
- There's a blue dashed line with the triangles on the side.
- That indicates he thinks there's a concealed trust fault
- 18 there.
- And most of the faults running and up and down
 Coyote Spring under the basin fill are drawn as north/south.
- 21 So we oriented line 12 east/west to give us the best
- 22 resolution of where those are and what they look like.
- 23 If we could go now to slide nine. This is just a
- 24 little bit of background from the 2012 survey that we did

Page 1263

10

11

12

13

14

15

20

21

22

running up and down Kane Springs Valley. This is the one 1 called the axis line. It was that solid red line on one of 2 the first maps that runs along Kane Spring -- Kane Springs 3 Valley. So running right along the valley. 4

And the main key here is we see in the middle of the line and on the northeast end of the line we see a lot of green shading and yellow shading. That's indicating moderately low resistivities. And then the moderately low resistivities, as we seen in prior discussion last Monday, that's most likely the basin fill material.

6

8

16

17

18

19 20

But we're seeing the northeast, the right hand part of this plot is over basin fill material in Kane Springs.

But as you go to the southwest towards the mouth of Kane Springs, we see that we have this high resistivity in blue, which we associate it in the prior work with carbonates, coming up from very deep and coming up and almost right to the surface on the very last few stations of the line, which is the far left-hand part of this cross-section.

19 The blue actually does come up to the surface. 20 So the surprising thing about this line when we 21 first took it in 2012 was the topography of Kane Springs 22 Valley slopes downward from the northeast towards the 23 southwest. But the underlying basement of carbonate rock 24

like they're mostly vertical. So instead of one big blue 1 blob, it looks like a bunch of blobs all packed together. 2

If we go to slide 11, now we're at, this was 3

called line one in 2012. And in this case it actually went 4 5 over that knob, over that dolomite outcrop that's right in

the center of this. And where we go over that carbonate knob 6 7 just booming high resistivities. So everything is looking

good. It's where we can get ground truth it's looking fine.

So we have the high resistivity knob showing up very nicely. 9

Further out on the west side of the plot is also very high resistivities. You see the things are kind of broken up. You see a big red area. That's low resistivity material. It's likely saturated. There may also be a lot of clay there. That also lowers the resistivity. But we're right here very near the mouth of Kane and we're seeing mainly high resistivity features.

The KSPW-1 well is also shown on there. It encountered about 200 feet, 250 feet, basin fill and then went directly in to carbonate there. And I believe that's the one that was discussed earlier, a very good producer. It did go through what a geologist called a fault zone. So some additional ground truth is always good to have.

If we move to slide 12. 23

24 Q. Mr. Carlson, was there a correction you needed to

Page 1264

1 slopes in the opposite direction. It's deep on the northeast and becomes shallow on the southwest. So it's actually 2

exactly backwards of what we expected. 3

But what we're seeing in this access line on Kane Springs Valley is a large block of high resistivity carbonate rock coming up close to the surface as we get towards the mouth of Kane Springs.

Now, if we go to slide ten, this is one of the short cross-lines of Kane Springs just a little northeast of that knob that I mentioned earlier. So this line, the right-hand side of the plot is dominated by the carbonates and the crew did go up on to the carbonates taking some of the data there. So we know that the outcrop is there. We know that that's quite a high resistivity carbonate.

As we get to the center of the line, we see a blue resistant blob coming up from that and it is evidence of a very conductive zone. But that blue blob as you see as we move further towards the mouth of Kane Springs that becomes more shallow. That's sort of part of what we were seeing on the axis line.

And then we also see the Kane Springs Wash fault 21 zone, which is on the right-hand half of this line, looks 22 like numerous blue high resistivity blobs. The carbonates 23 are all broken up there. There's multiple faults. They look

make in the top part of slides 11 and 12?

2 A. Thank you. Yes. The title on slide 11, it says

near the southeast end. I have a little bit of age-related

dyslexia or something. But that should say southwest. And 4

then on the next slide it says southeast and it should say 5

southwest. Sorry. 6

So on slide 12, this is line ten, the 2019 work. 7

This is right at the very mouth of Kane Springs right there 8 9 at the southwest end of the Kane Springs. It does not cross any outcrop there in the middle. It doesn't cross the knob. 10 It's on the southwest end of the knob. As you can see, it's 11 12 all blue. I mean, this is all high resistivity ground, very high, thousands of ohm meters in many cases. 13

We interpret this to be almost entirety carbonate 14 in the subsurface. Very thin veneer basin fill over it. The 15 carbonate is broken up. We do see some low resistivity 16 17 features at different angles and things. But the gist of it here is that right there at the mouth of Kane Springs instead 18 of seeing a fault and maybe separate it from other faults 19 20 with low resistivity basin fill, we see all carbonate high

21 resistivity results.

22 Q. Mr. Carlson, you're about 15 minutes in?

A. Okay. Thank you. 23

On slide 13, this is line 11. This is the line

Page 1266

Min-U-Script® (9) Pages 1263 - 1266 **Capitol Reporters** 775-882-5322

24

Page 1270

Page 1267

- 1 that is about two miles from the mouth of Kane Springs. And since I like to keep plots as a one-to-one aspect ratio so 2
- you can actually see how steep angles are, this one is kind 3
- of skinny. So in slide 14, I have just broken this up. The top plot in the south is the northwestern part of the line.
- And the bottom plot is the southeastern end of the line. So 6
- 7 just so we can see some detail a little bit better.
- The key features here are, unlike line ten, which 8 is just two miles closer to the mouth of Kane, line 11 is primarily moderately low resistivities, all of those greens 10 and yellows, it's mainly layered. It's not -- The center of 11
- the line is broken up, but both of the line is layered. 12 13 Moderately low resistivity that we interpret as basin fill.

On the far right-hand end of the lower plot, we see solid blue again. And that's where the crew went up on to outcrop and carbonate. So good ground truth there, but we're seeing a big, big change as we come away from Kane Springs, from the mouth of Kane Springs Wash.

We see some interesting things that probably have nothing to do with the hydrologist but interesting layering in this bottom half of the plot. You see some yellows and then bright reds, very low resistivity material. Again, that's probably saturated. There may be very fine grain low resistivity material map.

Across the bulk of the line we see low resistivity layering. 1

That bottom plot is just the same model but we've added a few 2

layers to get a little deeper. 3

4 In one of the earlier testimonies, I think it was

5 Dr. Waddell, he mentioned that he thought that a large fault

that we talked about in our reports didn't show up on this 6

7 because we just weren't seeing quite deep enough to get it.

And that's exactly right. The model that we had put in the 8

report was not the deepest model we had. If we show you the 9 deepest model, which is the bottom half here, and if you'll 10 go ahead and skip to the next slide. And actually one more 11

12 slide to look at the deeper one.

13 On the lower image here in this cross-section --

14 Q. And you're on slide?

15 A. I'm sorry. Slide 19. Sorry. On this slide 19

the lower image is the cross-section of the southeastern half 16 17 of the line. And you can see at depth high transmissivity the blue material. We would put a fault at the edge of the 18

19 biggest blue blob you see there and in between the two blobs

you see there another fault, a third one actually, on the 20 right-hand side of that mixed blob. 21

But Mr. Waddell was right. The fault that we 22 talk about a little bit later doesn't show up on line 12 23

because it just wasn't looking deep enough on that plot. 24

Page 1268

And if you come from left to right, that reddish 1

layer, it sort of jiggles around, but reddish layer is 2

roughly horizontal and comes to about the middle of that 3

lower plot and then plunges steeply downward. 4

We see that on other lines here and we also saw that on the Coyote Springs lines on Monday. It's a different interesting feature. I'm sure it's telling us something. But, for the current hearing, what's mainly important is the fact that as we've moved away from the mouth of Kane Springs we're in to low resistivity basin fill, a large amount of low

resistivity basin fill. This calculates to be 2500 feet to 11 12 3,000 feet of basin fall.

14 15

16

17

Min-U-Script®

If we can go to slide 15, just a very quick refresher of where we are. We just discussed lines ten and 11. Those are the ones on the southeast and northwest there near the center. And now we're going to discuss line, 12 which is oriented east-west, and we have oriented it that way so that we can get a look at some of the concealed faults

18 that Rowley had on his map. 19 20 So, again, so -- it's a very long plot so it plots very skinny if you keep the aspect ratio. So I'm going 21 to break it up. Although first I'm going to show you a 22 slightly different version of that upper plot. We're seeing 23 nice layering. In some ways, this looks a lot like line 11.

1 Other interesting things on here. On the top

plot you can see the northwestern half of the line, some very 2

interesting layering in the basin fill material. 3

At about station 7100 through about, oh, 4

10,000 -- 11,500, you'll see that the yellow and red well 5

resistivity material gets all the way to the surface. It's 6

saying that the surface there is very low resistivity. 7

And if you think back to the aerial view, that's 8

9 where this line crossed a vegetated area. And very near this

line is the Coyote Spring, which the valley is named after. 10

11 So we're seeing the effects of spring water and the

12 vegetation around it and the data here.

It's not terribly important for the discussions 13

here, but it's another ground truth for us, something that 14

you want to see when you're trying to make all of these 15

measurements. 16

17 If we go to slide 20, what I put here is just

lines ten and 11. Number ten is right at the very mouth of 18

Kane Springs Valley. And then the lower plot is line 11, and 19

20 that's about two miles in to Coyote Springs. And this is

just to point out the radical difference between the two 21

lines. The top line is virtually all high resistivity 22

material, broken up, but high resistivity material. 23

Whereas, as you move out and parallel out of Kane

24

Capitol Reporters 775-882-5322

(10) Pages 1267 - 1270

Page 1274

Page 1271

1

7

Springs Valley, we see all low resistivity material looking 1 like 2500 feet, as much as 2500 feet of basin fill. And

2 there are two wells near line 11 here, near line 12, out in 3

the basin fill. And those indicated a minimum of 1500 feet 4

of basin fill material. So some good ground truth again. 5

So, if we go to slide 21, this was sort of a

summary slide of the results, sort of the gross features of

the results on the Rowley map. And we have our lines, ten, 8

and 11 and 12 again, but in between those two lines, in 9

between ten and 11, we've drawn a heavy red dash line that 10

has small down drawn symbols along the southwestern side. 11

But that's indicating that we're virtually certain that 12

13 there's a large fault roughly parallel to those two lines and 14

it has to be in between those two lines since we see this big

15 change from line ten to line 11.

6

For graphic purposes, we just put it roughly in 16

17 the center. But, personally, I believe it's very, very close to line ten. But until we run the line perpendicular to

18 19

these lines to cross it, we can't place it exactly. But the

change in resistivities from line ten to line 11 just demands 20

that there be a big flow right there. 21

And very boldly we called this the boundary --22

northern boundary -- northern boundary LOWRFS, we gave it a 23

grandiose name. In the discussion actually we called it 24

calibrations always worked. Automatic checks always worked.

The data did agree with specific locations of 2

some faults that are mapped as concealed. And other --3

mapped other faults that Rowley mapped as concealed, we did 4

not see. That's probably because they've been interrupted by 5

the large fault that we did see. 6

And that's probably the most significant finding

is that there is a large fault, very significant change, 8

approximately 2500 feet, in between CSAMT lines ten and 11. 9

Now we go to demonstrative exhibits; right? 10

11 Q. Yes. Please proceed. Yes.

12 A. Okay. Very quickly, the National Park Service

13 pointed out the geologic report by the USGS. It's in open

file report 00-420. And we talked a little bit about it in 14

15 the CSI discussion further south in the valley. And they did

do a couple of gravity lines near the Kane Spring line, so 16

17 we, of course, looked at that to see how things worked.

On this plot there's very -- you can -- up at the 18 19 very top in the center right on the edge of the plot is a

very faint blue shaded blob. That's the knob that we talked 20

about, the dolomite knob. So the miles of Kane Springs is 21

right at the very top of this map. 22

Other geology that's shown on this map as faint

shading, pink and blue and light green, the bulk of the map

Page 1272

23

24

3

1 Dorothy's fault, but we didn't want to put that in the

report. So I've heard multiple comments in the past about 2

our name. But that's how we discuss it. It has to be a 3

major fault and it has to -- Since the carbonates and the 4

higher resistivity material on line ten are virtually right 5

up to the surface, almost, but on line 11 they're down at the 6

depth of 2500 feet, that means that that fault has to be a 7

big step downward of 2500 feet some place in between line ten 8

9 and 11. So very significant fault.

If we go to --10

23

Q. Mr. Carlson, you're at 25 minutes. 11

A. Great. Thanks. To summarize and to go back to 12

the perspective view, we're looking downward at the geologic 13

map and then we hung the two lines in their appropriate 14

places on the geologic map. And you can see the big, big 15 difference in data as we go from right at the mouth of Kane 16

Springs, solid blue, high resistivity carbonate, to two miles 17

away, low resistivity, a minimum of 2500 feet of basin fill. 18

So that's why we put Dorothy's fault in there and considered 19

20 a major, major feature as far as hydrology goes.

And the next slide summarizes things. The CSAMT, 21

it showed realistic results where we crossed out known 22 outcrop and we knew what we were on, it matched. The data

work, the equipment worked well, no problems. Automatic 24

1 though is just a white background because it's on the basin

> fill and we don't know what it is. 2

The contours that you see, all of these lines,

parallel lines, kind of swirling around and curving up 4

from -- going from south to north, it's sort of north-south 5

and then veers off to the side. Those are called isostatic 6

anomaly contours. All it's saying is that as we go from the 7

right side of this plot towards the center of the plot we're 8

9 going from very high density rocks, the granites and things

like that, towards low density rocks out in the middle where 10

you see a big oval and a bulls eye in the middle but a big 11

12 oval all around it. That's the basin center. That's the

center of the valley. That's where the basin material is the 13 deepest. 14

The basin fill material is very low density. 15

It's loose rock. It's sand, gravel, clays, things like that. 16

17 So the contours are showing from where you're going from high

density to low density or from low to high or something like

that. 19

18

20 In the upper half of this plot there's some very

dense little points. Those are their data points along two 21

lines that we did called the N-1, which is the northern line 22

of points, and N-2, which is the southern line of points. 23

All of the other little dots you see are on the map are

Min-U-Script® (11) Pages 1271 - 1274 **Capitol Reporters** 775-882-5322

Page 1278

Page 1275

- they're gravity stations. But their lines were high density 1
- gravity. In the rest of the plot it's very, very low density 2
- stations. They were sometimes two miles and three miles 3
- between a gravity station. So they consider this -- And they
- stated in their report that this is a very low resolution
- look at the valley. But where they have high density, that's 6
- a good gravity cross-section. 7
- So if we go to the next slide --8
- Q. And just to clarify, Mr. Carlson, that is not
- Rowley's geology on that last slide? 10
- A. You're right. From memory I think they used Page 11
- but I'm not a hundred percent sure. That is not Rowley's 12
- 13 geology map. Rowley based a lot of his on Page too.
- The result of the gravity along these very 14
- tightly spaced lines, on the top is that northern line and 15
- the gravity line N-1. And they've divided up the subsurface 16
- 17 in to just two layers. Along the top you'll see some red
- dots that look like they have little antennas on them. 18
- Q. And you're on the top plot? 19
- A. Sorry. On the top image on slide 25. Those
- little red dots that look like they have antennas, that the 21
- surface of the ground, that's where they parked and made a 22
- measurement. 23

1

And then right below those on a line is a very 24

- other. Lines ten and 11 and 12 and then for reference the 1
- Coyote Springs Investment line A down at the very bottom give 2
- you a reference of where we are in the valley. 3
- So we have line ten in the upper central part of 4
- this plot. And you can see that the southeastern half of 5
- line ten approximates their line and the gravity line N-1. 6
- 7 And then about the southeastern third of line 11 is where
- they have their gravity line in two. 8
 - And if we go to slide 27, very quick refresher,
- there's line ten, solid carbonates, blue. 10
- If we go to slide 28, there's line 11. And 11
- 12 actually let's go ahead and go to the next one. So on this
- 13 plot, the top image --
- 14 Q. You're on 29?
- 15 A. I'm sorry. Yes. Slide 29. The top image on
- slide 29 is that southern half of line ten approximating 16
- 17 their gravity line in to N-1. The southern -- The bottom
- image on this slide is the southern third of our line 11 to 18
- approximate their line N-2. Confusing. 19
- And we're seeing the same thing that they were 20
- seeing. By coincidence they use blue for their carbonates 21
- and we use blue for our high resistivities. Our line ten and 22
- their line N-1 are both solid blue because we're detecting 23
- carbonates. They see it as a high resistivity -- or they see 24

Page 1276

lightly shaded yellow layer and they label that as the 1

9

- Cenozoics, which is the basin fill in this case. 2
- And then below that, which is the vast majority 3
- of the line is light blue labeled PZ for the Paleozoics, and 4
- they identify that as the carbonates. They don't
- differentiate from dolomite, from limestone, or anything like 6
- that. It's just that's their carbonate. 7
- So they're saying on line N-1, the northern line 8
- 9 which is near our line ten, they see a thin layer of Cenozoic
- basin fill. And then down to 6,000 feet they see carbonate. 10
- The lower image is their line N-2, which is close 11
- to our line 11. And you can see we're now on the bottom 12
- image on slide 25. The surface of the ground is those red 13
- dots with the antennas. And now we see a very thick zone of
- the pale yellow labeled CS, the Cenozoic basin fill. 15
- You can see in the middle of their line it's just 16
- about 3,000 feet deep. So they're also seeing basin fill 17
- clear down to 3,000 feet as they move away from the mouth of 18
- Kane Springs. 19
- And then below the basin fill we show the pale 20
- blue again as the high density carbonates. 21 If we go to slide 26, this just for reference 22
- shows their plate one again and we've just overlaid our CSAMT 23
- lines in blue so you can see where they are relative to each

- it as a high density feature. We see it as a high
- resistivity. 2
- Go further out on the valleys at line 11 and 3
- we're seeing basin fill very deep. You'll even notice that 4
- in the middle of this section at line 11 the deepest part of 5
- these low resistivities is right about in the middle of the 6
- line out here, not in the middle of the valley. And that's 7
- exactly what we saw on their line N-2 that they had the 8
- 9 deepest basin fill in that part of the line and not in the
- 10 middle of the valley. So we're in agreement with that.
- We go to the next slide. Thereto, again, we see 11
- the same thing. As we move from the mouth of Kane out in to 12 Coyote Springs, a great big huge step of carbonates. 13
- Everything drops off 2500 feet. 14
- If we go to the next slide. That's really the 15
- perspective view again. 16
- So -- But I wish we had seen the USGS report 17
- before we laid out our lines. Similar to Coyote Springs, we 18
- would have laid things out a little differently, because it's 19
- 20 unusual when we get two different data sets from two
- different groups that are measuring two different physical 21
- properties of the ground and you're seeing the same 22
- surprising unexpected thing. They see this high density 23 24
 - change in low density over a very short distance. We see

Min-U-Script® (12) Pages 1275 - 1278 **Capitol Reporters** 775-882-5322

9

10

11

high resistivity change to low resistivity over a very short distance. 2

And the only thing I can come up with is a very 3 significant fault in between lines ten and 11. And I think 4 that probably wraps it up from my end. 5

MS. PETERSON: Thank you.

6 7 8

THOMAS BUTLER

- Called as a witness on behalf of 9
- Lincoln County/Vidler, having been first duly sworn, 10

Was examined and testified as follows: 11

12 13

DIRECT EXAMINATION

- By Ms. Peterson: 14
- 15 Q. Now we'll turn to Mr. Butler.
- A. Sorry. I'm recovering from a really bad cold, so 16
- 17 you might have a hard time hearing.
- I was recently hired by Vidler to provide 18
- assessment and geochemical data. More specifically, the 19
- question I was hired to answer is whether there is 20
- geochemical evidence to support the conclusion that there was 21
- a significant component of water from Kane Springs entering 22
- Coyote Springs or the Muddy River Springs area. 23
- The geochemistry data set that I evaluated was 24

Page 1281

- 1 Springs Valley up here, Coyote Springs Valley. A groundwater gradient in Kane Springs Valley is presumed to be based on
- 2 outpatient data to the southwest. And the northern portion
- 3
- of Coyote Spring Valley it's to the south and southeast. 4
- The important thing here I want to draw is 5
- gradient alone does not mean flow. You all still have that 6
- 7 conduit so it does not necessarily mean the flow is
- occurring. More importantly, if it is occurring, whether or 8
 - not it's significant. It's just a potential.

Next slide. Okay. So when I first got this data set, you know, one thing that struck me -- And I got this

12 cold, so I had no idea how the context was going on here.

13 This guy has been involved in this for years.

The similarities you see between CSVM-4 and KPW-1 14

15 in temperature. They had very similar temperatures compared to every other well in the basin. So I just did a -- You 16

17 know, if we got these groundwater gradients coming out in

Coyote Springs, this groundwater gradient down in Kane 18

19 Valley, what's the potential for some mixing going on here?

So I did a very simple mixing model and I 20

calibrated on water from CSVM-7 and KPW-1, the N-members, and 21

see if I could simulate CSVM-4. And based upon that model, I 22

come up with an approximate percentage of water for CSVM-4 of 23

74 percent. KPW-1, 26 percent. So that's just one 24

Page 1280

Page 1282

- from CH2M Hill report dated 2006, which is entitled 1
- Hydrologic Assessment of Kane Springs, Geochemical Framework 2
- and the whole data sets from that report. 3

I also provided some comments to some findings in 4

some recent reports prepared by Mifflin and Associates from 5 their July 3rd, 2019 report. 6

And together the conclusion that I draw from this 7

- is that we're going to show how KPW-1, Kane Springs pumping 8
- 9 well, in the southern portion of Kane Springs Valley and
- CSVM-4, which is the northeastern well in Coyote Spring 10
- Valley, how they are related and how they differ from other 11
- wells in the entire system. And that's the Lower White River 12
- Flow System. 13

And we'll do that through a series of Piper plots 14

and Durov plots, the carbon-14 data, the fluoride 15

concentrations, we're going to look a little bit at 16

equilibrium modeling and how things appear to be different in 17

certain areas and we'll talk a little bit about how arsenic 18

is not a very valuable tool in evaluating flow components. 19

This slide is actually meant to be placed over --20

I was never able to get the proper slide. But it shows the 21

same things I showed before. Mainly deep groundwater 22

elevations to various wells. 23

Other folks that talk about this, this is Kane 24

constituent. 1

2

14

15

16

17

18

19

20

21

22

So then I took that same mixture and I looked at

does it apply to other things that are in this. Does it 3

apply to the fluoride? Does it apply to temperature? How 4

about water isotopes? That's independent of soluble 5

chemistry all together. And the carbon-14. So when I 6

calculate them, model CSV-4 data with all of those different 7

constituents you'll see here, that they actually do compare 8

9 quite well with temperature being the biggest discrepancy

with 15 percent, but most of them plot at a very low percent 10

difference. High probability that these two wells are indeed 11

related. There's a component of the Kane Springs water and 12

13

there's the component of the Coyote Springs water there.

(The court reporter interrupts)

THE WITNESS: So taking that same percent of each of these N-members, I then applied that to the major cations and the anions for those two water chemistry types to see if I could simulate a similar water type at CSVM-4. And that's what you see in the Piper block here. Actual CSVM-4 data is that purple dot, and the simulation is the teal dot. They do compare. We're able to see them. Just provide some evidence that they are very similar.

Next slide. And we're able to -- we show that 23

KPW-1 and CSVM-4 are related. This plot here is the Piper 24

Page 1283

- diagram that brings in a lot of other data. And I want to 1
- point out a couple of errors or corrections. The data shows 2
- that the Black Mountain data is in this. It is not. Rogers 3
- point or -- I'm sorry. Blue Point and Rogers Spring from
- Black Mountain Springs would plot right about here.
- Q. (By Ms. Peterson) And describe where you're 6
- pointing.
- A. To the north. To the northeastern corner of the 8
- Piper diagram.
- Also, the circle area, it says it depicts central 10
- 11 CSV water. And it actually depicts Kane Springs water. So,
- a real quick description of these data. So these diamonds 12
- right here in the center portion of the Piper diagram, those 13
- represent all of the Coyote Spring Valley water chemistry 14
- 15 from basically everything except CSVM-4, everywhere else in
- 16 the system.
- The solid circle indicates -- The blue circle, 17
- it's hidden behind the purple circle, is KPW-1 or CSVM-4 --18
- (The court reporter interrupts) 19
- THE WITNESS: And the black circle is Willow 20
- Spring. Willow Spring is also located in the southern end of 21
- Kane Springs Valley. The open circles are the northern 22
- springs in Kane Valley. 23
- The star up here, the stars are actually all of 24

- old substances, TDS as well as another variable of pH. 1
- Again, what we see here is these are KPW-1 2
- springs and CSVM-4 in that northeastern portion of Coyote
- Spring Valley. Willow Springs they kind of plot along a new
- relationship with each other. We also see central Coyote
- Spring Valley water right here. We see the MRSA water here. 6
- 7 And we have the railroad well, that alluvial well, out in
- Lower Meadow Valley Wash area. And what we see is mixing
- relationship here appears to be between alluvial source and 9
- the Kane -- or the Coyote Springs -- the Coyote Spring Valley 10
- water. Kane and CSVM-4 and Willow Springs are not along this 11
- 12 trajectory.
- 13 So, again, these chemistry data suggest that Kane
- Valley is not a significant component of water entering the 14
- 15 MSRA(sic) or is mixing with it.
- Q. And Mr. --16
- 17 A. Oh, I'm sorry.
- Q. Mr. -- Mr. Butler, when you were describing the
- mixing relationship, you were talking about the rectangle on 19
- the right-hand side of the slide? 20
- A. Yeah. That's the -- Yeah, this -- And there's a 21
- line drawn between the points. There is a straight line. 22
- And just a clarification here. This also shows 23
- that the Black Mountain Basin samples are on this. They're 24

Page 1284

Page 1286

- the samples. And I should preface this. I can only create
- this diagram for where we have complete water chemistry. So 2
- these are all the water, all the data from that 2006 report.
- They have complete water chemistry that enable us to make 4
- this diagram for these wells. 5
- Star data is from the Muddy Springs, MR -- I'm 6
- 7 sorry. MRA --
- (The court reporter interrupts) 8
- 9 THE WITNESS: MSRA springs. I got it backward.
- And so these are these right here and this one 10
- here. This little triangle is actually an alluvial well. 11
- It's a railroad well from the Lower Meadow Wash area. 12
- What we can see here is there's a potential 13
- mixing relationships between either central Coyote Spring
- Valley and your in-basin recharge in the Muddy River -- Muddy 15
- Springs or the Lower Flow Valley Wash. 16
- In the Kane Springs and the CSVM-4 are chemically 17
- unique and do not appear on any of those mixing 18
- relationships. That would indicate that they are not a part 19
- 20 of that mixing relationship. Not likely a significant
- component of water to the MRSA. 21
- Next slide. Durov diagram is very similar to the 22
- Piper diagram in that it presents featured cations and anions 23
- in the system and it also brings in the total amount of those

- not. If we were to plot them, they would plot about right
- here way off the graph. 2
- 3 Q. And you're pointing to the text on the right-hand
- side? 4
- 5 A. Yep. Yeah. Right about where it says recharge
- in MRSA. And those would again be Blue Point and Rogers 6
- 7 Springs.

11

- Next slide. This is really hard to see here. I 8
- 9 should blow it up more. This is carbon-14 data. And the
- 10 main point here is that it's measured in percent modern --
 - (The court reporter interrupts)
- 12 THE WITNESS: Percent modern carbon. And the
- values here at KPW-1 and CSVM-4 are quite low. The values in 13
- central Coyote Spring Valley and the MRSA are quite a bit 14
- higher. So what that means is if the presumed groundwater 15
- flow path is from Kane to the MRSA, the groundwater would 16
- 17 have to get younger, not older, as it flowed along the
- groundwater flow path. So that can't happen unless there's a 18
- vary significant influx of much younger water. 19
- 20 So, again, the data here suggests that Kane
- Springs Valley is not a significant component of water to the 21 22
- MRSA and that -- that there's probably another source most
- likely that's coming from Coyote Springs or somewhere else 23 24

that the percent margin in these areas they jive pretty

Page 1287

- nicely. 1
- Q. (By Ms. Peterson) So you have about five minutes 2
- left. But don't talk any faster.
- A. That's going to be difficult. Okay. So this is
- just a comment to the Mifflin report. The comments in green,
- I won't read it for time. But basically it's saying things,
- arsenic could be used as a tool to define the MRSA capture
- 8
- 9 I just want to state that arsenic is a horrible
- indicator of anything because it is extremely transient and 10
- variable. It's dependent very much so on the REDOX potential 11
- of the groundwater. It's dependent on the pH of the 12
- 13 groundwater. It's dependent on whether or not it travels
- through any iron oxyhydroxides because they effectively 14
- 15 damage it.
- And, case in point, we showed earlier that KPW-1 16
- 17 and CSVM-4 are likely to replete it and that CSVM-4 from
- multiple indicators is likely about 76, 75 percent KPW-1 18
- 19

8

- While KPW-1 has an arsenic concentration of 46 20
- micrograms per liter, CSVM-4 has five. If that relationship 21
- could hold true, this should be 35.
- Q. And what are you pointing to?
- 24 A. I'm pointing to the concentration that is on the

- temperature. 1
- We also did a system that involves calcite, 2
- gypsum, and fluoride. These are very common minerals.
- Nothing exotic here. You expect these. Green line, that's
- the equilibrium model for calcite, fluoride, gypsum. Blue 5
- dash line here is the equilibrium model for calcite and 6
- 7 fluoride alone.

8

9

10

19

And what we see is KPW-1 and CSVM-4, they collect right on the concentration of where you expect fluoride to be versus temperature for a system that's dominated by fluoride

and calcite, as does this stream. It's only there because 11 12 that data that was in that data set where they were available

13 and it's in a similar equilibrium of a similar simulation. 14

All of the other minerals -- All of the other

15 samples throughout that 2006 report where we have fluoride temperature data plot below that equilibrium line and more 16 17 similar to a plot that would keep that gypsum as also being

involved in that system. 18

So, again, these data suggest that the Kane

Valley is not a significant component. It's very unique 20

compared to many of the other samples in the MRSA and 21 elsewhere in the valley. 22

Water isotopes. So Mifflin again suggests --23

states that groundwater captures and could be confined by 24

Page 1288

Page 1290

- 1 figure on the map for CSVM-4.
- And if you were to use arsenic, which has been 2
- postulated to include Kane, the high concentrations aren't 3
- seen anywhere else in the basin. So if you're going to 4
- include arsenic, you would use it the exact opposite way. 5
- I'm not saying to do that, because it's not good. It would 6
- indicate that it should be excluded from the system. 7
 - And, finally, I want to go on to the next slide
- and talk about fluoride. Mifflin also stated that fluoride
- can help define the capture zone due to high concentrations 10 of fluoride present. Kane, again, has some of the highest 11
- concentrations of fluoride. So does CSVM-4. Those 12
- concentrations aren't seen anywhere else in this immediate 13
- area. Most of the equal concentrations of fluoride up here 14
- again. Central Coyote Spring Valley as well as MRSA. 15
- The fluoride is -- The fluoride is a mineral that 16
- is temperature-controlled and it will also show in the next 17
- slide, I believe, that the temperature is indeed controlling 18
- its concentrate, elevated concentration, at the location. 19
- 20 Okay. So this is a simulation. This is a
- PHREEQC. You're probably familiar with PHREEQC modeling. 21
- 22 It's a USGS geochemical modeling program. It's a very simple
- model that takes the -- basically takes mineral calcite and 23
- mineral fluoride and sets it in to equilibrium with

- water isotopes, a difference to signature that these could be
- related. Kane and CSV-4 got compared to other isotopic 2
- valleys in the area are isotopically light in comparison to 3
- most of the samples in central Coyote Spring Valley and the 4
- MRSA where they're slightly more depleted, slightly less 5
- negative, and very similar to one another. 6
- 7 So these data would suggest, isotope data, would
- suggest that KPW-1 and CSVM-4 are isotopically different than
- 9 central CSV water and the MRSA water. So, again, not the same. Different. 10
- So the conclusions here where we looked at 11 several different indicators, not just one mining -- mineral 12 or one parameter. General, slides --13
- (The court reporter interrupts) 14
- THE WITNESS: We look at several parameters 15
- including general mill chemistry. We plotted in Piper and 16
- 17 Durov diagrams, that carbon-14 data, we looked at fluoride
- concentration, and we did some equilibrium models, and we 18
- also looked at water isotope data. All of these data, every 19
- 20 single independent parameter, independent parameter suggests
- that the MRSA is not dominated by Kane water but it's more 21
- likely dominated by water from central CSV or the Lower 22
- Meadow Wash area. And, again, arsenic is still just a 23
- horrible thing to use. So don't use it. 24

14

- MS. PETERSON: So this would maybe be a good time 1
- for a break if we were going to take a break this afternoon. 2
- HEARING OFFICER FAIRBANK: We can go ahead and do 3
- 4 that. We'll go ahead and take a ten-minute break.
- (Break was taken) 5
- HEARING OFFICER FAIRBANK: We'll continue on with 6
- Lincoln County and Vidler Water's presentation. Thank you. 7
- TODD UMSTOT 9

8

13

1

19

- Called as a witness on behalf of 10
- Lincoln County/Vidler, having been first duly sworn, 11
- Was examined and testified as follows: 12
- DIRECT EXAMINATION 14
- By Ms. Peterson: 15
- Q. Todd Umstot. 16
- A. Hi. My name is Todd Umstot and I work with 17
- Daniel B. Stephens & Associates. My talk today is on drought 18
- and groundwater positioning. 19
- Q. And I'm sorry. Just briefly could you give the 20
- State Engineer's office a little bit of information about 21
- your background.
- A. I have a Bachelor's degree in environmental
- science and geology from the University of Massachusetts in

- eighties. And then since the eighties there's been a general 1
- increase in occurrence of droughts. So the nineties had a 2
- higher drought than the eighties. And then the 2000s had a 3
- higher drought to the nineties. And the recent decade has
- been similar to the past decade. 5
 - And then you can also see on here I've plotted
- 7 two different colors. The blue bars represent Nevada Climate
- Division 3. So when NOAA publishes Palmer drought data, they
- publish it for different regions of the United States. And 9
- so one of the regions is Nevada Climate Division 3. That 10
- represents generally central Nevada and it cuts in to the 11 northern portion of Kane Springs and touches on the north 12
- part of Coyote Springs Valley. 13
 - And then Nevada Climate Division 4 is southern
- 15 Nevada. And that covers the rest of the lower -- covers the
- Lower White River Flow System. 16
- 17 So if you look at the time series analysis of
- drought conditions in Nevada Climate Division 3 since 1960. 18
- So the Y-axis here on the left, this shows whether or not 19
- they're drought or wet conditions. So for the Palmer drought 20
- index, zero represents normal conditions. And pretty much 21
- the range from minus two to two is a normal range of drought 22
- and wet conditions. 23
- As you get to negative three and negative four, 24
- you start to go in to severe drought and extreme drought. 1
- And then when you go in to positive values of 2
 - three and four, you get in to very wet or extremely wet 3
 - conditions. 4
 - And so as faintly shown on here for the monthly 5
 - Palmer drought values from NOAA are shown as the blue line. 6
 - And then I've taken the trailing 12-month average of that 7
- data to kind of show what the general trends are and kind of 8
- 9 smooth out the noise that you see in the Palmer drought data.
- 10 So the groundwater -- what you're going to see in
- the groundwater elevations, they're going to see a 11
- 12 combination of these different processes, depending on where
- recharge in the system is sourced. If the recharge is 13
- sourced from further away, it's going to be a more dense 14
- response that's going to reach the well. If it is recharge 15
- that is coming from an arroyo that's right next to the well, 16
- then that's going to be a quicker response for the well. 17
- So it's different recharge areas, different 18
- amounts of recharge in these areas. Higher recharge in the 19
- mountains. Lower recharge in the valley. And different 20
- distances from these recharge sources to the wells. And all 21
- of these different processes are going to end up making 22
- variations in the hydrographs. 23
 - And so the Nevada Division Climate 3 showing

Page 1292

Amherst. And a Master's degree in hydrogeology from the

University of Nevada, Reno. 2

- I worked for Dan Ravie and Associates in New 3
- Jersey for a good part of the nineties. And I've worked for 4
- Daniel B. Stephens & Associates since 2002. And I'm 5
- currently employed there as a senior scientist. 6
- So I'm going to talk about how drought has caused 7
- a general decline in the groundwater elevations prior to the 8
- 9 MX-5 testing.

So the occurrence of drought has increased in 10

- recent decades. What I'm showing here is the monthly 11 occurrence of drought decade by decade. So plots bars that 12
- are higher indicate higher conditions of drought. Bars that 13
- are lower indicate more wet conditions. 14
- So the Palmer Drought Index is a simplified water 15
- balance model that takes in to account precipitation, soil 16 moisture conditions, and air temperature. And the data that 17
- I used is published by the US agency NOAA, National Oceanic 18 and Atmospheric Administration agency.
- 20 And, so, as you look from decade to decade, in
- the 1920s it was a very dry condition. I mean kind of wetter 21 condition. Thirties, drought. It was very dry. And a 22
- little bit wetter. Then a very dry condition again in the 23 sixties. And then a wetter condition in the seventies and

24

Page 1295

- 1 again over here on the right the climate division, the
- 2 Climate Division 4 is this southern area divided by the black
- 3 line. And then Nevada Climate Division 3 is an area to the4 north.
- 5 So the rate run time that the 1169 aquifer
- 6 testing in MX-5 pumping began there was a general decline.
- 7 There was a general increase in drought conditions that would
- 8 expect to cause the decline in groundwater elevation. So if
- 9 you look at the period, the one-year period, before the MX-5
- 10 pumping began, there were drought conditions about 42 percent
- of the time. And if you look at the period when the 1169
- aquifer test took place and the additional time the MX-5
- pumped beyond that in to April 2013, drought occurred 82
- percent of the time. So you had drought conditions occurring
- twice as often during the test as you had occurring in the
- year just before the test started.
- You also have in 2005 a very wet period.
- 18 Precipitation that occurred in 2005 water year is probably
- 19 the first or second highest precipitation in the hundred
- years that occurred in this area. So you had a very large
- recharge pulse to happen in 2005. Smaller recharge pulses in 2010. But overall a general decline in groundwater
- 22 2010. But overall a general decime in groundwater
- 23 elevations that occurred to this generally increasing level
- 24 of drought.

- the 1 decline back to normal conditions following a very large
 - 2 recharge event, which is not one that you see in the aquifer
 - 3 system in here.
 - 4 And then you have an increasing amount of drought
 - 5 as you go in to the time of the test.
 - 6 And then groundwater elevations start -- they
 - 7 decline through the test and continue to decline after the
 - 8 test, after the MX-5 testing.
 - And so if the -- what you would expect to see
 - here -- And I'll show this on the next slide in a little moredetail, slide seven. What this shows on the top I've broken
 - them out. I have the groundwater elevations for CSVM-4 shown
 - them out. I have the groundwater elevations for est vit I shows
 - 13 on top. I have the pumping amount shown in the middle plot
 - 14 where I have in blue the total amount of carbonate pumping.
 - 15 And then in red I have the amount of MX-5 pumping. And then
 - on the bottom I have the Palmer drought severity index.
 - Again, that trailing one-year average for regions of Climate
 - 18 Divisions 3 and 4.
 - And so you see due to drought conditions you
 - would expect water levels to decline up in to 2015. And in
 - 21 Division 4 water levels probably start to increase around the
 - end of 2014. In Division 3 that might cause more of them to
 - decline through 2015. Because that's the pattern you see with CSVM-4 is they continue do decline during that whole

Page 1296

17

Page 1298

- 1 Q. And you were just talking about slide four; is
- 2 that correct?
- 3 A. That was slide four. Now I've moved on to slide
- 4 five. If you look at Nevada Climate Division 4, this is the
- 5 southern area, it's very similar to what we just saw. It --
- 6 Generally, Climate Division 3(sic) is a little bit drier over
- the past decade or so than Climate Division 3. But, again,you see a similar effect where there's wet conditions just
- 9 before the MX-5 pumping began and then increasing the level
- of drought as you go in to the period of time the MX-5 was
- 11 pumping.
- So now I show comparison --
- 13 Q. You're on slide six?
- 14 A. Slide six. So now showing a comparison of the
- 15 Palmer drought index. This is using the trailing 12-month or
- one-year average for the severity index. I have plotting on
- the darker line here. I can't quite see the color. That's
- 18 Climate Division 3. And then the orange line is Climate
- 19 Division 4. And then the blue line is the monthly average
- water level that most people here have been using for their
- analyses for the CSVM-4 hydrograph.
- So there's a big jump in groundwater elevations
- 23 following the recharge event in 2005. Being that it was such
- an extreme event, you would expect that you will have a

- 1 period.
- Now, if you compare the pumping signal to the
- 3 hydrographs, you don't see any response to when MX-5 well
- 4 stopped pumping. So the MX-5 well went through two periods
- 5 of time where it stopped pumping. And I'll show later on how
- 6 other wells responded to that cessation of pumping at MX-5.
- 7 But you don't see any response to CSVM-4 to that change in
- 8 pumping.
- 9 So some had postulated that all of this decline
- 10 is due to pumping, then this well would have to be very well
- connected to the location of MX-5. And then even if there's
- any kind of time shift, you would still expect to see maybe a
- shift in the time the fluctuations due to when MX-5 stopped
- 14 pumping.

15

- And then once MX-5, the end of the test, the
- complete end of pumping occurred, the MX -- the CSVM-4 wellcontinued to climb and there was no recovery signal seen.
- So that can be confusing to kind of discern
- 19 drought and the pumping signals or the potential pumping
- signals on CSVM-4 during the period of decline. But it's
- 21 very clear during the period of recovery that you don't have
- a response to the MX-5. So I think that's very diagnostic
- that this well is not connected to pumping at the MX-5
- 24 location.

18

Moving on to slide eight. So this will be a very 1 similar story that we see for KMV-1. KMV-1 again it was --2 we don't have a record going back to before for this recharge 3 event, but because it's close to CSVM-4 and it shows similar 4 hydrographs, you would expect that this has an increase over what it was in the previous years. And then after that high 6 recharge event you're going to have a general decline. And that's going to be supported by the drying trends that you 8 9

see in the Palmer drought. And, again, moving on to slide nine, I show the pumping effects. You don't see recovery responses in KMW-1. So it may be hard to discern drought from pumping effects from the declining curve. But you can definitely see because of a lack of recovery signal that the MX-5 is not connected to the KMW-1 well location.

And so I want to look at some of the other 17 hydrographs in the region and put the focus on that recovery response. 18

19 So, prior to the MX-5 pumping, you have wells 20 CSI-1 and CSVM-6 right near the pumping MX-5 well. Prior to the pumping occurring, you had a general decline in 21 groundwater levels. There's some seasonal fluctuations 22 probably due to the pattern of the carbonate pumping from 23 24 overall in the system.

1 MX-5. KMW-1 and CSVM-4 are the wells near Kane Springs. You

don't see that seasonal pattern from the carbonate well 2

pumping before the MX-5 test began. And you also don't see 3

any response when MX-5 turned off during 1169 aquifer test or 4

when MX-5 finally stopped pumping at the end of the MX-5 5

test. And the water levels continued to decline for up to 6 7 one and a half years after the pumping ends.

So people have postulated different lags for why maybe it just takes a long time for the signal to get up to these wells at KMW-1 and CSVM-4 for the MX-5 pumping. I'll talk later about it looks like SNWA is using maybe a three-month lag. I believe National Park Service expert testified there was a nine-month lag. When I looked at his chart I saw a ten-month lag before water levels started to decline at KMW-1 and then a ten-month lag for what he thought when water levels went up.

So people don't even agree on what's the lag period for when you might see a response at this well. But if you look overall, there's just no -- there's no response to the recovery.

And so another way of looking at this is a 21 special --22

Q. And, excuse me, you're on slide 15? 23

24 A. Slide 15. So what I'm showing here is I look at

Page 1300

1 You'll see a recharge event responding to

recharge and then decline from that recharge event to heavy

precipitation in 2005 and a response that occurred later on 3

in 2006. 4

2

9

10

11

12

13

15

16

17

18

19 20

10

11

12

13

14

15

16

And then during the MX-5 pumping test you see in 5 the CSVM-6 that when the MX-5 well is temporarily turned off 6 7 that you get these little bump-ups from the well. So you get these little recovery responses. 8

Moving on to slide 12. So, again, looking at the different wells, this is looking at the CSI wells, one through four, and CSVM-1 at the bottom. You're looking over here at the representative carbonate wells in the system. Again, when you look at wells that are near MX-5 well that are -- it all shows this characteristic bump in January 2012 when the MX-5 pumping was turned off.

Moving on to slide 13. And so if you look at the hydrographs for all of these wells, you also see a general up and down pattern of all of these wells responding to pumping in the carbonate system. So they're all responding. Not only do they respond to the MX-5 test but they're

responding -- you see this characteristic seasonal response 21 22 to the MX-5 pumping. I mean to the carbonate well pumping.

When you look at the hydrographs at KMW-1 and 23 CSVM-4 and you look off at CSVM-1 -- CSVM-1 is right near the change in water level between the end of the MX-5

pumping, April of 2013, and January 2014. So I'm showing in 2

blue wells that had a rise in water level. So near the MX-5 3

pumping you see blue locations as you would expect as they

have rising and response to the end of the MX-5 pumping. But 5

if you look up to the north you see red where you still have 6 7 declining water levels.

So what this plot is showing is that you're not 8 9 seeing any response to the MX-5 pumping in the vicinity of CE-VF-1 or CE-VF-2 and areas to the north of that. 10

So now I'm going to talk about some of the other analyses that others have done. Southern Nevada Water Authority has primarily relied on correlation analyses to support hydraulic connection. And then they also use the correlation analyses with a linear regression to estimate drawdown. That's very unusual to me to see people use linear regression to estimate drawdown. Typically you would use Theis equation or some variation of the Theis equation. Or in a system that's this complicated I would use a groundwater

19 20 flow model. So I'm surprised in the years that they've been

working at this that they don't have a groundwater flow model 21

that they're relying on for this. Instead, they're relying 22

on very simple linear regression. 23 24

And when I look through the USGS report that they

Page 1302

Min-U-Script® (18) Pages 1299 - 1302 **Capitol Reporters** 775-882-5322

Page 1303

- cite, I don't see any support for using linear regression to estimate water level drawdown from an aquifer test.
- 2 So when you look at --3
- 4 Q. You're on slide 17?
- A. Slide 17. When you look at hydrographs and you
- do comparisons, generally in this area they're all kind of
- responding to similar patterns of climate. But you can also
- see, you can get kind of spurious correlations. So others 8
- that reported that CSVM-5 that's farther to the north in 9
- Coyote Springs Valley is not connected to the MX-5 pumping 10
- region. And so you could do a regression on that well of 11
- KMW-1 and you come up with a fairly high R-squared of .68 and 12
- 13 is similar to the type of regression that you get using
- between EH-4 and KMW-1 without using any type of a lag. So 14
- 15 you could find these types of spurious correlations. And I
- don't think this is enough evidence to show hydraulic 16
- 17 connection and it's not sufficient to be used to predict
- drawdowns from an aquifer test. 18
 - And simply having correlation is not proof of
- causation. Causation is neither proved nor evaluated in a 20
- regression analysis. 21

19

- Slide 18. So kind of an extreme example is you 22
- can look at does MX-4 correlate better to a well in Cave 23
- Valley as it does to CSVM-4. So if we look at the drawdown 24

- different calculations and it's used to estimate the half 1
- foot of drawdown from the MX-5 aquifer test in their linear 2
- regression analysis. And what I see is that all that lag
- 4 does is improve the R-squared analysis. And that lag does
- not apply in the correlation or I don't believe it was tested 5
- with any of the other correlation analysis. 6
- 7 Q. And you were just on slide 21?
- 8 A. That was slide 21. I've now moved on to slide
- 22. Looking at the multiple linear regression that was
- provided in the Southern Nevada Water Authority's rebuttal 10
- report. So when you do multiple linear regression, there's 11
 - typically you can do it two ways. You can start with just
- 12
- 13 one coefficient. Coefficients here are listed on the left. And add one at a time to see how that affects the R-squared
- 14 15 and check the P-values. When you look for the P-values you
- want this probability to be less than .05, less than five 16
- 17 percent. Because what that pretty much represents is the
- chance that your coefficient here is zero. 18
- And so if you look at the P-values that came out 19 of the multi-linear regression, for the Black Mountains area, 20
- it's nearly 70 percent. So there's a 70 percent chance that 21
- the coefficient here is zero and that this pumping in the 22
- Black Mountain area has no effect on the EH-4 water level.
- 23

And then, similarly, if you look at the Muddy 24

Page 1304

Page 1306

- over the MX-5 test or we look at the groundwater elevations,
- I can get a higher correlation with this well in Cave Valley
- than I do with CSVM-4. So this is just not sufficient 3
- evidence to support hydraulic connection or to estimate 4
- impacts from MX-5 pumping at the CSVM-4 location. 5
- And also when I look at the analysis there's no 6
- justification given for this use of a three-month lag. And 7
- that lag is only applied -- Here you can see they apply it at 8 9 the beginning of the test but they don't apply it to the end
- of the MX-5 pumping. So you would expect that to be shifted 10
- on both sides there. 11
- And then I heard from the testimony that I guess 12
- the purpose of the three-month lag is they didn't know what 13
- the lag was. There was no other separate calculation or 14
- analysis to support what an appropriate lag was. They just 15
- tried various different lags to see what would give them the 16
- best R-squared. So this to me it's not appropriate. There's 17
- 18 relatively simple equations they could use based on aquifer
- properties to be estimated from this testing or from modeling 19
- 20 that you could use to figure out what the delay would be to
- reach the -- to see what pressure -- how long it would take 21 22 the pressure signal to go from the MX-5 well up to KMW-1 or
- 23
- And so, again, this lag is used consistently in 24

- 1 River Springs area, there's a ten percent chance that the
- coefficient is zero. And if you look at the certainty 2
- analysis given here for the Muddy River Springs area and the 3
- Black Mountain area, the certainty goes from negative to 4
- positive. So this multiple linear regression can't tell if 5
- the pumping in the Black Mountain area or the Muddy River 6
- Springs area will cause a decline in EH-4 water levels or 7
- might cause an increase in the EH-4 water levels. 8
 - And later on I'm going to go in to demonstrative

and I'll go in to some more detail. 10

But, when I see values, particularly when you 11

- look at P-values, they're very small. When you look at the 12
- P-values that were published I believe by Fish and Wildlife 13 or maybe it was by National Park Service, they were ten to 14
- minus five, ten to minus ten. They were virtually zero as 15 you see here. 16
- 17 When you see P-values around one percent and you have these other high P-values, the next step is to do a 18
- step-by progression where you take out the Black Mountain 19
- 20 area pumping and you take out the Muddy River Springs area 21 pumping and run the regression again and see how the P-values
- 22 change.

24

9

- And, further, you can remove some of these 23
 - others. And I'll show later on that the only one that

Min-U-Script® (19) Pages 1303 - 1306 **Capitol Reporters** 775-882-5322

Page 1307

remains significant is Garnet Valley. 1

3

5

19

So another issue with looking at the response at 2

CSVM-4 is that the water level data are not very accurate.

The transducer that was used during the MX-5 pumping interval

during the 1169 aquifer test as was described in Southern

Nevada Water Authority's report done in June 2013 had a high 6

failure rate due to the high water temperatures in the well

so that the data that they got from that transducer data 8

could be off by a foot or less. And then the estimating that 9

the drawdown of this well is a half foot. So the drawdown 10

11 that they're calculating from the linear regression analysis

12 at this well is less than the amount of air that they're

13

giving in their transducer -- in their transducer

measurements. And those transducer measurements will 14

15 continue to be used in their correlation analysis. So

they're included in the monthly average of water level, which 16

17 is then used in the calculations.

And so another anomaly that I noticed --18

O. You're on slide 24? 19

A. Slide 24, yes. Another anomaly that I notice is

that if you look at the MX-4 well and you look at the 21

groundwater elevations during the MX-5 test, you look at the 22

figure that was published in the June 2013 report, all the 23

water levels are around 1,820 or less. 24

uncertainty at least within the range of groundwater 1

elevations that were considered in this case and the region 2

of the MX-5 aquifer test. And so it may not be appropriate 3

to use the MX-4 well for any kind of a correlation analysis 4

or a linear regression prediction of drawdown. 5

So another thing is looking at barriers. We've 6

7 looked at -- We've generally looked at CSVM-4, KMW-1, and the offset in this region versus the offset in groundwater 8

elevations to the south. I'm on slide 27 now. But you can 9

see if you look here at region CE-VF-2 and CSI-4 that there's 10

a big drop in groundwater elevations just between those two

12 locations.

CE-VF-2.

11

17

20

13 And so I'm showing on the right I plotted -- I pulled both of these figures from Southern Nevada Water 14 15 Authority, but I've added the red polygons and the red text and the blue polygons and the blue test and I've incorrectly 16 plotted here CE-VF-W2. It should be just to the east of the highway and more south here. And this red line that I've added should be between CSI-4 and the corrected location of 19

Q. And you were just pointing at the right plot? 21

A. I was pointing at the right plot. The right plot

23 needs to have location for CE-VF-2 corrected and moved to the

east. 24

1

9

10

11

12

13

14

15

16

19

20

21

22

23

24

Page 1308

Page 1310

1 If you look at the elevations that were used in all of the MX-4 correlation and linear regression analyses, 2 they're all above 1,820. So there's been an offset here of 3

about two feet. I'm not sure why the offset is there. I 4

different from the period of time used for the MX-5 test or 6

don't know if a different time interval was selected that was

7

there was a survey error. But, ultimately, I think what this shows is that there's errors and uncertainty in these 8

9 groundwater elevations here of two feet. So, again, if we're

looking and trying to estimate a half foot of drawdown to 10

CSVM-4 and there's errors in these data of one to two feet, 11

the data themselves are not sufficient to be used to estimate 12

the drawdown and the estimated impact at KMW-1 or CSVM-4. 13

So if you look at -- This is out of the June 14

report from Southern Nevada Water Authority for the 15 groundwater elevations. Now with this new water level for 16

MX-4 it's much higher than you see than the water elevations 17

That's typically your contour that that would be a source of

that you get from wells around it. So that's really anomaly. 18

20 recharge there.

So this well elevation is off now. I don't know 21

22

needs to be adjusted back down. So there's a lot of 24

what's the status of the other elevation to wells around it. Do they need adjustment or there's something in the MX-4 that 23

But, anyways, you see there's most faults even though they go north-south, you do see evidence of slight

2 slip faults that have more of an east to west direction. We 3

were at the end of a ridge here. Why that ridge terminates 4

near the location of the offset between these two wells is 5

unknown. But that might be an indication that there's some 6

sort of hydraulic barrier, in addition to the hydraulic 7

barrier indicated by the geophysics up to the north. 8

So, if you look at the hydrographs, moving on to slide 28, these wells that are two miles apart, CE-VF-2, that plot in the top is to the north. CSI-4 is the plot in the bottom is the well to the south. There is an anomaly that happens at CE-VF-2 that I believe there's a hole in the casing or something where the groundwater elevation increased. But if you look at the hydrograph even before that, the groundwater elevation was around 1,856, whereas the groundwater elevation of CSI-4 is around 1,822. So there's a

17 change in head here of over 30 feet over for this area a 18

relatively short distance.

And others have testified that this is more of a bathtub with fairly flat gradient. You wouldn't expect to see this much offset from these two locations that are only two miles apart.

And then you also see -- I do think you see a

Min-U-Script® (20) Pages 1307 - 1310 **Capitol Reporters** 775-882-5322

Page 1311

9

1 little bit of the carbonate pumping signal in CE-VF-2 but you see a much dampened effect than you see on CSI-4. So already 2

because this hydraulic barrier and there's at least another 3

- one that is up to the north beyond this, you see a dampening
- of hydraulic effects as you move to the north. 5

And now moving in to my demonstrative slides. So 6 I'm going to go in to some details on the polling of

- regression. So pulling the reference that was used by 8
- Southern Nevada Water Authority as a USGS report is Sell and
- Hersh, 2002. When you do multiple linear regression, 10
- 11 abbreviated MLR, you want to choose the best MLR water model.
- And the way you do that is you use a stepwise procedure. 12
- 13 There's some software now that can do that in an automated
- sense. But if you're using Excel, you have to do it more 14
- manually where you have to look at the P-values. 15
- So I replicated Southern Nevada Water Authority's 16 17 first analysis. I've highlighted here -- And I've moved on
- to slide 30 demonstrative. I've highlighted here in red --18
- MR. TAGGART: We would like to just object for 19
- the record. My understanding is this is a new analysis. 20 This was not provided in the expert reports. If I'm wrong 21
- though, I can be corrected. But my understanding is this is 22
- new work that was done since the submittal of the expert 23
- 24 reports. And I thought our rule was that witnesses would

- demonstrative slide. 1
- MR. TAGGART: Again, yeah, we in our report 2
- discussed multi-linear regression. I don't know where they 3
- discussed multi-linear regression in their reports nor in any 4
- of this analysis on this slide, the next slide, the slide 5
- after that, the following slide. So the next four slides are 6
- 7 all analysis that was not included in any report that
- described stepwise linear regression. 8
 - MS. PETERSON: Again, stepwise -- the linear
- regression was discussed in Mr. Umstot's report, his rebuttal 10 report, specifically in response to SNWA's information in 11
- 12 their report. These figures -- And, frankly, I don't even
- 13 have the demonstrative exhibits in front me, so I don't even
- know what the next slides show. I can't remember what they 14
- 15 show. But the figures that are used are contained in SNWA's
- evidence. And you -- I mean, the witness that just appeared 16
- 17 for the irrigation district or the Moapa Valley Water
- District did a totally different analysis than he had 18
- 19 contained in his report and you allowed all of that in.
- HEARING OFFICER FAIRBANK: Mr. Herrema. 20
- MR. HERREMA: Brad Herrema for CSI. You know, 21
- Mr. Taggart has asked every witness that's come after the CSI 22
- witnesses that they thought of that prior testimony provided 23
 - by CSI witnesses regardless of whether it was in their report

Page 1312

24

Page 1314

- 1 testify about the conclusions that they had in their reports
- and we didn't have a chance to respond to this testimony 2
- about the stepwise regression. So if I'm wrong about this 3
- being in the reports, I apologize. But I haven't been able 4
- to locate it. 5
- HEARING OFFICER FAIRBANK: Ms. Peterson, was 6
- this -- is this analysis contained either in the initial July 7
- 3rd report or the August report? 8
- 9 MS. PETERSON: Not this specific slide, no.
- HEARING OFFICER FAIRBANK: Then I would say that 10
- Mr. Taggart's objection is reasonable based upon the fact 11
- that the testimony and evidence that was to be submitted was 12
- limited to the analysis that was performed and provided 13
- within those reports. If this is an evidence and analysis
- that's contained in the reports, then I think that's fair 15
- game. But, unless a participant has an opportunity to review 16
- and have it in preparation for the proceedings, that does 17
- raise a certain level of concern. 18
- MS. PETERSON: So the stepwise linear regression 19 20 was discussed in the report and explained in the report.

- that figure is in evidence, this figure right here on this
- This specific figure was not in the report. And the 21 information comes from the SNWA chart that's in the rebuttal 22 report. I think it's Figure A-1 in the appendix. And so 23

- 1 or their rebuttal report. So, if we're striking some of
- this, then we might want to go back and ask for other things 2
 - to be stricken as well.
- 3 HEARING OFFICER FAIRBANK: So I guess a couple of 4
- considerations is one is, Ms. Peterson, is you guys have 5 about 20 minutes, roughly, left within the time allotted for 6
- 7 you for your presentation of your evidence today. If this is
- a manner in which you guys want to go ahead and extend that 8
- 9 time, that's certainly within your discretion and we're not
- micromanaging that. To the extent the State Engineer finds 10
- 11
- value in it or not find value in it, the State Engineer will
- 12 make a determination with regards to the analysis and whether
- or not it's appropriate within the confines of these 13
- proceedings and those reports contained. 14

(The court reporter interrupts)

- And so with that I would note Mr. Taggart's 15 objection and we appreciate your response and we'll let you 16
- 17 proceed as you see fit.
- MS. HARRISON: I just --18
- HEARING OFFICER FAIRBANK: It's Sylvia Harrison. 20
- Ms. Harrison. 21
- MS. HARRISON: Sorry. I just want to echo 22
- Mr. Taggart's objection. This is a new analysis that we have 23
- not seen before. It's not simply a rendition of previous 24

SE ROA 53512

Min-U-Script® (21) Pages 1311 - 1314 **Capitol Reporters** 775-882-5322

19

Page 1318

Page 1315

testimony. It appears to me to be a completely new analysis
 of other rebuttal testimony. So it's in effect a rebuttal of
 rebuttal. So we haven't got a chance to analyze it. So I

4 just want to put that on the record. Thank you.

HEARING OFFICER FAIRBANK: Thank you,

6 Ms. Harrison. And for those who are listening remotely,

Ms. Harrison echoed Mr. Taggart's objection. And, again,

8 I'll just reiterate that the State Engineer will take --

9 takes those objections in to consideration and we'll assign

the weight to the testimony as appropriate.

MR. TAGGART: We do believe your initial ruling was correct. This is far different than anything else we've seen statistical analysis that's been completed and is now going to be testified about. We have no chance to respond to this. And it's different than someone putting up a hydrograph that everyone has been looking at, like Mr. Lazarus did.

Mr. Lazarus did.
 HEARING OFFICER FAIRBANK: And I understand that,

19 Mr. Taggart, and we appreciate that and your objection is

being noted and will be taken under consideration. And

21 you'll have your opportunity to cross-examine the witnesses

22 as well.

11

12

13

14 15

16

MR. TAGGART: Okay. Thank you.

24 Q. (By Ms. Peterson) And, Mr. Umstot, you're going

1 these groundwater elevations are collected manually, this is

2 not easy field work, the depth to water is something around I

3 believe a thousand feet. The tape has to be unspooled and

4 stretched. It could change over the course of a day. It

5 could change depending on who went out that month to take the

6 measurement. It could depend on the person who did the

7 electrical tape that was used to make the measurement,

8 different measurement location. Was it done to the ground?

9 Was it done to the top of the casing? So you can see within10 the manual measurements there's some jumping around from

month to month sometimes on the order of a foot or so. So,

12 again, greater error in the manual measurements than the half

foot that SNWA has estimated of drawdown at the CSVM-4 well.And then the red values, once they start using

And then the red values, once they start using calibrated tape -- I'm not sure how that was calibrated -- but you see a distinct change in the hydrograph. I mean, it could be that this is just because there's kind of wet conditions that occur around the end of 2014 in the Nevada Climate Division 4 that caused water levels to kind of stop declining. But, again, it's kind of odd to me that the break seems to occur with the change in the water level measurement method.

And you see sort of a similar thing again when you look at the KMW-1 well. Again, there's some up and down

Page 1316

15

16

17

18

19

20

21

22

1

to proceed ahead; right?

2 A. Yes. This is Todd Umstot. So what my

3 demonstrative just supports is that if you continue to do the

4 stepwise regression you would find that only Garnet Valley in

5 this regression contributes to the decline or the change in

6 water levels in EH-4. So anyone that did the analysis would

7 find the same thing.

8 So I'll skip ahead to another demonstrative.

9 This is slide 34, demonstrative slide, where it's the

10 hydrograph for CSVM-4. What I'm showing here in addition

11 that we haven't seen is in green the transducer levels that

12 have an error rate of around a foot. And, blue, manual water

13 level elevations. And then in red, what are described as

14 calibrated manual groundwater elevation data.

So, you can see, you know, the up and down, the kind of jumping around in the transducer data that Southern

AR November Western Angeler and in the 2012 are not Deet

17 Nevada Water Authority pointed out in the 2013 report. But

what this also calls in to question is the manual

19 measurements. So you can see here the water level went up a

20 foot and went down a foot.

21 Q. What are you pointing to, what months?

22 A. If you look after the MX-5 test, you're looking

around it looks to be maybe late 2013, the groundwater

4 elevation from month to month changes by a foot. So when

values from month to month. So, you know, there's some error

2 and uncertainty in those groundwater elevation measurements.

3 And then, again, there's a break in the change once there's a

4 switch to using the calibrated measurements. It may be

5 related to climate or it may be related to -- So it's very

6 hard.

7 In summary, there's too much error in the data to

8 be able to discern drawdown response from the MX-5 test and

9 to determine that there's a hydraulic connection to the

10 southern carbonate pumping in the Lower River Flow System to

11 the location of KMW-1 to CSVM-4 and that climate conditions

would explain the general trends, the downward trends, that

13 you do see in the groundwater elevations. So I don't see any

14 evidence, hydraulic connection, to southern Lower White River

15 Flow System.

16

18

21

17 PETER MOCK

Called as a witness on behalf of

19 Lincoln County/Vidler, having been first duly sworn,

Was examined and testified as follows:

22 DIRECT EXAMINATION

23 By Ms. Peterson:

24 Q. Okay. Dr. Mock, so you have about five minutes.

SE ROA 53513

Min-U-Script® Capitol Reporters (22) Pages 1315 - 1318 775-882-5322

Page 1319

1

- I apologize. Could you just give the State Engineer's office
- a brief summary of your experience and then just maybe hit 2
- the high points of your rebuttal presentation. 3
- 4 A. Sure. Good afternoon.
- Turn your mic on, please.
- A. I'm sorry. So just to give you a quick overview,
- I received my Bachelor's degree in hydrology from the
- University of Arizona. The first two years of my Bachelor's
- work was in mining engineering where I received quite a bit
- more geology than you probably would have expected from a 10
- hydrology degree. 11
- And then worked as a hydrologist one, two, and 12
- 13 three for the Arizona Department of Water Resources. I
- worked there for three years under a registered geologist, 14
- 15 actually several registered geologists. And worked on basin
- models, regional modeling, and also the Regional Groundwater 16
- 17 Pumping Task Force, which is a rather unique opportunity. I then went to CH2M Hill in Phoenix where I
- 19 worked both in Arizona and California. My primary work there
- had to do with the beginnings of the superfund program, the 20
- great big flumes of TC that were miles long, finding the 21
- potential responsible parties for that and contracting the 22
- model. 23

18

I also did some work with artificial recharge in 24

- My doctoral dissertation was on the sedimentary
- architecture and how that affects hydraulic conductivity. So 2
- you see a mix of geology in with it. And, in fact, my
- 4 advisor had to replace Mr. Shariq with Victor Baker on my
- advisory team to address the geologic aspects of what I was 5
- pursuing there. 6
- 7 I finished that and started my own firm for which
- I've been working about 22 years. I typically work in teams
- as you see here. I do not work as a loan consultant, but I 9
- work with a group. There is generally an overlap in the 10
- expertise of the team. And that's where I work and I enjoy 11
- 12 that sort of work.
- 13 I've done many regional models with my own firm.
- And I've done some artificial recharge work. I've done water 14
- 15 rights work in the Gila River Indian Community. I was in a
- type of prospect of the Water Rights Ranch Settlement Act of 16
- 17 2004 and the subsequent implementation which has included
- many factors, also developing artificial recharge projects 18
- for the Gila River Indian Community. 19
- Q. So, let's go on to slide two, okay, because I 20
- think that's all we're going to get to, okay, Dr. Mock. I 21
- apologize. 22
- A. Yes, ma'am. So my summary is that Kane Spring 23
- 24 Valley is outside of and distant from the Muddy River Springs

Page 1320

Page 1322

- Arizona, in Southern California as well. And I worked for a
- registered geologist in California at that time. And I when 2
- I was at CH2 I became a registered geologist both in Arizona 3
- and i California. 4
- And then I went back to school. After working 5
- for 11 years, I went back and became a non-traditional 6
- 7 student and received my doctorate in hydrology groundwater
- resources at the University of Arizona. In relevance to 8
- 9 this, I was also the teaching assistance for Tom Maddox
- MODFLOW class. And MODFLOW is just the title actually 10
- because he teaches basin dynamics and systems analysis using 11
- 12 MODFLOW. And so being in the teaching system I got to work
- with the students and work on basin responses and how models 13 work. 14
- I received my Ph.D. while doing a minor in 15
- applied mathematics. And my particular specialty in that was 16
- numerical analysis. And that's the solution of partial 17
- differential equations. That's where we use in groundwater 18
- we use Darcy's law and we use mass balance. 19
- And I also, in doing that, out of necessity I had 20
- to write the code. I've written code for finite difference 21
- models. I've written code for the solvers. I've written the 22
- code for finite elements. And I'm familiar with how they 23
- work on the inside, if you will.

- 1 area. The Lower White River Flow System hydrographic areas
- 2 and the surrounding hydrographic areas are underlain by
- 3 strongly broken-up arrangement of Paleozoic carbonate blocks.
- Kane Springs Valley is in a different structural 4
- block of Paleozoic carbonates. I used the term in my report, 5
- a labyrinth, a maze. I've tried to find terms. Corridors. 6
- I don't think they're tubes. These aren't -- I'm not making 7
- analogy of rivers. I'm just saying that the pieces are 8
- 9 broken up.

10

775-882-5322

- And if you look at -- I depend strongly on the
- work of Page and Rowley. I've seen very similar features in 11
- 12 both of them. But it's critical to look at the structures in
- the area. So I'm saying that there are structural 13
- impediments of the blocks to groundwater flow. I'm not 14
- saying that all of them are impermeable. I would think that 15
- the East Mormon Mountains are where the actual underlain 16
- granite come to the surface, that might be pretty close. But 17
- there's no such thing as impermeable in my book. Tratzoky 18
- showed that concrete isn't even impermeable. 19
- 20 So there are structural pieces between Kane
- Springs Valley and the MRSA. And that would include both of 21 22
- what you see today as well as what's in Page and Rowley. So conjectures about Kane Springs Valley being an 23
- effective important place to manage and so as to protect the 24

Min-U-Script® **Capitol Reporters**

(23) Pages 1319 - 1322

Page 1323

- springs and associated surface flows of the Muddy River
- 2 Springs area are erroneous. And that's my summary.
- 3 MS. PETERSON: Thank you.
- 4 So I think we'll end right there. I don't know
- 5 how much time we have left. The rest of the pages of the
- 6 slides for Dr. Mock are contained in his report. And, again,
- 7 they are in evidence because this power point presentation
- 8 was already admitted in to evidence. So, if we can get back
- 9 to it, we will. Thank you.
- 10 HEARING OFFICER FAIRBANK: Ms. Peterson, you have
- 11 about five minutes left of the time that you reserved. So if
- you have time for -- or if you wish after we have
- 13 cross-examination to come back for redirect, you'll have
- 14 about five minutes.
- MS. PETERSON: For redirect?
- 16 HEARING OFFICER FAIRBANK: Yes.
- MS. PETERSON: Okay. Thanks.
- 18 HEARING OFFICER FAIRBANK: Okay. We'll go ahead
- and start with the cross-examination. And the participants
- 20 will have seven minutes for their cross. And we'll start
- 21 with Coyote Springs Investments.
- 22 CROSS-EXAMINATION
- 23 By Mr. Herrema:
- ANSWERS BY MR. BUTLER:

- 1 A. I would have to look at them specifically.
- 2 There's some -- I would have to look -- I couldn't answer
- 3 that directly. I would have to go look at it independently.
- 4 I wasn't calculating the years. I was looking at the
- 5 carbonate water gross difference. But, yes, if there was
- 6 significant differences, it could.
- 7 Q. Okay. When you do this analysis do you have to
- 8 assume a flow path to -- for the age dating of the water?
- 9 A. There was -- In -- When I group the similarities
- 10 in water chemistry, there is no assumption of anything. It
- was just similarities. So that was just like gradient
- indicates potential, it's just similarities in percent modern
- 13 carbon. For them to be connected there would have to be a
- 14 flow path. But I did not provide any such evaluation.
- 15 Q. Okay. The 2006 Page preliminary report and the
- July 2019 report, it states, even the current geochemical
- models cannot really account for the relative amounts of
- 18 mixing with groundwater of the many different agents.
 - Given the wide range of ages, the different ages,
- 20 between alluvial and carbonate aquifers and the potential
- 21 different flow paths in the Coyote Springs Valley, does your
- analysis using carbon-14 data represent a unique solution?
- 23 A. I was focused mainly on the difference between
- 24 Kane, which is quite a bit older, quite a bit less percent

Page 1324

19

Page 1326

- 1 Q. Thank you. Brad Herrema on behalf of CSI. I'd
- 2 like to start with a couple of questions for Mr. Butler.
- 3 Good afternoon.
- 4 A. Hello.
- 5 Q. Are you familiar with the wells in the Coyote
- 6 Spring Valley that were used in the carbon-14 analysis? And,
- 7 specifically, do you know if the analysis differentiated
- 8 between alluvial and carbonate wells?
- 9 A. I would have to go back and look specifically.
- 10 The data that I circled there was from that report, that 2006
- 11 report. I didn't create that. That graphic is showing the
- carbon-14 data that was specifically from that 2006 report.
- 13 Q. You don't know sitting right now if it's
- 14 differentiated between alluvial or carbonate wells?
- 15 A. I'm sure they're a combination of both. If the
- data were present, they were all plotted.
- 17 Q. Okay. For instance, the table on page one has
- alluvial well CSV-3 which shows a water age of 28,000 years.
- 19 And the nearby carbonate well, CSVM-2, has an age of 30,500
- 20 years. Similarly, in northern Coyote Spring Valley, the
- 21 alluvial well, CSVM-7, has an age of 21,000 years. And the
- nearby carbonate well, CSVM-3, has an age of 14,200 years.
- Would the differences between alluvial and carbonate wells
- 24 affect your conclusions?

- 1 modern carbon than Coyote Springs. I was not focused on
- 2 Coyote Springs per se. It was the difference between Kane as
- 3 the component of flow coming in to Coyote Springs.
- 4 Q. Okay. Thank you.
- 5 ANSWERS BY MR. UMSTOT:
- Q. Question for Mr. Umstot. One of the attorneys
- 7 earlier today asked Mr. Lazarus about his review of your work
- 8 regarding the effect of climate on water levels in the Lower
- 9 White River Flow System. Were you present for that?
- 10 A. Yes, I was.
- 11 O. Do you agree with the hydrographs that
- Mr. Lazarus presented in his assessment of climate?
- 13 A. I don't agree with his assessment. I see a
- 14 decline in groundwater elevations from climate.
- 15 Q. Okay.
- 16 ANSWERS BY MR. BUSHNER:
- 17 Q. And one question for Mr. Bushner. Although we
- didn't hear your presentation, we do have your slides.
- 19 A. Yes.
- 20 Q. Were you able to determine a value of
- 21 transmissivity for the carbonate aquifer in Kane Spring
- Valley from the pump test that you performed?
- 23 A. Yes. So the transmissivity value that we
- 24 calculated from our aquifer test for the region localized

Min-U-Script®

Capitol Reporters 775-882-5322

(24) Pages 1323 - 1326

Page 1330

Page 1327

- 1 there in Kane Springs Valley was about 50,000 gallons per day
- 2 per foot. It wasn't anywhere near the 300,000 number that
- 3 Mr. Lazarus had put up. And that's also in my report on page
- 4 5-5.
- 5 MR. HERREMA: All right. I have no further
- 6 questions at this time. Thank you.
- 7 HEARING OFFICER FAIRBANK: United States Fish and
- 8 Wildlife Service? Seeing no questions.
- 9 National Park Service.
- 10 CROSS-EXAMINATION
- 11 By Ms. Glasgow:
- 12 Q. Good afternoon. Karen Glasgow with the
- 13 Department of Interior Office of the Solicitor for the
- 14 National Park Service.
- All of my questions, because I'm really kind of
- stupid about all of this are -- anyone is welcome to answer
- 17 them, okay. So if I don't call a specific person, just chime
- in by whomever has an answer, okay.
- Earlier I think it was Mr. Carlson or
- 20 Dr. Carlson, whichever, you talked about the permeability and
- 21 your CSAMT data. Can you determine the permeability of the
- 22 carbonate rock from the CSAMT data?
- MR. CARLSON: No, not directly. There's so many
- 24 different things that vary the resistivity results. So

- 1 MS. GLASGOW: Okay. Thank you.
- 2 Could I approach the witness? I would like to
- 3 give them a -- one of the chart -- one of the power point
- 4 graphs that came out.
 - HEARING OFFICER FAIRBANK: Certainly.
 - MS. GLASGOW: Thank you. And I have more than
- 7 one, but if you guys could share amongst yourselves. I have
- 8 for you guys too.

5

6

- 9 MS. PETERSON: How about for me?
- MS. GLASGOW: Oh, I need one -- I do have one for
- 11 her too. Sorry about that. I forgot all about you. Do you
- need more than one? There are two pages.
- And a second one for you all so you don't have to
- 14 share as closely. And what I handed to you was -- So I want
- 15 you to look at on the first or the second page, so it's
- 16 Figure 5.6 or 5-6. And I want you to look at five down from
- 17 the top for CM -- CSVM-5. Can you identify the climate
- 18 signals in this hydrograph?
- 19 ANSWERS BY MR. UMSTOT:
- 20 A. This is Todd Umstot. You see a large -- You see
- 21 a general increase in groundwater elevations following the
- high recharge event in 2005. And then it generally goes up
- 23 after that. You don't see any variability from any climate
- 24 or pumping.

Page 1328

- permeability is one of them. But we don't know what else is
- 2 influencing it.
- 3 ANSWERS BY MR. BUTLER:
- 4 Q. (By Ms. Glasgow) My next question is about
- 5 geochemistry, which really I know nothing about. What is the
- 6 source of the arsenic that had to be removed from the water
- 7 pump from MX-5 prior to release?
- 8 A. I don't --
- 9 (The court reporter interrupts)
- 10 A. Oh, I'm sorry. Tom Butler. The exact source I
- 11 don't know. But arsenic is very common in volcanic rocks.
- 12 It's also -- It's absorbed to iron oxide in subsurface which
- 13 then can be released under reduced conditions and/or acidic
- 14 conditions. So any one of a number of those conditions.
- 15 Being that it's hydrothermal, volcanic signature could be the
- 16 source.
- 17 Q. Do you have -- I'm wondering how much CSVM-7
- water is required to mix with the KPW-1 water in order to
- 19 produce the values that were observed in the central CSV and
- 20 MRSA, the percent amount of carbon?
- 21 A. Percent amount of carbon? CSVM-7?
- 22 Q. Yes.
- 23 A. I would have to go back and look at the
- 24 calculation.

- You do see, after the MX-5 pumping ended, which
- 2 was indicated by this vertical dash line, that there is a
- 3 drop and a change in slope in the CSVM-5 hydrograph. When I
- 4 looked at the data, that change in slope is due, I believe,
- 5 to a measurement error. That's when they switched to using
- the calibrated tape for doing the manual measurements. And
 previous to that drop they used regular -- a regular tape, I
- 8 guess, for doing their measurements. So there's some --
- d d d d d d d d d d d d d d d d
- 9 there's some variation sloped here. But I believe that's due
- to measurement error.
- 11 Q. So let me make sure I understand. So there's a
- surrogate for change in the hydrographic signals, what you
- 13 just talked about? I'm trying to make sure I understand,
- because I don't see the plotted signals, so I'm trying to
- 15 figure out --
- 16 A. Oh, you see a very strong climate signal. If you
- look at the period from 2003 to 2005, the water level is
- 18 flat.
- 19 Q. Okay.
- 20 A. From the 2005 onward there's a general increase
- 21 that seems to have a relatively steady slope. That's from
- the recharge event in very, very wet years. One in a
- 23 hundred-year, two in a hundred-year recharge event. So you
- can see a lot of wells, I believe, in Nevada are still

Min-U-Script® Capitol Reporters (25

775-882-5322

Page 1331

- 1 responding to that really extreme event. And the way they
- 2 respond depends not only on climate but also on the
- 3 particular hydrogeologic characteristics around that well.
- 4 Q. So the recharge event that you're talking about
- 5 is the 2004-2005 bump that you can see in that same
- 6 hydrograph?
- 7 A. Yeah, it's the bump you see in 2005.
- 8 Q. Okay. And so -- And you just testified that you
- 9 think a lot of wells are -- were responding or still
- 10 responding to that recharge event as we speak?
- 11 A. It depends on hydrogeologic characteristics
- around a particular well. Some wells, I think, are still
- 13 responding to that recharge event, as you see a continuous
- 14 increase in groundwater elevations. Some wells, depending on
- 15 particular characteristics around that well, kind of increase
- 16 and then I have a decrease following that recharge event. So
- 17 now I have a declining trend.
- 18 Q. Is this a good surrogate for effects of water
- 19 levels from climate?
- MS. PETERSON: Clarification. Is what?
- MS. GLASGOW: The -- This particular hydrograph.
- MS. PETERSON: CSVM-5?
- MS. GLASGOW: Correct.
- MR. UMSTOT: I don't believe it is, in that it

- 1 A. I don't know. I mean, Kane Springs water, I
- 2 don't have an opinion on it. It's got signatures of both.
- 3 It's in communication with carbonate rocks and in
- 4 communication hydrothermal activity. It could be all of the
- 5 above.
- 6 Q. And you saw that the chemistry indicated that the
- 7 carbonate aquifer water in Kane Springs was distinct from
- 8 what was going on closer to the Muddy River Springs area; is
- 9 that correct?
- 10 A. That's correct.
- 11 Q. Where do you see that the water in Kane Springs
- is going, if anywhere?
- 13 A. I don't have an opinion. The -- My scope on this
- 14 project was to evaluate the chemistry data and see if there
- was a chemical link. It is clear there is a chemical link
- 16 between CSV-4 -- CSVM-4 in the northeastern Coyote Valley and
- 17 Kane Springs. I don't see it anywhere else. I don't see
- 18 it -- That could mean it's so greatly attenuated you don't
- 19 see it elsewhere or has some alternate flow path that I'm not
- 20 aware of.
- 21 Q. Did you see any indication that the carbonate
- 22 water in the Kane Springs was stagnant, that it stayed where
- 23 it was and didn't go on a flow path?
- 24 A. No opinion. I was just evaluating chemistry

Page 1332

- doesn't -- it only responds to long-term climate signals. It 1 dependent of other -- I mean, I did look at gradient. That
- 2 doesn't respond to short-term climate signals. So those only
- 3 give information on the long-term climate signal.
- 4 MS. GLASGOW: Okay. Thank you. I appreciate
- 5 your time.

1

- 6 HEARING OFFICER FAIRBANK: Next is the Moapa Band
- 7 of Paiutes.
- 8 CROSS-EXAMINATION
- 9 By Mr. Berley:
- 10 ANSWERS BY MR. BUTLER:
- 11 Q. Hello. Richard Berley for the record.
- 12 Mr. Butler, I just want to ask you a question or two about
- 13 chemistry.
- 14 A. Okay.
- 15 Q. You talked about fluoride as a chemical marker to
- 16 try to figure out, you know, how water from one place relates
- 17 to water from some place else. Where does fluoride come from
- 18 generally?
- 19 A. Mineral fluoride is quite common.
- 20 Q. Does it come from volcanic rocks?
- 21 A. It's common in volcanic rocks. It's common in
- 22 carbonate rocks. It's common in a whole sleet of rocks.
- 23 Q. Do you have any special opinion about where it
- 24 comes from in Kane Springs water?

Page 1334

- was all I looked at.
- 3 Q. You didn't see any other place other than -- You
- 4 didn't look to see where this water might go if it didn't go
- 5 to the Muddy Springs --
- 6 A. I was specifically looking at chemical
- 7 signatures. I wasn't looking at groundwater. I wasn't
- 8 looking at basin deposits. I wasn't looking at the
- 9 structure. I wasn't looking at groundwater flow paths
- 10 particularly, other than just a generalized gradient in the
- 11 Kane Springs Valley. And the chemical signatures are quite
- 12 different. I mean, it wasn't -- it's not like we were just
- 13 looking at one particular chemical signature. We're looking
- 14 at soluble chemistry, isotope data, everything pointing to
- 15 the same conclusion.
- There is some dissimilarities there that can
- maybe be explained by either the very small flux through
- 18 there or alternate flow path. I would be speculating if I
- 19 say I knew where that was because there's not enough data to
- 20 support it.
- 21 Q. Okay. So your analysis went to the point of
- 22 where you reached a conclusion that there was a dissimilarity
- between the water in Kane Springs and in the springs area,
- but you didn't go further and try to figure out where maybe

Min-U-Script®

Capitol Reporters 775-882-5322

(26) Pages 1331 - 1334

Page 1335

- 1 the water might have gone if it didn't go towards the
- 2 springs?
- 3 A. Well, if I had the data, I could make that
- 4 conclusion. But there's not the data to support it. Kane
- 5 Springs chemistry is unique. It's an N-member. So if it was
- 6 plotted between some other N-member then I might be able to
- 7 make a conclusion that there was some mixing or it was
- 8 traveling somewhere else. There just wasn't the data to
- 9 support that because it wasn't an N-member.
- 10 Q. Okay. Is that true for isotopic evidence as
- 11 well?
- 12 A. The isotopic data for southern Kane Springs is
- 13 lighter than -- lighter than most of the other samples in
- 14 Coyote Valley and most of the samples in the MRSA and also
- 15 lighter than most of the samples in northern Kane Valley.
- 16 And so that suggests possibly that it was recharged under an
- even quarter climate, higher elevation, it could be any of
- those, mixing with another source.
- 19 Q. Did you find any basins in the general vicinity
- that had similar isotopic signatures?
- 21 A. I would say surrounding it, it was mostly
- 22 heavier, mostly -- more S-negative.
- 23 Q. And so what do you think that shows? Does that
- 24 tend to show stagnancy or does that tend to show --

- Springs Valley.
- 2 Q. So you agree that there is a strong hydrologic
- 3 connection between Kane Springs and Coyote Springs Valley?
- 4 A. I guess I would attenuate that a little bit. I
- 5 think with the evidence that we have provided today --
- 6 Q. Mr. Bushner, do you agree with the statement or
- 7 not?
- **8** A. I guess I don't agree with the strong connection.
- 9 But there is groundwater flow. We've never denied that that
- 10 groundwater flows from Kane Springs Valley in to Coyote
- 11 Springs Valley, just as it does from Pahranagat Valley in to
- 12 Coyote Springs Valley, just as it does from --
- 13 Q. Thank you, sir. Thank you, sir. I have very
- 14 limited time.
- So you disagree with the statement that there's a
- strong hydrologic connection; is that fair?
- 17 A. Fair.
- 18 Q. And is that the same answer for everyone on the
- 19 panel?
- MR. UMSTOT: Todd Umstot. Yes.
- MR. MOCK: Peter Mock. Yes.
- MR. BUTLER: Tom Butler. Yes.
- MR. CARLSON: And Norman Carlson. Yes.
- 24 Q. (By Mr. Taggart)

Page 1336

Page 1338

- 1 A. I wouldn't make a conclusion on stagnancy. I
- 2 wouldn't have the data to support that.
- 3 MR. BERLEY: Okay. Thanks very much.
- 4 HEARING OFFICER FAIRBANK: Las Vegas Valley Water
- 5 District, Southern Nevada Water Authority.
- 6 CROSS-EXAMINATION
- 7 By Mr. Taggart:
- 8 ANSWERS BY MR. BUSHNER:
- 9 Q. Good afternoon. My name is Paul Taggart. I
- 10 represent the Southern Nevada Water Authority and the Las
- 11 Vegas Valley Water District. Good afternoon, Gentlemen.
- 12 I'm going to read to you a statement from Lincoln
- 13 County Exhibit Number 13, page 21. This is Ruling 5712. The
- 14 State Engineer issued this ruling and then the State Engineer
- made this finding. The State Engineer finds the evidence
- 16 indicates a strong hydrologic connection between Kane Springs
- 17 Valley and Coyote Spring Valley, specifically that
- 18 groundwater flows from Kane Spring Valley in to Coyote Spring
- 19 Valley. And I want to ask each one of you, each one of you
- 20 disagree with that statement; is that true?
- 21 A. This is Greg Bushner for Vidler Water Company.
- 22 I'm going to answer for all of the experts. No, we don't
- 23 disagree with that statement. There is a connection.
- Groundwater does flow from the Kane Springs in to the Coyote

- 1 ANSWERS BY MR. UMSTOT:
- 2 Q. Okay. Now I have a question for Mr. Todd -- what
- 3 was your last name?
- 4 A. Umstot.
- 5 Q. Umstot, thank you. Mr. Umstot, do you have an
- 6 opinion that thousands of acre-feet of water can be pumped
- 7 for a permanent subdivision without impacting the Moapa case
- 8 in the Muddy River Springs if that water is pumped south of
- 9 the Lower White River Flow System down the fault?
- 10 A. I haven't evaluated pumping effects.
- 11 Q. Okay. So do you believe thousands of acre-feet
- 12 can be pumped south of the Lower White River Flow System down
- 13 the fault without impacting the Muddy River Springs?
- 14 A. That's not something I've evaluated.
- 15 Q. Okay. So you don't have an opinion on that?
- 16 A. I don't have an opinion.
- 17 Q. What about anybody else on the panel? Mr. Mock?
- 18 I'm sorry. Doctor.
- MR. MOCK: I haven't evaluated I and I don't have
- an opinion on it to the question as stated.
- 21 Q. (By Mr. Taggart)
- ANSWERS BY MR. BUSHNER:
- 23 Q. Mr. Bushner, does Lincoln County own the water
- 24 rights in Kane Spring Valley?

Min-U-Script® Capitol Reporters
775-882-5322

(27) Pages 1335 - 1338

Page 1339

- 1 A. I believe so, yes.
- 2 Q. You're not aware of it?
- 3 A. I'm --
- 4 Q. You're not aware the State Engineer granted
- 5 applications for groundwater to Vidler and Lincoln County in
- 6 Kane Spring Valley?
- 7 A. Yes, I am aware.
- 8 Q. Okay. Would you agree with me that it was a
- 9 thousand acre-feet that were granted?
- 10 A. Yes.
- 11 Q. And if the proposal that is offered by Vidler and
- Lincoln County in this proceeding where a boundary is
- established at the Dorothy fault or the Lower White River
- 14 Flow System boundary fault, if a boundary is located there
- 15 then is it true that Vidler and Lincoln County could develop
- that water in northern Coyote Spring Valley as long as it's
- 17 north of that boundary fault?
- 18 A. No. We would develop the water in Kane Springs
- 19 Valley.
- 20 Q. Okay. So you have no intention of trying to
- 21 develop that water in northern Kane Springs Valley?
- 22 A. No. We do have an intention of developing that
- water in Kane Springs Valley.
- 24 Q. I'm sorry. You have no intention of developing

- 1 existing water right permits that Vidler and Lincoln County
- 2 own can be developed north of the boundary fault without
- 3 impacting the Muddy River Springs?
- 4 A. It's our position that we would develop those
- 5 water rights if awarded out of Kane Springs Valley. I think
- 6 the boundary fault that we identified is just more evidence
- 7 to support our assertion that we will have no impacts on
- 8 water rights or impacts in the Muddy River Springs area and
- 9 Coyote Springs Valley.
- 10 Q. No matter how much water is pumped north of the
- 11 fault?
- 12 A. We would evaluate that.
- 13 Q. Well, that's my question. Is there a -- Is it an
- impermeable barrier, the boundary fault?
- 15 A. No.
- 16 Q. So there must be some maximum amount of water
- 17 that you can pump without impacting areas south of the fault;
- 18 right?
- 19 A. Mr. Taggart, we have -- we were on a trajectory
- 20 to go to hearing on our groundwater right applications until
- 21 this issue came up before us. And I have these gentlemen
- 22 here as professional scientists to evaluate that. And we
- 23 haven't evaluated that yet, so I don't have an answer for you
- 24 yet.

Page 1340

Page 1342

- that water in northern Kane Springs Valley? I'm sorry.
- 2 Northern Coyote Spring Valley?
- 3 A. Correct.
- 4 Q. Okay. Now, you also have applications pending
- 5 before the State Engineer; correct?
- 6 A. Correct.
- 7 Q. And there may be another 5,000 acre-feet
- 8 requested in those additional applications in Kane Springs
- 9 Valley; is that true?
- MS. PETERSON: I'm going to object based on
- 11 relevancy. I don't think our application in Kane Springs
- 12 Valley have anything to do with this proceeding and I thought
- water rights were the next phase.
- 14 HEARING OFFICER FAIRBANK: I agree, Ms. Peterson.
- Mr. Taggart, is this line of questioning related
- to the five questions that were presented in Order 1303
- 17 relating to the geographic boundaries?
- MR. TAGGART: Yes.
- 19 HEARING OFFICER FAIRBANK: And can you explain
- 20 that?
- MR. TAGGART: Yes. I'll just ask the question.
- 22 Q. (By Mr. Taggart) Is it your position that the
- 23 water rights that are sought by Vidler and Lincoln County in
- 24 the applications that are before the State Engineer and the

- 1 Q. Mr. Bushner, are you familiar with the Muddy
- 2 River?
- 3 A. Not that familiar.
- 4 Q. And does Vidler or Lincoln County own water
- 5 rights in the Muddy Valley Irrigation Company?
- 6 A. I believe we do.
- 7 Q. Okay. So are you familiar with those water
- 8 rights?
- 9 A. No.
- 10 Q. Okay. Are you familiar with the fact that SNWA
- owns water rights in the Muddy River?
- 12 A. I think I've heard that.
- 13 Q. Okay. And are you familiar with the opinion of
- 14 SNWA's hydrologist that pumping in the northern Kane Springs
- area will impact the Muddy River Springs, that that's their
- 16 opinion?
- 17 A. I don't recall that.
- 18 Q. You don't recall --
- 19 A. But if that's their opinion, that's their
- 20 opinion.
- 21 Q. You filed a rebuttal report challenging that
- 22 opinion. So are you sure you don't recall it?
- 23 A. We filed a rebuttal report because SNWA said that
- 24 Kane Springs Valley should be included in the Lower White

Min-U-Script®

Capitol Reporters 775-882-5322

(28) Pages 1339 - 1342

Page 1343

- 1 River --
- 2 Q. Okay. Well, my question was, were you familiar
- 3 with the fact that a witness for SNWA has the opinion that
- 4 pumping in northern Kane Spring Valley can impact the Muddy
- 5 River Spring? That was my simple question.
- 6 MS. PETERSON: Objection. Asked and answered.
- 7 MR. TAGGART: No, it was not answered.
- 8 THE WITNESS: I do not recall a witness in this
- 9 case saying that.
- 10 HEARING OFFICER FAIRBANK: Mr. Taggart, you're
- 11 out of time.
- MR. TAGGART: Thank you.
- 13 HEARING OFFICER FAIRBANK: We'll move on to the
- 14 City of North Las Vegas.
- MR. MORRISON: Were we overlooked?
- 16 HEARING OFFICER FAIRBANK: Sorry. I checked the
- wrong line on my little sticky note here. Mr. Morrison for
- 18 Moapa Valley Water District.
- 19 CROSS-EXAMINATION
- 20 By Mr. Morrison:
- ANSWERS BY MR. BUSHNER:
- 22 Q. Good afternoon. Greg Morrison for the record for
- 23 the Moapa Valley Water District. Quickly, I would like to
- start with Mr. Bushner. Page 2-2 of your report, you make

- 1 with high resolution.
- 2 Q. Yet you found the boundary fault using lines
- 3 parallel to that boundary fault?
- 4 A. Right. One is on one side and one is on the
- 5 other. So the difference between the two gives us the data
- 6 that it exists.
 - 7 MR. MORRISON: Okay. Thanks. This question
- 8 might be for Mr. Bushner, might be for Mr. Carlson. We've
- 9 got a page out of your report here and I've got copies if you
- would like to take a look at it.
- 11 May I approach the witness please?
- HEARING OFFICER FAIRBANK: Yes, you may.
- MR. MORRISON: Thanks.
- 14 Q. (By Mr. Morrison)
- 15 ANSWERS BY MR. BUSHNER:
- 16 Q. All right. First paragraph on the second page
- there, first full paragraph. First sentence says that the
- 18 hydrographs for KMW-1 and CVSM-4 are plotted with the same
- 19 time and water level elevation scale for the combined period
- 20 of record. The difference in head between these wells is
- 21 explained due to presence of a fault between those wells. Am
- 22 I reading that accurately this?
- 23 A. This is Greg Bushner. Yes.
- 24 Q. Okay. And if you could turn to the next page,

Page 1344

- the statement that groundwater management is on a
- 2 basin-by-basin basis and that including that Kane Springs
- 3 Valley would result in setting a dangerous precedent, kind of
- 4 a slippery slope argument, if I recall. Does that sound
- 5 right to you?
- 6 A. That does.
- 7 Q. All right. Is it your position that any
- 8 multi-basin management unit is improper in Nevada?
- 9 A. No
- 10 Q. So is Kane Springs so unique that only its
- inclusion would trigger that slippery slope to over
- 12 inclusion?
- 13 A. No. No.
- 14 Q. Okay. Let's go to Mr. Carlson.
- ANSWERS BY MR. CARLSON:
- 16 Q. Did you say that you -- in slide 23 you said you
- 17 discovered the boundary fault based on analysis of 2019 lines
- 18 ten and 11?
- 19 A. Yes, that sounds right.
- 20 Q. All right. Did you state at the beginning of
- your testimony that situating a CSAMT line parallel to a
- fault is not an effective methodology?
- 23 A. Right. If you're running parallel to a fault or
- a structure, a fracture zone, you're less likely to see it

Page 1346

- 1 I've got Figure 4-9, which is your location map showing the2 northern boundary fault. Is the boundary fault as you've
- 3 illustrated it in this picture, is that in between those two
- 4 wells?
- 5 A. No.
- 6 O. How is it situated in relation to those two
- 7 wells'
- 8 A. So, again, we're not sure exactly where this
- 9 boundary fault is, so we basically drew a line between the
- transect, the physical transect line ten and geophysical
- transect line 11 and said that there was a fault that occurs
- 12 in this area.
- 13 Q. But that fault finding was based on the
- 14 difference of head between the two wells. You have not
- situated the fault between the two wells, did you?
- 16 A. You are correct on that.
- 17 Q. Okay. Thanks.
- 18 ANSWERS BY MR. BUTLER:
- 19 Q. (By Mr. Morrison) Let's see. How about
- 20 Mr. Butler. You had a quote from CH2M Hill on page 39 of
- 21 your report. Are you familiar with that quote?
- 22 A. You'll have to read it to me.
- 23 Q. I'm not going to read it to you. It's a pretty
- expansive quote. So I guess we'll skip over that.

Min-U-Script® Capitol Reporters (29) Pages 1343 - 1346 775-882-5322

Page 1347

- Do you also recall a statement in the CH2M Hill 1
- report that you relied upon that carbon-14 dates are 2
- particularly unreliable in carbonate settings? 3
- 4 A. They can be, yes.
- Q. Okay. You stated that MRSA flows are not
- dominated by Kane Springs water but you didn't state that
- there was no Kane Springs water present, did you?
- A. No. 8
- MR. MORRISON: You know, I think we're going to 9
- leave it at that. Thanks. 10
- 11 HEARING OFFICER FAIRBANK: Now it's the City of
- North Las Vegas. 12
- **CROSS-EXAMINATION** 13
- By Ms. Ure: 14
- Q. Good afternoon. Therese Ure for the City of 15
- North Las Vegas. And I think I have just a, more of a 16
- 17 clarifying question. On your demonstrative slide number 30
- it is entitled stepwise linear regression shows only Garnet 18
- 19 Valley pumping effects EH-4 water levels. Does an outcome
- from this analyses that the responses --20
- MR. TAGGART: I'm going to object. This 21
- testimony was not offered during direct exam. 22
- MS. HARRISON: And --23
- (The court reporter interrupts) 24

- analysis. My opinion is not that Garnet Valley is the sole 1
- cause of fluctuations at EH-4. That does not make hydrologic
- sense. I think my point is that this whole analysis of
- 4 linear regression as given by SNWA is not useful for any
- conclusions. 5
- MS. URE: Okay. Thank you. 6
- 7 HEARING OFFICER FAIRBANK: Center for Biological
- Diversity? Not seeing any questions from the Center for 8
- Biological Diversity. 9
- Georgia Pacific and Republic? 10
- MS. HARRISON: We have no questions. 11
- HEARING OFFICER FAIRBANK: Seeing no questions. 12
- 13 Nevada Cogeneration? Seeing no questions.
- Muddy Valley Irrigation Company? 14
- 15 MR. KING: No questions.
- HEARING OFFICER FAIRBANK: Seeing no questions. 16
- 17 Bedroc?
- MS. URE: No questions. 18
- HEARING OFFICER FAIRBANK: Seeing no questions. 19
- Nevada Energy? 20
- **CROSS-EXAMINATION** 21
- By Ms. Caviglia: 22
- Q. Justina Caviglia on behalf of NV Energy. And 23
- this is sort of a follow-up on some questions you've received

Page 1348

Page 1350

- HEARING OFFICER FAIRBANK: Ms. Harris said she 1
- echoed Mr. Taggart's objection as well. And Mr. Taggart's 2
- objection was that this is beyond the scope of the direct 3
- examination. 4
- Ms. Ure, will you please repeat the question 5
- again because I think if this is relating to what the 6
- State -- what we decided the State Engineer would decide what 7
- if any weight or value to give to the testimony on these 8
- 9 particular slides that were offered for demonstrative
- purposes in the subsequent analysis that wasn't included as 10
- part of the report or rebuttal reports. 11
- MS. URE: I don't think I ever got to the 12
- question. But the multiple linear regression analysis was in 13
- one of SNWA's reports and so this addresses it. I was just
- going to ask a question about it. 15
- HEARING OFFICER FAIRBANK: So to the extent that 16
- there was testimony with relation to this, we'll go ahead and 17
- permit the question. And, again, the State Engineer will 18
- decide what, if any, weight to assign to the responses. 19
- 20 MS. URE: So my question is does an outcome from
- the linear regression analysis that all responses at EH-4 are 21 22
- from Garnet Valley make hydraulic sense? MR. UMSTOT: If you look at slide 22, which was 23
- accepted in to evidence from my presentation, I showed SNWA 24

- 1 so far. Where do you think the water from Kane Springs
- Valley goes? 2
- MR. BUTLER: For me. 3
- MS. CAVIGLIA: For any you. 4
- MR. MOCK: This is Peter Mock. Some of it goes 5
- in to northern Coyote Spring Valley. And some probably goes 6
- in to Lower Meadow Valley Wash. I haven't done a detailed 7
- analysis. But that seems reasonable to me. 8
- ANSWERS BY MR. MOCK: 9
- 10 Q. And then what percentage of the water do you
- think goes to the Muddy River Springs?
- 12 A. I haven't done that analysis.
- 13 Q. But a portion would?
- 14 A. You said would. You're saying in the future?
- 15 Q. Or could.
- 16 A. You're saying now?
- 17 Q. Yeah.
- 18 A. Actual water molecules?
- 19 Q. Well, I'm just asking -- You stated that some of
- 20 the water will discharge to Kane Spring, some to Lower Valley
- 21 Meadow Wash. What do you think that percentage possibly can
- 22
- 23 A. I haven't done that analysis and I want to answer
- your question. I'm saying that at the boundaries of Kane

Min-U-Script® (30) Pages 1347 - 1350 **Capitol Reporters** 775-882-5322

Page 1351

- Springs Valley it would appear that some flow can go to 1
- Coyote Springs Valley and some flow currently, and this is 2
- flow currently, could go to Lower Meadow Valley Wash because 3
- there are carbonates on the southern boundary of Kane Springs
- Valley. I don't know what the percentage is though. I
- haven't done it. 6
- 7 MS. CAVIGLIA: Does anyone else have an opinion?
- I have no further questions. 8
- HEARING OFFICER FAIRBANK: Okay. So at this 9
- point we'll go ahead and open up for questions to the State 10
- Engineer and Division of Water Resources staff. 11
- EXAMINATION 12
- 13 By Mr. Benedict:
- ANSWERS BY MR. CARLSON: 14
- 15 Q. Jon Benedict for the record. Question for
- Dr. Carlson. There were several other structures that had 16
- 17 been mapped across CSAMT line 12 by previous geologic offers
- that were concealed and I think were shown on, let's see, 18
- page 15. A couple of thrust faults, a couple of normal 19
- faults. Did you see any of those in the CSAMT lines? 20
- A. I believe the -- From memory here, I believe on 21
- the strike slip fault that you see running through the center
- of this by a dotted or dashed line, I can't quite see. But 23
- it's got the arrows on each side as well that goes from the 24

- 1 Q. Right. Okay. You indicated that Kane Springs
- Valley, the basin fill was relatively thick and then it
- becomes thin from northeast to southwest. And I see that as
- it shows in here. Did you interpret any structures on that 4
- shallow in Kane Springs Valley, just out of curiosity? 5
- A. Yes. I interpreted a fairly significant fault
- there in the -- There's a label here for line two. That's 7
- where one of the lines crossed and then line three across
- there. I interpret this as a fault. I don't think this is 9
- just a very uniformly slope in surface on top of that blue 10 carbonate. 11

12 I think in addition to a slope this appears to me 13 to be a fault. So this would be an upthrown side or this is

a downthrown side. I see a fault there. We're also seeing a 14

15 low resistivity layer here in the basin fill. That seems to

pinch out and disappear up against some higher resistivity 16

17 basin fill material. So it's probably dry and coarse

probably. It's possible there's another fault in that area. 18

But there's a lot of interesting changes,

especially when you look at it relative to the other 20

cross-lines. But many of those changes the hydrologists 21

don't seem to care about, so I don't get to talk about it. 22

Q. Okay. So that structure you described at, like, 23

3900 or 4700, right in there, is that comparable to the kind 24

Page 1352

19

- southern part of the map, it runs up north and then bends and 1
- then goes in to Kane Springs Valley. And it's right on the 2
- upper west side of that knob. I believe we see that when 3
- we -- I believe we saw that on line ten. I believe it's 4
- difficult to distinguish on 11 and 12. It's possible that
- that was truncated by the large -- the fault that we see 6
- between that. But it's just -- it's not blatantly obvious to 7
- 8 us, no.

1

- Q. So if we move to slide 21. Maybe this will help
- better. So on this map a few faults aren't shown. Is that 10
- because they weren't interpreted to exist including on the 11
- previous slide there was a thrust of blue and then a 12
- north-south structure that had normal faulting? 13
- A. Right. Right.
- Q. Signature?
- A. Yeah, exactly. We didn't see clear evidence of 16
- those faults on the lines. So we removed them from this 17
- particular image. 18
- Q. Okay. Thank you. Another question on 19
- 20 geophysics. On line, I think it was called, it was a long
- line that went up Kane Springs Valley and I think you 21
- showed -- or you called a CSAMT interpretation of that. 22
- A. Yes. We call it the axis line because it runs 23
- right up the axis of the valley.

Page 1354

- of thing that you see on the other side going in to Coyote
- Springs Valley? Is that analogous to that? 2
- 3 A. Right. If we had done the line parallel to this
- or just continued this line on further southwest out of Kane
- Springs Valley, I think we would have seen another big 5
- feature like this but in the opposite direction. 6
- 7 Q. Okay. Thank you.
- ANSWERS BY MR. BUSHNER: 8
- Q. And I'm not sure who this question is for. But I
- was curious about the seven-day aquifer test that was 10
- mentioned previously that was done on the KPW well and I was 11
- 12 wondering if any analysis was done with that to see if that
- test did or should have ID'd a barrier or two in the boundary 13
- in the direction expected in the distance presumed? 14
- A. So this is Greg Bushner with Vidler Water 15
- Company. So we did do an analysis. Unfortunately, I didn't 16
- 17 put it in my report. I should have. We compared the water
- 18 levels at CSVM-4 because we had some data as far back as 2006
- where that information with the test water levels from 19
- 20 moderate flow to KMW-1. And it -- you had to exaggerate the
- scale for the water levels on CSVM-4 to even show any type of 21
- 22 change, otherwise it would have plotted as a flat line. But it actually showed a decline in water levels before the test. 23
- 24

And then during the test it showed a rise that started to be

Page 1355

- in -- Again, this is, like, two-tenths of a foot or 1
- four-tenths of a foot change in CSVM-4, according to the 2
- data. So virtually there was no effect from the pumping the 3
- seven-day aguifer test at KPW-1 on CSVM-4. 4
- The testimony that has been given last week and
- some today, the response to the Order 1169 aquifer test was 6
- pretty much immediate. You saw it immediate in the
- hydrographs. This didn't show up at all. So, again, it's 8
- indicative of not a really high transmissivity area as was
- testified today. But a structure that would -- or an aquifer 10 11 system that would transmit up and down Kane Springs Valley
- more than anything else? 12
- 13 Q. So do you think the test was long enough to have
- seen that boundary or do you think that the data is just not 14
- 15 sufficient to be able to?
- A. That's a great question. Probably as SNWA knows 16
- 17 and all the people sitting behind me know these tests are
- extremely expensive things to conduct. A seven-day aquifer 18
- 19 test is very expensive. And so at the time what I was trying
- 20 to do is get through enough log cycles to have a good data
- set, which I think I accomplished, but could have gone 21
- longer. We didn't see any boundary effects again. Not to 22
- mean that there's none there. We just didn't see them yet. 23
- They just haven't appeared. You could have run it longer and 24

- 1 looked at KPW-1 and CSVM-4 you said that the data suggested
- something like 26 to 74 percent kind of ratio. And you had 2
- some errors of two and three up to 15 percent between the 3
- model and the data. And I'm just curious if you have a 15 4
- percent potential error in data mixing what could you not see 5
- in those data? Does that make since? 6
- 7 A. Well, I point out that the largest area was the
- temperature. So --

9

10

- (The court reporter interrupts)
- THE WITNESS: Most of the error occurs when
- calibrating with TDS. And then we looked at other things in 11
- the water that might -- to use to compare that comparison to 12
- see if it held through. And fluoride, what was it -- I can't 13
- read it. It was four or six percent. Temperature was the 14
- 15 biggest area of concern. Deuterium, point-nine. Water
- isotopes are pretty conservative unless they're being 16
- 17 evaporated. And it is 14, 2.4. So it's pretty low error
- overall I think between the two. But, I mean, it's complex. 18
- 19 Q. Can you give an opinion though I guess on the
- 20 extent to which you can take those measurements and talk 21
- about mixing ratios? Is there some kind of a limit where you talk about this being an N-member but you can dilute things 22
- to a point where the data is insufficient to tell you whether 23
- there's some mixing or not. So I'm trying to get a sense of 24

Page 1356

Page 1358

- 1 maybe would have seen something. But there were no -- If
- there was going to be an effect because it was so highly 2
- 3 transmissive, you would have probably seen it immediately.
- Peter, I don't know if you want to add anything. 4
- MR. MOCK: This is Peter Mock. I agree with 5
- Greg's assessment. I plotted the test and looked at it and I 7
- see a standard response to a fissured aquifer, which is a
- simplification. But there was nothing unusual in the change 8
- 9 of slope except compared to Theis it had a flatter response.
- This might be what it's like to people thinking that there's 10
- a very high transmissivity but there's not. That's just the 11
- beginning of the S-curve, what happens with the fissured rock 12
- test, so I didn't see a boundary and those two days. 13
- Q. Okay. Thank you. 14

6

- ANSWERS BY MR. BUTLER: 15
- Q. (By Mr. Benedict) On the geochemistry, I'm just 16
- curious and I sort of danced around this question a little 17
- 18 bit, I think. But curious if you have an opinion on what
- kind of mixing ratio you could have such that the, I guess, 19
- 20 the error in the method would have secured the data. In
- other words, I'm trying to get a sense of how far you can 21
- 22 take the data with respect to saying you can't see this as an
- N-member. Would a ten-to-one mix make the data insufficient? 23
- I know you talked about some when you did a model where you

- where we are on that --
- 2 A. You really need more information because it
- really is just those two data points in southern Kane and
- 4 northeastern Coyote Springs Valley, the CSVM-4, just those
- two data points. And they are chemically unique to 5
- everything else that's out there. So there's no other data 6
- 7 that shows that they're mixing with something else that would
- look like MRSA water, so I guess it's hard to quantify it. 8
- 9 O. Yeah.
- 10 A. It's the fuzzy science.
- 11 O. Okay. Thanks.
- 12 ANSWERS BY MR. UMSTOT:
- Q. In terms of the discussion of climate in response 13
- to things like the 2005 wet year, it was suggested, I think, 14
- that you expect to see an increase in water levels because of 15
- this exceptionally wet year and then the corresponding 16
- 17 decline after that. And I'm curious about these kinds of
- 18 responses and what you really expect to see, whether you expect to see a step-up or pulse-like configuration in 19
- 20 hydrographs and if that means anything. And I'm just curious
- about your experience in terms of describing these responses 21
- 22 and I guess what kind of supporting data you have for an
- expected response from climate? 23
- 24 A. You definitely would see a response of increase

Min-U-Script® (32) Pages 1355 - 1358 **Capitol Reporters** 775-882-5322

Page 1359

- in the hydrograph from the recharge in 2005. And then
- 2 depending on the local hydrogeologic conditions, you'll see
- 3 there a pulse response, I think, or you'll see a continued,
- 4 basically a very long pulse response that we're still seeing
- 5 maybe a rise from, that exception of a very wet year that was
- 6 maybe once or twice in a century.
- 7 So I think that's -- it depends on, you know,
- 8 there's a climate effect that kind of gave the pulse. But
- 9 how that thing was interpreted by the aquifer is going to
- 10 depend on the aquifer conditions. Where is the source of
- 11 recharges and where is the source of discharge and the
- 12 hydraulic connectivity and the storage pump and the aquifer
- 13 materials.
- 14 Q. So seeing responses suggest near source recharge
- or a very permeable aquifer?
- 16 A. Right.
- 17 Q. Seeing similar responses on either side of a
- structure, would that indicate communication or?
- 19 A. It's not evidence to know either way.
- 20 Q. But it would be supporting the evidence if you
- 21 did?
- 22 A. If you saw the same response to climate, that
- wouldn't be enough evidence.
- 24 Q. I guess this is the last question. I think

- 1 for Dr. Carlson. And I'm looking at your slide 21 where
- 2 you're showing the northern Lower White River Flow System
- 3 boundary fault.
- 4 A. Yes.
- 5 Q. Well, actually maybe it's in the other slides.
- 6 So if we look at the sections that were produced for lines
- 7 ten and 11, what other possible explanation is there for
- 8 those changes across a two-mile distance other than a fault
- 9 with 2500 feet of displacement on it?
- 10 A. Well, I'm sure there's some really bizarre ones,
- because if we were in, say, in the over thrust belt and we
- actually had a high resistivity, high resistivity unit, that
- has been moved on top of a low resistivity unit and then that
- 14 has in turn been tilted, what we may be seeing is a contact
- 15 between high resistivity and low resistivity. It would have
- to be fairly steep. But it would be a contact between two
- 17 lithologies but not a fault between two lithologies. So
- 18 that's going to take some pretty serious over thrust stuff
- 19 from up in Wyoming and Utah that generally over thrust belt
- 20 or something.
- But when we have a large area of high resistivity
- 22 material and a large area of low resistivity material then
- 23 where they meet is either going to be a contact, one was laid
- down on top of the other and then that contact was rotated to

Page 1360

Page 1362

- 1 you've already answered it maybe, but if you can do it again
- 2 in a different way. I'm just curious if you could explain
- 3 the relative lack of correlation between the Palmer drought
- 4 varying index and other water level measurements and
- 5 hydrographs that have been provided in previous presentations
- 6 here that are near but outside of the basin. Were you here
- 7 for those presentations?
- 8 A. Yeah. I forget -- I think you're referring to
- 9 the National Park Service or Fish and Wildlife?
- 10 Q. I think National Park Service had a number, they
- 11 presented a number of hydrographs that were nearby but
- outside the basin that didn't show anything similar. And I'm
- just curious what your thoughts are on that.
- 14 A. From what I recall, some of the hydrographs were
- increasing, some of the hydrographs were flat. And then
- maybe one or two of them were decreasing. When I looked at
- 17 the decreasing hydrographs, they were not unsimilar to KMW-1
- and CSVM-4. So it seems like it could be in the mix of the
- 19 types of hydrographs that you see in the basins to the north.
- MR. BENEDICT: Okay. Thank you.
- 21 EXAMINATION
- 22 By Mr. Kryder:
- ANSWERS BY MR. CARLSON:
- 24 Q. Levi Kryder for the record. My first question is

- 1 meet this requirement or there's a fault that's brought high
- 2 resistivity material in to contact or low resistivity
- 3 material. So, geologically, yes, you could come up with
- 4 something exotic that doesn't require a fault by definition.
- 5 Q. Okay. Thank you.
- 6 ANSWERS BY MR. UMSTOT:
- 7 Q. My next question is for Todd Umstot. What do you
- 8 think is the response time of the groundwater system here to
- 9 climate or drought?
- 10 A. I think there's different signals that some of
- 11 the wells see. So it looks like it's within a month or two
- you start to see, especially after the 2005 wet year, you see
- a fairly quick response to that in many of the wells. And
- 14 then in some of the drought signals again it's probably in an
- order of a few months or less.
- 16 Q. So, in general, one to several months?
- 17 A. Yeah.
- 18 Q. For either recharge events or drying signals?
- 19 A. That's correct.
- MR. KRYDER: Thank you.
- 21 EXAMINATION
- 22 By Mr. Sullivan:
- ANSWERS BY MR. CARLSON:
- 24 Q. For Dr. Carlson. The resistivity is measuring

Min-U-Script® Capitol Reporters

(33) Pages 1359 - 1362

Page 1363

- the property of the rock matrix; is that right?
- 2 A. The matrix has whatever is in the pores. So
- 3 it's -- I mean, it's literally how well does this bunch of
- 4 rock or whatever it is conduct electricity. And the things
- 5 that influence that to conduct electricity include the matrix
- 6 and the pore space and the pore fluids and then also how well
- and the pore space and the pore finites and their also now w
- 7 interconnected those pores are. So the resistivity, if we 8 were doing this would be in, say, a salt water intrusion zone
- 9 on the coast where we have fresh water in a nice uniform
- 10 aquifer and salt water coming in because people are pumping
- out, everything there is uniform, say, the sandstone or
- whatever the aquifer is, that's all uniform. But we would
- see a difference in resistivity because fresh water conducts
- 14 electricity less well than salt water. But in other
- environments we might have a uniform type of water but the
- matrix is changing resistivity in this area versus that area.
- 17 Maybe the matrix is faulted, heavily faulted. And so
- 18 electricity is conducted more easily because of all of the
- water in the pores is connected. So, yeah, a lot of
- 20 variables.
- 21 Q. Okay. What I'm getting at is with regard to this
- structure, that subsurface feature map, what is that -- how
- informative to us is that about the hydraulic properties?
- 24 A. Well, in some environments that tells you a lot.

- But I think you have to look at it all in
- 2 totality. You can't look at one piece of information and
- 3 separate it out. I hope that helps.
- 4 MR. SULLIVAN: Yes. Thanks.
- 5 ANSWERS BY MR. MOCK:
- 6 Q. (By Mr. Sullivan) And, Dr. Mock, I realize you
- 7 didn't get much opportunity to talk about your work. And
- 8 thumbing through your power point, one of the slides you
- 9 touch on some of the characterization of the tertiary
- 10 calderas and the water budget for Kane Springs. Would you
- 11 mind summarizing that?
- 12 A. Yes. The statement has been made many times that
 13 the calderas are barriers or just impermeable to groundwater
 14 flow or very low flow because I think the thought process for
 15 the people is that you've got a magma that has come up and
 16 though it's exploded it stayed pretty much together in the
 17 subsurface and as it cools it becomes -- it is a just a mass
- Having worked with Vidler and some of their investigations of the geology of the area, the different calderas, it has been clear to me that the picture that -- I forgot who said it earlier in the week, but their explanation was very good. They said so the magma comes up and it's very solidific and it's very light and it's also encountering a

that's very difficult for the water to flow through.

Page 1364

18

Page 1366

- 1 High resistivity rock often is resistive because it's very
- 2 tight. Other times high resistivity rock may not be so tight
- 3 that the matrix is a resister. Some types of rocks are
- 4 better resisters than others. So we see a high resistivity
- 5 rock and then it seems to be faulted down and then you have
- 6 low resistivity material. Just that information all by
- 7 itself does not tell us the hydraulic properties of either8 side.
- 9 And maybe Greg is going to expand on that.
- MR. BUSHNER: Greg Bushner, Vidler Water Company.
- 11 Yeah, I have a little bit to add to what Norm has just said
- in response to your question. I think that geophysics is an
- instructive. But you have to use it in combination with all
- 14 the other data that you have available. And, again, that's
- why I tried to bring the robust nature of this panel and look
- at the geochemistry, look at the water level changes over
- 17 time. Look at the differences in head between KMW-1 and
- 18 CSVM-4 and wells to the south.
- I think we detected something was there back in
- 20 2006 when we went to hearing on our first application for
- 21 water rights. And here we have a justification for what we
- saw back in 2006 in the changes in heads. We have an
- 23 explanation for it. We didn't know we would find this. We
- went out and collected this data.

- 1 lot of groundwater and it literally blows the top off and
- then everything comes settling back down. I, for one, amglad I wasn't around for it in Arizona or in Mexico. But
- 4 that was a different process than a smooth expulsion of lava.
- 5 And so you get -- Even though the materials are very hot and
- 6 the particles are hot when they come down and they can
- 7 re-welt. I've been taken on some tours and looked at it and
- 8 discussed it.
- There's plenty of room for water to move in these
- 10 calderas. And what I noticed and I put in as a quick
- statement as to why I don't and so just for these brief
- submittals is that Todd Umstot's work in -- where Vidler
- 13 reflects water level -- I'm sorry. They collect transducer
- data in the femoral streams, they also then have weather
- 15 stations they set up. And then Todd does the actual surface
- water modeling to look at the recharge.
- The highest recharge areas, the most intense
- precipitation areas, are focused on our calderas here in the Delamars and in the Clovers. And my thought is that from
- Detainers and in the Crovers. That my thought is that from
- 20 working in the general hydrology of the southwest is if that
- 21 material was granite, I think you would probably have some
- 22 drought streams on both of those mountains, that you would
- 23 have intermittent or perennial flows all the time coming off
- 24 that you would be able to see at the surface. But, instead,

24

1 the numbers are pretty large, thousands of acre-feet are

- 2 going down in to the calderas and then out. And so that's my
- 3 viewpoint and secondary reason why I don't think they are
- 4 barriers to flow.
- 5 So I think the Delamars are an important recharge
- 6 area and groundwater flow area and I think the Clovers are as
- 7 well.
- 8 Q. And you really don't have any theories about
- 9 where that water would discharge?
- 10 A. The water discharge from the Delamars, the --
- 11 Q. The recharge --
- (The court reporter interrupts)
- 13 Q. The recharge that you just described.
- 14 A. So I think it would join the flow that is
- 15 generally moving through the area. So I think there could be
- 16 flow from the north rejoining in the system with northward to
- 17 southward flow. Flow coming down through Kane and could go
- 18 through the calderas and the caldera recharge would join it.
- MR. SULLIVAN: Okay. Thanks.
- 20 HEARING OFFICER FAIRBANK: All right. So we will
- 21 go ahead and conclude today's hearing. It's 4:30, which is
- 22 our quitting time. And then we will go ahead and commence --
- or reconvene the panel and Vidler and Lincoln County's
- 24 presentation tomorrow morning for additional

Page 1368

- 1 cross-examination. And then we will move -- Once we're
- 2 concluded with Lincoln County and Vidler, we'll move to the
- 3 City of North Las Vegas. So we will reconvene at 8:30
- 4 tomorrow morning. Thank you.
- 5 (Hearing concluded at 4:30 p.m.)

1 STATE OF NEVADA)

COUNTY OF WASHOE)

I, CHRISTY Y. JOYCE, Official Certified Court

Reporter for the State of Nevada, Department of Conservation
and Natural Resources, Division of Water Resources, do hereby
certify:

That on Monday, the 30th day of September, 2019, I was present at the Legislative Counsel Bureau, Carson City, Nevada, for the purpose of reporting in verbatim stenotype notes the within-entitled public hearing;

That the foregoing transcript, consisting of pages 1231 through 1368, inclusive, includes a full, true and correct transcription of my stenotype notes of said public hearing.

Dated at Reno, Nevada, this 1st day of October, 2019.

CHRISTY Y. JOYCE, CCR #625

3

- HEARING OFFICER FAIRBANK: Good morning. So this 4
- is the continuation of the hearing regarding the Lower White
- River Flow System and Order 1303, and so we're going to go
- ahead and continue this morning with cross-examination.
- We have just under one hour left for
- cross-examination, and so we'll go ahead and reopen the time
- period to the participants to ask questions. 10
- And at this point, we're going to go ahead and 11
- 12 limit that time frame to five minutes per participant for the
- continuation of cross-examination, and so we'll start with 13
- Coyote Springs Investments. 14
- MR. HERREMA: We have no questions at this time. 15
- HEARING OFFICER FAIRBANK: Okay. So seeing no 16
- further questions from Coyote Springs Investments, United 17
- States Fish and Wildlife Service. 18
- Seeing no questions, National Park Service. 19
- **CROSS-EXAMINATION** 20
- BY MS. GLASGOW: 21
- Q. Good morning. Karen Glasgow with the Solicitor's
- Office, Department of Interior representing the National Park 23

Good morning, gentlemen. Can we see -- could you

put up Mr. Umstot's Slide Number 15. Mr. Umstot. Sorry.

CSVM-2 did not show a response to MX-5 pumping.

Is this why you stated that this well would be a

good well to use for seeing short-term climactic events for

Thank you. On this slide, you indicate that

A. I don't recall testifying that you'd use CSVM-2

14 A. At the moment, I don't recall which well I used

Q. Do you recall that you identified a well as being

Q. I'd like to show you -- I don't know if you have

one that would be good for seeing short-term climatic effects

them. I've got their Appendix A and Appendix B from our

MS. GLASGOW: Do you have copies there with you?

Q. Do you recall what well you did identify as being

one that would be good for showing short-term climatic

separating out pumping effects?

for that purpose.

A. I don't recall.

rebuttal report.

MR. UMSTOT: No.

effects?

for it.

ANSWERS BY MR. UMSTOT:

for separating out pumping effects?

Service. 24

- MS. GLASGOW: Well, let me hand these to you. 1
- That's just for you to look at, but that's what I'm handing 2
- him. 3
- 4 HEARING OFFICER FAIRBANK: Sounds good. Thank
- 5 you.
- BY MS. GLASGOW: 6
- 7 Q. Now, you testified that the MPS provided
- hydrographs which included records with rising water levels,
- declining water levels, and some showing the short-term 9
- climatic effects. 10
- 11 Can you look through our Appendixes B and A or A
- 12 and B as I just handed to you and could you tell us which
- 13 hydrographs for wells in and near the Lower White River Flow
- System and the USGS PowerPoint that shows many other 14
- hydrographs and identify the wells that have a similar 15
- hydrograph to the well that you identified as being actually 16
- indicative of short-term climatic effects? 17
- MS. PETERSON: I guess I have to ask for 18
- clarification because I think he testified that he couldn't 19
- remember which well that was. 20
- BY MS. GLASGOW: 21
- Q. Well, how about any well. Any well that you see 22
- on any of our hydrographs or the USGS PowerPoint that show 23
- short-term climatic effects. 24

Page 1375

- ANSWERS BY MR. UMSTOT: 1
- 2 A. I haven't analyzed all of the wells shown in
- these appendices. I would need to spend some time to go
- through and look at these hydrographs and do some analysis to 4
- determine which ones have a -- short-term responses to
- climatic effects. 6
- Q. Okay. Well, unfortunately, they gave me five 7
- minutes, so I can't let you do that. Let's move along, then.
- Isn't it true that well CSVM-5 does not show 9
- effects of the short-term climatic changes that you testified 10
- about? 11
- 12 A. Yes, at the scale that is plotted on here, I
- don't discern any short-term effects.
- Q. Isn't it also true that CSVM-5 does not exhibit
- declining water levels, which is a common characteristic of 15
- nearly all of the other hydrographs in the Lower White River 16
- Flow System? 17
- A. Yes, CSVM-5 does not show a declining water 18
- level. 19
- 20 Q. Are your answers the same for the hydrograph for
- BMONCO-2, which is located in the Black Mountain area, I 21
- 22
- A. I haven't analyzed this hydrograph before. It 23
- looks a little odd to me, and that is a completely straight

Min-U-Script®

Capitol Reporters 775-882-5322

(2) Pages 1374 - 1377

Page 1378

- line, but -- so I'm not sure about that.
- Q. I want to ask you whether or not --2
- HEARING OFFICER FAIRBANK: Miss Glasgow, your 3
- time is up. We will probably get back to you --4
- MS. GLASGOW: Okay. Thank you. 5
- HEARING OFFICER FAIRBANK: -- on a second -- a 6
- third round. 7
- MS. GLASGOW: Thank you very much. 8
- HEARING OFFICER FAIRBANK: Next is the Moapa Band 9
- of Paiutes. 10
- MR. BERLEY: No further questions. 11
- HEARING OFFICER FAIRBANK: Seeing no additional 12
- 13 questions, Las Vegas Water District and Southern Nevada Water
- Authority. 14
- MR. TAGGART: Would you mind bringing up on the 15
- screen the first page of the demonstratives from yesterday, 16
- please? 17
- MS. PETERSON: Which ones? 18
- MR. TAGGART: The first page of the 19
- demonstratives that were handed out. 20
- **CROSS-EXAMINATION** 21
- BY MR. TAGGART: 22
- Q. All right. Good morning. 23
- First, I want to ask Mr. Umstot: In your 24

- 1 A. No. I have not.
- 2 Q. 25 times?
- 3 A. No.
- 4 Q. Okay. The website also says that you developed a
- watershed model that has been successfully used in water
- rights hearings to estimate the quantity of recharge available
- for groundwater procreation. The model has been applied in
- numerous basins in New Mexico, Nevada, and California. 8
- So my question is: What basins has your 9
- groundwater model been successfully used in Nevada? 10
- 11 A. The Tule Desert Basin.
- 12 Q. And the State Engineer relied on that model in
- that case? 13
- 14 A. Yes.
- 15 Q. Okay. And they didn't modify any of the
- conclusions that you arrived at based on the model?
- A. They -- I can't recall the ruling precisely.
- They relied on the model and they also relied on other
- evidence. 19
- Q. Okay. Okay. 20
- Dr. Mock, with this up on the screen, I just 21
- wanted to ask you. So there's a fault that you've identified 22
- that you believe exists in between line 10 and 11 of your 23
- resistivity data; correct? 24

Page 1379

Page 1381

- opinion, is there a well, a monitor well in Coyote Spring
- Valley that can be properly be used to monitor the impacts 2
- from 1169 pumping at MX-5? 3
- ANSWERS BY MR. UMSTOT: 4
- A. Yes. The EH-4 well and the MX-4 wells show a
- response to the MX-5 pumping. 6
- Q. Okay. Yesterday, you testified about the MX-4 7
- well and some concerns about the data gathering at the MX-4
- well. You -- despite that, you agree that the MX-4 well is a
- well that can measure that impact? 10
- A. Yeah, if you look at the data that was presented
- in the SNWA 2013 report, the MX-4 well showed a response to 12
- the MX-5 well pumping. 13
- Q. Now, Mr. Umstot, on your website, it indicates
- that you're a technical expert for environmental litigation;
- is that true? 16
- 17 A. I haven't looked at the website in a while. That
- seems kind of an odd phrase. 18
- Q. Okay. Well, when you click on technical expert
- under the environmental litigation tab, your name comes up, 20
- doesn't it? 21
- 22 A. Yeah. I do a lot of different litigation.
- Q. Okay. So you testified as -- my count, at least
- 50 times in front of a tribunal like this; right?

- MS. PETERSON: Is that for Dr. Mock? 1
- MR. TAGGART: I'm sorry. Mr. Carlson. I'm 2
- sorry. Thank you. 3
- ANSWERS BY MR. CARLSON: 4
- A. What was the question?
- BY MR. TAGGART: 6
- 7 Q. Okay. I have two minutes.
- ANSWERS BY MR. CARLSON:
- 9 A. I'm sorry.
- 10 Q. So the fault that you identified, the boundary
- fault, the Dorothy fault, whatever we call it --
- 12 A. Right.
- 13 Q. -- that fault is not on the Rowley map; correct?
- 14 A. Correct.
- 15 Q. It's also not on the Page map; correct?
- 16 A. Correct.
- 17 Q. It's also not on the Phelps Gravity work;
- correct? 18
- 19 A. It's --
- 20 Q. The fault that you identified is not shown on
- this gravity map; isn't that correct?
- 22 A. It's shown in the contours.
- 23 Q. Sir, I'm not asking you to interpret it.
- 24 A. Okay.

Min-U-Script® Capitol Reporters 775-882-5322

(3) Pages 1378 - 1381

Page 1382

- 1 Q. I'm asking you if it's marked there on there as a
- 2 fault.
- 3 A. It's not marked on the Phelps map.
- 4 Q. Okay. And on your line 10, you did not see the
- 5 fault; correct?
- 6 A. Correct.
- 7 Q. And your line 11, you did not see the fault;
- 8 correct?
- 9 A. Correct.
- 10 Q. And -- and do you know how much displacement the
- carbonate rocks show between line 10 and line 11? Would you
- agree with me it's about 900 feet?
- 13 A. No, I think --
- 14 Q. -- okay --
- 15 A. -- the -- is two across --
- 16 Q. All right. Maybe you don't know, so just say you
- don't know, and then I can move on.
- MS. PETERSON: I don't think that was his
- 19 testimony.
- MR. TAGGART: So on this contour map -- I only
- 21 have a few minutes, please.
- BY MR. TAGGART:
- 23 Q. And so on this contour map, isn't it true that
- this shows the interface between the alluvial aquifer and the

- 1 Do you recall that?
- 2 ANSWERS BY MR. BUSHNER:
- 3 A. Yes, I do.
- 4 Q. And I think the quote -- and perhaps it's
- 5 paraphrase. I think it's a quote. You said: "The
- 6 transmissivity is not as high as was testified to today", and
- 7 you were referring to Mr. Lazarus's testimony, I believe?
- 8 A. Correct.
- Q. So I'm looking at a Slide 11 from our
- 10 presentation yesterday, and it's got Mr. Lazarus's statements
- 11 regarding his conclusions from the seven-day pump test results
- 12 summary.
- One of his conclusions was, quote, "The carbonate
- 14 aquifer behaves as a porous media and can be analyzed as
- 15 such?'
- Is that the statement that you disagreed with?
- 17 A. Nope.
- 18 Q. Do you remember who wrote that statement?
- 19 A. Yes.
- 20 Q. Was that you?
- 21 A. Yes.
- 22 Q. Okay. So what about Mr. Lazarus's testimony do
- you disagree with?
- 24 A. Well, I don't believe that the transmissivity

Page 1383

Page 1385

- 1 carbonate aquifer. That's what the contours show; correct?
- 2 A. The contours show the isostatic and gravity
- 3 anomaly.
- 4 Q. But the intent of the document is to show the
- 5 interface between the alluvial aquifer and the underlying
- 6 aquifer; isn't that correct?
- 7 A. It's intended to show the change in gravity as
- 8 you go from over --
- 9 Q. All right.
- 10 A. -- high-density material to low-density.
- 11 Q. And isn't it true that this map shows a down
- thrust in the southwest direction between line 10 and line 11?
- 13 A. Downturn in the southwest direction, yes.
- MR. TAGGART: Okay. Thank you.
- 15 HEARING OFFICER FAIRBANK: Moapa Valley Water
- 16 District.
- 17 CROSS-EXAMINATION
- BY MR. MORRISON:
- 19 Q. Good morning. Greg Morrison for Moapa Valley
- 20 Water District.
- I want to start with Mr. Bushner. Now,
- 22 yesterday, at the end of the testimony, you were asked about
- 23 the transmissivity that was revealed by the seven-day KPW pump
- 24 test.

- 1 values are as high as 300- or 400,000 gallons per day per foot
- 2 as Mr. Lazarus presented. They might that high in a fault
- 3 zone, but that's a very limited storage. So that's going to
- 4 be drawn down very, very quickly.
- 5 What I was talking about from our test was a
- 6 localized or very local regionalized area of Kane Springs
- 7 Wash.
- 8 As you can see in this diagram, this area over
- 9 here, here's our well. Here's the Willow Springs fault that
- 10 has a slight inclination to the -- I guess it would be to
- 11 the --
- 12 Q. This one we're looking at here, any kind of
- 13 hydrologic data?
- 14 A. No.
- 15 Q. So it's kind of irrelevant to the question I
- asked you, so we'll just move on.
- I want to talk about in the rebuttal to the Moapa
- 18 Valley Water District report, referencing page 1, whoever
- 19 wrote this section -- I'm not sure who it was -- wrote that
- 20 "there is no direct connection that can be drawn between the
- 21 change in water levels in KMW-1 and the Order 1169 aquifer
- 22 test."
- They also wrote that the Moapa Valley Water
- 24 District offers no data analysis or credible science to

Page 1386

- 1 support statements made that there was a response seen in well
- 2 KMW-1 from the 1169 aguifer test.
- 3 Do you have a copy of Figure 3-9 from your
- 4 original report handy, by chance? If not, I've got one here.
- 5 A. Let me find it. Yes.
- 6 Q. All right. Looking at that Figure 3-9, I think
- 7 the average water level decline rate there is based on a
- 8 comparison of the first and last points here that you referred
- 9 to in your report.
- 10 A. There's two graphs on this. I don't know what
- 11 you're referring to.
- 12 Q. The KMW-1, so the top blue line.
- 13 A. Okay.
- 14 Q. All right. Is that water level decline rate,
- which I think you calculated as .1 feet per year, has that
- been constant since the well was drilled?
- 17 A. Well, you can see from the hydrograph that it's
- 18 highly variable, and we've had a lot of testimony --
- 19 Q. Okay. Thanks.
- 20 A. -- that --
- 21 Q. Was the highest rate of water level decline from
- 22 2011 to 2014?
- 23 A. Yes.
- 24 Q. All right. And does that time frame include the

- 1 MR. MOORE: Okay. Thanks. My time is up.
- 2 HEARING OFFICER FAIRBANK: City of North
- 3 Las Vegas.
- 4 MS. URE: No questions.
- 5 HEARING OFFICER FAIRBANK: Seeing no further
- 6 questions, Center for Biological Diversity.
- 7 Seeing no further questions, Georgia
- 8 Pacific-Republic.
- 9 MS. HARRISON: No questions.
- 10 HEARING OFFICER FAIRBANK: Seeing no further
- 11 questions, Nevada Cogeneration.
- 12 CROSS-EXAMINATION
- BY MR. FLANGAS:
- 14 O. Good morning.
- This is for the panel. I'm not really sure --
- 16 HEARING OFFICER FAIRBANK: Mr. Flangas, will you
- 17 make sure your mic is on.
- BY MR. FLANGAS:
- 19 Q. This is for the panel. I'm not really sure who
- 20 it will be.
- In the rebuttal report at page 2, paragraph 2,
- 22 the statement is made: There is no local recharge from KSV,
- 23 Kane Springs Valley, to the Lower White River Flow System.
- 24 And on page 7, there's a statement that Lincoln and Vidler

Page 1387

Page 1389

- 1 entire period of the Order 1169 pumping test?
- 2 A. I don't believe so. I think it's from 2010.
- 3 Q. 2011 and 2014 wasn't -- the 1169 pumping test
- 4 wasn't within that time frame?
- 5 A. Oh, yes.
- 6 Q. So the greatest declines were coincidental with
- 7 the 1169 pumping test?
- 8 A. Coincidental.
- 9 Q. Okay. And finally, Dr. Carlson, I believe -- I
- 10 think you said you determined your boundary fault line as
- parallel to lines 10 and 11 from your 2019 analysis?
- 12 A. Yes.
- 13 Mr. Carlson.
- 14 Q. Mr. Carlson?
- 15 A. I don't want to take too much credit.
- 16 Q. I notice you have a line 12 that transected both
- 17 lines 10 and 11. Why didn't you rely on line 12 to
- 18 demonstrate that fault line since it would have crossed it?
- 19 A. Line 12 would have intersected -- it should have
- 20 crossed that fault, yes. And it would intersect it at a 40-
- 21 to 45-degree angle, and when we're running at a shallow angle
- 22 like that to a linear feature, the resolution becomes poorer,
- so we don't resolve it as well.
- We do see it in the deep data.

- 1 agree there is interbasin flow from the Kane Springs Valley to
- 2 Coyote Springs Valley.
- 3 Are those two statements consistent?
- 4 ANSWERS BY MR. BUSHNER:
- 5 A. So this is Greg Bushner, Vidler Water Company.
- 6 And, no, they're not inconsistent in my mind. There is much
- 7 local recharge in Kane Springs Valley. We have been measuring
- 8 that since probably around 2007 or '8.
- 9 We collect precipitation data, runoff data,
- 10 temperature, groundwater -- or soils temperature data,
- 11 chloride data. We submit all of this information to the State
- on a quarterly basis, and we -- our intent is to document what
- 13 recharge occurs in Kane Springs Valley.
- There is underflow that comes -- groundwater flow
- 15 from Kane Springs Valley into the northern Coyote Springs
- 16 Valley.
- 17 Q. So you don't consider the underflow to be local
- 18 recharge? That's the distinction?
- 19 A. Not in Coyote Springs Valley.
- 20 Q. Okay. So what you're -- what your contention is
- 21 is that whatever is flowing into Kane Springs Valley that's
- 22 local recharge, when it hits underflow, it goes from Kane
- 23 Springs Valley to Coyote Springs. That's not local recharge?

24 A. The local recharge that we're documenting relates

Page 1390

- to the perennial yield of Kane Springs Valley.
- 2 Q. Okay. So you do agree that there is interbasin
- 3 flow, and that interbasin flow goes from Kane Springs Valley
- 4 to Coyote Springs Valley?
- 5 A. Yes, just like it is from Pahranagat Valley.
- 6 Just like it is from Delamar Valley. It can go all the way up
- 7 the flow system.
- 8 Q. All right.
- 9 And you're familiar with the CH2M Hill report
- 10 from 2006, the framework report where it reported
- 11 16,000 acre-feet of flow; correct?
- 12 A. I -- I don't recall that number, but I am
- 13 familiar with the report, yes.
- 14 Q. At page 12 and 13 of that report, it was done for
- 15 Lincoln County. It actually states "Local groundwater
- discharge into Coyote Spring Valley" -- top of page 13 --
- 17 "16000 acre-feet a year based on analysis by Walker."
- Is that consistent with the position that Lincoln
- 19 County would have today?
- 20 A. Probably not. I think from our data that we've
- 21 collected in-basin that there's probably less groundwater
- recharge that occurs than 16,000 acre-feet in Kane Springs
- 23 Valley.
- However, we're going to analyze that and look at

- 1 Q. Thank you.
- 2 What month and year, do you know, was KMW-1
- 3 completed? Was it October 2005?
- 4 A. That -- that --
- 5 Q. Sound about right?
- 6 A. -- sounds right or it might be -- it was sometime
- 7 late fall of 2005.
- 8 Q. And then water level measurements began for that
- 9 in April of 2007; is that right, KMV-1?
- 10 A. Yes.
- 11 Q. How did Lincoln determine the impacts of the
- 12 extraordinary precipitation event of 2005 if groundwater level
- monitoring began in 2007?
- 14 A. Do you want --
- 15 HEARING OFFICER FAIRBANK: Go ahead and answer
- 16 the question.
- MR. BUSHNER: So if you go back to that figure --
- what is it you asked me earlier -- I have it right here.
- 19 That's why it's so important.
- So if you go back to the Figure 3 line of my
- 21 report that we submitted, and everybody wants to compare the
- 22 water levels between CSVM-4 and KMW-1, and so that's what we
- 23 did.
- And CSVM-4 was constructed, I guess, prior --

Page 1391

- 1 that, and hopefully, Mr. Umstot will run his recharge model on
- 2 that
- 3 Q. But we do have the CH2M Hill report from 2006
- 4 that talks about 16,000 acre-feet, and if that -- if that
- 5 inflow is coming in, it would be coming in through the
- 6 carbonate aquifer; isn't that right?
- 7 A. Most likely through the carbonate.
- 8 Q. Sir, I'm curious. There's another statement that
- 9 was made in the report: "The effects of pumping from Kane
- 10 Springs Valley would not be felt for over a hundred years
- 11 outside of Kane Springs Valley."
- What's the basis of that statement?
- 13 A. So several years ago, I think SNWA developed a
- 14 model -- I think the author of it was Dagnisi. I had Dr. Mock
- evaluate that and look at pumping from Kane Springs Valley of
- our water rights to give us an idea of what the potential
- 17 effects would be on the Muddy River Springs area based on that
- analysis, and he can speak to that, if you would like.
- 19 Q. It's based on a different report, not an analysis
- 20 done at this particular valley?
- 21 A. Correct.
- 22 Q. So a different report, a different valley?
- 23 A. No. A different model that was available several
- years ago. It was Southern Nevada Water Authority's model.

- Page 1393
- obviously, prior to 2003, and so you have a hydrograph from
 that well that you can compare with the well -- with KMW-1.
- 3 You have to look at those together. That's what we did.
- 4 MR. FLANGAS: Thank you.
- 5 HEARING OFFICER FAIRBANK: Muddy Valley
- 6 Irrigation Company.
- 7 MR. KING: No questions.
- 8 HEARING OFFICER FAIRBANK: Seeing no further
- 9 questions, Bedroc.
 - MS. URE: No questions.
- 11 HEARING OFFICER FAIRBANK: Seeing no questions,
- 12 Nevada Energy.

10

- MS. CAVIGLIA: No questions.
- 14 HEARING OFFICER FAIRBANK: Seeing no further
- 15 questions, we'll go ahead and open it up to the State Engineer
- and Division of Water Resources staff.
- 17 EXAMINATION
- MR. BENEDICT: Jon Benedict for the record.
- 19 A question about hydrographs, and I think maybe the best way
- to do this is to go to Slide Number 6 of Mr. Umstot's
- 21 presentation.
- 22 Okay. Great. So this is -- this is CSVM-4 hydrograph;
- 23 correct?
- MR. UMSTOT: This is Todd Umstot. That's

Min-U-Script® Capitol Reporters (6) Pages 1390 - 1393 775-882-5322

Page 1397

Page 1394

- 1 correct.
- **2** BY MR. BENEDICT:
- 3 Q. Okay. So there was a question about what -- what
- 4 hydrograph might represent the best hydrograph for climate. I
- 5 mean, would -- you've kind of used this one to demonstrate a
- 6 relationship with climate.
- Would you say that this is the best hydrograph to
- 8 represent and show climate responses based on their uses and
- 9 such?
- 10 A. Yeah, this would be a good one for looking at
- 11 climatic effects. There are errors in the water level
- 12 measurement collections that show probably more variation than
- is actually occurring, but this does show the response to the
- 14 2005 recharge and then a decline as things dry up.
- 15 Q. And you've also concluded that it doesn't -- in
- your opinion, it doesn't show response to the MX-5 test?
- 17 A. That's right. There's no discernible response in
- 18 this hydrograph.
- 19 Q. Okay. Another question:
- Do you -- you've stated that you see water level
- 21 declines that continue for about a year and a half after the
- test period in this one -- I think KMW-1 as well; correct?
- 23 A. That's correct.

hydrographs?

questions.

24 Q. Do you also see in those two hydrographs declines

A. Yeah, I see a decline. It's hard to see from

MR. BENEDICT: Okay. Thank you. Those are my

HEARING OFFICER FAIRBANK: Okay. We'll go ahead

and open it back up for questions for cross-examination. And

we will go ahead and give you -- you have four minutes.

So Coyote Springs Investments. Seeing none,

Q. It's still morning. Good morning. Karen Glasgow

representing the National Park Service. Hello again.

Given the differing opinions about the response

of KMW-1 and CSVM-4 to MX-5 pumping, do you agree that prior

to granting water rights in Kane Spring Valley, the State

So I had just a couple of questions. Let's start

with the Department of Interior Solicitor's Office

here, but it looks like it starts around 2016.

United States Fish and Wildlife Service.

Seeing none, National Park Service.

MS. GLASGOW: Yes.

BY MS. GLASGOW:

with Mr. Bushner.

CROSS-EXAMINATION

- 1 to determine the degree of connection between these wells and
- 2 the Muddy River Springs area?
- 3 ANSWERS BY MR. BUSHNER:
- 4 A. No, I don't. The State Engineer has already
- 5 granted water rights in this area, and they qualified that.
- 6 They allowed 500 acre-feet to be pumped from the southern part
- 7 of the valley, and we have another 500 acre-feet that can be
- 8 pumped further into the valley.
- 9 And I think we have provided data evidence here
- today -- geophysical data, an analysis of water levels,
- 11 climate -- that shows that there's no reason to conduct
- another long-term aquifer test in this area.
- And we've also been collecting in-basin recharge
- 14 data that we use to support the perennial yield value of Kane
- 15 Springs Valley.
- 16 Q. So was that another long-term or just a
- short-term test?
- 18 A. Was what?
- 19 Q. That you were just discussing, that you just
- 20 explained that you had done to show here.
- 21 A. So if you're referring to our tests in 2005 and
- 22 '6, that was a seven-day aquifer test.
- 23 Q. Have you done any tests longer than the seven
- 24 days that you've described?

Page 1395

- from 2016 to present, as others have suggested in other | 1 A. No, we have not.
 - 2 Q. Can you use the CSVM-4 hydrograph as an index
 - 3 well for climate and use the same hydrograph to determine that
 - 4 there is no pumping effect from MX-5 pumping?
 - 5 A. I'm not sure I understand the question. If
 - 6 CSVM -- oh, use the CSVM-5 well?
 - 7 Q. I'm sorry. CSVM-4.
 - 8 A. So you would use CSVM-4, which -- if you assume
 - 9 it's all climatic effects and it has no effect of pumping to
 - see if there was a pumping effect, then, in KMW-1?
 - 11 Q. No, in CSVM-4.
 - 12 A. Well, CSVM-4, if you assume it's all due to
 - 13 climatic effects, then you can't -- I don't think you would
 - 14 discern any pumping effects.
 - 15 Q. Thank you.
 - I think I have one more question. It's about...
 - With respect to the use of the -- forgive me --
 - 18 Dagnisi model by Mock, the 100-year delay for pumping effect,
 - 19 was the SNWA model run by Dr. Mock calibrated to the Order
 - 20 1169 test?
 - DR. MOCK: This is Peter Mock. I don't recall.
 - 22 I don't think so.
 - MS. GLASGOW: Thank you.
 - No further questions.

Page 1398

- HEARING OFFICER FAIRBANK: Moapa Band of Paiutes. 1
- Seeing no additional questions, Las Vegas Valley 2
- Water District, Southern Nevada Water Authority. 3
- 4 CROSS-EXAMINATION
- BY MR. TAGGART:
- Q. Dr. Mock, just real quickly, you don't recall 6
- whether it was calibrated -- well, the pump tests came after
- the model was completed, so it couldn't have been calibrated 8
- to the pump test; right? 9
- ANSWER BY DR. MOCK: 10
- 11 A. That makes sense to me.
- Q. Okay. Bushner, so in your opinion, a new fault 12
- should be -- or this new fault that's been identified by 13
- Mr. Carlson's work should be the boundary between Coyote 14
- Springs Valley and Kane Spring Valley; right? 15
- A. I think it provides a good --16
- Q. Okay. Should it be the boundary or not? 17
- A. Sure, yes. 18
- O. And so CSI would not be able to file a change 19
- application to move points of diversion for its permits that 20
- it owns in Coyote Springs Valley to the area in Coyote Springs 21
- Valley that's northeast of that fault under your proposal; 22
- correct? 23

1 A. Well --

ANSWERS BY MR. BUSHNER: 24

- to waste any more time on this. 1
- Under your proposal, a hydrographic boundary 2
- would be established at the fault; correct?
- A. No, I don't think you'd change the hydrographic
- boundary. The issue is the administrative unit.
- Q. Okay. Thank you. 6
- 7 Now, is it also true that CSI has a contract with
- Lincoln County Water District to acquire the water rights that 8
- Lincoln County has in Kane Springs Valley? 9
- MR. HERREMA: I'm going to object again. I don't 10
- think this is within the scope of their reports for water 11
- 12 rights, water right contracts, or within in the scope of this
- 13 hearing.

14

17

22

2

7

13

- MS. PETERSON: We would join in that also.
- 15 HEARING OFFICER FAIRBANK: So the objection is
- that you believe it's beyond the scope? 16
 - MR. HERREMA: The scope of the hearing --
- MR. TAGGART: Excuse me, is it my turn to 18
- 19
- MR. HERREMA: -- beyond the scope of the 20
- testimony. 21
 - HEARING OFFICER FAIRBANK: Mr. Taggart.
- MR. TAGGART: It's certainly relevant to the 23
- 24 question of subdivision maps and the coordination between CSI

Page 1399

- MR. HERREMA: Can I object to this? I don't 2
- believe there's been any testimony in the reports or the 3
- rebuttal about CSI change applications. 4
- MR. TAGGART: It's a simple question. 5
- MR. HERREMA: It's beyond the scope of the 6
- salient conclusions that they either reported about or 7
- testified about. 8
- MS. PETERSON: I join in that. 9
- HEARING OFFICER FAIRBANK: I think to the extent 10
- that the question is going to -- you know, boundaries and 11
- changing of boundaries, that is within the scope. But as to 12
- specific water rights and those particular issues, I don't 13
- know that that is within the scope or within the particular
- issues in which have been addressed here today. 15
- So, Mr. Taggart, if you want to rephrase your 16
- question in a manner that is within the original scope of 17
- testimony and the issues that are subject to these 18
- proceedings. 19
- BY MR. TAGGART: 20
- Q. Well, would the fault change the boundary of the 21
- hydrographic basin and how could it not if it's not the 22
- boundary that you propose, Mr. Bushner? 23
- And I'll strike the question because I don't want 24

- 1 and Lincoln County. There's a contract that's public record.
 - It was put before the Lincoln County Commission
- on September 16th, so I think it's important for the State 3
- Engineer to understand that there's a contract between these 4
- 5 two parties in this proceeding for the water that's being
- 6 sought.
 - HEARING OFFICER FAIRBANK: But, Mr. Taggart, how
- does it relate to the geographic boundaries, the movement of
- 9 water rights, the amount of water that may be developed on a
- 10
- sustainable basis within that geographic area that has been 11
 - designated as the Lower White River Flow System?
- 12 MR. TAGGART: I think it goes to credibility about the whether the boundary really is a hydrologic boundary
- or whether it's a place that can be drawn so that applications 14
- can be developed in Kane Springs Valley and then water sold to 15
- CSI from there. 16
- HEARING OFFICER FAIRBANK: I'm going to go ahead 17 and sustain the objections on the basis that it's beyond the 18
- scope of these proceedings. 19
- MR. TAGGART: Okay. Do I have any time left? 20
- HEARING OFFICER FAIRBANK: I'll give you -- I'll 21
- 22 give you another 15 seconds. You can ask one more question.
- 24 BY MR. TAGGART:

23

Page 1402

- 1 Q. It will be the last question. All right.
- 2 I'm not going to ask Mr. Umstot about the
- 3 Patriots.
- 4 So, Mr. Mock -- or Dr. Mock -- or actually, I'll
- 5 ask Mr. Carlson.
- 6 So the deep data that you talked about, none of
- 7 that deep data was presented in the presentation you shared
- 8 with the State Engineer yesterday; correct?
- 9 ANSWERS BY MR. CARLSON:
- 10 A. No. I think it was on a demonstrative slide --
- 11 Q. Okay.
- 12 A. -- but I'm not sure.
- MR. TAGGART: Thank you.
- 14 HEARING OFFICER FAIRBANK: Moapa Valley Water
- 15 District.
- Seeing no further questions, City of North
- 17 Las Vegas.
- MS. URE: No additional questions.
- 19 HEARING OFFICER FAIRBANK: Center for Biological
- 20 Diversity. Seeing no further questions.
- Georgia Pacific-Republic. Seeing no questions,
- Nevada Cogeneration.
- MR. FLANGAS: Thank you.
- 24

- 1 seemed to be suggesting that the discharge was really limited
- 2 to the Muddy River Springs area but that Vidler and Lincoln
- 3 County were saying, no, there's additional recharge, really,
- 4 into the carbonate from other areas, and there's additional
- 5 discharge from the carbonate system that occurs beyond just
- 6 the Muddy River Springs area that's not being accounted for.
- 7 A. I don't recall saying that I thought there was
- 8 additional recharge. I'm not aware of additional recharge
- 9 compared to what others have brought to the table.
- But I will say that Lincoln and Vidler, as I
- 11 said, has Mr. Umstot and his firm collecting data and running
- what I call a land surface model and calculating discharge in
- some areas, and I'm not sure if that will lead to larger
- 14 numbers than people have seen before.
- But I have agreed in my rebuttal report that I
- 16 think there's flow out to the Las Vegas Valley just based on
- the structure, and the residual of what many people put
- 18 together for a water budget makes that reasonable as well.
- 19 Q. Is that based on geology, sir, and things?
- 20 A. Quite a bit of this is based on the framework of
- 21 the geology, there being large carbonate corridors that are
- 22 pointed toward Las Vegas.
- 23 Q. Do your colleagues at the panel agree with you on
- 24 that basis?

Page 1403

Page 1405

- 1 CROSS-EXAMINATION
- 2 BY MR. FLANGAS:
- 3 Q. I have just -- I have just one question for
- 4 Dr. Mock.
- 5 Generally, sir, is it a correct statement that
- 6 you don't agree with the contention that the -- that the
- 7 majority or, really, all of the discharge occurs in the Muddy
- 8 River Springs area from the carbonate but that, in fact, there
- 9 are other areas where the carbonate discharges water here.
- Is that a generally correct statement when I read
- all of these reports? I think that's what I'm understanding
- you to say, that there's additional discharge occurring from
- 13 the carbonate system beyond just the Muddy River Springs area?
- 14 ANSWERS BY DR. MOCK:
- 15 A. In my rebuttal report, I said that I thought the
- 16 flow to the Las Vegas Valley was -- was a reasonable discharge
- point for the Lower White River Flow System.
- Is that what you're asking?
- 19 Q. I'm just trying understand generally that
- 20 concept. It seems like the two things that I understood from
- all of the reports generally, but especially from yours, was
- 22 that there was additional recharge to the carbonate and
- 23 additional discharge from the carbonate beyond what many of
- the other parties were saying occurred, that everybody else

- 1 Generally, I don't know if everybody has to nod
- 2 their head. I don't --
- 3 MR. BUSHNER: This is Greg Bushner. I do -- I
- 4 agree with Dr. Mock on that.
- 5 MR. CARLSON: This is Norman Carlson. Yes, based
- 6 on my understanding of things, yes.
- 7 MR. FLANGAS: Okay. Thank you. No further
- 8 questions.
- 9 HEARING OFFICER FAIRBANK: Muddy Valley
- 10 Irrigation Company?
- 11 Seeing no questions, Bedroc.
- MS. URE: No questions.
- 13 HEARING OFFICER FAIRBANK: No questions.
- 14 Nevada Energy.
- MS. CAVIGLIA: No questions.
- 16 HEARING OFFICER FAIRBANK: No further questions,
- so we'll go ahead and open it up to the Division of Water
- 18 Resources staff and the State Engineer.
- Okay. So at this time, we'll go ahead and open
- 20 it up to Lincoln County and Vidler for redirect, and I will go
- 21 ahead and -- we'll give you ten minutes.
- 22 REDIRECT EXAMINATION
- BY MS. PETERSON:

24 Q. Thank you. Karen Peterson.

Page 1406

- 1 Mr. Bushner, what did Lincoln County and Vidler
- 2 do in response to Interim Order 1303?
- 3 ANSWERS BY MR. BUSHNER:
- 4 A. So in response to the State Engineer's request on
- 5 this interim order, we went out and collected new data. We
- 6 collected new geophysical data that has reviewed and presented
- 7 in this hearing and also discussed in our reports.
- 8 Also, it's been stated that we should do
- 9 additional pump tests or aquifer test analysis on additional
- 10 wells.
- Well, the people that have stated that haven't
- 12 even reviewed the tests from our 2006 test of well KSW-1, and
- that data has been publicly available since our hearing in
- **14** 2006.
- Also, we've analyzed geochemistry data throughout
- 16 the whole Lower White River Flow System for your benefit, and
- we've brought new scientists here to look at that and to
- 18 reanalyze and provide opinions on it.
- And so all of this information has been provided
- 20 to you previously, including the new information, the new
- 21 geophysical data that we collected.
- 22 Coyote Springs Investment, Lincoln County Water
- 23 District, and Vidler Water Company are the only ones, I think,
- 24 in this hearing that have been responsive to collecting new

- 1 We don't think that Kane Springs Valley should
- 2 be -- it's not in Order 1169. It's not one of the Lower White
- 3 River Flow System basins, and we don't think it should be
- 4 included.
- 5 But thank you. That's all I have to say.
- 6 BY MS. PETERSON:
- 7 Q. Thank you, Mr. Bushner.
- 8 Dr. Mock, could you please explain the difference
- 9 between flow paths and impacts.
- 10 ANSWERS BY DR. MOCK:
- 11 A. Just briefly -- yes. Just briefly, the --
- 12 there's been a lot of discussion about flow paths through the
- 13 system, and I think that is valuable in understanding how
- water interacts with the structural geology of the area.
- And certainly, that's important, and we'll
- continue to learn from that. But the impacts as I understand it are to the springs and the surface water features of the
- 18 Muddy River Springs area is the focus of this.
 - And what causes impacts, I think, is -- are
- 20 drawdowns, and I haven't seen anyone bring to the table their
- 21 estimates of drawdowns based on recent information at Muddy
- 22 River Springs due to pumping at the Kane Springs Wash that
- 23 would cause the engineer -- the State Engineer to reconsider
- 24 what they're doing.

Page 1407

19

Page 1409

- 1 information and providing it to the State Engineer to help him
- address the four questions that are outlined in Interim Order1303.
- 3 1303.
- 4 The Moapa Band of Paiutes have provided a new
- 5 analysis, a peat flow model. However, that's not based on any
- 6 new data as near as I can tell, but that is a new way of
- 7 looking at the flow system.
- 8 The other thing that CSI and Lincoln County Water
- 9 District and Vidler Water Company have done is contributed to
- the Fish and Wildlife Service for the Moapa Dace habitat
- 11 restoration.
- We've contributed a significant amount of money
- 13 of which we don't know how that has been spent. We don't know
- 14 what has come of that. We've not received any information on
- what habitat has been restored for the monies we have agreed
- to give them. So -- and we have given them.
- Finally, I just want to say we've been very
- 18 responsive -- we've tried to be very responsive to your
- requests in this Interim Order 1303.
- We've focused our analysis on the issue most
- 21 germane to Lincoln County Water District and Vidler Water
- 22 Company, which is the boundary of the Lower White River Flow
- 23 System, the administrative boundary. And that's our new
- 24 geophysical evidence that we've brought to the terrible.

- So how is that different? And if you read my
 - 2 rebuttal report, you'll see my specific responses to these
 - 3 specific comments where I think this happens.
 - 4 But a drawdown from a well does not only go
 - 5 focused running downstream to the -- down the flow path, and
 - 6 it is allowed by the porous mediad or the fracture system to
 - 7 go off in all variations until it encounters variations in
 - 8 permeability that cause it to be modified. But it has a lot
 - 9 of other places to go besides capture, the downstream capture
 - zone or the current steady flow.
 - 11 Q. And then one last question, Dr. Mock. You've
 - 12 listened to the evidence. I think you've been here since the
 - start of the proceedings.
 - And in your professional opinion, is there any
 - basis for the State Engineer to change his previous
 - 16 determination that Kane Springs Valley should be excluded from
 - the Lower White River Flow System or the Order 1169
 - 18 proceedings?
 - 19 A. Well, just to correct you, I arrived at 1 o'clock
 - on Monday, but I don't think I've missed anything else.
 - I don't think there has been evidence that would
 - 22 cause the State Engineer to change the boundaries that have
 - been set and -- and put into place for the Lower White RiverFlow System as an administrative unit. And let me explain why

Min-U-Script® Capitol Reporters (10) Pages 1406 - 1409

775-882-5322

Page 1410

1 I think that.

I think the most prominent assertion that I have
heard is that the 1169 test led to us seeing a drawdown
response in response to that specific pumping at CSVM-4 and
KMW-1, and you certainly know what I'm talking about. You've
seen this over and over again.

And I don't think that that is a reliable basis for the State Engineer to make his decisions about the boundaries. I love aquifer tests. I teach aquifer tests and practical analysis at seminars. And I think it's a great way to characterize aquifer parameters in the vicinity of the well. The closer the better, and I can go into that in more detail.

When you're working at the edges, I think it can give you unreliable information. In this specific case, let me line up what I think makes this an unreliable measure of what the boundaries should be.

First of all, let's just realize what we're talking about. We're measuring waterways that are a thousand feet below land surface. I personally have never done that. My deepest water level is 750, and it was quite a physical exertion. So I'm quite impressed with everyone's work here in taking water levels at a thousand feet and working with them. We're talking about what people have projected or

the testimony yesterday -- that there's a one-foot variability, approximately, in some of their data for various reasons, and they've answered for that.

Finally, in another group, there are no seasonal signals that I see, not the clear seasonal signals of pumping in the KMW-1 and CSVM-4 hydrographs that we see further south.

I don't see the multi-marked substantial recovery and renewed decline in approximately January 2012. The MX-5 pumping was shut down for a while, but that signal is a beautiful aquifer test signal farther south into the system.

And finally, this is the most important thing to me is that you can't have a very short response time between the start of the pumping and the start of the aquifer response, say a few months at the beginning and then have more than a year for it to respond with the cessation of the pumping.

The way the physics of well response is of a sharp, clear, focused impulse on the system is that when you make a change, the timing of those responses as they go out is the same.

So you can't have a few months going out of the pumping response and over a year's response to a recovery response because the pump has been shut off. And shutting off a pump is just as powerful as turning it on.

Page 1411

.

seem to be looking at and thinking they see a half a foot or a
 foot and a half of drawdown due to pumping caused by the 1169
 test. So we're measuring one foot at the bottom of what is
 essentially a hundred-story building in depth.

There are notes of the sounders sticking to the side of the casing. Certainly, this is going to happen, and you have to give them a jerk to keep it loose and moving around, and people are doing the best they can. And I think that's fine. But, again, I'm talking about the reliability of being able to see drawdowns in this measure.

Near the end of the pumping, we have three kinds of data. There were transducer data that were averaged, and there were sounder data and there were calibrated sounder data. And I'm not casting aspersions on this. I'm just saying that there were changes that were going on, and we're looking at different pieces of data. And we're again talking about a foot of change -- approximately -- people are talking about.

There were sudden one-foot swings that Mr. Umstot showed near the end of the test in the data, and you see swings when he compares the transducer data to the sounder data. And we must wonder what would cause these sudden swings at such a great depth, you know, in support of the aquifer.

And finally, SNWA says -- and we've seen this in

Finally, I think there's a reasonable inference of a decadal scale decline. We've heard all the arguments here today, but if you look at SNWA's many -- almost every graph, they have a nice plot at the bottom of the percentage above precipitation above and percentage below.

If you look at the last 20, 21 years, 14 of them are less than. Seven of them are higher than, and that's all I want to go into with that.

And I think the drought continues declining that I have been associated with elsewhere in the southwest. There's a stronger opinion that there is a decadal spin on it, set of drought persistence since 1999 or 2000.

And, finally, I think there's a reasonable inference that there's a multiyear recession from a rise due to the big recharge event of 2005. I think those are two reasonable things people can say about what happened during this test.

I would say from being a person who runs aquifer tests I want some long ones. I avoid long ones because these things can happen. You can have a recharge event. You can have people turn wells off during your time of your test. All these things happen. So I understand it completely. But this is not the sum total.

This is not a reasonable -- this is not a strong

Page 1413

(11) Pages 1410 - 1413

Page 1414

- foundation for the State Engineer to make changes to his 1
- decisions that are based on a bigger set of data. So I do not 2
- think the 1169 test helps you with the far edges of response. 3
- 4 And in fact, I think the data, especially that
- timing issue, indicates that it did not make it into the 5
- CSVM-4 KMW-1 winter. 6
- 7 So if I'm so tough on sounders and aquifer
 - testing, I tell you why I like those things. But what is
- reliable here? And what I see that is reliable and what I
- think is the core of the boundary delineation. 10
- 11 There is a catch from water level elevations of
- about 1800 to 1820 that we first saw in the CH2M Hill report 12
- from 2006, and I've seen persistently since then. It's this 13
- patch of water levels. It's plus or minus five feet that is 14
- 15 remarkable, and I think that's something that's reproducible.
- I think it is reliable. 16
- I think you can go out with a sounder and a drill 17
- rig and a survey crew any time you want. My only suggestion 18
- is you have one surveyor go and do all of these well heads 19
- because this is not much a change, but this is the core of the 20
- five and a half or six or seven -- six and a half -- six-basin 21
- selection. 22

8

- The selection engineers make of core depth, I 23
- think, is just plus or minus five feet or 10 feet between 1800 24

- So, next, we will go ahead and move to City of North Las Vegas 1
- and to allow some time for everyone to move around and shift.
- We'll go ahead and take a quick ten-minute break.
- (Recess.) 4
- HEARING OFFICER FAIRBANK: Okay. We'll go ahead 5
- and go back on the record and start with the City of North Las 6
- 7 Vegas, Ms. Ure.
- MS. URE: Good morning, Tracy Ure appearing for 8
- the City of North Las Vegas. And today Dwight Smith is going 9
- to be testifying on behalf of the City, so if we could have 10
- 11 him sworn in.

12

- called as a witness in this matter, 13
- having been first duly sworn, 14

DWIGHT SMITH,

- 15 testified as follows:
- **DIRECT EXAMINATION** 16
- BY MS. URE: 17
- 18 Q. Thank you, Mr. Smith. Do you have a copy of the
- City's exhibits in front of you have?
- 20 A. Yes.
- 21 Q. Can you briefly describe your background which is
- presented in your CV at Exhibit 1? 22
- 23 A. I'm the principal hydrogeologist with the
- interflow hydrology. I have been practicing for a little over 24

Page 1415

Page 1417

- and 1820. That's where something is -- very interesting is
- going on in the system, and it makes a lot of sense that
- that's the core of this. And I would say that is reliable,
- and I would stick with that. And that's something you can 4
- work with. 5
- Now, we know that the water levels go up over 6
- 20 feet as you head into northern Coyote Springs Valley, and 7
- if you head up another seven or eight feet as you go up to 8
- Kane, and I'm convinced by the geophysical data that's been
- shown of that normal fault -- I think that's a basin and a 10
- range fault that's -- that Mr. Carlson has found in his 11
- 12 fieldwork.
- It's just an idea of why would there be a water 13
- level drop? Well, there are these faults and these
- juxtapositions that mature. 15
- So if you were to make a change to this, you 16
- might want to look at northern Coyote Springs Valley because 17
- of that water level distance and that it doesn't quite fit 18
- with this area of very uniform water levels. 19
- But as it stands, the current basin 20
- configuration, I think there's support for it. I haven't seen 21
- reasonable evidence against it. 22
- MS. PETERSON: Thank you. Thank you. 23
- HEARING OFFICER FAIRBANK: Thank you. All right. 24

- 30 years. The majority of my work has been in Nevada
- throughout my tenure. 2
- And it's been my privilege to have testified 3
- 4 before the Nevada State Engineer on 15 prior occasions. So
- this is my 16th -- 16th time to be here before you.
- Q. And have you been previously qualified as an
- expert in hydrogeology?
- 8 A. Yes, in those prior hearings.
- 9 Q. Okay. And did you submit reports in this case at
- Exhibits -- or City of North Las Vegas Exhibits 2, 3, 4 and 7?
- 11 A. That's correct.
- 12 Q. And for Exhibit 5, did you assist in drafting of
- this report letter as well? 13
- A. I did assist Mr. Duval with that cover letter. 14
- MS. URE: Okay. Mr. Smith is available for 15
- cross-examination, we will go into his testimony, but we would 16
- like to offer the City of North Las Vegas exhibits. 17
- HEARING OFFICER FAIRBANK: And the exhibits are 18 so admitted.
- 20 (Exhibit 2 admitted into evidence.)
- (Exhibit 3 admitted into evidence.) 21
- (Exhibit 4 admitted into evidence.) 22
- (Exhibit 7 admitted into evidence.) 23

19

Page 1418

BY MS. URE: 1

- Mr. Smith, did you prepare a presentation for 2
- this hearing? 3
- 4 A. I have.

21

- Q. And can you take us through that, please?
- With pleasure. The presentation I've compiled
- today is going to take us through just a few key aspects.
- I'll have -- up front I just want to get all the key points 8
- that we'd like to convey to the Nevada State Engineer and

staff this morning. 10

> I would like to briefly present an overview on the water supply strategy that the City of North Las Vegas has for the Apex Industrial Center in Garnet Valley.

> Our technical work has been in support of advancing that water supply strategy. And then we'll use that technical work to then provide some additional data, additional interpretations from which the State Engineer can address some of the questions posed in Interim Order 1303.

The -- the tables and figures in this presentation are all from our Exhibits 3 and 4 unless otherwise noted on the overview.

My key points for today. The -- the 22

administrative boundary as proposed by the State Engineer we 23

feel are appropriate. Our work has concentrated on just the 24

aquifer systems. 1

areas.

I'll touch briefly on my opinions regarding water 2

level trends. And we have not offered, because we have not 3 4

studied the entire system in my recent work here, I'm just

concentrating on the southern end. 5

I'm not going to offer an opinion on why a perennial yield would be except for I would offer the advice that we shift to a safe yield management scheme in the system rather than perennial yield. And safe yield, I'll talk a little more about that. Really what's safe, what can be safely established as pumping in perhaps different geographic

And what is safe for the Muddy River Springs area. I think that's the key here. The levels of drawdown that we've been observing are long-term trends we've been observing are not all that critical to anything except for the high altitude springs that supports the Dace habitat. So everything's got to be framed around that.

So that I would encourage moving forward that this certainly needs to be tied more to a safe yield concept.

Just briefly now, I'd like to kind of encapsulate the water supply strategy that's been brought forth by the City of North Las Vegas. And that that is basically four principal components.

Page 1419

southern part of the administrative area that's proposed. 1

Our technical analysis has not incorporated

northern aspects that have been discussed in detail in this

proceeding. So our work is really focused on the south. I will point out a few uncertainties about the

southern boundary, but as a general position the City of North 6

Las Vegas supports the basic boundaries as defined in the 7 interim order. 8

One issue that we feel is critically important is permitting the opportunities for transfer of water rights from in between alluvial and carbonate aguifer systems.

And in particular, I'll convey how this relates to the City's desire to lease or potentially acquire some of the senior most water rights in this administrative area that have historically been pumped from the alluvium, transfer those down to Apex in Garnet Valley.

We think that's a prudent thing to propose and I would also suggest that that opportunity needs to be left open for others because I touch briefly on how there are examples that transfer water rights between those two aquifer units could have positive water management implications.

So every application needs to stand on its own 22 merits, I think it would be premature to draw any limitations 23 or conclusions about potential transfers between the two 24

Page 1421

The first component is to complete a water supply 1 pipeline from Las Vegas Valley up to Garnet Valley into the 2 3 Apex area.

As planned, it's currently a six-phase project to build the pipeline, 36-inch diameter pipeline, it's a large pipeline project.

Phase 1 is under construction, it's bringing the pipeline up along the I-15 corridor. It's scheduled to be completed in April of 2021 under construction currently.

The second phase of the pipeline extends another three, three and a half miles and gets into Garnet Valley and into the southernmost portion of the Apex Industrial Center. That's not planned to be completed until April of 2022.

So this will enable delivery of Colorado River source water from the greater Las Vegas area water system to be brought up into the Apex area and provide water service for the City of North Las Vegas and their municipal service area.

Now, pipeline construction takes time and a lot of financing. In the interim the City owns two municipal wells, the Playa Well, the very north end, and I'll have a few maps to look at the locations here, and the Kapex Well, both of these are in northern Apex area. Currently there is a lease agreement with SNWA to utilize some of their water rights that have been granted in Garnet Valley at these wells

11

leading into the future. 1

9

10 11

12 13

14

15

16

17

18

19

20

15

But as I will express, the City is interested in 2 giving senior water rights down to these wells to be utilized 3 into the future. Temporary water right transfers of a junior 4 status water right are not the optimal situation that a water municipality wants to be in. And I think the reasons are 6 7 clear for that.

Then the other two components here, the City is interested in pursuing an AR concept, artificial recharge. That could be implemented as soon as the phase 2 pipeline is completed. And I haven't -- I won't be discussing that in detail, but I certainly can discuss that in more detail if the State Engineer and staff would like. We've done some conceptual testing on that. It appears to be a reasonable proposal to bring forward.

This could have some -- some great -- or facilitate some wise water management in the southern part of the basin, it could facilitate pumping and support pumping in the northern part of Apex for an interim period if needed. It might become a long-term strategy if needed.

And also I would suggest that, you know, we've 21 talked about having the stress and test aquifer systems, quite 22 difficult to do to put a large pumping stress on if you don't 23 have anywhere the water can be used or place of use. 24

Page 1424

- boundary and the red line is the phase 2 pipeline. Just about 1 right in the center just at the lower center part of the 2
- overuse at blue point. That blue point is the approximate 3
- 4 location of a proposed artificial recharge well.
- Q. And, Mr. Smith, when you referred to the basin
- boundary are you talking about the black dotted line and
- that's the basin boundary between Las Vegas Valley and Garnet
- Valley; is that correct? 8

A. Yeah, that's the approximate hydrographic basin boundary. 10

Then as the pipeline -- you'll see it continues on north in different phase and segments to the northern end of Apex. This next overview shows the loop system for the pipeline around the northern end of Apex end.

So you'll notice the two wells that I've referenced, Playa and Kapex. Kapex is at the southern part of that loop, the blue point inside that loop. And then up on the northern edge of the loop there's a blue point that's labeled the Playa Well. So that's where those two existing wells are today.

Just to give some geographic context here, on the right-hand figure it shows in pink shading the Apex area, extends from the east, northeasternmost edge of Las Vegas Valley and then on up into Garnet Valley and into the central

Page 1423

Page 1425

- 1 But let's flip this around, do a long-term
- injection test of a high rate, we can do that fairly easily. 2
- If we get the pipeline up and into the valley and we have an 3
- artificial recharge well, injection well or several wells, 4
- whatever is required, you can do long-term testing at large 5
- magnitudes. And we can do that, technically it's synonymous 6
- to doing a pumping test. 7
- So I think there's a lot of advantages to 8
- 9 pursuing that and advancing that concept.
- And then the final component is just the wise 10 utilization of reclaimed water in the basin, the centralized 11 wastewater treatment plant is planned, it's not present today, 12 but how do we utilize those resources to conserve water and 13 conserve the amount of water that needs to be brought into the 14 valley or pumped.
- So that's the -- that's the strategy for water 16 supply that the City has for Apex. 17
- And just briefly how -- how this looks and 18 planned, the dashed black line along the bottom of the 19 20 overview is the approximate basin boundary between Las Vegas Valley and Garnet Valley. You see at the very bottom of that, 21 this overhead, there's a green line that comes up, that's the 22
- tail end of the phase 1 pipeline. 23
- And then advancing on up across the basin 24

- south part of Garnet Valley. 1
 - And above to the north is Hidden Valley and above
- that to the north is Coyote Springs Valley, Muddy River 3
- Springs area northeast and directly to the east of Garnet 4
- Valley is California Wash. To the south is Black Mountains. 5
- This may not be shown up too well on the 6
- 7 overview, but it should show up on your figures. The green
- shaded area, I think we need to take note of that. That is 8
- 9 the Desert National Wildlife Refuge. So that the constitutes
- a large amount of area and incorporates the westernmost arm of 10
 - Garnet Valley.
- 12 I think there are obvious limitations to any
- disturbance of any type or development of water resources over 13
- in that arm of Garnet Valley because of its land use 14
- designation. Apex is otherwise surrounded by mostly public 15
- lands, BLM, with some utility corridors cutting through it and 16
- 17 I-15 forming the southern boundary and U.S. 93 forming the
- northern boundary. 18
- So the geologic context that we're in, this is 19
- 20 just an overview of the regional geology and of some of the
- 21 primary fault zones. The blue shading are the carbonate
- rocks. The yellow is the alluvial -- alluvial materials. And 22
- you can see the band of bluer rocks that stem from north --23
- northward up from the Las Vegas sheer zone through Garnet 24

Min-U-Script® Capitol Reporters 775-882-5322

(14) Pages 1422 - 1425

Page 1429

Page 1426

- 1 Valley.
- 2 So we certainly do agree with the interpretations
- 3 of Garnet Valley being incorporated in this regionally
- 4 connected carbonate system.
- 5 The one thing I would like to point out is that
- 6 hydrologically and from a modeling perspective, we use the Las
- 7 Vegas -- we -- I should say most scientists have used the Las
- 8 Vegas sheer zone as a southern boundary, so that then results
- 9 in incorporation of that northern tip of the Black Mountains
- 10 area.
- One thing that I have not heard discussed at all
- is there is that part of Las Vegas Valley on that edge above
- 13 the Las Vegas sheer zone that possibly should be considered
- 14 for inclusion, but I don't suggest that we do that now,
- because as you'll see as we go through this presentation
- 16 there's a lot of uncertainty there about the boundary between
- 17 Garnet and Las Vegas Valley. But we certainly need to keep in
- 18 mind for the future what the actual hydrologic boundary might
- be for the flow system.
- 20 Q. And, Mr. Smith, so you're on slide 8, and I just
- 21 want to make it clear for the record that the Las Vegas Valley
- sheer zone is labeled on your side and it's on the bottom
- 23 left-hand corner of your demonstrative exhibit; is that
- 24 correct?

- 1 A. So you can see the bluish shades or the
- 2 principally carbonate rock types and the greener shades are
- 3 the plastic rock types and a major discontinuity across the
- 4 Muddy River Fault.
- 5 You'll notice in the bottom cross section there's
- 6 a little derrick symbol, it's labeled Grace Petroleum, Arrow
- 7 Canyon number 1. So right in the Apex area there was a deep
- 8 petroleum exploration well drilled in 1982. It's over
- 9 17,000 feet deep.
- 10 So the only geologic real subsurface -- deep
- 11 subsurface lithologic control we have in these sections is
- that one petroleum exploration well. But there it is, it has
- 13 defined a substantial thickness of carbonate rocks exceeding
- 17,000 interpreted to be on the order of 20 to 25,000 thick inGarnet Valley.
- Just as a quick note, there's some testimony by
- 17 Rick Waddell from the National Park Service about concerns
- 18 over potentially impacting flows of Rogers and Blue Point
- 19 Spring.
- The concerns are duly noted, but you can see
- 21 through these cross sections, on the upper cross section
- 22 you'll see Blue Point Springs labeled. And the considerable
- 23 geologic discontinuities in the carbonate aquifer would have
- 24 to exist for that to be the regional source of water to those

Page 1427

- 1 A. Yes, that's correct. Just a couple other
- 2 regional faults I'll touch briefly on. On the -- running
- 3 through the eastern side of Garnet Valley is the Dry Lake
- 4 Thrust, but also a number of normal faults that are run
- 5 generally parallel to that fault feature. So we have a series
- 6 of faults along the east side of Garnet Valley.
- 7 It is possible that those are somewhat of an
- 8 impediment to the eastern flow. We're lacking any data to
- 9 from which to interpret that. So any data that will be
- 10 further east, it's just not available.
- 11 Until we get all the way over near the Muddy
- 12 Mountains Thrusts, which I think most people recognize as a
- major geologic continuity for the carbonate aquifer.
- So for now I guess I would also pose the question
- is that part of California Wash in the southernmost part isreally part of the system.
- 16 Tearry part of the system.
- I think for now we have to say yes because of the
- 18 interpreted geology and presence of substantial carbonate
- 19 rocks extending through that. I will note these are two --
- 20 these are zoom-ins on two of the geologic cross sections by
- 21 page numbers --
- 22 Q. And you're on slide 9 -- sorry, slide number 9?
- 23 A. Slide number 9.
- 24 Q. Okay. Thank you.

- 1 springs. Not that we shouldn't still acknowledge those
- 2 concerns, but from a geologic perspective it's rather
- 3 difficult to conceptualize that flow system.
- 4 So, regarding flows to and from Garnet Valley,
- 5 and what we understand based on the data we have, and I will
- 6 note that there are certain areas where we really don't have
- 7 any data from which to make interpretations, but as we
- 8 understand it, and this has been the -- really the conceptual
- Classication
- 9 flow system.
- 10 Q. And you are on slide 10?
- 11 A. I've advanced to slide 10.
- 12 Q. Thank you.
- 13 A. So, since the earlier studies, all the way back
- to Rush 1968, it's been interpreted that there's a southern
- 15 component of flow down through Hidden Valley and down into at
- 16 least the northern portion of Garnet Valley. And then from
- 17 there out to California Wash. That's been a conceptual flow
- 18 path that's been -- that has existed for many decades based on
- 19 the available data.
- So water levels in Garnet Valley are all lower
- 21 than water levels in the Muddy River Springs area and are all
- 22 lower than water levels in Coyote Spring Valley. So this is
- supported by water level data that we have.
 - I believe I have an overview coming up that will

Min-U-Script® Capitol Reporters
775-882-5322

24

Page 1430

- zoom in on water levels in Garnet Valley, but the lowest water
- level in the basin occurs at the GB-1 well. And I think we'll 2
- -- I'll save that section so we can zoom in a little more. 3
- 4 But water levels are relatively flat in that 1808
- to 1814 altitude range, so consistent with -- with that band
- of water levels that was discussed in just the prior 6
- 7 testimony.
- Q. And, Mr. Smith, going back to slide number 10, 8
- did you discuss why you had a question mark going from Las
- Vegas Valley into Garnet? 10
- A. Yeah, thank you very much. So, question mark 11
- there, we've interpreted based on our data evaluation back 12
- 13 there is potential flow from Las Vegas Valley into Garnet
- Valley. And I'll look into that, discuss that in more detail. 14
- And also we have an arrow going out to the Black 15
- Mountains based on that -- that really deserves a big question 16
- 17 mark there also because it depends on which water level you're
- trying to tie that to, certainly the water levels are within a 18
- few feet of each other, so... 19
- But the highest water level, I just mentioned the 20
- lowest water level tying in the northern arm of -- or the 21
- northernmost part of Apex is the lowest occurring water level, 22
- that's been the case for decades. 23
- The highest water level over the decades that 24

- And up in the northern tip of the diamond or 1
- triangle for Apex that's shaded pink you'll see the upper tip 2
- of that and right on the basin boundary we put in Hidden
- 4 Valley is well GB-1.
- So using the well log data, we looked at a 5
- variety of things including depths to water and depths to top 6
- 7 of limestone that's recorded, et cetera, most all the wells
- are completed into the top of the carbonate aquifer. There
- are a few that were completed -- reported to be completed only
- in the alluvium. 10
- 11 Q. And you are on slide 12; is that correct?
- 12 A. Yes, correct, I advanced to slide 12.
- So, using the specific capacity data, so that's 13
- just the production data reported on the well log and the 14
- 15 drawdown associated with that production, we can apply some
- simple equations to estimate aquifer transmissivity. 16
- 17 So for all the available logs that had this
- information, I believe it's 17 logs, we have computed the 18
- estimated transmissivity. 19
- So one thing that becomes immediately apparent is 20 that the transmissivity of the majority of the wells in Garnet 21
- Valley is about two orders of magnitude lower than the 22
- transmissivity estimated for up in the MX-5 area and the Arrow 23
- Canyon area. 24

5

11

14

Page 1431

Page 1433

- we've monitored has occurred in that southernmost --1
- southernmost tip of that arrow is GB-2, that's consistently 2
- been the highest elevation water level in Garnet Valley, 3
- higher than the water levels of Seradep at Moapa down in 4
- Paiutes area included. So why is that the highest water
- level? That's going to lead us down the -- my path 6
- investigation on this. 7
- So advancing to slide 11. One thing that we do 8
- have, you know, we're always finding sparsity of data in this
- flow system in general, but we have -- we have about 50 well 10
- logs on record for this southern central portion of Garnet 11
- 12 Valley along the I-15 corridor, some of the wells on record
- are done in the logs, about a third of them. 13
- So we have at least 30, 35 logs, plus or minus, 14
- with geologic information, water level information, some 15
- production information. 16
- And on these two overviews I'm going to zoom in 17
- on the right-hand side, the blue, dark blue points are logs of 18
- production wells, red are abandonment logs and lights, light 19
- green or light blue shade are logs for wells drilled for 20
- monitoring purposes. 21
- You'll see -- I mentioned the GB-2 well, you'll 22
- see that that as a light green color point in the south 23
- central part of Apex. 24

- So, the transmissivity in general, we're not 1
- privileged to have wells that can produce several thousand 2
- gallon a minute with only a couple feet of drawdown, but those 3
- type of wells do not exist. 4
 - For reference to Playa Well that the City owns
- now was drilled to 2,000 feet. As a static water level it's 6
- down around 800 or 850 feet in depth. It's been tested at 7
- 600 gallons a minute. And the Kapex Well to the south there
- 9 has a production capacity of about 200 gallons a minute. And
- 10 it's completed down to 1145 feet. That Kapex Well was drilled
 - in 1990. It was called the Krut (ph.) Well for a long time.
- 12 Kapex -- what the City calls the Playa Well has
- also -- has also been called the Solar Well, it was drilled 13 recently in 2006 -- '16, excuse me, 2016.
- So you will notice all of these points are scaled 15
- based on the transmissivity, the calculate transmissivity 16
- 17 value. So in the southernmost part you will notice a fairly
- large blue point with a value of exceeding 50,000 feet squared 18 19 per day.
- So that is about one-third or, you know, it's 20
- starting to approach the types of transmissivities that are --21
- that have been determined up north, it's not quite as high, 22
- but it is getting high. 23
 - Now, that is the well owned by Georgia Pacific.

Min-U-Script®

Capitol Reporters 775-882-5322

24

(16) Pages 1430 - 1433

Page 1437

Page 1434

- On the well log it's reported that it was pumped at 1
- 140 gallons a minute with ten inches of drawdown. So, we have 2
- not done anything to confirm that that ten inches is not ten 3
- 4 feet or we're trusting that that information on the well log
- is accurate. If it is, then that is a higher transmissivity
- well. And there's one well up along the I-15 corridor in the 6
- 7 northern area there that GBR-1 also had a notably higher
- transmissivity. 8
- And those perhaps not coincidentally are located 9
- along fault and structure that projects along the east side of 10
- Garnet Valley. 11
- 12 Q. So, Mr. Smith, is it your opinion that the
- transmissivity in Garnet Valley is modest or moderate besides 13
- these two outliers? 14
- 15 A. Yes. The average transmissivity in Garnet Valley
- is I would just say moderate. It's not extremely high. 16
- 17 Q. And you're moving to slide 13 now?
- A. Yes. Thank you. So just a little more on 18
- 19 potentiometric water levels, I think I've touched on this
- 20 already. These are water level information, some -- there's a
- number of wells being monitored in Garnet Valley, which is a 21
- good thing, but a substantial number of them are actually 22
- pumped wells. 23
- So we have a mix of the static water levels from 24

- there with a dashed line, one is labeled Diamond Construction, 1
- the other is labeled Diamond Apex. 2
- And I was hoping to gain some insight, but 3
- looking at these two wells they're both drilled to 4
- approximately 900 feet in depth. And they have water rights 5
- so we can reasonably accurately determine where their location 6
- 7 is. This was all an office exercise. So I think for me to
- understand water level elevations we have to understand the
- land surface elevation and then use the log data for depth of 9
- water, we can draw elevation for the water tables. So this 10 11
 - was strictly an office exercise.

But unfortunately what we got out of those two wells was about a 60-foot difference of predicted water elevations, one of them being higher than Garnet Valley and one of them being lower. So generally answered the questions

is could groundwater be coming in from Las Vegas Valley and 16

17 the Garnet Valley?

12

13

14

15

2

So we then expanded our search further out into 18 19 Las Vegas Valley. And I should note that this geographic

region is still north of Las Vegas sheer zone. 20

But there's quite a few well logs, and like 21

domestic well logs, other logs, we tried to ferret through and 22

find well logs that are associated with water right points of 23

diversion. So we know it would be lance our elevation more 24

Page 1435

- 1 monitoring wells and then also wells that have both static and
- pumping water levels. And that's fine and it's good to be 2
- reflecting both types of data in the basin. 3
- You'll see circled in black dashed lines on the 4
- right-hand pane is the two wells that I've already discussed, 5
- the GB-1 well to the north with water level elevation and 6
- average water level elevation year 2015 of 1,808 feet as 7
- contrasted to the water level at GB-2 at 1,114 feet. So about 8
- 9 six feet of water level difference between those two wells.
- And again, GB-2 being the highest water level that's observed. 10
- The reason I've presented 2015 ties into the test 11 boundary modeling that we did which will be coming up shortly 12
- in my presentation. 13
- Advancing to slide 14, so the fact that GB-1 --14
- GB-2, excuse me, has the highest observed water level and it's 15
- down in the southern boundary of Garnet Valley kind led us to 16
- want to inquire further about why this could be. 17
- We began with looking at water levels just 18
- outside the basin boundary in Las Vegas Valley. So in the 19
- 20 overview on slide 14 you'll see in the upper right-hand corner
- there is a black line where the basin is labeled, that's the 21
- Garnet Valley/Las Vegas Valley boundary, hydrographic 22
- boundary. 23
- And then you'll see two wells that I've circled 24

- accurately. And deeper -- deeper well logs. 1
 - At the end of the day we compiled about 20 well
- logs with estimates of water level elevation from the reported
- depths to water. And the average of all of those values 4
- places us a little lower in Las Vegas Valley than Garnet 5
- Valley or GB-2. The median places us a little above, about 6
- ten feet above. 7
- So, my preliminary interpretation is I relied 8
- 9 more upon the median because we have a few outliers in this 10
- dataset and the median probably more accurately represents potential water level. 11
- So, a very preliminary assessment is that there 12
- appears to be a gradient between the two basins from Las Vegas 13
- Valley and the Garnet Valley. This -- this really can only be 14
- answered with a more accurate on the ground data. Ideally 15
- water level measurements from monitoring wells, not pumped 16
- 17 wells. And completed into the carbonate aquifer. So this is an area that I -- for now I can't
- advance this any further just using office techniques, that is 19 20 something that we need to understand better, especially for
- 21 composing to try some AR just north of this boundary.
- We need to understand artificial recharge water, 22
- where it's going to go, is it going to stay in Garnet Valley 23
- like we would hope or is it going to leak out in the Las Vegas 24

4 Now, advancing to my next slide, 15, I'm going to touch briefly on a test model that we did. We put together specifically to -- for me to try to gain a better 6 7 understanding and hopefully for the State Engineer staff to gain just a better understanding on the magnitude of potential 8 fluxes through Garnet Valley. 9

So now that we have an idea on the transmissivity, and the transmissivity is relatively moderate, we have water level elevation data, we can start to assess groundwater inflow and outflow from Garnet Valley.

So, this is really -- really I've turned this and I want to be careful, this is a test modeling exercise, this is not anything more than really just a modeling exercise is what this was.

So we assigned eight different boundaries along the periphery of Garnet Valley where we hypothesize there there potentially could be inflows and outflows of the water. And they're all assigned general head boundaries.

21 We then anchor that general head to water level 22 elevations at matching points outside the basin. And for 23 Garnet -- for the potential flow that we just spoke of, Las 24

that was collected. And we got reasonably good fit after 1

adjustments to the model boundaries and some adjustment to 2

hydraulic parameters. We got a pretty good fit to the water

4 level data that's available.

And the results -- let's see the results slide. 5

Just staying on slide 15 for a minute, the results of this, we used PEST to calibrate the boundaries. So I wanted to find the optimal with the boundary conductances that regulate flow into or out of the model. We used PEST to calibrate them.

And we also attempt sensitivity of each of those boundaries. 10

And there's a summary table in our report that goes through each of those boundaries, what are our assessment on the sensitivity of that boundary is.

So a boundary that has low sensitivity, really could be open to a number of different inflow, outflow scenarios, conversely a models boundary with high sensitivities probably does not have as much latitude to adjust deviate beyond what we have established as the calibrated inflow or outflow.

So -- oh, I'm sorry, this is maybe a little out of sequence, I just -- no, no, this is fine. I advanced to slide 16. To take up messages as our boundary's on the east side of the model going into the southern part of California Wash here have a higher sensitivity and suggest -- actually

Page 1439

Page 1441

Vegas Valley into Garnet Valley, I -- I used the median water level. So I have a higher water level represented outside the 2 boundary there. 3

And then I'll go through the effort of wanting to 4 calibrate the models. So I want to have a transmissivity, 5 this is a two-dimensional model by the way, it's just a single 6 layer that represents the upper thousand saturated feet of the 7 carbonate aguifer, that's all that it represents in a 8

two-dimensional manner.

So we have our water level dataset, I used 2015 because the pumping for the decade prior to 2015 is fairly constant in Garnet Valley at about 1500-acre-feet annually.

And years 2016 and 2017 water pumping increased for construction activities, I'll touch on that a bit briefly, but pumping was up around 2,000-acre-feet for those two years. 15 So I didn't want to pick a snapshot in time that may have more 16 dynamic influences than necessary. So 2015 was my -- my index year for this test. 18

In the model you'll see the reporting on the model in the -- in the document, I'm not going to dwell on that, but it did calibrate reasonably well to the water level date that we have.

It calibrated to both static water levels and 23 average pumping water levels, if that was the type of data

the model wanted to take no flow out of that boundary. 1

So minimal flow out to the east across that 2

boundary seems to result in the best fit to existing data. 3

Inflow from Las Vegas Valley around 700-acre-feet was derived 4

at a good model solution, a good match to the data. 5

Inflow into northern Garnet Valley and across the 6 Moapa Paiute area and then out to California Wash was 7

simulated, and that's the northern part of -- northwestern 8

9 part of California Wash for the outflow.

That model boundary has lower sensitivity. We had modest amounts of flow coming in at about 500-acre-feet or 450-acre-feet. And with an outflow, also a modest outflow of about 100-acre-feet. So -- but as noted a lower sensitivity threshold on that boundary. So the fluxes could be higher or lower, certainly that is the case.

One unexpected outcome is the inflow from southern Hidden Valley into Garnet Valley into the Apex area, I was thinking that that would be a source of inflow to the model, but the model wanted to suggest that it didn't need or necessarily want inflow coming in from Hidden Valley given that GB-1 is the most opportune water right in the system.

So again, this was just an exercise, this was a test and I don't want to convey this as being anything at all definitive, but it was trying to help me assess through as an

24

Shifting to slide 17, part of the input we

6 mentioned was pumping on the right-hand pane as shown in the 7 distribution of 2015 pumping.

But on the left-hand bar -- bar hydrograph, bar plot, you'll see the data from the State Engineer's pumping inventories, which have been published for the time frame of 2001 through 2017, I did not find that 2018 has been published yet.

And there are some notes, you know, this is -- by

the way, Exhibit 4 was an addendum to the original plot presented because we had not noticed that in the year 2016 there was notes that added in pumping from Las -- Southern Nevada Water Authority's permits in 2002 through 2005.

So I assume that my -- the interpretation on that 2006 pumping inventory was that that needed to be added back in. I might ask the State Engineer's Office could possibly amend those earlier pumping inventories to reflect that, because I wasn't a hundred percent sure if those should be added in, but it appeared to be that that was what the note

transferred to power facilities in Garnet Valley, primarily

2 power facilities. I think the -- well, there's several

3 different power facilities that are using this water, I

4 believe that Chuck Lindsey facility is using the most of those

5 water rights. But all the green is the newer leased at the

newer lease granted to SNWA in Garnet Valley.So, water level pumping, pumped amounts in

So, water level pumping, pumped amounts in 2016, 2017 approached 2,000 plus or minus acre-feet. Prior to that, for about ten years was a plus or minus around 15,000.

Prior to 2006, which we had additional power generate facilities come online in that time frame. The pumping was also plus or minus 1,000-acre-feet. And then the older historical pumping, we'll take a look at the 2001 pumping inventory data.

I'm going to skip ahead to slide 19. And this is just the state's 2001 pumping inventory, it's slide 19 and 20. And you'll see the total is 911-acre-feet of permitted rights being placed to use.

And then I have a number in the bottom, 805-acre-feet, that would be taking out chemical line and western gypsum pumping, which I believe are some wells completed on the alluvium, at least that's what my understanding is.

So historically those older rights were being

Page 1443

So, the colors for the bars on this, the yellow

was referencing in 2006.

2 and the blue is -- yellow is industrial, blue is commercial.

3 And that's a history that predates the period we have for a

4 history of water use in Garnet Valley that predates the

5 pumping inventory start of 2001. It's -- as I'll discuss

6 coming up here, it's that industry has been present in Garnet

7 Valley really began in earnest in the 1980s, came into

8 presence in the early 1990s and persisted on -- has persisted

9 on through actually, you can tell current and you'll notice

that those water uses are very similar year to year.

In 2016, 2017, at the base of the bar plot you'll see some orange bars, those are construction water supply for the I-15 interchange construction and the widening of Highway 93 in the fairly huge super pad construction site, which is a 700-acre super pad.

All those construction activities are consuming additional water. That was -- that water was done under temporary transfers of SNWA's rights that were granted in Garnet Valley in 2001.

The green bars on the top that we have stacked on top of what I would say is the older historic usage in the valley, that is the use of water rights that were granted to SNWA in 2001 in Garnet Valley. 2,280-acre-feet.

And there's a history of those water rights being

placed to use at somewhere between 800 -- well, 900-acre-feet,

2 but from the carbonate aquifer source probably about

3 800-acre-feet.

4 And I'm going to skip back now to slide 18. This

5 is just a summary table of records on file from your office.

6 This was compiled from EWR's electronic database online. And

7 this shows the history of some of the permits issued to

8 facilities in Garnet Valley.

You'll see going all the way back to the permit
granted in 1959 the completion of work and beneficial use in
1961. That's for a small amount of water right,

12 three-acre-feet.

But you can gauge from this table the history of water development and water use and the beginning of water use

and -- in Garnet Valley. And it spans back to the late '80s

16 -- well, some water -- additional water use came into play in

17 the 1960s. But then -- in the '70s. But then probably more

18 of the modern facilities still -- and so the water rights

being used today are for industrial water uses are -- stem

back to the late '80s, early '90s and most of them were being placed to beneficial use by the mid-'90s.

22 Q. And, Mr. Smith, these are all from water rights

23 in Garnet Valley; is that correct?

24 A. Yes, that's correct. That's correct. Again,

Page 1445

Min-U-Script®

Capitol Reporters 775-882-5322

(19) Pages 1442 - 1445

Page 1446

- from records of the State Engineer's Office. 1
- So this is going to lead me to one particular 2
- criticism that I have to offer today. It's to my colleagues 3
- at SNWA, it's regarding the multiple linear regression 4
- analysis that was submitted as a rebuttal analysis. And what
- you'll see is that the input pumping for Garnet Valley is 6
- quite different than the records we have for water rights and
- water use in Garnet Valley. 8
- The pumping input was -- the input values were 9
- indicated to be from the NDWR pumping inventories. But 10
- pumping inventories weren't published until 2001. So this 11
- early history of pumping portrayed as being until 1996. 12
- And then ramping up to approaching the 2001 NDWR 14
- level, they're not quite there, but ramping up over that late
- 15 '90s time frame. That is not the history of pumping in Garnet
- Valley that is known based on water rights and proof of 16
- 17 beneficial use filings in the basin. That is inaccurate.
- So, unfortunately -- and just some other 18
- inconsistencies, that is a big issue, that early history and 19
- how that's been input into their multiple linear regression 20
- model is a big issue and I'm going to discuss that in a 21
- minute. 22

13

- Also of note is all the values and input in are 23
- not consistent within NDWR pumping inventories. And what I 24

- you have an explanatory variable that has been incorrectly 1
- input and it has an association that the process is going to 2
- want to match with that corresponding water level decline. 3
- 4 So, what that leads to, and I think this has been
- borne out by observations by others, is all a sudden there's a 5
- high association of Garnet Valley pumping influence 6
- 7 coordinated with EH-4 water level. And what does that do to
- the other variables? Unfortunately, it doesn't just affect 8
- Garnet Valley relationship defined, it affects all the 9
- relationships defined in that analysis. 10
 - Because if you shifted and placed a lot of the
- 12 explanatory -- a lot of the explanation for that observed
- 13 water level turned to one variable. Well, that affects the
- assignment of the weighting for explanatory variable to the 14
- 15 other variables. And these are all inter-tied in the
- 16

11

- 17 So at the end of the day the erroneous input of
- historical Garnet Valley pumping basically invalidates this 18
- method. Not the method, it invalidates the results of this 19
- analysis for all the relationships defined. 20 Q. And that was your summary on slide 23; correct? 21
- That's correct. 22
- 23 Q. Okay. And you're moving to slide 24?
- 24 A. Yes. Slide 24. Now, a couple other notes. Now,

Page 1447

Page 1449

- believe has happened is I looked at the datasets that are
- available from -- from reporting 1169 in agreements that they 2
- have from the facilities, but I don't believe they've 3
- accounted for everybody. 4
- So you have two sets of data out there, so 5
- scientists beware. There's two sets of informational data out 6
- there, there's the NDWR pumping inventory data and then 7
- there's datasets that are available on NDWR's website 8
- 9 reporting under 1169 that have different values. And I
- believe the 1169 dataset is incomplete. 10
- O. And you're referring to slide 22 now?
- A. Yes, I'm sorry; right. Slide -- is that slide
- 22? Thank you. 13
- And of course the bottom value, 2018, we don't 14
- have published inventory data yet, so that leads me to believe 15
- it's all from the Order 1169 agreements from reporting our 16
- pumping totals. 17
- Where that leads us. Coincidentally, 18
- unfortunately, coincidentally, with that input interpretation 19
- 20 of zero pumping in Garnet Valley ramping up in the late '90s
- up to a significant amount, which is inaccurate, also 21
- 22 corresponds with the observed beginning of declines of water
- levels at EH-4. 23
- So what that does in this type of analysis, now 24

- perhaps not to the level of invalidating a particular 1
- analysis, but the inconsistency that's further propagated 2
- through the analysis for the pumping inputs not being 3
- consistent with NDWR inventory data, it is also an issue, but 4
- another issue that I take exception to in particular is not 5
- having a climate variable in that analysis. 6
- I think it was entirely inappropriate to suggest 7
- that that was the error or to presume that the error accounts 8
- 9 for an explanatory variable that you believe has some
- 10 relationship to the analysis.
- And also you'll find -- I've just made some 11
- 12 citations from the reference that SNWA cited. And their
- prejudgment of the outcome of the climate variable was also 13
- not in keeping with the scientific methods for this type of 14
- analysis. 15
- If you have an explanatory variable that you 16
- think or you suspect could be explained some of the 17
- relationship, then you put it in and you -- you run through 18
- the analysis and you look at the statistical parameters that 19
- 20 define whether it is an explanatory variable or has
- 21 significance or not, and then you leave it in there or you
- take it out accordingly. That procedure was not reported to 22
- have been followed in that analysis. 23
 - Okay. So I'll move on to maybe somewhat

24

1 constructive input to the State Engineer and staff.

One thing I would like to point out. Yes, we see similar water level trends throughout Garnet Valley as we do elsewhere in the Lower White River Flow System basins. We

5 have this decline in trend about 23 feet per year.

It is a concern obviously. I will note that
prior to the late '90s water levels at EH-4 were stable. And
that is the time frame that coincides with the beginning of
development in pumping in Garnet Valley. So there was
significant pumping throughout the '90s in Garnet Valley
through the time period where a lot of those are stable at

EH-4. I think we need to note that.

From my perspective I see that water levels are stabilizing again at EH-4. There are different opinions on that whether it could be declining or stabilizing, but from my perspective I see that as stabilizing. I think there is possibly a systematic explanation for that.

I'll elaborate a little more on a following slide.

20 Q. And you're now moving to slide 26?

21 A. Yeah, slide 26, the base plot is borrowed from

22 Tim Mayer's presentation and his report. And I -- I still

23 believe that we have both a mixture of pumping and climbing in

24 our hydrologic records and our water level trends. I think at

Page 1452

And while I do believe it's a mix, I think we're going to be debating this for a long time as scientists. And I'm not necessarily sure that we need to absolutely answer that for broader water management in Jackson Valley. The fact remains is that water levels are declining at EH-4. And

that's associated with the high altitude spring discharge.
So regardless of how the weighting of climate

versus pumping dominates in -- in the record doesn't override
the fact that water levels are declining and we need to manage
accordingly. So yes, there's scientific value in trying to
continue to parse through this.

But at the end of the day maybe for some broader water management directives we can move beyond this and just focus on -- on the fact that what the water levels are and what is within our abilities to do to help address that. So, okay. One other issue here --

17 Q. Mr. Smith, we're moving to slide 27; correct?

18 A. Thank you. Advancing to slide 27. I've heard

19 quite a few professionals over the past week here trying to

20 draw some conclusion out of the seasonal water level trends.

21 And what they've inferred to be pumping signals, I believe

Dr. Waddell also mentioned that ET signals and pumping

23 signals, seasonal signals.

One thing that we definitely need to take note

Page 1451

this point we can't argue that there is a wet climate signalwhen we have recharge.

But my position is pretty fundamentally that there's an equal and offsetting dry response to the wet response. If you don't have an equal and offsetting dry response then you're not maintaining dynamic equilibrium in any system.

So to suggest that there's only a wet response doesn't set well with me. I think it's much easier to see the wet responses because they're so dramatic in the record. Because dry responses are more subtle and spread over multiple years.

But one thing that I believe, and this was climate -- Climate Drought Severity Index for climate zone three, which is to the north, the northern part of the White River Flow System that I see in this record that you have a dominance of negative values. So moving into the dryer regimes for the last two decades as contrasted to the decade prior.

So I haven't -- I haven't expended a lot of time trying to parse through this. And I have done work on this in the past. You know, I've published along with authors at SNWA examinations looking at climate variables and indices and potential mix of pumping and climate signals. 1 of, all of us here, all of us scientists and engineers is that

2 there is a seasonal barometric pressure cycle and it's

3 significant, it's in Nevada.

So SNWA has been directing barometric pressure data to a number of different margin points. And the -- and the plot on the right is I've just picked one -- one that -- there wasn't any reason why I picked CSVM-1. I just picked one where it was being recorded. And you can see that fluctuation is over a foot, foot and a half of barometric pressure change seasonally that reoccurs every year. Okay. It's coincident with rising and falling water levels. So each well out in the system has a unique barometric efficiency.

So what I mean by barometric efficiency, some of the wells mentioned would be the ones that have the lower storage coefficients more confined will respond greater to barometric pressure change.

And how we define the barometric efficiency is by looking at the daily or hourly barometric pressure -- pressures with water level responses. So you pick a window of time that there's been a barometric change and you can go and determine the barometric efficiency of each well in the system. I've done this for a handful of wells. I believe some are presented in the appendices for the Order 1169 testing.

Page 1453

Min-U-Script®

8

9

10

11

12

13

15

16

17 18

19

Page 1457

Page 1454

But the barometric efficiencies range from near 1 zero, some wells do not show a barometric response, they tend 2

to be the ones that have a higher storage coefficient. But 3

- some have sufficient barometric efficiencies. Some as high as 4 60 percent. 5
- So 60 percent of the barometric -- seasonal 6 barometric trends is going to be reflected in a seasonal 7

variance in water levels. 8

10

14

22

1

12

13

19

So, before you can go anywhere with trying to 9 make a case that you do or do not see a pumping signal, first we have to factor out what we know. And we've done this -- by 11 the way, this is commonly done when we're looking at trends in 12 13 water levels, it's been done for published water level studies in Death Valley Regional Flow System. This is -- there's public domain software available to filter out barometric and

15 earth tide responses. 16 17 And in an aquifer system where we're dealing with very subtle, very small fluctuations in water levels from 18 wells that do have a barometric efficiency and do respond to 19

barometric pressure changes and earth-type changes, you need 20 to filter that out first. 21 You filter it out and then you're left with okay,

what -- what is the additional response in the system from 23 pumping, from ET, from recharge, whatever it may be. 24

I'll have a little more to say on that. 1

And again, my opinion is that we have been in a 2

dryer climate regime. There's been some attempts to contrast 3

with other geographic areas, but, you know, as the Death 4

Valley Regional Flow System is dominated by a much more arid 5

and southern weighted geographic area down the White River 6

7 Flow System far north in latitude.

As we understand the flow system to the desert 8

again is just a southern arid basin. So you have to be 9 careful when you're trying to contrast one basin to the next 10

because they all have their unique characteristics and their 11

12 unique geographic extent.

Q. And you were just reviewing your professional 13

opinions on slide 28; correct? 14

15 A. That's correct.

16 Q. Okay. And you're moving to slide 29?

A. Yeah. Just a brief observation here. Sometimes 17

the simplest explanations are the best. I think what SNWA's 18

work in both in their prior analysis and -- and in the current 19 analysis being brought forward. 20

It's pretty clearly demonstrated that pumping 21

right in proximity to the Muddy River Springs, so pumping from 22

the alluvium and the carbonate aquifer in the immediate 23

proximity of the springs has a pretty clear capture of Muddy 24

Page 1455

River Spring flows -- excuse me, Muddy River flows.

1 And I think -- you know, there's some attempt to 2

say that well, it's just a matter of how you stack the bars, 3

but let's not lose sight of just practical hydrology here. 4

You know, you're pumping some alluvial wells that 5 are within a hundred -- a few hundred feet of the river in 6

some cases. You're pumping from carbonate wells that are 7

likewise in pretty close proximity to the springs and the 8

9 headwaters of the river. Just fundamental hydrology here.

Those near a pumping center are going to have a more immediate 10

impact on the river system. 11

12 So I would suggest that the capture that we've

seen from the Muddy River to date has been overwhelmingly 13 dominated by pumping that has occurred proximal to the Muddy 14

River itself. And I think that's clearly shown in the data 15

and their analysis. 16

So where does that leave the regional pumping 17

that has occurred in those lighter blue bars stacked in Garnet 18

Valley. I don't think we felt much, if any, effect to 19

20 reduction of the Muddy River flows from those distant pumping

centers. Not to say that there isn't some small fraction and 21

over long periods of time that's going to increase. That 22

would be a traditional captured theory for wells that are say 23 24

25 miles away in Garnet Valley.

But I've seen quite a few people trying to make

arguments based off this absence of presence of a "pumping 2 signal" when they haven't first factored out the barometric 3

efficiency of the well and barometric response. 4

So anybody that has offered that opinion and has 5 not taken that step it's not a terribly difficult thing to 6

accomplish, needs to do so and then build their case from 7

there. Is there still a season of cycle or not. 8

9 In some cases you'll see that you will resolve out all of that seasonal variation simply by filtering for 10

barometric pressure change. 11

So, that is just a note for the State Engineer and for hopefully everybody that's working in the system.

So again, I think I've made these notes, but I'll just briefly go through my bullet ones here. Pre-1998 water 15 levels at EH-4 were stable and there was a history of pumping 16

in Garnet Valley. 17

18 I believe this suggests that there is a

manageable amount of pumping in Garnet Valley that can occur 20 without detrimentally impacting the EH-4 water levels and

therefore, high altitude spring discharges. 21

EH-4 water levels appear to be leveling off in my 22 opinion. I believe this may be result of starting to 23

collaborate to pumping near the Muddy River Springs area. And 24

Page 1461

Page 1458

- 1 But let's not lose sight of just fundamental
- 2 hydrology in the proximity of pumping to the river it explains
- 3 a lot of a capture that's been presented.
- 4 Q. And now you're on slide 30?
- 5 A. Yes, slide 30. I think I've touched on that,
- 6 again, duration, location magnitude all factors into capture
- 7 of river flows. I will note that some of the alluvial pumping
- 8 has been in place, you know, water rights going back to the
- 9 1940s. So this has been seven decades worth of pumping that's
- 10 probably affected the flows of the river. It is some senior
- 11 most groundwater pumping rights that we're dealing with.
- I believe that, you know, there's been a really
- 13 strong emphasis from SNWA about capture river flows. And
- 14 certainly it needs to be considered, we're grappling with this
- issue up to the north in the Humboldt River system and
- 16 elsewhere.
- There are appropriate approaches to this that the
- 18 State Engineer is implementing in other areas. We have a
- screen flow capture issue here, but it's not just related to
- 20 the Lower White River Flow System.
- There are wells pumping along the entire reach of
- 22 the Muddy River all the way down to its headwaters in the
- 23 Moapa area. And there are groundwater rights issued
- 24 throughout that area, I haven't examined them in detail, but

- 1 that's the driver for water granting decisions. Stream flow
- 2 capture does need to be addressed and we need to start moving
- 3 down that path. But again, it encompasses a broader
- 4 geographic area and it's going to have a different set of5 management outcomes.
- 6 So I just want to emphasize that. So I mentioned
- 7 up front and thank you for your attention, I'm just about
- 8 through here.

But according to the City of Las Vegas, they have what I think is a really great water supply strategy. You know, it's injunctive use bringing in multiple sources, it's redundancy, has the ability to adapt and manage. Having the Colorado River source, groundwater AR, put all this into

action, really do something sustainable in Garnet Valley.

But, it's going to happen incrementally in steps, that's just the way it has to happen. And for now, the City of North Las Vegas wants to secure senior water rights on

their municipal water supply lists.

They need to depend on those at least for the

bridge period while development occurs and while the pipelineis being completed up into the valley, maybe that's ten years,

22 maybe it's 15, I'm not sure, it depends on the -- you know,

23 how things get built out.

But there is I think a need to -- and there's a

Page 1459

24

11

- 1 this is not solely Lower White River Flow System basin issue.
- This is an issue that needs to be carefully
- 3 worked through, you know, and the future for rivers in Nevada
- 4 and stream flow capture, we do have to really quantify, have a
- 5 mechanism to quantify how much capture is occurring today, how
- 6 much capture is occurring tomorrow, where are we headed with
- 7 this, how can we mitigate this, does this mean that impactors
- 8 have to buy and relinquish dedicated decreed water rights
- 9 possibly, is there financial compensations, does it mean we
- 10 need some curtailments in pumping? All of the above. You're
- going to have approach this as a regional issue just like you
- are on the Humboldt River flow system.
 - So, while there's been a lot of emphasis placed
- by SNWA on this issue, I view it as being two issues here and
- 15 for stream flow capture, but it's a much broader area. It's
- 16 the Lower Meadow Valley Wash. It's the areas along the Moapa
- and Gilbert's Park. And, you know, we've got to consider the
- whole system and treat this appropriately.
 - Again, separate issue in my mind, right now what
- we're trying to understand is should we combine the LowerWhite River Flow System, if so, what might be some safe
- 22 yields.

13

19

- The safe yield is really associated with water
- 24 levels at Pederson and EH-4 of the high altitude springs,

- 1 desire to transfer through lease or acquisition senior water
- 2 rights and get down to those rights.
- 3 Senior is important because the future and how
- 4 we're going to manage these basins is unclear. I mean, could
- 5 there be curtailments in water rights based on priorities, I'm
- 6 not asking you how to answer that question today.
- 7 But from a municipal water conveyor perspective
- 8 that gives them a little extra assurance that they're offering
- 9 them senior groundwater rights for the water supply rather
- 10 than certain transfers of junior most water rights, which is
 - than certain transfers of junior most water rights, which
 - kind of presently how they're situated.
- So the merits of transferring I think really
- needs to assessed, we can't be prejudging with any of these possibilities to transfer water rights in or out of -- and I
- think they need to be considered on an individual basis by the
- 16 State Engineer and how the administrative policies are set up
- 17 for this Lower White River Flow System. You need -- you need
- 18 to keep that flexibility that we have in any other basin in
- 19 Nevada to make -- to have the opportunity to apply to transfer
- 20 water rights around and then judge the merits as they come
- 21 forth.
- You know, I'm going to flip this around for just
- 23 a minute. What about transferring carbonate pumping into the
 - 4 alluvial aquifer? I think you want to keep that option open.

Min-U-Script® Capitol Reporters (23) Pages 1458 - 1461 775-882-5322

16

17

18

19

20

21

22

2

Because, you know, if we have issues with water 1 levels at the springs and sustained high altitude springs, 2 boy, you know, the future may be we have to shift pumping out 3 4 of the carbonate aquifer, especially the local pumping occurring near the springs and shift it into the alluvium. 5

At that point you accomplished a situation where we relieve some of the burden on the carbonate aquifer local to the springs. Now, we have the flip side issue, we have to address the decreed water rights in the Muddy River, but that can be addressed. You know, entities could buy the leased water rights, whatever -- there's paths to look forward on

13 From a modern maverick perspective, again, I think you need to keep these options open to go either way on 14 these. I think you're prejudging potential beneficial 15 transfers of water rights at the end of the day. 16

17 So let's -- I would encourage you to -- to administer this basin like you would any other, allow 18 transfers based on their individual merits as they're 19 considered and brought before you. 20

Q. And you were discussing your information on slide 21

31; was that correct?

6

8

9

10

11

12

13

15

16

17

18

19 20

21

22

that.

23 A. Yes. Thank you.

24 Q. And you're now moving to slide 32?

again, how much that bears on -- on water, broader water 1 2 administration issues is that's not as necessary to define as one would think. 3

4 Perennial yield, I would encourage the State to shift to a safety overload approach. In fact, maybe, you 5 know, shift to a safety overload approach. 6

For Garnet Valley, that means let's do the testing you want to do in Garnet Valley, let's pump additional but also let's flip this around, let's do injection testing in Garnet Valley.

Let's view these different types of stresses. We can figure out, okay, what is -- what is causing effects to water levels at EH-4, that's -- water level effects elsewhere are just not relevant, EH-4, the high altitude springs.

Now, where can we find this threshold is that really an amount of development 900-acre-feet, maybe that was the sustainable amount, maybe that was the amount that was captured some of the southern flow through the system.

I mean, capturing some of the Las Vegas Valley inflow, maybe that was a balance that is really having minimal effects propagating north to the spring area, maybe that was it. Maybe it can be higher, maybe it has to be lower.

23 Certainly very stressing scenarios, complimented with

24 additional monitoring. I meant to touch on that, but we do

Page 1463

1 A. Okay. Conclusions. Again, it's our opinion and

again our focus has really been on the southern end of the 2

flow system that the boundaries as proposed for the Lower 3

White River Flow System are sufficient, are adequate. 4

We just discussed transfers from the alluvium 5

carbonate should not be generically limited, should be 6 7 considered on the merits on a case-by-case basis. And I think

the City of North Las Vegas is going to want to bring forward 8

9 an application for consideration at some point in the future, it's part of their water supply strategy. And we think it has 10

merit. So we would like to have the opportunity to bring that 11 before the State Engineer. 12

Capture of the Muddy River flows needs to be managed as a separate issue. Yeah, all the basins that are involved, you know, there's going to be interactions of management strategies, et cetera, but this is a broader issue than just the Lower White River Flow System, this includes the lower basins also all the way down to Lake Mead. There are existing groundwater permits issued along the river corridor and in these other basins.

So there's a need to be managed and you probably need to initiate that process, but that's a separate issue.

Again, I've given you my opinion that I think 23 we're still dealing with the effects of the climate. But 24

need some additional monitoring in place. 1

We really have no good monitoring levels in

Hidden Valley that SHV-1 down in the north I believe is 3

completely alluvium. We need some additional monitoring. 4

There's Las Vegas Valley. 5

Perhaps an additional monitoring well on the east 6

7 of the Dry Lake Thrust, maybe on that western edge of Southern

California Wash to then further assess and address the 8

9 National Park Service questions that are all in this testing

that's needed also needs to be augmented -- needs to have 10

augmented monitoring. 11

12 Let's move forward with this and let's figure out what is the safe amount to pump from Garnet Valley. It can be 13

done. And the City's water management strategy will 14

facilitate that happening. Thank you. 15

Q. And, Mr. Smith, it's your opinion -- or I guess 16

you didn't have an opinion as to the total quantity of 17

groundwater, your opinion was that we should just simply look 18

at it from a safe yield concept; correct? 19

20 A. That is correct. I have not offered an opinion

on the potential safe yield from the entire system, I've 21 really just focused on the south end. 22

MS. URE: Okay. Thank you. We would like to 23

reserve the remainder of our time for redirect. And I also

Capitol Reporters Min-U-Script® (24) Pages 1462 - 1465 775-882-5322

Page 1469

Page 1466

- 1 don't know if I was clear that Mr. Smith was being offered as
- 2 an expert witness and he was not objected to.
- 3 HEARING OFFICER FAIRBANK: Thank you. And Mr.
- 4 Smith has previously been qualified before our office. We
- 5 appreciate that.
- 6 Let's go ahead and take a quick ten-minute break
- 7 and then we'll go ahead and proceed with cross-examination.
- 8 (Recess.)
- 9 HEARING OFFICER FAIRBANK: Okay. Let's go. Take
- 10 two. All right. We're back on the record, and we will go
- 11 ahead and start with cross-examination.
- And first is Coyote Spring Investments, and our
- 13 time allotment is seven minutes per participant. And as we've
- been doing, if there's additional time, then we'll allow --
- reopen that time up for continuation of questions if you
- weren't able to get everything done in the first go-around.
- 17 CROSS-EXAMINATION
- 18 BY MR. HERREMA:
- 19 Q. Thank you. Brad Herrema on behalf of CSI.
- Just a first question, and I don't know if this
- 21 is properly addressed to you, Mr. Smith, or to your counsel,
- 22 Ms. Ure.

well.

- But would it be possible for us to get a PDF
- 24 copy, an electronic copy of your presentation? The color from

that would be possible, we would appreciate that.

thinking of putting a folder together with all these

presentations, but that would be a request that we have as

HEARING OFFICER FAIRBANK: Thank you.

you suggested that there was no relationship between pumping

in Garnet Valley and groundwater levels at EH-4 during the

it's really not recognizable in that flat trend water levels.

heterogeneities in the aquifer or compartmentalization that

might exist within the flow system due to faults or folds?

A. For -- for the southern end of the flow system, I

do not think that is the case. As I mentioned, there are --

there's a -- some amount of groundwater flow that's coming

down to the south end. I believe there's a flow of water

Q. Mr. Smith, on Slide 25, during your testimony,

And I'm not sure if the State Engineer is

CROSS-EXAMINATION

Does that sound accurate?

ANSWERS BY MR. SMITH:

Q. Is it possible that this would suggest

A. Yes. I will say that if there was an effect,

BY MR. HERREMA:

late 80's and early 90's.

- 1 coming in from the Las Vegas Valley.
- 2 There is some amount of outflow, we believe, from
- 3 the southern end. So the degree that we were pumping and
- 4 predominantly capturing those flows, we do not need a
- 5 compartmentalization theory to explain that.
- 6 Q. Okay. When you reviewed the transmissivity in
- 7 the Garnet Valley, did you find higher values of
- 8 transmissivity near fault zones and lower values farther away
- 9 from fault zones?
- 10 A. Not in general. However, you will note that on
- 11 the transmissivity slide, the two highest values were along
- 12 that projection of the faulting that runs along the east side
- of Garnet Valley. You also note that there's some low
- 14 transmissivities in there too.
- It didn't point out, but, you know, there's a lot
- 16 of faulting all through that portion of Garnet Valley, a lot
 - of it kind of north-south trending.
- But those two examples I noted are potentially
- along the fault zone that runs along the eastern side, but
- other than that, I could not make that inference.
- 21 Q. In regard to Slide 10, the model results in your
- written report discuss inflow to your model from northern
- 23 Hidden Valley along the Arrow Canyon Range.
- Do these results suggest a preferred flow path

Page 1467

17

- your slides doesn't show up on the copy. So if we could -- if | 1 along the north trending normal faults parallel to the Arrow
 - 2 Canyon Range?
 - 3 A. I'm not certain I can make that association.
 - 4 There is a general north to south flow, and at some point,
 - 5 that flow system is interpreted to turn to the east.
 - 6 Q. You suggest the Dry Lake Thrust Fault might act
 - 7 as an impediment to eastward groundwater flow. Is that a
 - 8 general comment regarding the impact of thrust faults on
 - 9 groundwater flow or was that specific to Dry Lake Thrust
 - 10 Fault?
 - 11 A. Well, that was more specific to the Dry Lake.
 - 12 And I should have noted, if I didn't, that there is an -- a
 - 13 number of significant normal faults that are coincident with
 - 14 that thrust fault.
 - So, again, the boundary testing suggests that
 - there is very little outflow there to explain the water levels
 - 17 at least in that upper slice of carbonate aquifer, and whether
 - 18 it's normal faulting or the thrust fault, I -- I can't go that
 - C 1 C 1
 - 19 far to define that.
 - 20 Q. Okay. Thank you.
 - MR. HERREMA: I have no further questions at this
 - 22 time.
 - 23 HEARING OFFICER FAIRBANK: United States Fish and
 - 24 Wildlife Service.

- 1 Seeing no questions, National Park Service.
- 2 CROSS-EXAMINATION
- 3 BY MS. GLASGOW:

8

- 4 Q. Let's see. Good morning still. I'm Karen
- 5 Glasgow with the Department of Interior, Office of the
- 6 Solicitor representing the National Park Service. And good
- 7 morning to you, Mr. Smith. I just have a few questions.
 - Your Slide Number 10 shows an arrow heading
- 9 northwest or northward in southern Coyote Springs Valley based
- on the measured water level in CSVM-2.
- What does that imply about the movement of large
- 12 amounts of water moving southward from Coyote Springs Valley
- into Hidden Valley and eventually, into Las Vegas Valley?
- ANSWERS BY MR. SMITH:
- 15 A. Well, we do have a -- a higher than normal water
- level there that defines a gradient to the north back to
- 17 Coyote Springs Valley. I don't think we have enough data over
- 18 there to really make broader interpretations.
- 19 I'm not precluding that there is north to south
- 20 movement of water, and I also have questioned in the past
- 21 whether there is some -- some fault influence on those --
- 22 those water levels as in the fault being between the --
- probably north-south fault.
- But between them and the -- the lower elevations

- 1 A. Yes, it could. Some.
- 2 Q. Okay. Do you have information to indicate that
- 3 water levels throughout Garnet Valley are at a steady state?
- 4 A. Well, until we're able to clearly parse out
- 5 climate versus pumping, you know, we do have a declining water
- 6 level trend.
- 7 Pumping can't occur without some storage
- 8 depletion, so I don't think the water level record is devoid
- 9 of pumping influence. I think it is embedded in it.
- Does that answer your question?
- 11 Q. Thank you.
- So another question. In his rebuttal report,
- 13 Dr. Mock disputes your characterization of the Las Vegas
- 14 Valley Shear Zone.
- Do you agree with his inference that groundwater
- in Garnet Valley flows largely south to an entrance of the
- 17 Las Vegas Valley at a rate of somewhere between thousands to
- tens of thousands of acre-feet per year?
- 19 A. So that is a hypothesis that, in my opinion,
- 20 really is not based on any information. So, you know, to
- 21 answer that, we would need to have monitoring wells drilled,
- 22 defined water levels, but I have not represented that in the
- 23 model strictly because I don't have any data to really suggest
- 24 its presence or its magnitude.

Page 1471

- of the valley floor in Coyote Springs Valley, some of these
- 2 more south-turning faults. So really, I don't have enough
- 3 data -- I don't have enough data to really offer an opinion of
- 4 whether that would, say, preclude southern flow. I think that
- 5 is still a possibility. We're really lacking data to define
- 6 that.
- 7 Q. Thank you.
- 8 So, with respect to your modeling, was it a
- 9 steady-state model?
- 10 A. That's correct.
- 11 Q. In a steady-state model, doesn't all the water
- move into and out of the model through the boundary
- conditions, and no water is derived by lowering water levels
- 14 in the model?
- 15 A. I didn't mention, but we also have some local
- 16 recharge applied as a specified flux on the western edge of
- 17 the model representing recharge in the Las Vegas Range.
- So there is a recharge source, internal, and then
- all the other water is derived from the boundary flows in andout.
- 21 Q. And that's a boundary condition; correct?
- 22 A. That's correct.
- 23 Q. Would the steady-state assumption affect the
- 24 calculated boundary flow rates?

- 1 Q. Thank you.
 - 2 So similarly, were you here for Dr. Johnson's
 - 3 testimony?
 - 4 A. I was not.
- 5 Q. Okay. Then I will -- if I -- if I told you that
- 6 Dr. Johnson stated that somewhere on the order
- 7 48,000 acre-feet of water flows into the Las Vegas Valley
- 8 across the Las Vegas Shear Zone, would you agree with that
- 9 assessment?
- 10 A. I would not have any data to really support that
- 11 assessment. I would be looking for water level data along
- that shear zone in the carbonate rock.
- You know, this is part of what happens when we're
- 14 not constrained by having much data or any data is, you know,
- 15 it's still open to all kinds of hypotheses. Those hypotheses
- can certainly be tested if one is willing to expend the effort
- to go and collect data and drill wells.
- 18 But --
- 19 Q. Thank you.
- MS. GLASGOW: I appreciate your time.
- 21 HEARING OFFICER FAIRBANK: Moapa Band of Paiutes.
- MR. BUSHNER: No questions.
- HEARING OFFICER FAIRBANK: Seeing no questions,
- 24 Las Vegas Water District and Southern Nevada Water Authority.

Min-U-Script®

Capitol Reporters 775-882-5322

(26) Pages 1470 - 1473

Page 1474

- CROSS-EXAMINATION 1
- BY MR. TAGGART: 2
- Q. Good morning, Mr. Smith. 3
- A. Good morning.
- There are a couple preliminary questions. 5
- First of all, the -- North Las Vegas is a member 6
- agency of the Southern Nevada Water Authority; correct?
- A. That's correct. 8
- Q. Okay. Is it true that none of your presentation 9
- or your expert reports were coordinated with the Southern 10
- Nevada Water Authority and their presentation of information? 11
- A. That's correct. 12
- Q. You started your discussion indicating that the 13
- water that is under a legal agreement with the Southern Nevada 14
- Water Authority, you referred to it could be considered 15
- junior; right? 16
- 17 A. That's correct.
- Q. Would you agree that if the basins in the Lower 18
- 19 White River Flow System were managed on priority based on by
- basin instead of all in one unit, if Garnet Valley was just 20
- its own valley and it was managed on priority, the SNWA water 21
- rights would actually be more senior? 22
- A. The SNWA rights would still be junior in Garnet
- Valley. They were basically the last, you know, appropriation

- And so now, we've exceeded kind of the salient 1
- conclusions of his reports and his testimony. 2
- HEARING OFFICER FAIRBANK: So the objection was 3
- whether it exceeded the salient conclusions of his report by 4
- extending outside of the Garnet Valley region --5
- MR. HERREMA: Right. 6
- 7 HEARING OFFICER FAIRBANK: -- just to summarize
- your objection? 8
- 9 MR. HERREMA: Yes. You did very well. Thank
- 10 you.
- HEARING OFFICER FAIRBANK: Thank you. 11
- 12 BY MR. TAGGART:
- 13 Q. The testimony you gave regarding moving water
- from one point of origin to another --14
- Do you recall that? 15
- 16 A. Yes.
- 17 Q. Okay. And first of all, do you understand that
- when the five basins that are now considered the Lower White
- River Flow System, when they were separate basins, alluvial 19
- water rights in the Muddy River Springs area could not have 20
- been moved to Garnet Valley; right? 21
- A. That's my understanding. 22
- Q. Okay. So it's really just a function of this new 23
- Lower White River Flow System that's allowed for alluvial 24

Page 1475

Page 1477

- granted in Garnet Valley. So all of the appropriations prior
- to that would be senior. 2
- Q. Okay. Now, in some of your testimony -- and
- let's find a slide, Slide 30. You indicated that pumping in
- the proximity -- immediate proximity of the springs is -- and I think you said based on basic hydrologic principles, the 6
- 7
- pumping more proximate to the springs is having more effect on
- the springs. 8
- 9 A. I agree.
- Q. And when you talked about the immediate 10
- proximity, does that immediate proximity include Coyote Spring 11
- 12
- A. No, I was really referring to the pumping from, 13
- for example, the Arrow Canyon wells.
- Q. Okay. Do you believe that pumping in Coyote 15
- Spring Valley effects EH-4? 16
- 17 A. Yes, I think we've demonstrated that in Order
- 1169. 18
- Q. Okay. 19
- MR. HERREMA: I'd like to object. I know he's 20
- already answered the question, but he said at the beginning of 21
- 22 his testimony that his focus and the conclusions in his report
- were all focused on what was happening in Garnet Valley, not 23
- on Coyote Springs. 24

- rights to be moved elsewhere; right?
- A. Alluvial rights or any rights to be moved from
- one hydrographic basin to the next. 3
- 4 Q. Right. And you agree that alluvial pumping in
- the Muddy River Springs area does affect the Muddy River;
- right? 6
- 7 A. I agree.
- Q. Okay. And do you believe that any conflict
- between that pumping of alluvial water in the Muddy River
- Springs area and senior decree rights in the river should be 10
- addressed before any of that alluvial water rights can be 11
- moved? 12
- A. No, I wouldn't agree with that. You know, the 13
- structure and framework to address streamflow capture is going
- to require a process of its own. But to the degree that we 15
- can -- to transfer those water rights from the alluvium 16
- elsewhere, as proposed by the City, down to Garnet Valley, I 17
- think the merits of that will have to bring forward on its 18
- application, maybe, for the State Engineer. 19
- 20 Q. Okay. Now -- now, in your recommendations
- regarding safe yield, do you agree that maintaining a certain 21
- 22 flow at the Warm Springs West Gage should be a control that
- the State Engineer maintains in determining how much 23
- groundwater pumping should be allowed? 24

Min-U-Script® Capitol Reporters 775-882-5322

(27) Pages 1474 - 1477

Page 1478

- 1 A. I do.
- 2 Q. Okay. And do you agree that the -- well -- well,
- 3 let me strike that, please.
- 4 You had some criticism of the MLR analysis at
- 5 SNWA; correct?
- 6 A. Yes.
- 7 Q. Okay. And you also are aware that SNWA did an
- 8 analysis of how much groundwater can be pumped from the
- 9 carbonate system while maintaining a 3.2 flow at the Warm
- 10 Springs West Gage; correct?
- 11 A. I recall that testimony.
- 12 Q. Okay. Do you recognize that that analysis and
- the MLR analysis are two distinctly separate analyses?
- 14 A. Yes.
- 15 Q. Okay. So your critique of the MLR approach does
- 16 not apply to the approach that SNWA used to determine the
- control in order to protect 3.2 CFS in the Warm Springs West
- 18 Gage; is that true?
- 19 A. That's true.
- 20 Q. Okay. And most -- your -- your testimony
- 21 indicated that the -- the conclusions and analysis that you
- 22 conclude -- that you prepared were based upon the idea that
- 23 additional carbonate pumping in Garnet Valley by the City of
- North Las Vegas would be temporary until a pipeline is built

- 1 strategies was bringing in senior groundwater rights.
- 2 A. Correct.
- 3 Q. Does -- has the City identified or targeted any
- 4 specific senior water rights to date?
- 5 A. Yes. The senior -- excuse me. The City has
- 6 entered into a Memorandum of Understanding with the Church of
- 7 Jesus Christ of Latter-Day Saints, the LDS Church, to initiate
- 8 discussions on leasing with possible long-term option to
- 9 purchase water rights from -- that are utilized along the
- 10 alluvium in the Muddy River Springs area.
- 11 Q. And are those -- are those rights currently being
- 12 pumped?
- 13 A. Since the decommissioning of the Reid Gardner
- 14 Station power plant in 2017, these water rights were under
- 15 lease for the past few decades to the power company for -- to
- 16 Nevada Energy for that -- that facility.
- So since the decommissioning in 2017, I do not
- 18 believe they've been pumped, or if they have been, they have
- 19 not been pumped to a great amount.
- 20 Q. Okay. And you said those were alluvial rights?
- 21 A. The -- they are water rights at wells that have
- 22 historically pumped from the alluvium.
- 23 Q. Okay. The City's Kapex and Playa wells, are
- 24 those alluvial rights or are those carbonate right -- or

Page 1479

Page 1481

- 1 to bring water to North Las Vegas from the Las Vegas Valley;
- 2 is that correct?
- 3 A. I would say initially. I think ultimately,
- 4 through additional stress testing, whether it's pumping or
- 5 injection testing, will arrive at the proper amount to
- 6 perpetuate from the carbonate aquifer from Garnet Valley. I
- 7 don't think we've established that yet.
- 8 Q. Is the City of North Las Vegas prepared to pay
- 9 for the costs of those types of stress testing that you have
- 10 described?
- 11 A. I can't answer that.
- 12 Q. Okay.
- MR. TAGGART: Thank you.
- 14 HEARING OFFICER FAIRBANK: The Moapa Valley Water
- 15 District.
- 16 CROSS-EXAMINATION
- 17 BY MR. MORRISON:
- 18 Q. Greg Morrison for Moapa Valley Water District for
- 19 the record.
- Good morning, Mr. Smith. How are you?
- ANSWERS BY MR. SMITH:
- 22 A. Good morning.
- 23 Q. I just got a couple questions about you spoke
- about the City's long-term strategy, and one of those

- 1 wells, excuse me?
- 2 A. The wells are completed in the carbonate aquifer.
- 3 Q. Okay. So would it be fair to say that the
- 4 movement of the senior permit rights that the City currently
- 5 has targeted for acquisition, beginning to pump those would
- 6 increase pumping in the carbonate aquifer?
- 7 A. That's correct.
- 8 MR. MOORE: Okay. Thanks.
- 9 HEARING OFFICER FAIRBANK: Lincoln County-Vidler
- 10 Water Company.
- 11 CROSS-EXAMINATION
- BY MS. PETERSON:
- 13 Q. Hi, Mr. Smith. Karen Peterson --
- 14 ANSWERS BY MR. SMITH:
- 15 A. Good morning.
- 16 Q. -- representing Lincoln County Water District and
- 17 Vidler Water Company. I just had a couple questions for you.
- 18 Is there any recommendation by your client to
- 19 include Kane Springs Valley into the Lower White River Flow
- 20 System?
- 21 A. No. Again, we have not done any assessment on
- the other regions of the flow system.
- 23 Q. But in this proceeding, there is no
- 24 recommendation by your client based on the work that they've

Min-U-Script®

Capitol Reporters 775-882-5322

(28) Pages 1478 - 1481

Page 1482

- 1 done to include Kane Springs Valley; that is correct?
- 2 A. Yes, that's correct. We support the basins as
- 3 delineated in the Order 1303.
- 4 Q. And that would include the northern basins also?
- 5 A. That's correct.
- 6 MS. PETERSON: Okay. Thank you.
- 7 HEARING OFFICER FAIRBANK: Center for Biological
- 8 Diversity? Seeing no questions, Georgia Pacific-Republic?
- 9 MS. HARRISON: We have no questions.
- 10 HEARING OFFICER FAIRBANK: Seeing no questions,
- 11 Nevada Cogeneration?
- Seeing no questions -- oh, okay.
- 13 CROSS-EXAMINATION
- 14 BY MR. FLANGAS:
- 15 Q. Good morning, Mr. Smith.
- I think it's your Slide Number 15 and 16.
- 17 HEARING OFFICER FAIRBANK: Mr. Flangas, will you
- 18 turn on your microphone.
- 19 MR. FLANGAS: Sorry.
- 20 BY MR. FLANGAS:
- 21 Q. I think it's your Slides 15 and 16. If you could
- 22 explain just a little bit your understanding of the -- kind of
- 23 the boundary condition and the -- really, the boundary at the
- 24 Black Mountains area a little bit better because I wasn't

- 1 preliminary area for the Lower White River Flow System.
- 2 But also, you would incorporate a similar sized
- 3 area that's bound by the Gas -- Gas Peak Thrust Fault on the
- 4 west, the Las Vegas Valley Shear Zone on the south, and then
- 5 extends over to the Black Mountains area.
- 6 So there would potentially be a small corner
- 7 geographically that should be included also.
- 8 Q. I'm sorry. A small corner that could be --
- 9 A. Small corner of Las Vegas Valley that should be
- 10 incorporated.
- 11 Q. And with regard to that shear zone, what is it
- telling us as far as is it a corridor for water? Is it a
- 13 boundary fault or what?
- 14 A. The hypotheses are that that is a boundary, and I
- believe in some of the prior modeling efforts, it's been
- interpreted as a no-flow boundary.
 - Again, we really don't have sufficient data to
- 18 define that, but I would agree that conceptually, it is likely
- 19 some type of terminal boundary to the flow system.
- 20 Q. But we don't have enough data in that area to
- verify one way or the other; right?
- 22 A. I don't think we can absolutely conclude that.
- MR. FLANGAS: Okay. Thank you very much. That's
- 24 all we have.

17

1

13

Page 1483

- 1 clear on that during your direct testimony.
- 2 A. I'm going to refer to my exhibit, Exhibit 3. So
- 3 we did include that boundary as a separate segment, and I'm --
- 4 bear with me here. I'm just looking for the outcome.
- 5 So the model simulation shows a very small flux
- 6 of water across that boundary and was testing of about seven
- 7 and a half acre-feet.
- 8 The sensitivity -- if I recall correctly, the
- 9 sensitivity was not high on that model boundary. So that
- would imply that -- let me just confirm, please.
- Yeah, the sensitivity was low on that model
- boundary, so that would imply that there certainly could be a
- 13 notably different flux of water back and forth along that
- 14 model boundary and still produce a satisfactory solution.
- 15 Q. The comment here on Slide 16 when you say the
- 16 Las Vegas Shear Zone as a physical boundary incorporates a
- 17 portion of Las Vegas Valley similarly to incorporating a
- portion of the Black Mountains area, what exactly does that
- 19 mean?
- 20 A. Let me go to overhead. Let's see. Let's look at
- 21 Slide 8. So you'll notice that if that carbonate corridor
- that's coming down to the south and butts up against the
- 23 Las Vegas Shear Zone, then it would incorporate that corner of
- 4 the Black Mountains area that has been included in the

- Page 1485 HEARING OFFICER FAIRBANK: Muddy Valley
- 2 Irrigation Company.
- 3 MR. KING: No questions.
- 4 HEARING OFFICER FAIRBANK: Seeing no questions,
- 5 Bedroc.
- 6 MS. URE: No questions.
- 7 HEARING OFFICER FAIRBANK: Seeing no questions,
- 8 Nevada Energy.
- 9 MS. CAVIGLIA: No questions.
- 10 HEARING OFFICER FAIRBANK: Seeing no questions,
- 11 I'll go ahead and open it up to the State Engineer and
- 12 Division of Water Resources staff.
 - EXAMINATION
- 14 BY MR. BENEDICT:
- 15 Q. Jon Benedict for the record.
- I have a question about the concept of capture in
- 17 Garnet Valley and the potential for additional sources of
- 18 capture there, and I guess that question is pretty general.
- What do you see as being capturable commodities?
- 20 I mean, if there is water that flows, for example, from Las
- 21 Vegas to Garnet Valley, how is that captured?
- I mean, is it really just a loss of storage in
- 23 Las Vegas Valley that's actually occurring there or is that a
- 24 physical capture of a -- of water, in other words, and

Min-U-Script® Capitol Reporters 775-882-5322

(29) Pages 1482 - 1485

Page 1486

- inducement of flow or a reduction of discharge?
- A. Yeah, we -- you know, I -- first off, I think we 2
- need to start with the defining is this flux real or not and
- 4 is it really occurring. And if it is, then we can perhaps
- start to investigate further, is this the result of rising
- water levels, artificial -- or aquifer recharge in Las Vegas 6
- 7 Valley? Was this fundamentally present throughout the
- history? You know, has it always been a flow source in that
- direction? We have to understand that further. 9
- But as far as it relates to capture, yeah, I 10
 - think there are -- there's a certain amount of flow in Garnet
- 12 Valley that has bypassed -- I'll use the word bypass -- the
- 13 Muddy River Springs. There's a certain amount of flow just
- based on gradients that continues south. We know that by the 14
- 15 gradients.

8

11

- Now, based on the transmissivities that we're 16
- 17 able to find to date, it appears that that flow is fairly
- modest. But to the degree it's present, we can begin to pump 18
- and capture that with wells. 19
- Now, can you do that without absolutely having 20
- other effects that you're trying to avoid? Well, it's usually 21
- not an absolute scenario, you know. You're going to pump and 22
- you're going to capture maybe an inflow source that was then 23
- continuing out on out to the east. 24

- when I say early, the 1990s into the 2001 time frame before 1
- the additional power facilities came on or were born out there 2
- in that area. It sure looks like the pumping that it was 3
- 4 doing was not creating any difficulties with water levels
- propagating the EH-4. 5
- How far we can go beyond that, you know, we 6
- 7 pumped at 2,000 acre-feet in 2016 and 2017. It looks likes
- EH-4 water levels, you know, had stabilized. Now, we can't
- reach that far yet. We need to do more testing and 9
- observations to figure out where we can land in Garnet Valley 10
- and maintain the water levels we want to preserve at EH-4 and 11 12 at the springs.
- 13 MR. BENEDICT: I think that was my only question.
- Thank you. 14
- 15 **EXAMINATION**
- BY MR. SULLIVAN: 16
- O. Adam Sullivan for the record. 17
- Your recommendation for safe yields, are you --18
- are you recommending a distinct safe yield concept for the 19
- Garnet Valley area that would be separate from a safe yield 20
- for the northern portion of the Lower White River Flow System? 21
- A. Yeah, I think that's what should be considered. 22
- You know, how accurate is the water budget and how accurate 23
- can it ever be? 24

Page 1487

Page 1489

- 1 I think any eastern flow that makes it out, which
- appears to my eye to be modest, but I know the regional flow 2
- modeling authored by the National Park Service, you know, has 3
- at least 1,500 acre-feet flowing by and out through to the 4
- waters of Dupont Springs, but possibly deeper. 5
- 6 But, yeah, you can capture a part of that. Can
- 7 you do that absolutely without having other far-reaching
- effects? Probably not. It's not an absolute scenario, but 8 9 the degree that we can be pumping and harvesting a few of
- those sources of water that were not flowing out and flowing 10
- upgradient, obviously, to the Muddy River Springs, that is 11
- 12 what we need to try to achieve in Garnet Valley.
- And we need to do so with minimum -- you know, if 13 you end up in a scenario where you're pumping three, four
- times that manageable amount of water, then you're going to 15
- see a preponderance of drawdown propagating far beyond where 16
- you are intending it to. So we've got to find that right --17 that right amount. 18
- And I think we can get there. It's going to take 19
- time and effort. But we can find that. I don't think we 20
- found it today. I think the evidence we have do have is that 21
- 22 that really, pumping doesn't appear to be affecting EH-4 water 23
- So I would suggest that that early pumping --24

- 1 You know, say, for example, the computations
- where there's 10,000 acre-feet flowing through the system 2
- somewhere, it's kind of irrelevant. You know, we need to 3
- define how much we can safely pump in different geographic 4
- areas and maintain levels at EH-4. That's what we need to 5
- 6 find.
- It's going to be different for different 7
- geographic areas. Some areas might be quite a bit more
- 9 sensitive. You may find compartments, you know, through
- 10 further testing to where you can sustain greater amounts of
- 11 flow. I don't want to preclude that as being a possibility.
- 12 But, yeah, so I think you need to be looking at
- this for a perspective because this is a -- this is a large 13 area. 14
- Yes, there are some connections and commingling 15
- of effects that need to be considered, but I think we can boil 16 this down to the southern area, we have some amount of 17
- southern flow in the system, some amount that we can pump and
- 18 harvest and not get be getting into trouble, not be getting 19
- 20 into trouble with EH-4.
- And I think that philosophy could apply elsewhere 21 in the basin also. It's kind of irregardless of what the 22
- perennial yield and the water budget is. 23
- 24 Q. Okay. Thanks.

775-882-5322

Min-U-Script® **Capitol Reporters**

(30) Pages 1486 - 1489

Page 1490

- And one clarification on Slide Number 14, which 1
- is -- you might not even need to look at the slide. It was 2
- where you showed various water levels at the north end of Las 3
- 4 Vegas Valley.
- A. Yes.
- Q. Did you say those are to the north of or to the
- south of the Las Vegas Shear Zone?
- A. Well, we know for certain that Diamond
- Construction, Diamond Apex wells are north of the Las Vegas
- Shear Zone. 10
- 11 Where that structure would cut through, I
- believe, is also south of those wells that are plotted on that 12
- 13 figure or at least south of some of them, but we're certainly
- getting right in the area of the shear zone in there. 14
- MR. SULLIVAN: Okay. Thanks. 15
- **EXAMINATION** 16
- BY MS. BARNES: 17
- Q. Michelle Barnes for the record. 18
- Can we go to your Slide 27. If the groundwater 19
- elevations are already corrected for barometric pressure, 20
- would you still expect to see this barometric response that 21
- you talked about?
- A. So to be clear here, and you'll have to let me
- know if I've answered your question. But quite commonly, we

- CROSS-EXAMINATION 1
- BY MS. GLASGOW: 2
- 3 Q. Karen Glasgow, Department of Interior for
- National Park Service. Hello. Still morning, Mr. Smith.
- A couple more questions. Your model has general 5
- head boundary conditions along your reaches 4 and 6 between 6
- 7 Garnet Valley and the Black Mountain area leading to Rogers
- and Blue Point Springs with a hydraulic conductivity of
- approximately ten to the minus five feet per day. Isn't this 9
- orders of magnitudes smaller than other boundary conductance 10
- 11 values?
- 12 A. It is, and I pointed out that the solution to the
- 13 calibration wants to make that a tight and practically a
- no-flow boundary, and that's the reason the conductance is 14
- calibrated to such a low value. 15
- 16 Q. Do you have data that supports these values?
- 17 A. Well, the model calibrated to match the water
- levels in the basin.
- And I'll add, though, you know, you have to keep 19
- in mind this is the upper thousand feet that we've represented 20
- of a very thick section of carbonate rock. 21
 - So that certainly -- and I would say this testing
- is certainly not definitive by any means, and it doesn't 23
- 24 exclude deeper flow systems out.

Page 1491

22

10

Page 1493

- have an instrumentation correction for barometric pressure,
- and I believe mostly interpretation of this area are vented, 2
- so we don't have to do that atmospheric correction. But 3
- that's an equipment accuracy issue. If they're sealed, then 4
- you have to then -- then have to process the data for 5
- barometric correction to get a true water level. 6
- So what I'm talking about is actually true water 7
- level response, not an instrumentation type of correction or 8
- 9 adjustment. This is a true observed when the barometric
- pressure rises, the water levels fall in the aquifer, 10
- physical -- it's actually a physical process that takes place. 11
- Does that clarify? 12
- Q. That does answer my question, yes. Thank you. 13
- HEARING OFFICER FAIRBANK: Okay. Seeing staff 14
- has completed their questions, we'll go ahead and reopen it 15
- for additional questions. 16
- Coyote Springs Investments, do you have any 17
- further questions? 18
- MR. HERREMA: Not at this time. 19
- HEARING OFFICER FAIRBANK: Seeing no further 20
- questions, Fish and Wildlife Service? 21
- Seeing no questions, National Park Service. I'll 22
- go ahead and give you five minutes. 23
- MS. GLASGOW: Thank you. 24

- 1 Q. But would this affect any model-based conclusions
- on the amount of water flowing across this boundary to Rogers
- and Blue Point Springs, making the discharge rate very small?
- 4 A. I don't think we can use this model in that
- manner. It's really just judging internal to Garnet Valley.
- I think you do need to stick to a regional platform such as 6
- Dr. Waddell's model to start examining that regional sort of 7
- question on detail. 8
- 9 MS. GLASGOW: Okay. Thank you.
 - HEARING OFFICER FAIRBANK: Moapa Band of Paiutes.
- Seeing no questions, Southern Nevada Water 11
- Authority, Las Vegas Valley Water District. 12
 - MR. TAGGART: No questions.
- 13 HEARING OFFICER FAIRBANK: Seeing no questions, 14
- Moapa Valley Water District. 15
- MR. MOORE: No questions. 16
- HEARING OFFICER FAIRBANK: No questions. 17
- Lincoln County-Vidler? No questions. 18
- Center for Biological Diversity? No questions. 19
- Georgia Pacific and Republic? 20
- Seeing no questions, Nevada Cogeneration? 21
- Seeing no further questions, Muddy Valley 22
- Irrigation Company? No questions. 23
- Bedroc? 24

Min-U-Script® **Capitol Reporters** 775-882-5322

(31) Pages 1490 - 1493

Page 1494

11

- MS. URE: No questions. 1
- HEARING OFFICER FAIRBANK: No questions. 2
- And Nevada Energy? 3
- Seeing no questions, again, I'll open it up to 4
- Division of Water Resources staff and the State Engineer. Are 5
- there any questions? 6
- 7 **FURTHER EXAMINATION**
- BY MR. BENEDICT: 8
- Q. Jon Benedict. A really simple question. You
- suggested again that there's been pumpage in Garnet Valley. 10
- 11 It's not in the record, and you alluded to the proof of
- 12 beneficial use.
- 13 Do you have any numbers on what you think the
- pumpage had been in the 90's just out of curiosity? Do you 14
- 15 have those records yourself?
- A. Yeah, from the records I have observed -- and, 16
- again, this is just a criticism of the input values in the 17
- model. I believe that that -- if you looked at the 18
- hydrograph --19
- Let me see if I can pull that up. So the yellow 20
- bars and the blue bars represent those older water rights, 21
- predominantly, that, again, were similarly appropriated very 22
- early, in the 60's and earlier that are fairly modest, and 23
- those initial water rights were in the alluvium also. 24

- agricultural, we can find old photography and things like 1
- that, but that's not the case here. It's all industrial. 2
- Certainly, you could go through and scrutinize 3
- 4 this carefully and really try to put a detailed reconstruction
- of an earlier time. You might look at when the facilities 5
- were actually built, things like that. 6
- 7 But, yeah, I think you can get a reasonable
- approximation of that early history of pumping based on the 8
- water rights data, and I've successfully done that in quite a few basins that I've tried to reconstruct. 10
 - MR. BENEDICT: Okay. Thank you.
- 12 HEARING OFFICER FAIRBANK: All right. Well, it
- 13 looks as though we've concluded our proceedings today, so --
- oh, I'm sorry, Ms. Ure. You've reserved time for redirect. 14
- MS. URE: Yes. We have no redirect. 15
- HEARING OFFICER FAIRBANK: Okay. Thank you. 16
- All right. So now we've officially concluded our 17
- proceedings for today. 18
- So tomorrow, we will go ahead and start again at 19
- 8:30 in the morning commencing with the Center For Biological 20
- Diversity and then in the afternoon or then once we're 21
- concluded with the Center for Biological Diversity move on to 22
- 23 Georgia Pacific and Republic and Dry Lake.
- Again, as a reminder, on Thursday, October 3rd, 24

Page 1495

Page 1497

- But commencing in the 1980's, you started to see 1
- the new appropriations, the new developments occurring in the 2
- Apex area, and that -- the evidence we have based on the water 3
- right records is those facilities were up and operating 4
- through the 1990's. 5
- You know, their proof of beneficial use filings, 6
- if we just look at the table, you know, were occurring in the 7
- early 90's time frame just in general. Some of them are 8
- 9 extended out longer like that -- the Assignment Company rights
- down there, you see the file proof of beneficial use until 10
- 2001. But, yeah, in general, I think these facilities were 11
- operating pretty much through the 1990's. 12
- Now, the early 1990's, they may -- you know, it 13
- would have been a -- possibly some type of introduction of
- water pumping, but I think you could probably take your 2001 15 pumping inventory and project it back in time to the early 16
- 90's and look at when the proof of beneficial use filings were 17
- 18 made and proof of completion of where funds were made and then
- integrate that pumping -- and reconstruct that pumping history 19
- 20 back to the 1980's.
- Q. So you say the best data for that would then be 21
- the water rights files, for example; correct? 22
- A. Well, it's a source of information that I've used 23
- in other basins to reconstruct pumping. Sometimes with

- we will be starting later in the day, and depending on how
- things go and how far along we'll be moving, we'll make a 2
- determination as to whether or not we're going to start at 11 3
- as noted or we may start a little bit later. 4
 - And then on Thursday, we will have the
- continuation of Dry Lake, Georgia Pacific, and Republic, if 6
- necessary, the Nevada Cogeneration and then Muddy Valley 7
- Irrigation Company. 8
- 9 And then on the morning of October 4th, we'll
- proceed with Bedroc and Nevada Energy and then conclude with 10
- public comment. 11
- 12 So we will see everyone tomorrow morning, and thank you very much. 13
- (Proceedings concluded at 11:47 a.m.) 14

Page 1503

- 1 CARSON CITY, WEDNESDAY, OCTOBER 2, 2019, A.M. SESSION
- 2 ---oOo---
- 3 HEARING OFFICER FAIRBANK: This is a continuation
- 4 of the Order 1303 hearing regarding the Lower White River
- 5 Flow System and the administration of the basins as a joint
- 6 administrative unit.
- 7 And we will continue our presentations by the
- 8 participants starting today with Center for Biological
- 9 Diversity. And so we'll go ahead and kick it off with
- 10 Mr. Donnelly.
- 11 MR. DONNELLY: Thank you. Good morning. Patrick
- 12 Donnelly for the Center for Biological Diversity. And our
- 13 expert witness today is Dr. Tom Myers, a hydrologist, who has
- 14 appeared in front of the Nevada State Engineer in numerous
- 15 proceedings. His CV is available on CBD Exhibit 1.
- We appreciate the opportunity to present today.
- 17 The Center for Biological Diversity was founded in 1989 and
- 18 our mission is very simple. It's to save life on earth. In
- 19 particular, we focus on the protection of endangered species
- 20 and the habitats upon which they rely.
- 21 And I just want to provide the briefest of
- 22 remarks about the context of Dr. Myers' presentation. We
- 23 have been advocating for the protection of the Moapa dace for
- 24 over a decade, focusing on securing a long-term permanent

- 1 scientific experts presenting and interpreting data, Order
- 2 1303 asks a subjective question. What is the amount that may
- 3 be pumped? And the question that's implicit there is that
- 4 may be pumped within what constraints.
- 5 Different parties have had different
- 6 conceptualizations about what the constraints on pumping are
- 7 and thus have reached very different conclusions.
- 8 We feel that the Endangered Species Act is the
- 9 primary limiting factor on the overall quantity of allowable
- 10 pumping within the Lower White River Flow System and thus we
- 11 geared our analysis toward that goal of protecting the dace.
- However, other testimony has made it clear that
- 13 certain types and locations of pumping will also impact
- 14 senior surface water rights. As such, while our report
- 15 focuses on what actions are necessary to save the dace, our
- 16 report should not be considered exclusive of conclusions
- 17 raised by other parties as to requisite actions to protect
- 18 senior surface water rights.
- The findings in our report and other reports
- 20 instead may compliment one another, which is, of course, up
- 21 to the State Engineer's office to determine.
- Dr. Myers presents in his conclusion a number of
- 23 potentially allowable alluvial pumping. However, if the goal
- 24 of this proceeding's outcome is both to protect the dace and

Page 1504

Page 1506

- 1 water supply for the fish. And as parties in this room are
- 2 doubtless aware, we unsuccessfully litigated Fish and
- 3 Wildlife Services section seven consultation on the MOA some
- 4 ten years ago.
- 5 As we've been eliciting in cross-examination over
- 6 the past two weeks, we believe that withdrawals from the
- 7 carbonate aquifer that cause a reduction in habitat quantity
- 8 for the dace are a take under the Endangered Species Act and
- 9 thus prohibited.
- And while that implies that individual pumpers
- 11 may be potentially violating the Act, we believe that
- 12 responsibility lies with the Division of Water Resources.
- Rather than running to court to litigate this,
- 14 we're participating in this proceeding because we believe
- 15 that the State Engineer's office is taking the right approach
- 16 to addressing this matter. With almost 40,000 acre-feet of
- 17 groundwater rights and 37,000 acre-feet of surface water
- 18 rights, the basin is extremely over-allocated and the dace's
- 19 habitat is in danger of drying up, even at current pumping
- 20 levels, as Dr. Myers will demonstrate.
- Order 1303, Section 6-2-C asks about the
- 22 long-term annual quantity of groundwater that may be pumped
- 23 from the Lower White River Flow System. While this is a
- 24 technical evidentiary proceeding we're involved in involving

- 1 to protect in-stream water rights, we all need to consider
- 2 that the idea that all pumping must cease or at least that
- 3 needs to be part of the evaluation.
- 4 We would respectfully request of the State
- 5 Engineer's office the opportunity to present a brief written
- 6 closing argument after the termination of this hearing.
- 7 I'd like to move to have our Exhibits 1 through 4
- 8 admitted for the record.
- 9 HEARING OFFICER FAIRBANK: Those exhibits will be 10 admitted.
- MR. DONNELLY: Thank you. I want to note for
- 12 everyone that our presentation today differs slightly from
- 13 the presentation provided to the parties as CBD Exhibit 4.
- 14 We chose to highlight a couple of different elements from our
- 15 reports to ensure it's relevant to the ongoing discussions
- 16 we've had, but we haven't reached any new substantive
- 17 conclusions or anything in the presentation today.
- 18 Could we please swear in the witness?
- 19 (The witness was sworn in)
- 21 TOM MYERS
- Called as a witness on behalf of the
- 23 Center for Biological Diversity, having been first duly sworn
- Was examined and testified as follows:

A. Good morning, members of the panel and everyone 6 in the room. Thank you for this opportunity to present our analysis and our conclusions. 8

My name is Tom Myers. That's M-y-e-r-s. I've been working as a hydrologic consultant for about 25 years now, and, as Patrick mentioned, working this is my sixth or seventh time before the Nevada State Engineer. I've also done this in three other states, Arizona, Montana, and New Mexico. So I've got some background doing this.

The outline of my presentation is pretty simple. I'm going to summarize the direct evidence report which is submitted as technical memorandum, groundwater management in the Muddy River Springs. And I'm also going to present a summary of my rebuttal report, which was titled technical memorandum groundwater management in the Muddy River Springs, rebuttal and response to stakeholder reports filed with respect to Nevada State Engineer Order 1303.

I also note I'll try to speak slowly enough. I 23 actually already realize I'm doing that. Sorry. Just throw 24

around January 2002. The highest was in 2005, as we've heard

many times. There was a slight upward trend beginning 2

somewhere around 2010. And, as we've seen in other graphs by 3

other presenters, 2017 and even the winter of 2018-19 also 4

5 had some reasonably high precipitation amounts. And that is important as we go forward here. 6

As an aside, I realize both in listening last

week and reading lots of reports that, you know, what is best 8 to consider when we think of recharge in an arid region. Is 9 it precipitation or is it PDSI, the Palmer Drought Severity 10 Index. And I recently -- I thought a lot about this in both 11 12 listening to the data here and also in realizing I do a fair 13 amount back east and have recently moved back east. And I realize that PDSI is more appropriate in areas that have a 14

15 lot of soil cover. The PDSI tracks evap precipitation and evaporation and it simulates evaporation based on temperature 16 17

Precipitation, however, especially in arid

and a couple of other variables.

regions, drives the runoff and that is even during a dry period. For example, I mean, runoff can occur in an arid region before the moisture deficits as represented by Palmer Drought Severity Index are even made up. I mean, recharge

can occur due to runoff on pervious outcrops like carbonate 23

rock. It occurs as mountain-front recharge. I think if you

Page 1508

something at me. 1

On my presentation there will be page numbers and 2 that is frequently is a reference to where in the report if 3 I'm referring -- if I'm in the first part of it is in the 4 direct evidence report or the second part the page numbers 5 are where I've addressed this. I mean, it's not a direct 6 quote, usually. It's often where I paraphrase something from 7

my reports. 8 9

The first section I'm going to go over is analysis of the Order 1169 pump test and subsequent data and I'm going to consider climate, water level changes by well, water level changes over the area, and spring flows. While some of this will, no doubt, be repetitious of what we've already been seeing, you know, with some small variability perhaps in interpretation, I'm going to try not to dwell on this because we have seen this so many times going forward.

16 First, regarding climate -- And I've chosen to 18 consider precipitation trends primarily. This is the -- This is data. We've already seen this a couple of times, but it's 20 from the Western Regional Climate Center and it's the extreme southern division. This is a 12-month running average of the precipitation for the southern zone in Nevada. It shows a 22 seasonal variation. I see no evidence of a 20-year drought in this data. You'll see that it went the lowest right

Page 1510

looked at some research that has been done, it's been

referenced earlier by other people. For example, the 2

research Scott Tyler at DRI did in runoff in desert washes. 3

It's just one event that causes a recharge slug. 4

And so I think my point here is that for the type

of area that we're looking at here, rainfall, like in the 6

previous graph that I presented, is a better thing to 7 consider for climate trends and for recharge slugs,

8 9 considering recharge, than is the Palmer Drought Severity

Index. And at that may be especially true going forward as 10 11

temperatures warm.

And I guess the point is that any year, even a very, very wet year, the soil moisture is dissipated by the end of the water year. And so you start almost every year on a -- at the beginning, if you will.

Now, to consider a few of the well trends here.

This is a graph of the Coyote Spring carbonate wells that even back in Order 6254 the Nevada State Engineer found that the reduced pumping completed during the aquifer test, but I am repeating the fact that it wasn't the full amount that had originally been ordered in Order 1164, satisfied the goals and the pumping in Coyote Spring Valley cause impacts north in Coyote Spring Valley and then -- And this is a quote -- at

least to Kane Springs Valley south to Hidden Valley and

Garnet Valley and southeast to the Muddy River Springs area and California Wash. 2

The water levels in the carbonate monitoring 3 wells in central and southern Coyote Spring Valley have varied in parallel since the early two 2000s. The trend has been downward except for the brief increase that occurred 6 around 2005. And then all of the carbonate wells in central and southern Coyote Spring Valley decreased at least two feet 8 during the pump test period and they have all recovered by 9 less than half that amount by 2016. 10

Most carbonate monitoring wells show a continued lowering of water levels since 2016. And I think it's important that that's even with the wet winters in 2017 to 2019. That's why I mentioned that was important on the precipitation graph I showed before.

And this lack of recovery shows that -- it 16 17 indicates that, I mean, that an increase gradient caused by the drawdown is that it has not drawn substantially more 18 19 water from beyond the boundaries of the higher transmissivity 20 zone, that the broad two-foot drawdown cone or -- I guess you would call it a cone. The broad drawdown levels throughout 21 the five basins is reached up to the boundaries and thus it 22 doesn't pull -- it hasn't really begun to pull substantially 23 more water from beyond the boundaries, which is partly why 24

ten feet seasonally. And that could change the gradient

between the connection in the carbonate and basin fill wells 2

and that could allow the carbonate wells to go up and down, 3

the water levels to go up and down, by half a foot like we 4 5

1169 aquifer test accelerated the decline in the monitoring wells with a decrease of as much as two and a half

And I want to go back -- Yesterday we heard that the well EH-4 may have been, you know, was steady, had steady water levels during the nineties and even the late eighties when pumping had begun in Garnet Valley and the idea was that Garnet Valley pumping may not affect it at all.

Well, if you -- there is a, I interpret, a slight downward trend here in the late eighties and early nineties until we get to the -- until we get to a wet period in '92 and '93. And I also interpret a slide down at least steady if not slight downward trend in the late nineties. So I'm not really sure that we can say that Garnet Valley pumping has had no effect at all on the carbonate water levels in the Muddy River Springs area.

And I want to show two of the same graphs that I've already shown but up close and in a little more detail. And that is just to show that from late 2016 from the EH-4,

Page 1512

we've seen so little recovery. 1

The basin fill groundwater levels in the southern portion of Coyote Spring Valley have also trends downward since the late 1990s, with the exception being during the wet period around 2005. Well CSV3011M water levels increased from its installation in 2008 until the aquifer test after which it began to climb as well.

And then well DF-1, which is a basin fill well in the middle of southern Coyote Spring Valley, not shown on this particular graph, however, had water levels of about 200 feet higher than other wells in the area.

Carbonate monitoring wells in the Muddy River Springs area also show long-term downward trend commencing in the 1990s with the familiar uptick in 2005.

The report, the USDOI 2013 report identified several wet year responses. That's -- The graph at the bottom is from that particular report. They identified several wet year response in groundwater levels including

1992, '93, 2005 and to a lesser degree in 1998 and 2011. 19 20 I'm not sure I can prove this. But the small seasonal fluctuation that we see in many of the carbonate 21 wells, and it was discussed a little bit yesterday, I could 22 see that it could relate to the pumping in the basin fill 23 aquifer, which is seasonal, and in cases varies by as much as Page 1514

EH-5b, and UMVM wells, all of them show a slight downward

trend with time especially starting in late 2015 and added 2

that this time period where there is a slight upward trend in 3

the precipitation. So this is occurring, this downward trend 4

in the last several years occurs, even though there has been 5

a slight uptick in the precipitation. 6

And then basin fill wells in the Muddy River

Springs area, both of these graphs are from -- I mean, show 8

9 some basin fill wells, basin fill wells in the Lewis Field

portion of the Muddy River Springs area have, you know, have 10

been steady but with a slight decline more recently. And 11

12 this is where you actually see the almost ten-foot seasonal

variation. So if you go back to my previous statement about 13

potential seasonal variability in the carbonate aquifer 14

possibly being related to pumping that occurs in the alluvial 15 16

aquifer.

And I realize I may go back and forth and say alluvial and basin fill interchangeably, and it probably shouldn't. But I recognize that I refer to them interchangeably. And these tend to be more alluvial than

20 basin fill in this area. 21

All wells in the Lewis Field portion of the Muddy River Springs area exhibit a drawdown of several feet during and then just after the pump test. Basin fill wells near the

springs, and that's in the bottom graph, have declined, other 1 than during the uptick in 2005 since the 1990s, far more than 2 the Lewis Field wells, that declined, it accelerated through 3

the aguifer test period. And although it is mostly 4

completely recovered, however, most of that recovery is probably due to the very significant decrease in alluvial 6

7 pumping that I'll show in a slide or two here.

springs.

Now, overall, the groundwater levels at the end of the pump test show the very flat potentiometric surface from midway up Coyote Spring Valley through the Muddy River Springs area. On this graph you can see almost all the way from the middle of Coyote Spring Valley. And I realize that you can't read the -- indeed these elevations are not extremely readable. But there's only a several-foot variability all through the 30-mile area or 30-mile distance here. I mean, and during pumping, the water levels responded. And, literally, it responded to the aquifer of

throughout the whole area very quickly. Carbonate water levels in northern Coyote Spring Valley they are several tens to almost 400 feet higher than in the southeast portion of Coyote Spring Valley. But the water levels at least at CSVM-4 did decline during the aquifer test.

the pond. And you pull water at one end and it reduces

Basin fill water levels in the Coyote Spring 1

Valley are substantially higher than they are in the 2

carbonate. That's most apparent in well CE-VF-2, which is

4 about 50 feet higher than in the carbonate.

Basin fill well DF-1 exceeds 2,000 feet while the underlying carbonate wells are a good 200 feet lower.

Now, I suggest that because of the aridity of the area that this doesn't so much reflect a substantial recharge from the basin fill to the carbonate but it suggests that there could be a hydrologic disconnect due to a low conductivity zone or something between the carbonate and the basin fill in Coyote Spring Valley.

In the Muddy River Springs area, carbonate water levels exceed those in the basin fill, which reflects the upward movement of water from the carbonate to the -- in the to alluvium, and that also helps to provide water to the springs and to the alluvium in the Muddy River Springs area.

And then just as a note, in the Lower Meadow Valley Wash area, which is outside of the pump test study area, these three wells up here, I believe those are, like, MW-1 or something like that, they demonstrate sort of an upward gradient from depth in what's a very thick basin fill aquifer.

24 And then this graph here is a profile of the

Page 1516

I just mentioned the groundwater level at CSVM-4, 1 which is near the southern end of Kane Springs Valley, it's 2 just four to five feet lower than well KMW-1, which is 3 further north in Kane Springs Valley. And that does suggest 4

that there's a connection of transmissivity, the high 5

transmissivity, of carbonate rock that extends in to that 6

valley. And I'll allude to this area and this several times. 7

And I'm not denying that there is a fault in -- there is 8

9 probably a fault between those two wells. But with only a few feet of variability and the fact that KMW-1 did vary 10

during the pump test, the fault cannot be providing a huge 11 12 impedence. And I will probably come back and say that several more times, probably in response to questions later 13

14 too.

Carbonate groundwater levels drop from the Muddy River Springs area they -- down to the far to the southeast here they drop almost 250 feet. These levels down in this area here at very, you know, south and east of the Muddy River Springs are about 200 feet lower than they are at the springs themselves. And that observation -- I mean, the fact that there's a fair drop in the carbonate aquifer at that point reflects some impedence in the carbonate, which probably is partly responsible for the location of the

Page 1518

water levels at different wells from Muddy River Springs in 2

EH-4 in the far right up to CSVM-4. And these are water

levels before and after the pump test period. And the 3

profile, first off, it demonstrates the flatness of the 4

potentiometric surface. You can see an almost 20-mile area there where the water level varies from 1820 to about 1814 --6

or 1813. And during the aquifer test, the level there 7 8

consistently dropped about two feet.

Further north of CSVM-4, the groundwater level change was less than a foot. And further north, the carbonate water levels are about 200 feet higher. This is off of my graph. But carbonate water levels continue up for about -- they're about 200 feet higher. And that definitely reflects the fact that there is transmissivity in northern Coyote Spring Valley is lower and as reflected by the steeper gradient. And also inflow to Coyote Spring Valley from Pahranagat or Delamar Valley. It flows through the lower transmissivity area -- It flows through this lower transmissivity area to reach southern Coyote Spring Valley and well MX-5 and of course then the Muddy River Springs area. The point being that inflow to Coyote Spring Valley, I

21 mean, there may be a lower transmissivity in the north. It's

22

still passing all of the water needed for the Muddy River 23

Springs area. 24

And then if we consider discharge from Warm 1 Springs West, it decreased from the nineties, you know, 2 through the mid-2000s from about four to 3.4 CFS. It 3 upticked in 2006 and then during the wet period. And then 4 during the Order 1169 pump test it dropped to almost 3.2 CFS. That was a decline of about nine percent during the period of 6 the pump test and it recovered just a little bit more than 3.4 CFS since 2012. 8

Since 2016, it has decreased a little bit and become steady at -- steady or slightly decreasing at less than 3.4 CFS since a brief increase that occurred during the wet 2017.

I would point out that although the data is provisional, yesterday morning the flow at Warm Springs West is 3.23 CFS. I checked it. Very close to that 3.2 CFS. I mean, obviously it's provisional and I don't know how much they've changed over the years until they go finalize them. But it's been 3.23 CFS for over a week. So it's pretty steady right now.

At the Pederson Springs, the flow is about half of what it was in the mid-2000s right now there from this first part of the graph to the second part. Much of the decrease occurred during the pump test. There was some minor recovery especially in the Pederson Springs, especially at

And then, also, whatever groundwater flow originates in Kane Springs Valley probably is limited to local recharge, but it does come in to Coyote Spring Valley at some point. It has to come in to it. And so there's evidence that pumping in Coyote Spring Valley will draw flow from Kane Spring Valley, there's no limit to -- there's no

reason to not consider it, quite honestly.

And I also mention here no reason to separate out northern Coyote Spring Valley. I can't remember which report I read that suggested that maybe Coyote Spring Valley should be considered differently. But the fact that all of the flow in Pahranagat Valley and Delamar Valley has to flow through that area, there's really -- and intercepted, it's going to have effects in southern Coyote Spring Valley, you know, similar to pumping down there. There's really no reason to separate out northern Coyote Spring Valley from the flow -the Lower White River Flow System.

Here's the conclusion that I think stems from this. And I'll come back to it several times in the remainder of my presentation. But going forward in to the future there can be no carbonate pumping if the objective is to keep flows at Warm Springs West and at all of the springs at the level that is necessary to support the Moapa dace and quite honestly the water rights to further downstream.

Page 1520

Page 1522

Pederson Springs. At Pederson Springs the flows had declined about 63 percent. And at Pederson East Spring about 45 2 percent during the test. And the USDOI 2013 report they 3 found that had the rate of drawdown continued, Pederson 4 Spring would have gone dry in about a year and a half. And that Pederson Spring East would have gone dry in another two 6 7 and a half to three years had the pumping as observed during the pump test had continued. 8

Kane Springs Valley should be added to the Lower White River Flow System for management purposes. That's based on there being high or at least relatively high transmissivity up through Coyote Spring Valley to at least CSVM-4.

The fact that the groundwater level in KMW-1 is just four to five feet higher than at KMW -- than at CSVM-4. I apologize. That looks like a minor typo. That second KMW-1 should say CSVM-4. And that is on slide 16.

The groundwater level lowering that occurred during the pump test did propagate in to Kane Spring Valley. It's pretty obvious from the water level data that it did. There are large expansions of carbonate rock with no structure hydrogeologic barriers. I'm not saying there's not a structural -- that there's not a fault there, but it

doesn't appear to be having much of a hydrogeologic impact.

The figure I have here is actually I think was prepared by the State Engineer for one of the Lower White River Flow System meetings last summer or two summers ago and it kind of shows, you know, the different trigger points for consultations and things that occur as a part of the MOA. But, you know, Warm Springs flows almost 3.2 CFS during the aquifer test. And at the current much, much reduced levels, they're at 3.23 CFS, and for reasons I will

go in to will probably continue to go down.

The Muddy River Decree, the 1920 Muddy River 10 Decree, has a total water rights of about 37,000 acre-feet 11 per year. The Muddy River near Moapa is downstream of all 12 the area springs and downstream of some irrigation diversions. Based on the gage that this discharge from Eakin 14 in 1964 estimated discharge from the Lower White River Flow 15 System to be about 36,000 acre-feet per year from all of the 16 springs that supply the Muddy River Springs area.

From about 1943 to 1960, the recorded flow was just less than 34,000 acre-feet per year. After 1960, it decreased to less than 24,000 acre-feet per year. And after the wet year in 2005, it began to increase and reached a little over 30,000 acre-feet per year. And it's been relatively steady just above 30,000 since then.

The trends there are likely due to groundwater

23

increase -- the increase began in 2005 due to the high precipitation year. It also should be noted that in 2010 6 there was a fire somewhere in that vicinity that Southern Nevada Water Authority identified as increasing, you know, eliminating about a thousand acre-feet of a evapotranspiration. So that would have had some effect on 10 11 this rising limb at the gage. And then -- But it's important to realize that the flow hasn't met the requirements of the 12 13 decree, almost it's entire -- almost since 1940.

The pumpage shown -- Now I'm going to talk a 14 15 little bit about pumpage. This graph shows pumpage in the both total pumping and total carbonate pumping both on a 16 17 monthly and on a 12-month average basis. And this is for the entire Lower White River Flow System not -- as defined by the 18 19 State Engineer. It has -- It has been -- There have been 20 variable sources. Monthly pumpage, you know, it varied a fair amount between 2000 and 2010 from around 9600 to 12,000 21 acre-feet per year. A total carbonate pumping varied from 22 about 4800 to 7200 acre-feet per year. And that, of course, 23 increased a lot during the 1169 aquifer test. After the 24

It generally -- You know, until -- until the pumping 1

captures, you know, until pumping equals captured discharge, 2

it's going to continue removing water from storage. And

that's evidenced by the general downward trend in water 4

levels even since 2016 around the aquifer. Drawdown will 5

only stop when the pumpage equals captured discharge and 6

7 induced recharge or inflow.

The carbonate system has not yet reached any semblance of an equilibrium for any rate of pumping. And with carbonate pumping it's only a matter of time before the spring flow decreases significantly or is completely lost. And that is due to pumping in the carbonate capturing -capturing the discharge.

And I circle back to my recommendation a few slides ago. The Nevada State Engineer should not allow carbonate pumping in the Lower White River Flow System to prevent those further decreases.

One of the questions we were asked to consider is the conjunctive use of alluvial wells. And I did have a couple of statements here. I think the carbonate water discharges in to the basin fill and supports the basin fill aquifer. Secondary recharge, which is once the water discharges from the carbonate springs, it does support alluvial water levels. So that secondary recharge, which

Page 1524

Page 1526

- test, it has dropped to just over 8,000 acre-feet per year. 1
- Since 2015, alluvial pumping has dropped to close 2
- to zero, as can be seen in the far right side of this 3
- particular graph. And it's the gray. The gray line 4
- represents Muddy River Spring area alluvial pumping. The 5
- blue represents Coyote Spring Valley carbonate. And the 6
- reddish is Muddy River Spring area carbonate pumping. 7 8

Carbonate pumping in Coyote Spring Valley began in 2005. So the flow in the carbonate system upstream from the springs has only been pumped for 14 years. I think that when considering the trends at EH-4 and considering the trends in the springs, it's important to realize that pumping

hasn't been going on for all that long. 13

> Muddy River Spring area carbonate pumping has been steady or slightly decreasing at a range from 100 to 400 acre-feet per month. And, of course, the production is mostly from Arrow Canyon wells. And during the aquifer test, Coyote Spring Valley carbonate pumping dominated pumping from the carbonate aquifer. But since then it's been about half that in the Muddy River Spring area.

Then carbonate pumping mostly removes water storage as evidenced by the general downward trend around the carbonate aquifer. That can be seen in this graph, which I -- which is the source of the graph is USDOI report 2013. probably includes both direct spring flow and maybe even some

2 irrigation recharge, supports the basin fill water levels.

Some basin fill pumping could be acceptable in

the Muddy River Springs area because as secondary recharge 4

the water has already been used in the spring channels that 5

6 support the dace.

7 I've also suggested, and I don't have a

recommendation for the amount, but it's possible there could 8

9 be some basin fill pumping in Coyote Spring Valley that could

be sustainable. I think there's very little there now.

There's two wells in the far north end. I say that because 11

12 basin fill and carbonate water may be separated, like I

suggested before, by potential disconnect. 13

But before any water really starts being pumped from that area, there needs to be some study. I'm recommending more -- we have a better understanding of that potential connectivity so that you're not actually reducing water that would otherwise flow in to the carbonate. And I think there's a good possibility it doesn't. But if it does ultimately support carbonate groundwater, I don't think it could be pumped. I mean, it shouldn't be pumped. But that is subject to a recommendation for additional study.

And then in conclusion for my direct evidence, 23 there is a broad highly transmissive carbonate aquifer 24

Min-U-Script® (7) Pages 1523 - 1526 **Capitol Reporters** 775-882-5322

Page 1530

Page 1527

12

13

14

15

16

17

- underlying Coyote Spring Valley, Muddy River Springs area, 1
- Garnet Valley, Hidden Valley, California Wash. The aquifer 2
- is interconnected so much among basins that it's necessary to 3
- manage groundwater through all basins as if they were part of a whole basin. 5
- And then jumping down to my third conclusion 6
- here. Kane Springs Valley should be added to that or be
- managed as part of the Lower White River Flow System based 8
- upon the observed relative flat carbonate water level 9
- extending in to that valley and the response of Kane Spring 10
 - Valley wells to pumping.
- There seems a high likelihood that water pumped 12 13 from Kane Springs Valley would quickly contribute to the
- depletion of carbonate aquifer in Coyote Springs Valley and 14
- Muddy River Springs. But, of course, there's not been any 15
- pumping and so that is -- I mean, that's sort of applying 16
- 17 reverse logic. If you're affecting Kane Springs by pumping
- in Coyote Springs, it makes sense that the effect would go 18
- the other way. 19

11

- 20 Back up to conclusion number two. The Nevada
- State Engineer should not allow any pumping of the carbonate 21
- aquifer to avoid continued decrease in spring flow in the 22
- Muddy River Spring area. Again, this conclusion results from 23
- the direct correlation of carbonate pumping and carbonate 24

- what I meant to say. No, I'm just kidding. 1
- I've outlined the rebuttal section of my 2
- presentation by stakeholder. Detailed reference should be 3
- made to my rebuttal report, which is one of the exhibits
- we've provided. And because I have no chance at all of 5
- covering all of the rebuttal that I've written about in this 6
- 7 presentation and I would also note that there's an overlap in
- rebuttals for the various -- for the various stakeholders
- because it all -- we're all interpreting the same data. It's 9
- just a matter of different variations and different 10
- conclusions on that interpretation. 11

My first bit of rebuttal is Coyote Springs is on the Coyote Springs investment report and specifically I believe that the estimated recharge from the Sheep Range is inaccurate. And that is because of, as I'll explain in the next couple of slides, that is because of the way they did the calculations.

First off, you can see they divided the Sheep 18

Range in to 15 different basins that come off the east side 19 of the Sheep Range. And this table on the right side here 20

show -- And both of these figures are from the Coyote Spring 21 investment report. It shows how they applied four different 22

23 recharge estimate methods to these 15 different sub-basins.

24 Three of those sub-basins are in Hidden Valley and 12 of them

Page 1528

- water level and spring discharge decline. 1
- Until all pumping is captured from spring 2
- discharge, carbonate water levels will continue to decline. 3
- And as we've seen -- And I'll discuss a little on the 4
- rebuttal section of my presentation -- that linear 5
- relationship between EH-4 and spring flow definitely shows 6
- 7 that the, you know, shows that spring flow will continue to
- decline along with that. And then preventing carbonate 8
- pumpage -- Maybe I should say may also be necessary for
- protecting downstream water rights on the Muddy River. 10
- Some basin fill pumping could occur without 11 significantly affecting the spring flow. A preliminary 12
- estimate is difficult. But the pumping that occurred prior 13
- to significant carbonate pumping were about 4,000 acre-feet 14
- per year seems a decent level to start. 15
- But it's also important to, you know, to verify 16 that doing so is not going to affect the Muddy River flow 17
- rights. 18
- And then I have one slide here that shows the 19
- references I've been using and gives me the opportunity to 20
- take a breather before I start my rebuttal. 21
- Q. Dr. Myers, you've gone 45 minutes. 22
- A. I'll finish, no problem, in two hours. Thank
- you. That is unless I have a slide that I can't remember

- are to Coyote Spring Valley. And, for example, you can see
- the Maxey -- the original 1949 Maxey-Eakin method applied to
- 1966 Eakin precipitation that I'll talk about. You know, 3
- I'll mention that a little bit later. And then we have
- Maxey-Eakin apply to 2015 PRISM data. And then Nichols and 5
- Epstein both from 2001, 2004 also applied to 2015 PRISM data. 6
- Nichols and Epstein methods are based on the 7
- methodology of Maxey and Eakin 1949, by which I mean they 8
- 9 utilize -- they estimate recharge which is based on a
- 10 coefficient that is a percent of the total precipitation
- volume which falls within a precipitation interval in a 11
- 12 basin. For example, if you want to consider the greater than
- 20 inch per year zone which has a 0.25 coefficient, if 13
- whichever method you use for estimating precipitation tells 14
- you that there was 10,000 acre-feet of volume of 15
- precipitation in that zone, the methodology would then tell 16
- 17 you that 2500 acre-feet of it would become recharge at some
- point within that basin. 18
- Unfortunately, the application of the methods 19
- 20 showed a misunderstanding of this methodology. The methods
- 21 were originally, all of these methods, all four of them, were 22
- derived by equating precipitation bands within entire basins to discharges from the entire basin. And that is an 23
- important assumption. Because when you consider an entire

subdivisions.

It is not -- I mean, the method in general does not consider specific geology. For example, precipitation 6 runs off granitic soil or maybe it runs off granitic outcrops 7 and much off of volcanic rock but it infiltrates carbonate 8 rock. And the method does not specifically take that in to 9 account. But by virtue of considering basins that have a 10 mixture of outcrops, it blends them. Because of the 11 Maxey-Eakin method and the other -- and then these more 12 13 recent similar methods where we're derived using outflow estimates in precipitation zones for entire basins, it's not 14 15 appropriate to estimate your recharge for small sub-basins, and thus the subdivision of the Sheep Range it introduces a 16 17 level of granularity, if you will, to the analysis which is not appropriate, like I showed here of all of these 18 broken-down basins. These methods are not intended to 19

I would also say the method depended on using the same source of precipitation estimates as was done for developing the methods. For example, it's not appropriate to

estimate recharge for each of those individual little

does support functioning ecosystems. There's no evidencethat it could be feasibly captured.

3 And then, second, the report makes no showing

that any of the estimated amounts of evapotranspiration isavailable for capture.

And then, third, the report doesn't consider down gradient water rights that could depend on some of that capture.

The ET in the hydrographic areas in the Lower White River Flow System, I mean, it supports functioning ecosystems including dense and moderate meadowland, woodland, shrub land vegetation as well as agriculture. And includes this table, which is from, I believe it's from the DeMeo, et al. report, which estimated ET for a variety of the -- for many of the valleys down there. And I include it because it did show the amount of ET that comes from different functioning ecosystems in the Muddy River Springs area, the California Wash area, et cetera. And thus showing that these are potentially valuable wetland ecosystems. And, thus, capturing that ET would effectively make those ecosystems go away or transition. Thus, the proposal to include all ET as available water to be captured is unsupported and should be rejected.

And, also, there's a claim that ET in Coyote

Page 1532

use Maxey-Eakin coefficients with PRISM-estimated rainfall as

2 described. The method of precipitation estimates were

3 considered more scientifically sophisticated. That doesn't

4 make the estimate better. I mean, I think experience has

5 shown that PRISM actually estimates a lot more precipitation

6 for a basin than some of the older maps do. And in using

7 PRISM with this methodology is fine as long as the

8 coefficients were estimated using PRISM.

Thus, my conclusion there is that the estimated recharge of 5,280 acre-feet is not accurate. I can't say whether it should be higher or lower based on this analysis. It just is not accurate and should not be given any -- and not be used for estimating how much flow or how much recharge there is on the west side of the Coyote Spring Valley.

Then evapotranspiration. CSI had said something in their report that was actually rather troubling when we read it initially. This report recommends and supports an initial estimate of groundwater available for appropriation should be based on capturing all evapotranspiration and groundwater outflow from the Lower White River Flow System. But there's no evidence that all ET could possibly be captured. And in doing so there is no consideration that this ET supports functioning ecosystems. There's no evidence

that all ET from this extensive groundwater system that it

Page 1534

1 Spring Valley is a thousand acre-feet per year. And it was a

2 reference to Thomas, et al., 2001. The problem is that

3 reference and neither the reference nor Stetson says where

4 would that ET occur. I mean, I've been in Coyote Spring

5 Valley. I do not know where you're going to found a thousand

acre-feet of potential evapotranspiration out there. But
 I'll point out that this table, DeMeo, et al. which I pulled

from the Coyote Spring investment report, shows the estimated

ET from Coveta Spring Wellow to be zero

9 ET from Coyote Spring Valley to be zero.

And, just the other thing to consider, in Coyote Spring Valley, the depth of the water in the basin fill is quite high. It's not going -- It's not capturing -- If there's much -- I guess there's a bit of very -- There may be a little shadscale that has a little tiny bit of evapotranspiration. But for all intents and purposes, the ET from the Coyote Spring Valley should be considered zero.

The next rebuttal is of the Moapa Band of Paiutes report. And I list the name of the report there, which I refer to throughout as the Johnson-Mifflin report.

As I went through before, there is no evidence of a 20-year drought. There was no direct analysis of climate data in that report. So there was really no way to make a conclusion of using just climate data that we were in a drought period.

Min-U-Script® Capitol Reporters (9) Pages 1531 - 1534 775-882-5322

Page 1535

And then, as I stated before, the Climate 1

Division 4 data showed, you know, does not provide evidence 2 of drought. 3

Discharge from the Big Muddy Spring increased by 4 one CFS from 2010 to 2014 as shown on the right side of this 5 6

But Johnson-Mifflin claimed that the flow

7

22

increased during the aquifer test. And increase after the 8 test demonstrates a climate dominance rather than pumping as 10

a forcing agent for water level change within the MRSA and perhaps a complete absence of Order 1169 pumping effects.

The problem with that analysis is that it ignored the fact that there was a burn of over 600 acres which could have contributed a great deal to the failure to see pumping effect in the Big Muddy Springs.

The 40 -- Johnson-Mifflin estimated 40,000 acre-feet of flow from the Lower White River Flow System to the Las Vegas Valley. And I would just initially say that it should be given no credence because it is highly dependent on undocumented, unverified assumptions.

It was based on a Darcy's law analysis using a 21 transmissivity that was based on a report published for a 22 pump test a long time ago, back in 1992. I did not see that 23 24 report. Perhaps the State Engineer has had that report. But

System to the Las Vegas Valley. 1

And then, plus, there was really no evidence 2

given that the water is available to begin with. I mean, it

4 was based on flow path from a groundwater model. And if

memory served, I'm not sure where there would have been 5 6 enough water to support the Muddy River Springs of all of the

7 water that was shown in that model ran down in to the Lower

White River Flow System. Excuse me. In to the Las Vegas 8

Valley Wash. 9

18

19

20

21

22

23

24

And then a correlation analysis in the

Johnson-Mifflin appendix four does not prove correlation between the EH-4 levels and pumping at the Arrow Canyon wells. This table is from that appendix. And I've circled the T-value and the P-values for the coefficients that resulted from that analysis. And I'll point out that only the intercept and lag zero have statistically significant coefficients at the .05 level. Everything else is much higher than that, which suggests that, if anything, the average -- And, I mean, if this means anything, it basically means that the current pumping is most responsible for the -is most responsible for the drawdown. But it also points out that -- The report also pointed out that eight percent of Arrow Canyon well pumping is captured at the springs, which adds further credence to my concept earlier that continuing

Page 1536

Page 1538

I was unable to review it. 1

different number.

I also found -- And just yesterday, Dwight Sawyer with the City of North Las Vegas, presented transmissivity values in the area for which this flow would occur. I recall them being in the hundreds to low thousands as opposed to, I think, 300,000 for the transmissivity being used by Johnson-Mifflin here. So a great deal of difference in transmissivity. I mean, just one order of magnitude

There was also a lot of talk about the anisotropic, the form of the model, anisotropic, that somehow in this area the transmissivity along the flow path would be ten times greater than the transmissivity transverse to the flow path. I never did see evidence for that ten-to-one ratio.

difference would turn 40,000 in to 4,000, which is a hugely

And I guess the other thing that I would point out is that yesterday Sawyer, with Dwight Sawyer, also pointed out that that water, you know, to the south end of this flow path was actually, the water levels were a little bit higher than they were further to the north. So, for this to actually occur, water would have to go uphill.

So I believe that there's really no evidence for 23 a 40,000 acre-foot per year flow from Lower White River Flow to pump from the carbonate aquifer is pulling from storage which will eventually capture spring flow.

And I'm not sure what -- I'm curious what the 92 3 observation -- I'm not sure whether this meant 92 weeks of 4 data or whether it meant daily data for 13 weeks. If it was 5 the latter, the data was so -- wasn't very independent as is 6 necessary for statistical analysis. 7

The Lincoln Vidler report, the primary argument 8 9 is that Kane Springs Valley should not be added to the Lower 10 White River Flow System.

Lincoln County present water level data --However, they presented water level data that supported managing Kane Springs Valley as part of Lower White River Flow System. They did this graph here is adapted from the Lincoln Vidler report, Figure 3-9. And it clearly shows, you know, there's a long-term decline in both of them in parallel, a decrease in both of the wells just after the pump test.

There is not a significant difference in the delay either. I mean, there's a delay at the start. But between the two wells, there's not a huge different -hugely -- a huge difference in the delay. And then both can go on to continue their decline after a brief recovery.

So, to my mind, this is just further evidence

Min-U-Script®

Capitol Reporters 775-882-5322

(10) Pages 1535 - 1538

Page 1539

that Kane Springs Valley should be managed as part of the 1 Lower White River Flow System. 2

And I think it's -- there is a bit of lower

3 transmissivity between the point of the pump test and the mouth at Kane Springs Valley. There was about a 40-foot increase in the profile going up Coyote Springs Valley. The 6 additional lag would be -- The additional lag would be partly due to that. Now, yesterday, we actually heard some comments 8 that physics should make recovery commence as fast as the 9 initial drawdown. I would beg to differ with that comment. 10 Because physics would make -- that concept would make --11 would apply in an incident aquifer. But this very definitely 12 13 is not an incident aquifer. And indeed these are close to, these two wells are pretty close to the boundary. And it 14 15 would not -- it would not recover at the same time in all directions as was implied yesterday, I do not believe. 16

There was evidence presented that different geochemical data should show that these come from different areas or it's different segmented groundwater sources. So the groundwater from KPW-1 has total dissolved solids of about 774 milligrams per liter, which is a little higher than the groundwater at CSVM-4 at 682. I mean, but the fact that water from Kane Springs Valley is a little higher than that at Coyote Springs Valley is just evidence that it's starting

Kane Springs Valley is a completely separate flow system. 1

> And these flow paths along here, the blue one over to the 2

> west of highway -- to the west of the highway, for example,

4 is drawn to show similar temperatures.

What is -- The travel time between these two 5

points is probably many, many years, if not decades. I would 6 7 expect, if anything, the temperatures to decrease with that flow time, not be the same. I don't interpret these as being 8 the same flow path, necessarily. I mean, you're going to end 9 up with mixing out here. And rather than finding, you know, 10 connecting the dots of two wells or two wells that have the 11 12 same -- that have the same temperatures.

US Fish and Wildlife Service, I agree with almost everything in that report, except they argue for too much pumping from the Lower White River Flow System. They state that the average pumping of years 2015 through '17, which is a little over 9300 acre-feet per year, should be the long-term, allowable, you know, should be the long-term allowed pumping rate from carbonate and alluvial aguifers. The claim is that flows and levels were steady during that period. I, as I pointed out in several graphs a little while ago, that just isn't, you know, they are continuing to go down, and that's including during a relatively wet period, especially 2018 and '19.

Page 1540

23

24

6

7

to mix with water in Coyote Spring Valley. Because the other 1

wells -- I mean, wells further up gradient in Coyote Spring 2

Valley will probably or possibly have lower value. So what 3

you see is a bit of mixing. 4

17

19 20

21

else.

When I look at these tables, I don't see vastly different groupings of data. And in my experience over the years is things like TDS vary by 20 percent for reading the reading for no particular reason. So there is overlap between a lot of these readings.

And then there's also this discussion of flow paths through Coyote Springs Valley. And, for one, the water at KPW-1 has been shown to be the oldest at 29,000 years and the hottest at 136 degrees Farenheit of the wells in the area. And that is saying that, well, for one, if the water at that well originated in Kane Springs Valley as recharge, it should certainly -- it circulated very deeply. If it didn't originate in Kane Springs Valley, it means that we don't know where the inter-basin flow to that valley is coming from, because I haven't seen any evidence here that there's flow coming in to Kane Springs Valley from somewhere

But, once the water from KPW joins water in 22 Coyote Springs Valley, it begins to mix. And so the average 23 age is younger. So this does not stand out as showing that Page 1542

1 Although the flow briefly recovered to almost 3.6

2 CFS, the Warm Springs West flows have been decreasing since.

And that includes during a wet period. Most of the ongoing

carbonate pumping is removed from storage. And as it 4

5 continues, more will be captured from discharge, and spring

flow will continue to decrease to critical levels.

I mean, I guess the basic argument here is

primarily just based on first principles of water balance.

9 Initially, pumping -- pumping removes water from storage and

10 that causes drawdown. That drawdown either captures

11 discharge or induces recharge. And in this system with a

12 possible exception of some flow coming in up around Panaca --

I think someone mentioned that. I don't remember who. 13

Actually I think it was Fish and Wildlife. As long as the 14

pumping rate exceeds the rate of captured discharge, water 15

levels will continue to decline. It's not a matter of if but 16

when the pumping the carbonate aquifer fully captures 17

discharge from the springs. And that may ultimately result 18

in spring flow below critical rates.

20 National Park Service they presented simulations that were completed by Tetra Tech that considered several

21 different pumping scenarios with basically different 22

locations of pumping but they use the same total pumping 23

rate. I really wish they had used about 10,000 acre-feet per 24

Min-U-Script® (11) Pages 1539 - 1542 **Capitol Reporters** 775-882-5322

19

Page 1546

Page 1543

year less than that on these scenarios just to show how long it might take. 2

But, I mean, the differences among those 3 scenarios were during the initial years. The only point I really want to make here is that there was not a great deal of difference in the long term between moving this amount of 6 pumping around the Lower White River Flow System and so there's really no outcome -- I mean, the lack of difference 8 among the outcomes presented by the Park Service show 9 evidence that there is not some perfect scenario that would 10

11

12

13

14 15

16

17

18

19

20

14

allow pumping to continue at a much higher rate. And then, finally, a couple of words about Southern Nevada Water Authority's presentation. They showed that using the same data that I had used in my original report, they showed no significant climate trends since 1895. And they pointed out that since 2016 heads in the carbonate aquifer and discharge measured at Pederson Spring and Warm Springs West have declined. I mean, SNWA's analysis supports the concept that any carbonate pumping anywhere in the Lower White River Flow System will lead to a decrease in critical

spring flow. 21 And I will quote from SNWA's report. In the long 22 term it is expected that any groundwater production from the 23 24 carbonate system within the Lower White River Flow System

equilibrium. The relationship shows that pumping is still 1

removing groundwater from storage. The light blue here is 2

showing that as pumping continues, over half of the water by 3

4 SNWA's estimate is removed -- is being removed from storage.

And, as that is removed from storage, it continues to lower 5

the groundwater levels. And the bottom graph here simply 6

7 shows the relation that they had provided of the water level

at EH-4 and discharge at Warm Springs West. And as we get 8

down -- And it's a very linear relationship at this point. 9

And it shows that as the head continues to go down, so will 10 the flow rate. And, thus, I believe the analysis here does 11

12 not support the recommendation of 4,000 to 6,000 acre-feet

13 per year can be developed from the carbonate aquifer. 14

And then my last slide is just a quick little

reference to the Nevada Energy rebuttal report, which basically states that, you know, recent water levels are steady. And I guess I would just say I kind of differ with that because we're drawing a straight line through some data here at the very end of the -- at the very end of the -- Is

that EH-4? Yeah -- it's right at the end of the EH-4 graph 20

when really we should be drawing from the same time of year 21 to the same time of year. It's just a minor interpretation 22

23 of what we see here. But I believe that really, as I've

24 shown on several previous graphs, that it's not -- that we

Page 1544

15

16

17

18

19

will ultimately capture discharge to the Muddy River Springs

area, e.g. spring discharge, subsurface inflow to the 2

3 alluvial reservoir, and consequently, Muddy River Spring flow

because of the high aquifer diffusivity and hydraulic 4

connectivity throughout the flow system and because the MRSA 5

constitutes a majority, if not all, of the discharge from the 6

flow system. I agree with that totally. 7

However, SNWA recommended 4,000 to 6,000 8

acre-feet of carbonate pumping based on the relationship

between Warm Springs West flow and Muddy River Spring area 10 flow. And this was a table that I have presented to show 11

that the Muddy River Springs area discharge at several 12

different white -- west -- Warm Springs West discharge rates. 13

And I believe that these are based upon an

assumption that the system is at steady state, when previous 15 evidence has shown the system is not at steady state. So 16

while this may seem like an appropriate estimate for right 17

now, as the water levels go down -- And we're already at 18

3.23, that's if indeed the provisional data is correct -- it 19

20 is suggesting that this estimate based on steady state

conditions will allow ultimately the springs to fall below 21 critical levels. 22

And then the Figure 6-3 from SNWA's report shows 23

very direct -- very specifically that the aguifer is not at

1 can't say it's steady but that it is going down.

And, with that, I've finished my slide 2

3 presentation.

MR. DONNELLY: Thank you, Dr. Myers. 4

We have nothing further for our presentation. 5

HEARING OFFICER FAIRBANK: So that leaves you 6

7 about 46 minutes. Do you wish to reserve that time for

redirect? 8

9 MR. DONNELLY: We'll take -- Yeah, we'll hold on 10

HEARING OFFICER FAIRBANK: Okay. Great. Thank 11

16

you. 12 At this time we'll go ahead and open it up for 13

cross-examination. And we'll start with Coyote Spring 14

Investments. 15

And, for the record, the division of time for

today is seven minutes. 17

MR. HERREMA: Thank you. 18

CROSS-EXAMINATION 19

20 By Mr. Herrema:

21 Q. Good morning, Dr. Myers.

Good morning. 22 A.

Q. Brad Herrema on behalf of CSI. I wanted to start 23

with some questions on the Sheep Range recharge estimates.

Min-U-Script® (12) Pages 1543 - 1546 **Capitol Reporters** 775-882-5322

Page 1547

- 1 A. Okay.
- 2 Q. Did you review CSI's entire July 3, 2019, Order
- 3 1303 report?
- 4 A. I think I reviewed most of it, yeah. I mean,
- 5 yes, I did review the report.
- 6 Q. Do you know which method Stetson relied on to
- 7 recommend the 5,280 acre-feet per year of recharge from the
- 8 Sheep Range?
- 9 A. If memory serves, it was sort of a blend. It was
- a middle one. It wasn't the highest one. I know that. It
- 11 was -- I don't remember specifically which one it was, no.
- 12 Q. The Epstein method evaluated both the Maxey,
- 13 M-a-x-e-y, Eakin, E-a-k-i-n, method and the Nichols method
- and developed a new model using algorithmic optimization and
- 15 created four different recharge zones. And there's a table,
- 16 it's Table D-4, which supports the report. And it indicates
- 17 that the Epstein method was used to estimate recharge and two
- 18 coefficients of recharge were used. 1.9 percent for mountain
- areas with greater than -- at greater than 6,000 feet that
- 20 receive fewer than ten inches of rainfall and 4.9 percent for
- 21 mountain areas that receive between ten and 20 inches of
- 22 rainfall. Does that sound familiar?
- 23 A. That does sound familiar. But it doesn't take in
- 24 to account the different geologic differences nor the fact

- 1 Spring Valley by elevation?
- 2 A. I don't remember it by number. I would have
- 3 to -- I would have to look at it right now to verify that I
- 4 specifically looked at that. I assume that I did because I
- 5 reviewed the report. I don't remember what Figure 15 is.
- 6 Q. Are you aware whether those discrete basins that
- 7 Stetson used to calculate recharge were used for accounting?
- 8 A. Used for -- I'm sorry. For accounting?
- 9 Q. And that recharge bands were actually used to
- 10 develop the amount -- the estimated amount of recharge?
- 11 A. Recharge bands within each sub-basin, I presume?
- 12 Q. Throughout the entire area.
- 13 A. By -- By -- You mean throughout the entire area
- meaning just the east side of the Sheep Range?
- 15 Q. Correct.
- 16 A. But by 12 different sub-basins.
- 17 Q. Did you review the text on page 40 of the Stetson
- 18 report that states if the Maxey-Eakin related methods
- 19 investigated in our analysis are ignored since they rely on
- 20 older precipitation maps and use runoff coefficient that
- should not be applied to newer rainfall maps, then the range of recharge in Coyote Spring Valley is between 5,280
- 23 acre-feet and 7,380 acre-feet per year. And we suggest the
- lower value be used for sustainability planning?

Page 1548

Page 1550

- that it should consider an entire basin.
- 2 Q. Okay. Do you believe that Epstein performed an
- 3 independent analysis of recharge zones or do you believe that
- 4 the Epstein recharge is only based on the 1949 Maxey-Eakin
- 5 methodology as was stated in your rebuttal slide?
- 6 A. I did not review Epstein's original report for
- 7 this -- at this time. I read it ten years ago. And it's a
- 8 similar methodology to Maxey-Eakin. I believe that he -- I
- 9 believe that he did consider basin discharge and --
- 10 Q. So, if you believe it's based on Maxey-Eakin, how
- 11 do you explain why the recharge coefficients of Maxey-Eakin
- are more than three times of those that were used by Epstein
- as relied on by Stetson? For example, Epstein uses 4.9 percent recharge between 15 and 20 inches of precip and
- Maxey-Eakin suggests a 15 percent recharge rate.
- 16 A. Well, when I say it's based on Maxey-Eakin
- methodology, it means it's based on the same type of method
- 18 where you were estimating -- I mean you just described it.
- 19 It's -- What did you say -- 4.9 percent for that particular
- 20 zone. It's still a methodology of determining precipitation
- by zone. I didn't say they were the same regression
- 22 coefficients. I mean, they came up with new coefficients.
- 23 Q. And you've reviewed that Figure 15 of the CSI
- 24 July report that showed the recharge zones in the Coyote

- 1 A. I remember that, yes.
- 2 Q. And turning to the concept of precipitation, did
- 3 you review the entire period of record for the Division 4
- 4 rainfall data beginning in 1895?
- 5 A. I looked at it as part of rebuttal when I saw --
- 6 when I considered the SNWA's plot, yes.
- 7 Q. Do you believe it's important to review that
- 8 entire period of record to determine relative wet and dry
- 9 periods?
- 10 A. I believe I was reviewing -- I focused on the
- 11 most recent 30 years because that's pretty much what almost
- all of the reports here were referring to. And then we have
- no pumping data that goes prior to about 1990, so there's
- 14 nothing to really directly compare it to.
- 15 Q. Do you know what the average precip is for the
- period of record for the Division 4 rainfall?
- 17 A. Off the top of my head, no.
- 18 Q. If most of the years after 1990 were below the
- 19 long term, and that's the period of record average, would you
- 20 draw the same conclusion that there's no evidence of a
- 21 20-year drought?
- 22 A. If they were -- If -- Do you want to say that
- again? I'm sorry. The average after 1990 is less than the
- 24 long term --

Min-U-Script® Capitol Reporters 775-882-5322

(13) Pages 1547 - 1550

Page 1554

Page 1551

- 1 Q. Can I restate the question?
- 2 A. Sure.
- Q. Thanks. If most of the years after 1990 were
- below the long-term average, would you draw the same
- conclusion that there's no evidence of a 20-year drought?
- A. It depends on the significance of being below. I
- mean, if you're talking 01 inches, no. If you're talking a
- couple tenths of an inch in this area, yeah.
- Q. If most of the years after 2010 were below the
- long-term average would you continue to suggest a slight 10
- upward trend starting in 2010? 11
- 12 A. Well, based on my -- based on what I said about
- Palmer Drought Severity Index and the fact that I believe it 13
- is the rainfall that is the more important value. I mean it 14
- 15 shows an upward tick in the trend. I think you should ask
- that question again. Because I don't think I understood your 16
- 17 question.
- HEARING OFFICER FAIRBANK: Did he answer your 18
- 19
- MR. HERREMA: I had one question that follows up 20
- on the last couple. 21
- HEARING OFFICER FAIRBANK: I'll permit you one 22
- additional question and then you're done. 23
- MR. HERREMA: You haven't done that comparison 24

- 1 A. Yes.
- 2 Q. So what's the basis for your opinion that the
- EH-4 water level is continuing to decline at this time?
- A. Well, I mean, there's a trend from -- that is
- higher than that and that is slightly higher than that. I
- mean, the peak between 2015 and 2016 is slightly higher than 6
- 7 the peak in 2017. And, thus, there's a -- I mean, if you
- just look at the top -- But I'm also comparing it -- It's
- almost more obvious up here in UMVM-1 and it seems more 9
- obvious also in EH-5b, but you can see it in all three of 10
- them which are all very closely parallel. 11
- Q. Are you familiar at all with the pumping that was 12
- occurring during this time from the Arrow Canyon well? 13
- A. I believe it was just a similar -- similar to 14
- 15 what it's been through time.
- 16 Q. Okay. If there had been a reduction in Arrow
- 17 Canyon pumping in the last couple of years of your hydrograph
- would that influence your view on whether there is a 18
- continuing declining trend at this location? 19
- A. If there had been a decrease in Arrow Canyon 20
- pumping, I would have assumed that there should be a slight 21
- uptick in the flows and a slight uptick in the water levels, 22
- yes. 23
- 24 Q. Okay. On page 15 of your slides, you indicated

Page 1552

- though to see where the years after 1990 or 2010 fall in
- relation to the long-term average. 2
- THE WITNESS: With the long-term being from 1895? 3
- MR. HERREMA: Correct. 4
- THE WITNESS: No, I have not. 5
- MR. HERREMA: Okay. Thank you. 6
- HEARING OFFICER FAIRBANK: Next will be United 7
- States Fish and Wildlife Service? Seeing no questions. 8
- 9 National Park Service?
- MS. GLASGOW: No questions. 10
- HEARING OFFICER FAIRBANK: Seeing no questions. 11
- Moapa Band of Paiute Indians? 12
- MR. BERLEY: No questions. 13
- HEARING OFFICER FAIRBANK: Stating no questions.
- Southern Nevada Water Authority and Las Vegas 15
- Valley Water District? 16
- CROSS-EXAMINATION 17
- By Mr. Taggart: 18
- Q. Good morning, Dr. Myers. 19
- 20 A. Good morning, Mr. Taggart. We meet again.
- Q. Yes. Not as much time this time though. Could 21
- 22 you please turn to page nine of your power point slides. And
- on that slide I think that shows EH-4, the hydrograph for 23
- EH-4; correct?

- in your testimony that there was a lack of recovery after the
- pump test at some of these locations that are shown in this
- slide. Am I accurate in what you said there? 3
- A. Well, after the pump test -- These are the two
- Pederson Springs. I believe I said that Pederson East showed 5
- very little recovery because you don't -- if you -- I mean, 6
- 7 the Pederson Springs in blue went down and it did jump back
- up, whereas the Pederson East Springs show very -- I mean,
- there's a slight recovery, but it's very, very slight.
- Q. But not back to the pre-aquifer test levels? 10
- A. Oh, no. The pre-aquifer test levels are above 11
- .2 CFS and now they're below, generally below .15.
- 13 were at Warm Springs West gage, I mean in the last day, were,
- did you say 3.23 CFS? 15
- 16 A. That is correct.
- Q. And what's the basis of that statement? Where 17
- did you get that information? 18
- A. US Geological Survey water science center
- realtime flow data on the web. 20
- 21 Q. Okay. Were you present during the testimony of
- the panel for Lincoln County? 22
- 23 A. I think so, yes.
- 24 Q. Were you present during the testimony regarding

Q. Now, you indicated that recent flow measurements

Min-U-Script®

Page 1555

- 1 the resistivity data that Mr. Carlson presented?
- 2 A. Wait. Was that on Monday this week?
- 3 Q. I think it was yesterday, but I can't keep track
- 4 of the days. And I think yesterday was Tuesday.
- 5 A. Well, that was only rebuttal, I thought. I am
- 6 generally familiar with what you're saying, but I don't think
- 7 I was there for the whole testimony.
- 8 Q. All right. On page 23 and in your conclusions
- 9 there's one, two, there's a sub-bullet under your second
- 10 conclusion about until all pumping is captured from spring
- 11 discharge. So do you believe that spring flows at Warm
- 12 Springs West gage could continue to decline even if current
- pumping remains at current levels?
- 14 A. Yes.
- 15 Q. And why?
- 16 A. Because we have not yet captured -- Because
- 17 current pumping is not yet at a point of having captured all
- 18 of -- it has not yet captured itself from spring discharge.
- 19 It is still removing water from storage. I have shown quite
- 20 honestly best by the one slide that SNWA put forth that I
- 21 used.
- 22 Q. Okay. And then in your last bullet you indicated
- 23 during your testimony -- I just want to get you to clarify
- 24 what you meant by a comment that you made. Is it your belief

- 1 Q. But if it was pumped for industrial purposes
- 2 without -- that's fully consumptive, would that help you in
- 3 clarifying your estimate?
- 4 A. It's fully consumptive and it's in a different
- 5 basin where it's not going to recur in two of the rivers,
- 6 yeah, that would be a one-to-one.
- 7 MR. TAGGART: Thank you.
- 8 HEARING OFFICER FAIRBANK: Mr. Taggart, you're
- 9 out of time. Thank you.
- 10 Moapa Valley Water District.
- 11 CROSS-EXAMINATION
- 12 By Mr. Morrison:
- 13 Q. Good morning, Dr. Myers.
- 14 A. Good morning.
- 15 Q. I'm Greg Morrison with Moapa Valley Water
- 16 District. Looking at your slide 13 on your presentation, I
- believe you, like the district's expert, Mr. Lazarus,
- 18 examined the gradients throughout the Lower White River Flow
- 19 System?
- 20 A. I did.
- 21 Q. All right. And you were aware of Mr. Lazarus'
- 22 testimony on Monday that the gradient throughout the system
- 23 is remarkably flat?
- 24 A. It is Monday that I did -- I mean, two days ago

Page 1556

Page 1558

- that even if you moved alluvial pumping to carbonate wells --
- 2 Let's see. This last sentence -- that it's probably not
- 3 possible to increase that pumpage by transferring carbonate
- 4 rights to basin fill wells. Is it your view that that would
- 5 affect Muddy River decreed rights if that occurred, if moving
- 6 alluvial rights to carbonate rights occurred?
- 7 A. If you move -- I'm arguing there should be no
- 8 pumping at all from carbonate. So if you move alluvial to
- 9 carbonate, that's the opposite of what I'm suggesting. I
- 10 mean, I am suggesting that some alluvial pumping could
- 11 possibly continue if it's not completely reducing Muddy River
- 12 flows to the point of affecting downstream rights on the
- 13 Muddy River.
- 14 Q. And do you also agree with the conclusion that
- 15 others have reached that the pumping of alluvial wells in the
- 16 Muddy River Springs area captures Muddy River flow on a
- 17 one-to-one basis?
- 18 A. It captures it, but I've had this question of is
- 19 it consumptively used or was some of it possibly ending up
- 20 back in the Muddy River. In other words, you pump alluvial
- 21 water and you irrigate with it -- And I'm not an expert on
- where all of the irrigation is occurring. But some of it could end up back in the Muddy River as a result of return
- 24 flow.

- 1 that I did miss. But I agree with that statement, yeah. I
- 2 believe I have it in my report somewhere.
- 3 Q. That was my question. Thank you.
- 4 You recommend that carbonate pumping in the Lower
- 5 White River Flow System be zero; is that accurate?
- 6 A. To protect the spring flow, yes.
- 7 Q. You said you weren't here for Mr. Davis and
- 8 Mr. Lazarus' testimony on Monday, but did you review the
- 9 reports submitted by the district?
- 10 A. I believe so, yeah.
- 11 Q. Do you recall Mr. Davis' map that showed the
- location and the communities that this district serves?
- 13 A. I don't specifically recall that. I stuck with
- 14 mostly hydrogeology. And, admittedly, I didn't have time to
- 15 read every word from every report we have here, so I don't --
- 16 If you could show it to me though.
- 17 Q. That's understandable. Let's just say Mr. Davis
- stated the district serves approximately 8500 people,
- 19 including the reservation of the Moapa Band of Paiutes. Do
- you recall reading anything like that?
- 21 A. I don't recall reading it, but I'm familiar with
- 22 that fact. I mean, I do know approximately your service area
- or understand approximately where it's at.
- 24 Q. Okay. And you're aware that the district serves

Min-U-Script® Capitol Reporters (15) Pages 1555 - 1558 775-882-5322

Page 1559

- 1 its customers entirely using groundwater from the Arrow
- 2 Canyon wells?
- 3 A. Yeah, I think I know that.
- 4 Q. So I guess my question for you is what should
- 5 those 8500 people do for water?
- 6 MR. DONNELLY: Objection. That's not relevant to
- 7 the facts and data and interpretation that Dr. Myers
- 8 prepared
- 9 HEARING OFFICER FAIRBANK: Can you relate your
- 10 question to the four critical issues, the boundary, the flow
- 11 of --
- MR. MORRISON: We're talking --
- HEARING OFFICER FAIRBANK: I understand that this
- is a policy issue as far as I'm understanding your question,
- so if you can relate it to those four questions or how within
- that five catch-all it relates back to those four specific
- 17 questions, then --
- MR. MORRISON: I'll try.
- 19 Q. (By Mr. Morrison) Dr. Myers, did you see
- 20 Dr. Schwemm's presentation for the Fish and Wildlife Service?
- 21 A. Yeah, yes, I did.
- 22 Q. Do you recall seeing his slides detailing the
- 23 number of Moapa dace month over month and year over year?
- 24 A. Yes.

- 1 that?
- 2 A. Can you refer me to a section? I've got my
- 3 report right in front of me.
- 4 Q. It's on page 19.
- 5 A. Okay.
- 6 Q. Middle paragraph.
- 7 A. Okay. And what was the statement again? I'm
- 8 sorry
- 9 Q. That Kane Springs Valley pumping will reverse the
- 10 gradient and draw water from Coyote Spring Valley.
- 11 A. I say pumping in Kane Springs Valley that
- 12 decreases that gradient would decrease flow in the CSV. Do I
- 13 then say --
- 14 Q. About middle of the way, middle of the way down.
- 15 A. Well, I would say -- I would say that pumping in
- 16 Kane Springs Valley, considering it's only five feet higher
- than in Coyote Spring Valley, if it pumped enough could
- 18 reverse the gradient, yes.
- 19 Q. And did you -- how much pumping?
- 20 A. I don't know.
- 21 Q. So you didn't run any kind of model or do any
- 22 kind of analysis to support that conclusion; is that correct?
- 23 A. There is not sufficient transmissivity data with
- which to run a model of that.

Page 1560

Page 1562

- 1 Q. Do you remember seeing month over month and/or
- 2 year over year increases in dace numbers during certain
- 3 months and years?
- 4 A. Yes.
- 5 Q. Was carbonate pumping occurring during those
- 6 months of increase?
- 7 A. There was -- I mean, those increases -- there
- 8 were increases that occurred during the last 15 years. And,
- 9 yes, there was carbonate pumping, so yes.
- MR. MORRISON: All right. Thank you.
- 11 HEARING OFFICER FAIRBANK: Lincoln County, Vidler
- 12 Water Company?
- 13 CROSS-EXAMINATION
- 14 By Ms. Peterson:
- 15 Q. Hi, Dr. Myers.
- 16 A. Good morning.
- 17 Q. Good morning. Karen Peterson representing
- 18 Lincoln County Water District and Vidler Water Company. Did
- 19 you calculate drawdown to the Muddy River Spring area from
- 20 pumping Kane Spring Valley wells?
- 21 A. No.
- 22 Q. You indicate on page 19 of your original report
- that Kane Springs Valley pumping will reverse the gradient
- and draw water from Coyote Springs Valley. Do you recall

- 1 Q. Did you look at the information that Lincoln
- 2 County and Vidler have supplied with regard to their pump
- 3 test?
- 4 A. I don't recall looking at that, no.
- 5 Q. Do you have the URS report from 2006?
- 6 A. I didn't review the URS report.
- 7 Q. And then going to slide 23. The conclusion that
- 8 Kane Spring Valley should be managed as part of the Lower
- 9 White River Flow System. And you conclude with there the
- 10 high likelihood that water pumped from Kane Springs Valley
- would quickly contribute to the depletion of the carbonate
- aquifer in Coyote Spring Valley in the Muddy River Springs
- area. Do you see that?
- 14 A. Yes.
- 15 Q. And, again, did you run any kind of model or do
- any kind of analysis to support that conclusion?
- 17 A. The analysis I did was qualitative because we are
- 18 talking -- I mean, the overall results of the Order 1169 pump
- 19 test were that we were removing water from a carbonate well
- 20 that showed a drawdown of over about a five-basin area and
- 21 thus my analysis of what -- of Kane Springs Valley affecting
- 22 that is that -- is just another way of removing or preventing
- water from being in that five -- in that really high
- 24 transmissive zone in the Lower White River Flow System.

Min-U-Script®

Capitol Reporters 775-882-5322

(16) Pages 1559 - 1562

Page 1563

- 1 Q. And you were relying on the State Engineer's
- findings in Ruling 6254; is that correct?
- A. And as verified by almost every report here
- including the one I did.
- Q. Right. But your report -- I mean, you don't have
- any -- you didn't do any modeling or you didn't do any
- independent analysis. It's just qualitative you just said;
- 8
- A. I did independent analysis of the water levels 9
- and showed that we have a five-basin area, they all went down 10
- 11 as a result of removing water from the carbonate.
- 12 Q. And what was your analysis? Tell me what your
- analysis was. 13
- A. Observation of the water levels in comparison to 14
- 15 the carbonate pumping that occurred throughout Lower White
- River Flow System. Now, I am clearly qualitatively moving 16
- 17 that removal of groundwater from the carbonate to the mouth
- of Kane Springs Valley and assuming -- and at least making a 18
- 19 leap of logic that indeed that would have a similar effect.
- Q. In Kane Springs Valley? 20
- A. Because the flow has to come from Kane Springs 21
- Valley in to Coyote Spring Valley. The removal of flow --
- That interception of flow from Kane Springs in to Coyote 23
- Springs has to have an effect on the water levels in Coyote 24

- presenting today; is that correct?
- 2 A. Except we have the analysis of water levels at --
- at the well in Kane Spring Valley.
- 4 Q. Did you look at the water levels?
- 6 Q. What's the range, the period of time, that you
- looked at the water levels for the Kane Springs Valley well?
- A. I considered the hydrograph for its entire period
- of record. I believe it started in 2,000 -- What did someone 9
- say yesterday? It started -- It was constructed in 2,000 --10
- Is that the one that started in 2005? 11
- 12 Q. That's about right.
- 13 A. Okay. And data started being collected about
- 2007, I believe. And so that whole time period on it. 14
- 15 MS. PETERSON: Thank you.
- HEARING OFFICER FAIRBANK: City of North Las 16
- 17 Vegas?

19

22

- MS. URE: No questions. 18
 - HEARING OFFICER FAIRBANK: Seeing no questions.
- Georgia Pacific Republic? 20
- MS. HARRISON: No questions. 21
 - **HEARING OFFICER FAIRBANK:** Not seeing any
- questions. 23
- Nevada Cogeneration Associates? Seeing no 24

Page 1564

Page 1566

- 1 Springs. It's based on simple water balance. It doesn't
- matter whether you're taking it out as a part of pumping down 2
- at MX-5 or pumping up at KPW-1. 3
- Q. And you understand that in 2006 when the Kane 4
- Spring Valley applications of Lincoln and Vidler were
- approved that there was a proposal to put Kane Springs in to 6
- 7 the Order 1169 basin area and that was objected by the State
- Engineer. Do you recall that? 8
- 9 A. I was not -- I did not participate in that
- particular hearing. I am aware of what you said, however. 10
- And I would just point out that was before all of the pump 11
- test data that we're analyzing here. 12
- Q. Right. But after Order 1169 are you familiar 13
- with all of the pumping results and the State Engineer's
- determinations after Order 1169 and the 1169 pump test? 15
- A. I am encouraging the State Engineer to consider 16
- adding it. I am aware that the State Engineer has 17
- 18 included -- has recommended a certain number of basins. And I and a few other organizations -- us and a few other
- 19
- 20 organizations think KSV should be added. Q. Right. And there's no difference in the 21
- 22 information that the State Engineer had when he issued his
- Order 1169-A, which was a different State Engineer, Jason 23
- King, on December 21st, 2012, and the information that you're

- questions. 1
- Muddy Valley Irrigation Company? 2
- **CROSS-EXAMINATION** 3
- By Mr. King:
- 5 Q. Good morning, Dr. Myers. Steve King for Muddy
- Valley Irrigation Company.
- 7 A. Good morning.
- 8 Q. I would like to first turn to your slide 18. The
- fourth bullet down reads, trends at the Muddy River gage are
- likely due to surface and groundwater development upstream 10
- from the gage. Do you see that? 11
- 12 A. Yes.
- Q. And that Muddy River gage would be the -- Is that 13
- the Moapa gage?
- The gage that's presented here in this figure, 15
- yes. 16
- 17 Q. And then when you -- where it's written
- 18 groundwater development upstream from the gage, would that be
- -- include ground, alluvial groundwater development in the 19
- 20 Muddy River Springs area upstream from the gage?
- 21 A. Yes.
- 22 Q. Then turn to your slide, page 22, please. All
- 23 right. The second bullet. Some basin fill pumping could be
- acceptable in MRSA because as a secondary recharge the water

Min-U-Script®

Capitol Reporters 775-882-5322

(17) Pages 1563 - 1566

Page 1567

- 1 has already been used in the spring channels most important
- 2 for the dace. So this is related to the question just that I
- 3 raised on slide 18. This pumping -- It's impossible alluvial
- 4 pumping in the Muddy River Spring area upstream from the
- 5 gage. Could that be accurate?
- 6 A. Yes. Yes.
- 7 Q. All right. And this statement, would it be fair
- 8 to say that this is in relation to protecting the health of
- 9 the dace?
- 10 A. Our -- The primary focus of my client has been
- sufficient flow in the springs and Muddy River for the dace.
- 12 And so that's been my primary focus.
- 13 Q. Thank you. Then slide 23. And that's in
- 14 conclusion slide. And here with the last bullet, and it's
- talking about some basin fill pumping could occur without
- significantly affecting spring flow. I'd like to go to the
- 17 last sentence which reads, it is probably not possible to
- 18 increase that pumpage by transferring additional carbonate
- rights to basin fill wells because of the observed long-term
- 20 decline in Muddy River flows.
- 21 My next question in that regard is that I thought
- when you were testifying and answering a question I think
- 23 relating to the slide you used the term Muddy River flow
- 24 rights. I might have been wrong. So when you say Muddy

- 1 alluvial water. And if that was then take being to an inch
- 2 have industrial use which I believe he's referring to outside
- 3 the basin. Then there could be no return flow. I was just
- 4 opening up the idea that some pumping could have lead to
- 5 return flow. I honestly don't know whether there is any or
- 6 not in that area.
- 7 MR. KING: Thank you. I think I understand
- 8 better. And I think just for my understanding of some of the
- 9 permitted alluvial pumping rights were for recharge or power
- 10 plant uses which are in if not the spring area then directly
- 11 in to the Lower Meadow Valley Wash. Okay. Thank you.
- HEARING OFFICER FAIRBANK: Bedroc?
- MS. URE: No questions.
- 14 HEARING OFFICER FAIRBANK: Seeing no questions.
- Nevada Energy?
- MS. CAVIGLIA: No questions.
- 17 HEARING OFFICER FAIRBANK: Seeing no questions, I
- 18 will go ahead and open it up to Division of Water Resources
- 19 staff.
- 20 EXAMINATION
- 21 By Mr. Benedict:
- 22 Q. Jon Benedict for the record. Going back to slide
- 23 13, I think. On this legend you provide information about
- 24 hydraulic gradient in a different way than was provided

Page 1568

Page 1570

- 1 River flows I think you testified or in answering a question
- 2 of flow rates, would those be what I would characterize as
- 3 Muddy River decree rights?
- 4 A. Well, the Muddy River Decree, which I believe has
- 5 about -- is about 37,000 acre-feet. And I was referring to
- 6 Muddy River flows that was on those previous graphs. And
- 7 there's been a decline but not -- I mean, recently it has
- 8 come up. I mean, it's gone up and down based on a few
- 9 management changes.
- 10 Q. And then in answer to one of Mr. Taggart's
- 11 questions, I think it might have been his last question, and
- 12 I'm paraphrasing. I think Mr. Taggart asked if there was a
- 13 fully consumptive use of an alluvial groundwater well that
- 14 was pumped in the Muddy River Spring area would that affect
- downstream senior decree Muddy River rights?
- 16 A. At a one-to-one ratio was ultimately the question
- and ultimately what I agreed with, yeah.
- 18 Q. Well, thank you. The reason I wanted to clarify
- 19 that because I think that -- your answer I thought you might
- 20 have -- you might have brought in an analysis in a different
- 21 basin. But I think his question had to do with the Muddy
- 22 River Spring area. Would that be right?
- 23 A. My recollection of the question was that it was
- 24 pumping in the Muddy River Spring area of alluvial -- of

- 1 previously but you also state that the gradient is remarkably
- 2 flat throughout the area?
- 3 A. That's correct.
- 4 Q. You show a gradient above 50 feet and ten miles
- 5 or tenth of a percent. Does that refer to that flat gradient
- 6 or is that -- What does that refer to?
- 7 A. That is referring to going upstream from CSVM-6.
- 8 There's not a 50-foot drop -- There's -- Over 20 miles
- 9 there's only a couple of feet plus or minus. But when you go
- from 1820 to about 1870 up to CSVM-4, that's referring to --
- 11 to about a 50-foot drop over what appears to be about a
- ten-mile area, excuse me, a ten-mile distance. I should have
- labeled that better. I don't think I actually talked about
- 14 it when I was presenting.
- 15 Q. So that area that you consider to be flat is more
- the area around CSVM-6 through EH-4 and then --
- 17 A. Yeah. I mean, the relative flat area is from,
- 18 yes, from CSVM-6 to EH-4. That's the area that acts kind of
- 19 like a pond or a reservoir.
- 20 Q. Do you think the gradient between CSVM-4 and
- 21 CSVM-6 has any implication to how we consider management?
- 22 A. Part of the reason for showing that gradient is
- in a lot of basins -- 0.1 percent would not be considered a
- 24 steep gradient. It would really not be considered a steep

Min-U-Script® Capitol Reporters 775-882-5322

(18) Pages 1567 - 1570

Page 1571

- gradient in a lot of places I've worked over the years. But 1
- in contrast with this lower, you know, the lower 20-something 2
- miles, which is practically flat, it seems steep. It has a 3
- lower transmissivity than we have down here in what I'll call
- the pond there, yeah, which may be -- you know, then in the
- relatively flat area. But it's not an extremely high 6
- gradient and the flow -- and you do have flow coming from the
- northern part of Coyote Spring Valley through to, you know, 8
- down to the MX-5 area in the pump test area. And so you're 9
- going to continue to manage that. Because drawdown did 10
- propagate to CSVM-4, up that 50 feet. 11
- 12 MR. BENEDICT: Thank you.
- THE WITNESS: You're welcome. 13
- **EXAMINATION** 14
- 15 By Mr. Kryder:
- Q. Levi Kryder for the record. Dr. Myers, what do 16
- 17 you think the hydrologic boundaries of the Lower White River
- Flow System are? 18
- A. What the State Engineer has stated and plus the 19
- 20 Kane Spring Valley. I mean, basically all of Coyote Spring
- Valley, California Wash, Hidden Valley, Garnet Valley, and 21
- that portion of the Black Mountains, and then Kane Springs 22
- Valley. And I suppose we can argue whether there's some part 23
- of Kane Springs Valley to the north that's too volcanic to be

- levels. 1
- And I don't -- I've said, you know, there's no 2
- drought -- I don't think there's a huge drought effect going 3
- on here. There could be multi-decade or even multi-century 4
- changes that ultimately have to be considered going forward. 5
- I mean, a lot of this water is pretty old. It could be it's
- 7 recharge from a long time ago. Did that answer your
- question? 8
- Q. Yes, it did. And then early on you mentioned a 9
- distinction between alluvial pumping inn Coyote Spring Valley 10
- as an example of something that might be able to be developed 11
- 12 without long-term impacts to the Muddy River Springs area.
- 13 Do you have a similar feeling about alluvial pumping at other
- places within this Lower White River Flow System? 14
- A. Well, I mean, there is only alluvium --
- saturated -- I'm not even aware of saturated alluvium in 16
- 17 Garnet or if you're asking me about other parts of the
- system, I'm not aware of any in Garnet and Hidden, for 18
- 19
- Q. Yeah. Maybe I should just say wells that are not 20
- completed in carbonate where we observe very similar water 21
- level trends? 22
- A. I'm not -- I'm not aware of any, but I would 23
- 24 clearly -- if you don't -- if you didn't see a major impact

Page 1572

6

10

13

Page 1574

- part of it. But I would include Kane Springs Valley with
- what otherwise the State Engineer is considering as part of 2
- the Lower White River Flow System. 3
- MR. KRYDER: Thank you. 4
- **EXAMINATION** 5
- By Mr. Sullivan: 6
- Q. Adam Sullivan for the record. Dr. Myers, 7
- thinking about your characterization or your discussion about
- 9 steady state capture and observation that water levels are --
- continue to decline, I'm wondering if you think, would it 10
- follow that you could have some lesser amount of carbonate 11
- pumping that would reach a steady state at Warm Springs West 12
- that would be higher than 3.2 but somewhat less than 13
- pre-development flows at that point, so thereby protecting 14
- the dace? 15
- A. There may be a very small amount. But since 16
- we're already at 3.23 it would be very -- it would not be 17
- very -- it would not be very much. It would -- I mean, 18
- ultimately, if you go to complete steady state and you 19
- 20 neglect recharge and you neglect other changes in inflow
- either from Pahranagat Valley or from Kane Springs Valley, if 21
- 22 you neglect other changes like that, you could -- there would
- be a point at which the pumping equals the decreased 23
- discharge from previous steady state, from steady state 24

- 1 during the pump test -- I mean, part of my reason for saying
- this about the basin fill in Coyote Springs is that the basin 2
- fill seems to have substantially higher water levels than is 3
- in the carbonate and that's suggesting to me that there's not 4
- a whole lot of connectivity between the two and therefore 5
- that may be a separate source. But it would also be local recharge. And there's not a whole lot of, as I've said 7
- before, there's not a whole lot of local recharge in Coyote 8
- 9 Spring Valley either.
 - That requires more study, but it's just a
- suggestion that you might -- that the State Engineer might 11
- 12 consider for additional water in this area.
 - MR. SULLIVAN: Thanks.
- THE WITNESS: Sure. 14
- **EXAMINATION** 15
- By Ms. Barnes: 16
- Q. Earlier in your discussion you mentioned that 17
- you're recommending additional study to investigate the 18
- connection between alluvial and carbonate aquifers. I guess 19
- 20 what data or what information would you think is necessary
- for that recommended study. 21
- A. Well, if you're talking about Coyote Spring 22
- Valley, I think we would be doing a pump test that has 23
- monitoring wells both in carbonate and in basin fill. And 24

(19) Pages 1571 - 1574 Min-U-Script® Capitol Reporters 775-882-5322

Page 1575

- 1 also probably -- And this may have already been done, but
- 2 there needs to be some down-hole geophysics. Is there an
- 3 unsaturated or a very low transmissivity zone between the
- 4 saturated basin fill and the underlying carbonate? When I
- 5 see as much as 200 feet of difference, it's telling me that
- 6 there's a clay layer or something that does not allow much
- 7 water to flow in to the deeper carbonate aquifer.
- 8 And, thus, I don't know if it needs to have any
- 9 holes drilled or just a reconsideration of well logs. I
- 10 didn't do that, but that would be one way of getting at what
- 11 you're asking.
- MS. BARNES: Thank you.
- HEARING OFFICER FAIRBANK: Okay. We've been
- 14 going about two hours, so let's go ahead and take a
- ten-minute break. And we'll see everyone back here at 10:40.
- 16 Thank you.
- 17 (Break was taken)
- 18 HEARING OFFICER FAIRBANK: So we'll go ahead and
- 19 open it back up for cross-examination again. And Coyote
- 20 Spring Investments?
- MR. HERREMA: No questions at this time.
- HEARING OFFICER FAIRBANK: Seeing no further
- 23 questions.
- US Fish and Wildlife Service. Seeing no

- 1 asked for reports after the Order 1169 pumping test to be
- 2 submitted by all parties and that you yourself submitted a
- 3 report at that time?
- 4 A. Yes.
- 5 Q. Do you -- Just for the record, I -- Well, do you
- 6 remember when that was? Was it mid-2013, does that sound
- 7 right?
- 8 A. It was -- Yeah, it was just -- it was within a
- 9 few months after the pump test. I don't remember the exact
- 10 date.
- 11 Q. Okay. And in those reports are marked by the
- 12 State Engineer as Exhibits 245, 46, 47, 48, there's a CBD
- Order 1169 report in it's 248 and CSI has a report at Exhibit
- **14** 247.
- So at the time those reports were submitted was
- part of the data that's shown in that hydrograph in Figure
- 17 5-7 available, particularly the data that comes after 2013?
- 18 A. Well, it would depend. I mean, I don't remember
- 19 the exact date of that, but, yeah, there would have been some
- 20 additional data available.
- 21 Q. Okay. But, I mean, is it fair to say that we
- 22 have an additional six years of hydrologic data since all of
- those reports were submitted?
- 24 A. Oh, absolutely, there's six more years.

Page 1576

Page 1578

- 1 questions.
- 2 National Park Service?
- 3 MS. GLASGOW: No questions.
- 4 HEARING OFFICER FAIRBANK: Seeing no questions.
- 5 Moapa Band of Paiute Indians?
- 6 MR. BERLEY: No questions.
- 7 HEARING OFFICER FAIRBANK: No questions.
- 8 Southern Nevada Water Authority, Las Vegas Valley
- 9 Water District?
- MR. TAGGART: Yes, we have a couple.
- Good morning, Dr. Myers. For the record, Paul
- 12 Taggart for the water authority and then Las Vegas Valley
- Water District. I just have -- How many minutes do I get?
- 14 HEARING OFFICER FAIRBANK: Five.
- MR. TAGGART: Thank you.
- 16 CROSS-EXAMINATION
- 17 By Mr. Taggart:
- 18 Q. Dr. Myers, I put in front of you SNWA's
- 19 hydrologic exhibit, which I believe is SNWA Number 7, and
- 20 I've asked you to look at a figure there which is the Warm
- 21 Springs West gage hydrograph. Do you see that? It's in
- 22 Figure 5-7.
- 23 A. Yes, I see that.
- 24 Q. Okay. Are you aware that the State Engineer

- 1 Q. And is that data -- And I'm asking because
- 2 there's been this statement -- And I guess I'll ask you
- 3 whether you agree with it. But do you agree with the
- 4 statement that the only new evidence presented at this
- 5 hearing is the recharge calculations from Mr. Reich and the
- 6 resistivity data that was presented by Mr. Carlson for CSI
- 7 and Lincoln County. Do you agree with that statement?
- 8 A. Well, that's not the only new data. We still
- 9 have all the continued water level data and spring flow data.
- 10 Q. Okay. And what I want you to ask you about is
- 11 that particular data. Is that data important to understand
- 12 effects of climate on the water levels in the Lower White
- 13 River Flow System since 2019?
- 14 A. Since?
- 15 Q. I'm sorry. Since 2013.
- 16 A. It is important to -- If I understand your
- 17 question, it is important to understand the effects of
- 18 climate. I mean, yes, climate is a part of what we have
- since 2013. Neither extreme drought nor extreme wet. I
- 20 mean, neither extreme dry nor extreme wet. But that's why I
- 21 did focus on it a fair amount.
- 22 Q. Okay. And obviously the analysis of the six
- 23 additional years of water level data and stream flow data the
- 24 analysis of the National Park Service, the Fish and Wildlife

Min-U-Script®

Capitol Reporters 775-882-5322

(20) Pages 1575 - 1578

Page 1579

- 1 Service, SNWA, CBD, the City of North Las Vegas, all of their
- 2 analysis was not available in 2013; right?
- 3 A. That's correct.
- 4 Q. And are you also familiar with the statistical
- 5 analysis that SNWA performed and specifically the linear
- 6 regression between MX-4 and other monitor locations in Coyote
- 7 Spring Valley and the Lower White River Flow System during
- 8 the 1169 pump test?
- 9 A. I'm aware of -- Yes, I am aware of the linear
- 10 regressions.
- 11 Q. Okay. Well, do you know if that statistical
- analysis of the relationship during the pump test of certain
- water levels in monitor wells, I should say, that analysis
- was not available in 2013 either; correct?
- 15 A. Not the analysis that you presented or that SNWA
- presents that includes data to date, to 2019, no.
- 17 Q. Well, and the recovery of the system to the pump
- 18 test, what's your view on the importance of the additional
- six years of data to analyzing the recovery of the system to
- 20 that pump test?
- 21 A. Well, in addition to just being additional data
- 22 for the regression analysis, I mean, I would think in terms
- of it being -- I mean, recovery data in a relationship like
- this can be a little different than the initial drawdown. I

- 1 probably not include it.
- 2 Q. And you testified earlier today that your
- 3 client's purpose was to protect the dace. Do you recall
- 4 that?
- 5 A. That's correct.
- 6 Q. Would you agree that the US Fish and Wildlife
- 7 Service is also the agency responsible for protecting the
- 8 dace
- 9 MR. DONNELLY: Objection.
- 10 HEARING OFFICER FAIRBANK: And what's the basis
- 11 for your objection, Mr. Donnelly?
- MR. DONNELLY: A hydrologist may or may not be
- 13 familiar with the purpose of federal agencies.
- 14 HEARING OFFICER FAIRBANK: I think it's a fair
- 15 question to the extent of his knowledge.
- THE WITNESS: I'm aware that Fish and Wildlife is
- 17 responsible for managing the dace.
- 18 Q. (By Ms. Peterson) And you are aware that the
- 19 Kane Springs Valley project received a biological opinion
- 20 from Fish and Wildlife? Are you aware?
- 21 A. I'm not aware. Though it doesn't surprise me.
- 22 Q. Okay. All right. That the service found that
- 23 the project was not likely to jeopardize the continued
- existence of the endangered dace?

Page 1580

Page 1582

- 1 mean, there can be a bit of a hysteresis effect, meaning that
- 2 a lag in -- which I think actually explains -- I mean,
- 3 there's a bit of a scatter around all the plots that SNWA
- 4 present. And I've thought about that. Some of it is when
- water is going up and some of it is when it's going down. It
 makes a site difference and it adds to the scatter, but it
- 7 doesn't take away from your overall linear regression
- 8 results.
- 9 MR. TAGGART: Thank you.
- 10 HEARING OFFICER FAIRBANK: Thank you.
- Moapa Valley Water District? Seeing no further
- 12 questions.
- Lincoln County, Vidler.
- 14 CROSS-EXAMINATION
- 15 By Ms. Peterson:
- 16 Q. Hi, Dr. Myers. Karen Peterson again.
- 17 A. Good morning.
- 18 Q. Did you consider including Lower Meadow Valley
- 19 Wash in to the boundaries of the Lower White River Flow
- 20 System?
- 21 A. Very briefly. And I don't think I reached a
- 22 conclusion. I just failed -- I just stopped considering it
- 23 because there's not much data. There wasn't much reaction
- 4 from the -- I think, overall, if you were to ask me I would

- 1 A. I'm sure that's what it said. Although I'll
- 2 point out that it was prior to the pump test.
- 3 Q. And you agree that there was a stipulation that
- 4 was entered in to with Lincoln County, Vidler, and US Fish
- 5 and Wildlife on the Kane Springs applications that had
- 6 triggers, the 3.2 trigger, action trigger?
- 7 A. I'm familiar with the 3.2 action trigger. I
- 8 don't recall exactly what you just -- I'm sorry. I don't
- 9 recall exactly that description.
- 10 Q. Okay. So I'll represent to you that for the Kane
- 11 Springs pumping for the applications that have been approved
- and for future applications there is an amended stipulation
- and the triggers are included in that stipulation, all right.
- 14 A. Okay.
- 15 Q. So did you also hear the testimony of
- 16 Mr. Williams that with the biological opinion and the
- 17 triggers in place that Lincoln and Vidler are in compliance
- with the Endangered Species Act?
- 19 A. I believe Mr. Williams was on Monday when I
- 20 wasn't here.
- 21 Q. All right. Well, I'll represent to you that's
- 22 his testimony, all right.
- 23 A. Okay.
- 24 Q. So we're in compliance with the law; right?

. ago .

Page 1583

- 1 MR. TAGGART: Objection. This is all outside the
- 2 scope of any direct that was asked of this witness.
- 3 MS. PETERSON: It goes --
- 4 HEARING OFFICER FAIRBANK: I tend to agree with
- 5 Mr. Taggart's objection on the basis that this is outside the
- 6 scope of his original testimony today. And I don't know that
- 7 it is contemplated within the reports proffered by Center for
- 8 Biological Diversity. So if you could relate the questions
- 9 to those particular issues then I may entertain the
- 10 questions.
- 11 Q. (By Ms. Peterson) Your recommendation to the
- 12 State Engineer today on behalf of your client is that there
- is no further carbonate pumping; is that correct?
- 14 A. That is correct.
- 15 Q. And I'm telling you that Mr. Williams testified
- on Monday -- Sorry. The day that you weren't here -- that
- with the biological opinion and the amended stipulation and
- 18 the triggers in place, Lincoln and Vidler are in compliance
- with the Endangered Species Act. I'll give you that premise.
- 20 Is that correct? I'll give you the premise. Sorry.
- 21 A. Okay.
- 22 Q. So I'm giving you that premise and your position
- is that they're in compliance with the law but they should
- 24 not be able to pump their water rights?

- 1 Georgia Pacific Republic?
- 2 MS. HARRISON: No questions.
- 3 HEARING OFFICER FAIRBANK: Seeing no questions.
- 4 Nevada Cogeneration and Associates? Seeing no
- 5 questions.
- 6 Muddy Valley Irrigation Company?
- 7 MR. KING: No questions.
- 8 HEARING OFFICER FAIRBANK: No further questions.
- 9 Bedroc?
- MS. URE: No questions.
- 11 HEARING OFFICER FAIRBANK: No questions.
- 12 And Nevada Energy?
- MS. CAVIGLIA: No questions.
- 14 HEARING OFFICER FAIRBANK: Seeing no questions,
- 15 I'll open it back up to Division of Water Resources staff.
- All right. We'll open it up one last time.
- 17 Coyote Springs Investments, do you have any further
- 18 questions?
- 19 MR. HERREMA: No.
- 20 HEARING OFFICER FAIRBANK: US Fish and Wildlife?
- National Park Service?
- MS. GLASGOW: No questions.
- 23 HEARING OFFICER FAIRBANK: No further questions.
- Moapa Tribe? No further questions.

Page 1584

Page 1586

- 1 A. My hydrologic analysis is that continued pumping
- 2 of the carbonate will continue a drawdown and that will cause
- 3 it to go below 3.2 and will cause it to go below further
- 4 trigger points in the MOA. And I believe in the stipulated
- 5 agreement you were referring to.
- 6 Q. And you haven't done any kind of modeling or any
- 7 kind of Theis equation or any kind of hydrologic analysis
- 8 like that to support your conclusion that Kane Springs
- 9 carbonate pumping is going to impact the dace?
- 10 A. Well, a Theis analysis would be inappropriate for
- 11 these conditions. But what I have done is a water balance
- analysis that takes in to account -- I mean, I've done a
- qualitative water balance under assessment that shows we have
 not yet captured all of the spring -- I mean, pumping has not
- 15 captured spring flow. I mean, it has to eventually capture
- spring flow. It's the first principle. And so -- And it's
- 17 continuing to go downward and, thus, eventually pumping. And
- 18 I do think continuing in Kane Springs Valley will contribute
- 19 to that, yes.
- MS. PETERSON: Thank you.
- 21 HEARING OFFICER FAIRBANK: City of North Las
- 22 Vegas?
- MS. URE: No questions.
- HEARING OFFICER FAIRBANK: Seeing no questions.

- 1 Southern Nevada Water Authority? Seeing no
- 2 further questions.
- Muddy -- or excuse me. Moapa Valley Water
- 4 District? No questions.
- 5 Lincoln County Vidler? No further questions.
- 6 All right. I'm assuming that then everyone else
- 7 who hasn't asked any questions doesn't have any questions.
- 8 So I'm not going to go through the list name by name unless
- 9 anybody really expects me to do so.
 - All right. Now, let's go ahead and take about a
- 11 five-minute break and then we'll transition -- Oh, I'm sorry.
- Mr. Donnelly, do you have any redirect?
- MR. DONNELLY: Just a minute or two.
- 14 REDIRECT EXAMINATION
- 15 By Mr. Donnelly:
- 16 Q. Thank you. Patrick Donnelly for the record. I
- will not be using our full 46 minutes. Just a couple of
- 18 quick questions.
- Would you say that, Dr. Myers, that the pump
- 20 test, Order 1169 pump test, presented substantial new
- information to our understanding of the hydrology of the
- 22 Lower White River Flow System?
- 23 A. Yes.
- 24 Q. You were evaluating this system prior to the pump

Min-U-Script® Capitol Reporters (22) Pages 1583 - 1586 775-882-5322

10

Page 1587

- 1 test with the Center for Biological Diversity; is that
- 2 correct?
- 3 A. I began essentially working with the center on
- 4 Lower White River Flow System at the beginning of and
- 5 assessing the MOA at the beginning, as I recall. So, yes,
- 6 right at the beginning of the pump test.
- 7 Q. So would you say that the substantial new
- 8 information you just said was presented by the pump test
- 9 would influence or otherwise shape your understanding of the
- system as presented in your report here?
- 11 A. Yes, it would.
- 12 Q. And would you think it reasonable for any
- 13 hydrologic models developed to understand the system to
- incorporate that 13-year set of data since 2006?
- 15 A. Oh, yes. I mean, there is -- I mean, the pump
- test provided a substantial stress to the system, which is,
- when you're calibrating a groundwater model you like stress,
- 18 preferably beyond the point of which your future uses are
- 19 going to occur. I mean, it's great calibration data.
- MR. DONNELLY: Okay. Thank you. No further questions.
- HEARING OFFICER FAIRBANK: Okay. Then with that
- we'll go ahead and take a five-minute break. And then we'll
- be ready to start with Georgia Pacific, Republic Industries,

- 1 Q. And can you state your affiliation and title?
- 2 A. I'm an associate hydrogeologist with Broadbent
- 3 Associates.
- 4 Q. And are you here on behalf today of Georgia
- 5 Pacific and Republic Environmental Technologies?
- 6 A. Iam
- 7 Q. And, just for the record, I know the report is
- 8 written also on behalf of Dry Lake. But are you here today
- 9 on behalf of Dry Lake?
- 10 A. I am not.
- 11 Q. Are you familiar with Exhibit GP-REP01, which is
- called Broadbent July 2nd, 2019, initial report?
- 13 A. I am.
- 14 Q. And did you prepare GP-REP01?
- 15 A. I did prepare that.
- 16 Q. And is GP-REP01 a true and correct summary of
- 17 your review and opinions?
- 18 A. It is.
- 19 Q. Are you familiar with Exhibit GP-REP02, which is
- called Broadbent August 16th, 2019, rebuttal?
- 21 A. I am
- 22 Q. And did you prepare GP-REP02?
- 23 A. I did.
- 24 Q. Are there any corrections you would like to make

Page 1588

Page 1590

- 1 and Dry Lake starting at 11 a.m. Thank you.
- 2 (Break was taken)
- 3 HEARING OFFICER FAIRBANK: We will go ahead and
- 4 get started now with the Georgia Pacific, Republic, and Dry
- 5 Lake water. And so we will go ahead and turn it over.
- 6 MS. WILLIAMS: Good morning. I'm Paulina
- 7 Williams with Baker Botts. I'm here on behalf of Georgia
- 8 Pacific. And with me is my co-counsel, Sylvia Harrison, with
- 9 McDonald Carano, who is here on behalf of both Georgia
- 10 Pacific and Republic Environmental Technologies.
- And we have with us today John Bell. And so I would ask that he be sworn in.
- 12 Would ask that he de sworn in
- (The witness was sworn in)
- 14
- 15 JONATHAN BELL
- 16 Called as a witness on behalf of
- 17 Georgia Pacific and Republic, having been first duly sworn,
- Was examined and testified as follows:
- 19
- 20 DIRECT EXAMINATION
- 21 By Ms. Williams:
- 22 Q. Mr. Bell, would you please state your full name
- and the spell it for the record.
- 24 A. Jonathan Bell, J-o-n-a-t-h-a-n, Bell, B-e-l-l.

- 1 to GP-REP02?
- 2 A. I do have one -- two corrections, actually. On
- 3 page six, the last paragraph, the response paragraph, the
- 4 final sentence. And I incorrectly list it as eastern portion
- 5 of the basin moving eastward. And it should be western
- 6 portion. And the final word in that sentence, basin, should
- 7 be removed also. That's a typo.
- 8 Q. With those corrections is GP-REP02 a true and
- 9 correct summary of your review and opinions?
- 10 A. It is.
- 11 Q. Are you familiar with GP-REP03 which is called
- 12 the --
- (The court reporter interrupts)
- 14 Q. (By Ms. Williams) CV, curriculum vitae?
- 15 A. I am.
- 16 Q. And did you prepare GP-REP03?
- 17 A. I did.
- 18 Q. And is GP-REP03 a true and correct copy of your
- 19 CV summarizing your qualifications?
- 20 A. It is.
- MS. WILLIAMS: So we'll note that there were no
- objections to Mr. Bell's qualifications as an expert or to
- 23 these exhibits. And we offer GP-REP01, 02 as corrected, and
- 24 03 in to evidence.

Min-U-Script®

Capitol Reporters 775-882-5322

(23) Pages 1587 - 1590

Page 1591

- 1 HEARING OFFICER FAIRBANK: And we will go ahead
- 2 admit Exhibits GP-REP01 through 03. And with respect to the
- 3 qualification, what is the scope and disciplines in which
- 4 you're proffering Mr. Bell as an expert in?
- 5 MS. WILLIAMS: Geology and hydrogeology.
- 6 HEARING OFFICER FAIRBANK: Okay. And off the
- 7 basis of that, Mr. Bell was not objected to. Mr. Bell will
- 7 Dasis of that, IVII. Deli was not objected to. IVII. Deli will
- be qualified for the limited purposes of these proceedings,given that there was no objection. And that qualification
- will be such limited in any further proceedings he would have
- 11 to be requalified.
- MS. WILLIAMS: With that we're prepared to pass
- 13 the witness, but we would like to reserve the opportunity for
- 14 redirect.
- 15 HEARING OFFICER FAIRBANK: All right. We will go
- ahead and open it up for cross-examination of Mr. Bell. And
- 17 so we will go ahead and start with Coyote Spring Investments.
- 18 CROSS-EXAMINATION
- 19 By Mr. Herrema:
- 20 Q. Good morning, Mr. Bell.
- 21 A. Good morning.
- 22 Q. Brad Herrema on behalf of CSI. I just have one
- 23 question. The last sentence of your July report, which I
- believe is your Exhibit Number 1, says, we believe that

- 1 HEARING OFFICER FAIRBANK: No questions.
- 2 Nevada Cogeneration Associates? Seeing no
- 3 questions.
- 4 Muddy Valley Irrigation Company?
- 5 MR. KING: No questions.
- 6 HEARING OFFICER FAIRBANK: Seeing no questions.
- 7 Bedroc?

11

17

- 8 MS. URE: No questions.
- 9 HEARING OFFICER FAIRBANK: No questions.
- 10 And Nevada Energy?
 - MS. CAVIGLIA: No questions.
- 12 HEARING OFFICER FAIRBANK: Seeing no questions.
- All right. Well, given the fact that there are
- 14 no further questions, we will open it up for Georgia Pacific.
- 15 Do you have any additional questions or presentation?
- MS. WILLIAMS: No, we do not.
 - HEARING OFFICER FAIRBANK: All right. Seeing
- 18 nothing further -- Oh, and just one last comment -- Do we
- 19 have any questions from staff?
- 20 EXAMINATION
- 21 By Mr. Benedict:
- 22 Q. I believe in your report you stated that the
- 23 exclusion of Las Vegas Valley is arbitrary based on some of
- 24 the inferences that were made about flow between the two. Do

Page 1592

Page 1594

- 1 treating all of the Lower White River Flow System as a single
- 2 heterogeneous basin and correcting any imbalance in
- 3 groundwater diversions by a priority date is not supported by
- 4 the current science.
- 5 My question is whether the word heterogeneous is
- 6 correct or whether that should say homogenous?
- 7 A. That, in fact, should be homogenous.
- 8 MR. HERREMA: Okay. Thank you.
- 9 HEARING OFFICER FAIRBANK: United States Fish and
- 10 Wildlife Service? Seeing no questions.
- 11 National Park Service?
- MS. GLASGOW: No questions.
- 13 HEARING OFFICER FAIRBANK: Seeing no questions.
- Moapa Band of Paiute Indians?
- MR. BERLEY: No questions.
- 16 HEARING OFFICER FAIRBANK: Southern Nevada Water
- 17 Authority?
- MR. TAGGART: No questions.
- 19 HEARING OFFICER FAIRBANK: Seeing no questions.
- Moapa Valley Water District? Seeing no
- 21 questions.
- Vidler and Lincoln County? No questions.
- 23 City of North Las Vegas?
- MS. URE: No questions.

- 1 you suggest that the geographic boundaries should be
- 2 something different than that's been proposed by the State
- 3 Engineer.
- 4 A. I believe that boundary needs to be further
- 5 investigated. There's some evidence I think with some of the
- 6 groundwater elevations that were collected that there's
- 7 potential that there could be inflow from Las Vegas basins.
- 8 So I just think it's a spot where we probably don't have
- 9 enough data to understand that relationship, that boundary
- 10 relationship.
- 11 O. Do you have any other opinions on other
- boundaries that exist from the study that you've done?
- 13 A. Not -- No, not at this point.
- MR. BENEDICT: Okay. Thank you.
- 15 HEARING OFFICER FAIRBANK: All right. I'll open
- 16 it again. Does anybody else have any questions? Seeing lots
- of shakes of the head, I'm going to take that as a no.
- All right. Well, then let's go ahead and wrap
- 19 this day up. And based upon our time schedule, we will go
- 20 ahead and to allow additional time for lunch tomorrow, since
- 21 we've concluded today early and gotten through the initial
- 22 scheduling for tomorrow morning, we will start at 12:30
- 23 tomorrow with the Muddy Valley Irrigation Company. Excuse

me. Let me rephrase that. We will start at 12:30 tomorrow

SE ROA 53635

But if I have it wrong, that's fine. We'll just have to speed it up. I just want to make sure. Okay, guys. HEARING OFFICER FAIRBANK: Well, it looks like I made a typographic error, so hopefully we can try to work around it. But we'll make sure that we give everybody an equal opportunity. Because all of the other participants who submitted rebuttal reports were allotted two hours. And so that's what happens when you give lawyers calculators. MR. FLANGAS: Okay. Guys. Would you do me a favor then, if you can just let us know when we're at 50 minutes so we don't go over our time, so we can reserve just a little bit of time. HEARING OFFICER FAIRBANK: We'll do that. And we'll also work to accommodate. I think we can probably have a little bit of time to accommodate due to that error in the state hearing notice. MR. FLANGAS: No problem. HEARING OFFICER FAIRBANK: We didn't recognize that prior to this moment. Thank you. MR. FLANGAS: Thank you very much. Well, thank you. Nevada Cogeneration Associates Number 1 and 2. I'm
	Page 1602	Page 1604

- 1 here with three witnesses that are all authors of the NCA
- 2 report. And we will use NCA as an abbreviation. I have with
- 3 me here today Mr. Hugh Ricci, Mr. Jay Dixon, and Mr. Bob
- 4 Coache. I'll begin with Mr. Dixon. Mr. Dixon, could you
- 5 tell us --
- 6 (The court reporter interrupts)
- 7 (The three witnesses were sworn in)

8

13

- 9 JAY DIXON
- 10 Called as a witness on behalf of
- 11 Nevada Cogeneration Associates, having been first duly sworn,
- Was examined and testified as follows:
- And so, Mr. Flangas, you have one hour for the
- 11 presentation of your evidence and testimony from your experts

1 CARSON CITY, THURSDAY, OCTOBER 3, 2019, P.M. SESSION

HEARING OFFICER FAIRBANK: This is the

4 continuation of the hearing regarding the administration of

5 the Lower White River Flow System in Order 1303. And today

7 Cogeneration Associates and then from the Muddy Valley

we are going to go ahead and hear presentations from Nevada

Irrigation Company. And so we will go ahead and get started

- 12 and witnesses with respect to the Order 1303 matters. And
- 13 then after the expiration of the hour or if you finish
- 14 earlier, then we'll go ahead and open that up for
- 15 cross-examination.

this morning.

---000---

9

- MR. FLANGAS: Just for clarification, I thought
- 17 we had -- Yeah. I thought we had two and a half hours total,
- 18 so I was thinking we had an hour with a little bit of time
- 19 for redirect. Was I wrong on that?
- 20 HEARING OFFICER FAIRBANK: We divided it up in to
- 21 two hours.
- MR. FLANGAS: Okay.
- MR. COACHE: The order says two and a half.
- MR. FLANGAS: I'm sorry. I was -- We just wanted

- 14 DIRECT EXAMINATION
- **15** By Mr. Flangas:
- 16 Q. Mr. Dixon, could you give us a little bit of your
- 17 background, please.
- 18 A. My name is Jay Dixon for the record. So I've
- been a practicing hydrologist for over 25 years. I've got a
- 20 Master's degree in civil engineering from the University of
- 21 Nevada, Las Vegas. And, specifically, I've been working on
- 22 various projects in what is now the Lower White River Flow
- 23 System for about 15 years in the capacity of a consultant.
- 24 Q. Mr. Dixon, were you one of the authors of the NCA

Min-U-Script® Capitol Reporters (2) Pages 1601 - 1604 775-882-5322

Page 1605

1

5

- 1 rebuttal report in this matter?
- 2 A. I was. I wrote specific sections on my own and I
- 3 reviewed and contributed to all sections included in the
- 4 report.

16

21

- 5 Q. Did you work -- Who did you work with in regards
- 6 to that report?
- 7 A. Bob Coache and Hugh Ricci.
- 8 Q. With regard to Mr. Coache and Mr. Ricci, did they
- 9 have input in to your sections prior to becoming finalized?
- 10 A. Yes, they reviewed, edited, and approved my
- 11 sections as necessary.
- 12 Q. And with regard to their sections, who else was
- involved in drafting?
- 14 A. Bob Coache drafted specific sections on his own
- and then Hugh and I reviewed and edited as necessary.
- 17 ROBERT COACHE
- 18 Called as a witness on behalf of
- 19 Nevada Cogeneration Associates, having been first duly sworn,
- Was examined and testified as follows:
- 22 DIRECT EXAMINATION
- 23 By Mr. Flangas:
- 24 Q. Okay. Mr. Coache, could you give us a little bit

- HUGH RICCI
- 2 Called as a witness on behalf of
- 3 Nevada Cogeneration Associates, having been first duly sworn,
- 4 Was examined and testified as follows:
- 6 DIRECT EXAMINATION
- 7 By Mr. Flangas:
- 8 Q. Mr. Ricci, could you give us a little bit of your
- 9 background, please.
- 10 A. My background, I was the -- I worked for the
- 11 Division of Water Resources -- Let me back up. I have a
- Bachelor of science degree civil engineering from the
- 13 University of Nevada. I worked with the Nevada Division of
- 14 Water Resources for 26 years from 1981 to 2006. From 1991 to
- 15 2000, I was the Deputy State Engineer. And from 2000 to
- 16 2006, I was the Nevada State Engineer.
- 17 Q. And you heard Mr. Dixon's response with regard to
- 18 how the report, the NCA rebuttal report, was prepared. Did
- 19 you have input with regard to the editing and input in regard
- to how that final report was made?
- 21 A. Yes. My role mainly was under the review and
- 22 editing and suggestions dealing with some of the issues that
- 23 they stated.
- 24 Q. Thank you. Okay. Mr. Dixon, did you prepare --

Page 1606

Page 1608

- 1 of your background, please.
- 2 A. Yes, sir. This is Robert Coache --
- 3 HEARING OFFICER FAIRBANK: Mr. Coache, will you
- 4 make sure your microphone is on.
- 5 THE WITNESS: Robert Coache, C-o-a-c-h-e. I have
- 6 a Bachelor of science degree in watershed science from the
- 7 University of -- Utah State University. I'm also a
- 8 registered professional engineer.
- 9 My experience, personal experience, with the
- 10 White River flow system goes back to 64-65, starting with the
- 11 Division of Water Resources in '81. I have approximately 35
- 12 plus years of experience in hydrology, water rights, the
- 13 Lower White River Flow System, and other basins in that area.
- 14 Q. (By Mr. Flangas) Could you bring the microphone
- just a little closer to you. That will be better. Thank
- 16 you.
- You heard Mr. Dixon's response with regard to how
- 18 the report was prepared. Is that consistent with your
- 19 understanding?
- 20 A. Yes, sir.
- 21 Q. Thank you.
- 22 ///
- 23 ///
- 24 ///

- 1 Did the team here prepare a power point for today's
- 2 presentation?
- 3 A. Yes, we did.
- 4 MR. FLANGAS: Okay. At this time we would like
- 5 to, if we could, turn on the power point, if we know how.
- 6 HEARING OFFICER FAIRBANK: May need to go ahead
- 7 and open or get the projector warmed up.
- 8 MS. PETERSON: Just before we start the power
- 9 point, because I don't want to take up too much of your time.
- But we, Lincoln and Vidler, have an objection to page 27, 29,
- 11 30, 31, 36, and 39 of the power point because it's additional
- 12 analysis and reasoning and additional opinion not contained
 - in the reports of these experts.
- 14 HEARING OFFICER FAIRBANK: Karen, can I have you
- do that on the record, just because I am not going to
- summarize -- Can you do it on a microphone so that we can
- 17 make sure that those who may be appearing and attending from
- **18** afar.

13

- MS. PETERSON: Okay. Thank you. Karen Peterson
- on behalf of Lincoln and Vidler. We would object to the
- 21 power point pages 27, 29, 30, 31, 36, and 39, because they
- 22 contain additional analysis, additional opinions, that are
- 23 not contained in the rebuttal report.
- 24 HEARING OFFICER FAIRBANK: And just so I'm clear,

MR. FLANGAS: Part of our response would be that some of our power point is a response to testimony that we've had in this case already and the experts in this matter have heard the testimony from Vidler's experts in this case. I think it's appropriate for my experts to show up at this point in time and respond to the testimony they've heard in this case.

If part of our power point responds to the Vidler responses in this case, the fact that it wasn't contained in our response or report is appropriate testimony. These experts are here responding to testimony that occurred just days ago from Vidler's own experts. That's a completely appropriate response from experts in this case.

I don't know -- I haven't reviewed every single matter. But when I went to the very first page, 27, this is just a direct response to what was in Vidler's report. And I don't think this is, the second bullet, was one of the cross-examination questions that I asked of Vidler's experts, which was the CH2M Hill report.

I haven't reviewed every other page. But my

1 when we get to those particular slides.

Ms. Peterson, your objection is noted and to that
extent it's sustained. However, we also recognize that the
power point presentation is not -- is not necessarily
evidence of which will be considered by the State Engineer in
making determinations. The State Engineer is relying on the
reports that have been submitted. And, again, the purpose of
this hearing is for the experts to provide their salient
conclusions and to point the State Engineer to the evidence
that supports those conclusions.

And so the weight of any that's assigned with respect to the power point presentation that's been provided and which will be contained within the hearing record is not necessarily -- will not necessarily be given -- the State Engineer will make the determination as to what if any weight based upon this objection and our determination.

MS. PETERSON: Thank you.

MR. FLANGAS: If I could respond to one thing so that I can put this on the record. If I understand correctly, if witnesses have testified in this hearing to certain points that my experts have a rebuttal point to make and the State Engineer does not want to hear that rebuttal point simply because it wasn't contained in earlier report, I would respectfully submit that you're deciding not to hear

Page 1610

Page 1612

response would be if this is in response to their testimony,
 I think my experts are perfectly appropriate to testify to
 things that they've already testified to in this case.

HEARING OFFICER FAIRBANK: Mr. Flangas, so the scope of the testimony and the purpose of this hearing is limited to those reports and for the experts to opine and provide the State Engineer with the salient conclusions of the reports in which they submitted before the State Engineer's office. Vidler and other participants have all submitted reports. And their testimony thus far,

presentations to the State Engineer, have been confined to
 those particular issues which were memorialized within their
 reports.

I do find that some of these slides are beyond the scope of the report that was submitted by Nevada Cogeneration and Associates and I do believe that it would be inappropriate and improper for that testimony to be provided, as that would be supplemental to the rebuttal reports. And we have precluded such analysis and testimony by other participants in these proceedings.

participants in these proceedings.
So I will go ahead and limit the testimony to
that to which is the subject of the report that was submitted
by Nevada Cogeneration and Associates. For the purposes of
the power point presentation, we'll go ahead and address that

evidence from qualified witnesses that would be helpful tothe State Engineer to reach a decision.

3 It is my experience that especially in civil

4 matters exclusion of relevant evidence is a slippery slope.5 So I'm just pointing out to this panel that if you decide not

6 to accept relevant evidence, especially when other witnesses

have already testified to certain things, you're excluding
evidence that could be helpful to the decision maker. And I

would put my objection right out there right up front.

HEARING OFFICER FAIRBANK: So, Mr. Flangas, number one, this is an administrative proceeding and the State Engineer has invited expert analysis to help inform him in terms of making particular decisions with respect to the management of the Lower White River Flow System. This is not a civil proceeding.

MR. FLANGAS: Understood.

HEARING OFFICER FAIRBANK: So, in that particular scope, it is up to the State Engineer to make a determination as to what evidence is relevant. Mr. Flangas, you've had the opportunity to cross-examine witnesses and address these particular issues. Furthermore, you're making an assumption that there may not be an opportunity to address these particular issues. And those are things that are still under consideration. There's been requests by participants to

. age .e._

Page 1613

submit closing statements and there's also been a request by 1 participants for an opportunity to submit draft orders. 2

And so on that basis there's not an ignoring or a

- rejection of consideration of particular evidence. The
- evidence is before the State Engineer and his staff. The
- staff is qualified to understand and analyze the evidence 6
- 7 and to make a determination based upon the totality of the
- information before him. 8
- And so I appreciate your feedback. However, I 9
- want you to understand that this is a different proceeding. 10
- 11 And so on that basis, I will again sustain the objection
- offered by Ms. Peterson on behalf of Lincoln County and 12
- 13 Vidler and you may go ahead and proceed.
- MR. FLANGAS: That's fine. That's fine. Okay. 14
- 15 MR. TAGGART: Excuse me. Are there any more
- copies of the power point? 16
- MR. FLANGAS: I put all the power point copies I 17
- had over there. 18

3

- MR. TAGGART: Okay. 19
- MR. HERREMA: If I may. Brad Herrema on behalf 20
- of CSI. We have a similar objection to one of the points on 21
- slide 41 regarding the presence of faults and whether they 22
- act as a conduit to flow or impediment to flow. I don't 23
- believe that is in the rebuttal report either. I'll check 24

- system. And at the time it wasn't really considered a flow
- system. Even though we believed it was, we were still
- looking at Coyote Spring Valley individually. 3
- 4 After nearly four weeks of hearings, hundreds and
- hundreds, if not thousands, of pages of documents, a lot of 5
- internal discussion between Mr. Ricci and myself, it became
- evident to us that there was insufficient data available to
- proceed with any action regarding the applications that are
- before us in the Coyote Spring Valley. 9
- Slide four, please. What came of those four 10
- 11 weeks of hearings was the issuance of Order 1169. And I know
- 12 this has been beat to death on some issues. But it basically
- 13 was required to pump 50 percent of the existing rights in
- Coyote Springs Valley. It was looked at over multiple 14
- 15 basins. And, after eight years, it finally started in
- November of 2010. And this became the largest scaled aquifer 16
- 17 test in Nevada. Tens of millions of dollars were spent on
- this test by the participants, mainly SNWA. Hundreds of 18
- thousands, if not more, data points were collected, I mean 19
- some of those wells were collecting data every 15 minutes for 20
- a couple of years. 21
- It became clear that the responses to pumping 22
- 23 stress imposed during the Order 1169 aquifer test were very
- apparent and significant. 24

Page 1614

Page 1616

- 1
- objection. And, likewise, if it's beyond the scope of the 3
- rebuttal report submitted then we'll address that at the 4
- time. But your objection is noted and we'll take that under 5
- consideration. 6
- MR. FLANGAS: Mr. Dixon. 8
- MR. COACHE: Actually it's going to be Mr. Coache
- 10
- O. (By Mr. Flangas)
- ANSWERS BY MR. COACHE: 12
- Q. Okay, Mr. Coache. Thank you. 13
- A. We're here to present a hearing that may be a
- five matters of interest to the State Engineer. And each one 16

- that we discussed. 19
- sitting right where you guys are at when the original Coyote 21
- Springs Valley service began. And hearings were conducted 22

- before we get to slide 41, but I believe it is not.
- HEARING OFFICER FAIRBANK: So I will note the 2

- MR. HERREMA: Thank you. 7
- 9
- that begins.
- 11

- little bit shortened power point presentation to you on the 15
- of those matters shown on slide two will be addressed to 17
- route the presentation with regards to each of the matters 18
- About 18 years ago, Mr. Ricci and I were actually 20
- for a matter for almost four weeks. And a tremendous amount 23 of water was looked at as being appropriated within this flow

- ANSWERS BY MR. DIXON: 1
- 2 A. We're on slide five now. Jay Dixon for the
- record. 3
- So, as indicated in our rebuttal report, NCA 4
- disagrees. The next two sections cover the boundary issue 5
- and Item E in the State Engineer's interim order in the other 6
- matters. Specifically to the boundary issue regarding the 7
- Park Service's recommendation to include the entire Black 8
- 9 Mountains area basin in the LWRFS. So I'm going to walk
- through some slides that deal with that issue and our 10
- perspective on it. Specifically, obviously a big question is 11
- 12 where is the appropriate southeastern LWRFS boundary and is
- the proposed location correct. 13
- Q. Now, Mr. Dixon, in dealing with -- in dealing
- with the boundary issues and that, did NCA prepare a rebuttal 15
- report in this matter that was submitted to the State 16
- **Engineer?** 17
- 18 A. Yes.
- 19 Q. Is that NCA 1, Exhibit 1?
- 20 A. Yes.
- MR. FLANGAS: We would offer that exhibit at this 21
- time. 22
- HEARING OFFICER FAIRBANK: NCA Exhibit 1 is so 23

admitted. 24

Min-U-Script® (5) Pages 1613 - 1616 Capitol Reporters 775-882-5322

Page 1620

Page 1617

MR. FLANGAS: Thank you. 1

- Q. (By Mr. Flangas) Go ahead, Mr. Dixon. 2
- A. And one of the things that came out of this
- hearing that we have taken a closer look at is the issue of
- pumping in the Black Mountain area and whether or not it
- contributes or the extent to which it may or may not
- 7 contribute to effects observed at the Muddy River Spring
- 8
- 9 Also, in explaining this issue, I'm going to
- touch on some geology, some map geology. This is all 10
- information that's been presented previously. However, my 11
- focus is obviously going to be in that part of Black 12
- 13 Mountains basin.
- Slide six, please. All right. So this question 14
- 15 of NCA, Nevada Cogen Associates, pumping and the extent to
- which it affects or may not affect the springs. The area I'm 16
- 17 talking about, obviously, is shown in the southwestern corner
- of the current proposed boundary, just this little area right 18
- 19 here. The NCA wells are shown here, the blue dots. There's
- also a couple of monitoring wells included in that cluster of 20
- wells. 21

1

- So, you know, right now, the State Engineer has 22
- included NCA pumping which averages about 1500 acre-feet a 23
- year, again, based on perfected water rights in that initial 24

- 1 Q. Is Siri helping out, Mr. Dixon?
 - 2 A. I guess. I don't think she's qualified though.
 - Again, still staying on this recommendation 3
 - regarding this boundary and focusing on the geologic section
 - GG that I pointed out in the previous slide. The NCA wells,
 - as you can see, are put right in the middle of those
 - 7 strike-slip faults. That's where Marty purposely sited them.
 - And referring back to the larger question should 8
 - the entire basin be included? As you continue to the east, 9
 - you see a complete different map geology on this side. There 10
 - is no apparent consistency in the geology on the other side 11
 - 12 of that Muddy Mountain thrust fault, at least relative to
 - 13 this pumping.

14

15

16

Slide nine, please. So this is kind of zooming in on the area getting a little closer, and you're going to hear me talk about these series of wells. To the south is EBP-2. That is the third of the three pumping wells furthest

- 17 to the south. It is not a very productive well. They use it 18
- sparingly. The water chemistry is a little challenged 19 compared to the other two. 20
- And the nice thing about that is there is right 21
- within 300 feet of it was when Marty had drill rigs out there 22 23
 - poking around trying to find the sweet spot, this is one of
- the first holes he drilled or oversaw, EBM-3. This has a 24

Page 1618

- suggest pumping limit of 9318. So, if any portion of NCA's
- pumping should be excluded, then is this initial pumping 2
- limit maybe too high? 3
- Slide seven, please. So you've seen this several 4
- times throughout this hearing. This is the representative 5
- portion of the Rowley geologic map. The purple line drawn 6
- across here is actually a section that was included in the 7
- Page publication, Page 2011. I just added it here because of 8
- 9 its location and proximity to the geology that has been
- encountered where these wells are constructed. 10
- And of specific particular interest is the 11
- presence of this extension of a Dry Lake regional thrust 12
- fault just to the west of these wells. And then as you move 13
- to the east, the geology shown here is -- of particular
- interest is the Muddy Mountains regional thrust. That's the 15
- south end of that thrust. 16
- These wells were purposely, intentionally, sited 17
- by Marty Mifflin. At that time in the early nineties, he was 18
- a consultant to the owners of Nevada Cogen. And he sited 19
- 20 these wells in a perfect location, obviously, but it was
- intentional. He was aware of a series of strike slip faults 21
- and you can see coming off the east side of the Dry Lake 22
- 23 Range.
- Slide eight, please. 24

- monitoring record that goes back to 1993 and it's continuous.
- 2 The problem with that record, though, is when you look at the
- data, it's hard -- you have to acknowledge that there appears
- to be some pumping influence. The company tries very hard to 4
- make sure that their water levels -- They're all recorded 5
- manually. They don't use transducers. But they try to get 6
- 7 their levels when that well has been off for a certain amount
- of time. Unfortunately, when you look at that record, you 8
- 9 can tell that hasn't always been the case. And we are
- acknowledging that. It's very obvious. 10 11
- So, moving ahead, recent -- So the next wells to the north, EBM-6, is the new well that replaced EBM-4 in 12
- 2015. And then further to the north is the third well, 13
- EBM-5, which replaced EGV-3. Those wells were replaced 14
- within a couple hundred feet of each other. And the reason 15
- 16 is because they're in carbonate rock and the chemistry is
- 17 pretty tough on low carbon steel. And those casings failed.
- 18 However, when we completed the wells, we converted the wells to monitoring. And, for reasons you're about to see, we
- 19
- 20 waived the requirement to plug them. Because anything we pump down those wells to plug it we're going to pull out in
- the pumping well due to the karst features. 22
- So we did a little investigation, obviously, we 23
- spent a lot of time reviewing Marty Mifflin's work. He did a 24

Min-U-Script® (6) Pages 1617 - 1620 Capitol Reporters 775-882-5322

21

Page 1621

very good job of documenting what he saw when he was out 1 there in the early nineties. 2

So three things that caught my attention from his 3 completion report in 1992 from the wells that we replaced.

- He made reference to the upper 600 feet of the borehole
- having a hang wall on the northerly trending high angle 6
- 7 fault. That's the strike-slip fault that they were
- targeting. He saw evidence of that in his cuttings. 8
- He also noted a series of high angle fractures 9
- penetrated below 600 feet, abundant fractured limestone. 10
- 11 He also -- And this is really important.
- Confirmation that he was in the fault. Bottom hole samples 12
- 13 indicated travertine and collapsing blocks, large open
- solution structure. 14
- Slide 11. So, we've been talking about this 15
- carbonate rock for the last two weeks and I wanted to show 16
- 17 you a picture. The picture on the left is the well -- the
- borehole for the well we replaced in 2015. This is -- Marty 18
- couldn't see it at the time. But this is what he was 19
- drilling through, large caverns, right in that strike-slip 20
- fault area. That's what it looked like before we -- That's 21
- what it looks like today. 22
- The picture on the right is the borehole after we 23
- drilled the replacement well and more modern image. Also we 24

I'm on slide 13 now. So let's take a closer look 1

- at this table from their rebuttal report. This was put in 2
- the appendix. So I've called out the Black Mountain area. 3
- And first let me explain what these values mean, and
- specifically the P-value. We heard a little bit about it.
- Tim Mayer talked about it earlier and you heard Mr. Burns and
- Mr. Drici talking about it last Friday as well. But I want
- to try to tie this -- give it a little more color, if you 8
- will. 9

10

11

12

13

14

15

16

17

18

19

20

2

So let's talk about this P-value because this is very important. A predictor, which is the EH-4 water levels, that has a low P-value, in other words less than .05, means that changes in the predictor value, again, EH-4 levels, are related to changes in responsible variable -- the response variable. Sorry. In this context, the response variable is pumping. Okay. P-values that are greater than .05 are not statistically significant.

And what's interesting here, whether or not this is right or not, it's significantly higher than the other four basins. And that really caught our attention, obviously. You heard Mr. Smith for the City of North Las

- 21 22 Vegas talk about the issues that he found in Garnet Valley.
- 23 Okay. We're focusing on Black Mountains area. And relative
- contributions of observed water levels in EH-4 as a result of 24

Page 1622

Page 1624

- went a little deeper, 1400 feet. This picture is from 1366. 1
- That's what the carbonate rock looks like, the aquifer. 2
- So, you know -- I'm on slide 12 now. And 3
- regarding -- We want to -- The following slides summarize --4
- I want to be very clear about this. These slides, the next 5
- series of slides, summarize our review of data and provide 6
- 7 our opinions as to how SNWA may have arrived at this conclusion regarding Black Mountain area pumping and the 8
- 9 current location near these NCA wells. This is not -- We did
- not -- This is something we weren't looking at when we wrote 10
- our rebuttal report. This was made -- This was put in to 11 their rebuttal report. And the exact quote is BM-DL-2 -- And 12
- I'll show you where that is in a moment -- is undoubtedly 13
- within the carbonate aquifer of the LWRFS but the current
- production wells are probably not. 15
- So the next few slides just simply -- We wanted 16
- to obviously in the last couple of weeks we took a closer 17
- look at this and all we're doing now is stating our opinions 18
- because we think it would be very helpful for the State 19
- 20 Engineer to have this information. SNWA didn't look at it
- beyond what they have. We agree with them, we need more 21
- information to confirm this. But all I'm doing now is 22
- providing our opinions as to how SNWA may have arrived at this conclusion. We're not speaking for them.

23

- pumping from these individual basins. 1
 - So I want to go to slide 14, Hugh. So this is
- right out of the SNWA rebuttal report. I apologize. I 3
- forgot to put the figure caption for the plot on the right. 4
- But I want to be very clear it's not Garnet Valley. It's 5
- Coyote Spring Valley. So the plot on the left is the Black 6
- Mountains area. And all this shows is that we're 7
- examining -- they were examining a proportional response of 8
- 9 the system, EH-4 representing the system, that is the Muddy
- River Springs area, that are attributable to pumping from 10
- each individual basin. So each incremental component, this
- 11
- 12 is a small part of the EH-4 water levels that can be
- attributed or correlated to pumping in the Black Mountains 13 area. Very small in comparison to pumping in Coyote Spring 14
- Valley that portion of the EH-4 water level observation 15
- 16 responded fairly significantly to pumping in Coyote Spring Valley.
- 17
- 18 Slide 15. So, again, going back, the two wells
- that -- We took SNWA's regression analysis. I reproduced it 19
- 20 to make sure I could get the exact same results. And for
- these two wells I did. I also took it a step further and 21
- that's what I want to talk about. 22
- BM-DL-2, this is not an NCA well, but this well 23
- is only 3600 feet north northeast of EBM-3 down here. The 24

Min-U-Script® (7) Pages 1621 - 1624 Capitol Reporters 775-882-5322

Page 1625

11

- period of record for this well only goes back to 2002, but 1
- there's several months of water levels. It's a really good 2
- data set for BM-DL-2. I've already told you the issues with 3
- monitoring data for EBM-3. I'm not trying to work around
- that. It's very evident. There's noise in it and it's from 5
- pumping. 6
- 7 So next slide, 16. This is my reproduction of
- SNWA's result regression analysis on BM-DL-2 versus EH-4.95, 8
- that's the same result that they got. That's this plot on 9 the left. 10
- So I took it a step further. Even though, again, 11
- I'm acknowledging the pumping noise in EBM-3, especially 12
- early on, the correlation to EH-4 is .52. Significant --13
- Whether or not that value is correct, it's just significantly 14
- lower than BM-DL-2. These wells are only 3600 feet apart, so 15
- what's going on? What is causing this response. 16
- 17 Q. Mr. Dixon, both of those wells are approximately
- 30 miles? 18
- A. From EH-4, that's right. 19
- Q. EH-4. But they're less than two-thirds of a mile
- apart?
- That's right. 22
- They're 3600 feet apart? Q.
- 24 A. Correct.

develop that resource now.

This is the Las Vegas Valley -- Excuse me -- Lake 2

Las Vegas test wells that were installed in the early 3

- 4 nineties. Even though it wasn't a successful development
- program, there's a lot of good information that came out of
- it regarding the Horse Springs formation.
- 7 Slide 19. So this is another issue that we
- identified in our rebuttal report and it's regarding, again,
- boundary, boundary primarily, the boundary question. And 9 it's relative to Lower Meadow Valley Wash. 10

So four things I want to review real quickly.

Carbonate aquifer is deep. And the potential for development 12

13 is low. There's no effects from the LWRFS pumping observing

- groundwater levels in that basin. Current pumping in that 14
- 15 basin is minimal. And, as Colby Pellegrino mentioned last
- Friday for SNWA, you can't look at this boundary issues in 16
- 17 changing boundaries in a vacuum with only hydrology. There's
- management implications to adding basin to this. And I want 18 to talk about the ramifications of inactive water rights in 19
- that basin if it were to be included. 20
- So this is a cross-section from some surface 21
- geophysics gravity mapping that was done and reported in USGS 22
- Open File Report 2006-1396. I've shown the location of the 23
- 24 current LWRFS boundary coincident with the southern end of

Page 1626

5

16

Page 1628

- 1 Q. So very close together but 30 miles away from the
- other well and one of them correlates almost one to one?
- Pretty close.
- Q. And the other one significantly different?
- A. Right. 5

17

- Q. Okay. Thank you. 6
- 7 A. Slide 17. So this is a section from -- Now I
- want to move beyond this boundary and talk a little bit about
- 9 the rest of the basin, specifically to the south, and to
- demonstrate the significant difference in geology that 10 exists. 11
- This is line HH that you see on here from Page 12
- 2011. And I'm extending it to the south in to the Las Vegas 13
- shear zone near Lake Las Vegas. So, again, this is that
- section HH. The NCA well is located within that strike-slip 15
- fault zone. As you move to the south, we go through the 16
- shear zone, Las Vegas shear zone. And then once you get in
- to that Lake Las Vegas area, the east side of the Black 18
- Mountains basin, there's a completely different geology. In 19
- 20 fact, you know, there's a formation over there that's being
- targeted for groundwater exploration. And the thing is, 21
- 22 those water rights would have been developed years ago if
- there were a carbonate rock aquifer there. It's not there. 23
- And that's why, you know, their efforts are being made to

- Lower Meadow Valley Wash. And our contention is carbonate
- aquifer is very deep here. The bottom of the Cenozoic fill 2
- 3 has been estimated at approximately 5,000 feet. That matches
- the geology interpretations as well. 4
 - And the point I want to make is we think the
- State Engineer already has the authority to prevent a deep 6
- carbonate production well from being constructed here. 7
- As far as responses, this is the south end of the 8
- 9 basin. You see Moapa Valley here, Muddy River Spring area.
- There are three nested monitoring wells were installed and 10
- they've got a really good monitoring record. And what I'm 11
- 12 showing here is the portion of that record when the Order
- 1169 pump test occurred. And, as you can see, there's no 13
- response there. This particular borehole was encountered 14
- consolidated material at 1600 feet but it was only screened 15
 - down to 829. Again, no response from 1169 pumping.
- 17 Slide 22. Moving down to the south end, this is
- 18 a hydrograph from EH-8a, the monitoring well near the south end of the boundary. And what you see here is the response 19
- 20 from intense pumping that ceased in the late eighties. That
- response has been continuous with some cyclical variations 21 22 every year as you would expect.
- This particular well is completed. It's a dual 23
 - completion Muddy Creek formation, which is an aquitard below

Min-U-Script® (8) Pages 1625 - 1628 Capitol Reporters 775-882-5322

Page 1629

- 1 the sediment, alluvial sediment, in that area.
- 2 Slide 23.
- 3 Q. Again, no response?
- 4 A. No response. Third point here, current pumping
- 5 in the basin is minimal. I pulled this right out of the 2015
- 6 statewide pumping inventory. Even though there's 25,000
- 7 acre-feet of underground rights appropriated in this basin,
- 8 as of 2015 only about 1800 is being pumped. There's no
- 9 reason to include it.
- And in terms of -- If this basin were to be
- included, there's a substantial quantity of inactive
- 12 underground rights with a priority date in the 1960s. Adding
- Basin 205 in to LWRFS would reactivate these senior rights
- 14 elsewhere. And right now where they're at, they're not
- usable at their current location. The wells are shallow and
- the water quality is pretty bad. TDS 3,000 milligrams per
- 17 liter. That's not usable. So that might sound like a great
- 18 idea, but that changes -- that really has a huge effect on
- 19 future management decisions if it were to be included. And
- 20 that's my point. This goes beyond just looking at the
- 21 hydrology.
- Slide 25. And we'll turn it over to Mr. Coache.
- ANSWERS BY MR. COACHE:
- 24 A. Robert Coache for the record. This part of the

- 1 about that there was a comment from the State Engineer that
- 2 there would be no effect in Kane Springs Valley for a hundred
- 3 years. That was discussed in our rebuttal report.
- 4 MS. PETERSON: If I may. The objection is to
- 5 that second bullet. The first bullet was in the report.
- 6 HEARING OFFICER FAIRBANK: I'll sustain the
- 7 objection as to the second bullet.
- 8 Q. (By Mr. Flangas) So don't talk about the CH2M
- 9 Hill report.
- 10 A. Fine. What I'm going to do at this point is jus
- pass over 29 and 30 so I can go for a little bit and then if
- 12 I have time at the end we can discuss those. Is that fine?
- 13 Okay.

14

- MR. DIXON: Which slide?
- MR. COACHE: 29 and 30. So we're on 27 right
- 16 now.
- 17 Q. (By Mr. Flangas) Mr. Coache, do you want to
- 18 skip -- There's no objection to 28. Do you want to use slide
- 19 28
- 20 A. Oh, I just took out 29 and 30.
- 21 Q. Oh, okay. We're going to use 28?
- 22 A. Yes, sir. Okay. Lincoln-Vidler was asked
- 23 questions about this on cross. And, if I remember right,
- 24 they -- the response was that the basis for this finding was

Page 1630

Page 1632

- 1 presentation will be looking at Kane Springs Valley. And NCA
- 2 disagrees with the following key findings from the
- 3 Lincoln-Vidler report. Each one of these points we're going
- 4 to discuss individually.
- 5 26, please. Lincoln-Vidler key finding number
- 6 one was that the effects of pumping from Kane Springs Valley
- 7 would not be felt for over a hundred years. And then Lincoln
- 8 County makes a number of claims in their rebuttal report
- 9 states the following three items at the bottom that were
- found in Ruling 5712 and Ruling 6254.
- Go to slide 27, please.
- MR. FLANGAS: Now, in slide 27, I would like to
- 13 respond to Ms. Peterson's objection. At pages 12 and 13, we
- 14 specifically discuss Lincoln-Vidler's comment that there
- 15 would be no significant effect felt for a hundred years. And
- if the State Engineer takes a look at our report at those
- 17 pages, the comment was rebutted at those pages and the
- 18 discussion was had about that.
- The portion of the slide that I think
- 20 Ms. Peterson is objecting to is the CH2M Hill report portion,
- 21 which is what I discussed earlier. I don't know if she's
- 22 objecting to the whole slide because there's that portion in
- 23 it. But there was a specific discussion about the fallacy
- 24 that the State Engineer made a determination specifically

- the effect of -- the finding that the effect of pumping from
- 2 Kane Springs Valley would not be felt for over a hundred
- 3 years outside of the Kane Springs Valley was the result of an
- 4 SNWA model. However, in their report, they state otherwise.
 - And they quote specifically that the State
- 6 Engineer found that where no significant effects would be
- 7 felt for hundreds of years, the up gradient water could be
- 8 appropriated. And that's from pages 2-2 to 2-3 of the
- 9 report.

5

- And, unless I've missed something, I wrote some
- of this stuff. And to my knowledge the State Engineer has
- 12 never stated that Kane Springs Valley groundwater can be
- developed because there will be no significant impact, if
- any, from appropriation of groundwater for hundreds of years.
- Go to slide 28, please. In fact, with all the
- limitations that are on the State Engineer's at the time with regards to legislation that hadn't been passed yet and no
- 18 information that was obtained from the carbonate pumpage, the
- 19 State Engineer still found that in Ruling 5712 that the
- 20 applicant's pumping, being Lincoln-Vidler, supports the --
- pumping test supports the conclusion that there is
- 22 considerable potential for groundwater flow in the carbonate
- rocks in the vicinity of well KPW-1.
- The State Engineer also found the evidence

Min-U-Script® Capitol Reporters (9) Pages 1629 - 1632 775-882-5322

Page 1633

- 1 indicates a strong hydrologic connection between Kane Springs
- 2 Valley and Coyote Springs Valley, specifically that
- 3 groundwater flows from Kane Springs Valley in to Coyote
- 4 Spring Valley.
- 5 And, lastly, given the unique hydraulic
- 6 connections between the Kane Springs Valley hydrographic
- 7 basin and the Coyote Spring Valley hydrographic basin, the
- 8 development of groundwater within the Kane Springs Valley
- 9 will ultimately affect water levels and the flow in the White
- 10 River regional carbonate rock aquifer system.
- All right. So we're blowing through the next
- 12 two.
- 13 Q. Did you go to --
- 14 A. I didn't realize the next one was one she was
- 15 objecting too also.
- MR. FLANGAS: 29. I don't think you're objecting to 30?
- 18 HEARING OFFICER FAIRBANK: 30 and 31.
- MS. PETERSON: If you go through those then I
- 20 have to be up here.
- MR. FLANGAS: 31 I have a response to as well if
- 22 I could, Ms. Fairbank.
- 23 HEARING OFFICER FAIRBANK: Go ahead, Mr. Flangas.
- MR. FLANGAS: Specifically, once again, I'm not

- 1 And then, yes, the last dash on the bottom of
- 2 that slide, that comes from the rebuttal report of SNWA. So,
- 3 of course, it would not have been in the rebuttal report of
- 4 Nevada Cogen because they were submitted at the same time.
- 5 MR. FLANGAS: I suggest you read it directly from 6 our rebuttal.
- 7 HEARING OFFICER FLANGAS: Just a moment.
- 8 Mr. Flangas, please.

9

MR. COACHE: Robert Coache for the record.

10 HEARING OFFICER FAIRBANK: One moment, please.

Based upon a review of the report, as well as the hydrographs and other tables contained within the report, it appears to

me that the contents of slide 31 is maybe a restatement but

is a summarization of those findings and conclusions set

forth in the report. So to the extent the objection is that

this is new analysis, I'm going to go ahead and overrule that objection and allow the content -- the experts to go ahead

and provide their analysis with respect to those opinions

19 stated on slide 31.

MR. COACHE: Robert Coache again for the record.
Okay. The first two bullet points are basically points two

and three that we previously discussed or stated that we weregoing to discuss. And NCA believes that there's a

24 discernible trend pattern in water levels over time between

Page 1634

Page 1636

- 1 sure about -- the comment, everything on 30 is discussed
- 2 in -- pardon me -- on 31 is discussed in our rebuttal report.
- 3 Specifically at pages 13, 14, 15, and 16, virtually
- 4 everything on that slide is discussed in our rebuttal report
- 5 almost verbatim, in fact, in some places. The fact that
- 6 there were effects showing a high correlation between the
- 7 carbonate wells plotted against EH-4 is at the bottom of page
- 8 13. Based on this -- I'm quoting now. Based on this high
 9 correlation between EH-4 and spring discharge -- I'm looking
- at page 14. I'm looking also on page 15 are the hydrographs.
- 11 And page 16, once again, references the high correlation
- And page 10, once again, references the high correlation
- between carbonate wells plotted against EH-4 with a
- correlation of CSVW-4 and EH-4.
- 14 I'm not sure what the objection is to this. The
- 15 comment at the very top, NCA believes there's a discernible
- trend pattern, is nothing more than a conclusion of our
- entire section there in the rebuttal report.
- 18 HEARING OFFICER FAIRBANK: Ms. Peterson.
- MS. PETERSON: Thank you. The first two bullets,
- those opinions are not contained in the rebuttal report.
- Obviously, the first dash under the second bullet is
- 22 commenting, I guess, on all the other reports that have been
- 23 submitted related to CSVM-4 and KMV-1 and is not in the
- 24 report.

- 1 production well KPW-1 and pumping trends. And NCA also
- 2 believes that there is correspondence between the water level
- 3 trends in the wells in Kane Springs Valley, northern Coyote
- 4 Spring Valley, and wells located in southern Coyote Spring
- 5 Valley.

6

- Additionally, SNWA, Fish and Wildlife Service,
- 7 National Park Service, Center for Biological Diversity, and
- 8 ourselves all found that monitor well CSVM-4 and KMV-1 showed
- 9 effects resulting from the Order 1169 pump test. The values
- 10 for several wells, including CSVM-4, were then plotted
- against EH-4 for various periods, based on the record that
- was available. There were high correlations between all
- carbonate wells plotted against EH-4 with the correlation of
- 14 CSVM-4 and EH-4 resulting in the R-squared value of .82.

And I do need to make a statement for the record.

There seem to be some software issues on our end. Wherever in our report you see R2, lower case or regular, that's

18 R-squared. Something happened in the conversion. So if you

see R2 in our report, read it, please, as R-squared.These high correlations between carbonate wells

in the Lower Right River Flow System indicate a high level of hydraulic connectivity across the basins within the Lower

23 White River Flow System.

Page 32. For example, you've seen this before.

Min-U-Script® Capitol Reporters (10) Pages 1633 - 1636 775-882-5322

24

Page 1637

1

- 1 I believe this was in SNWA's presentation. But this is a
- 2 simple scatter graph with a correlation coefficient between
- 3 CSVM-4 and the one I was talking about in EH-4 with the
- 4 R-squared value of .82.
- 5 Q. (By Mr. Flangas) That was also contained at page
- 6 15 of our NCA Exhibit 1; correct, Mr. Coache?
- 7 A. Yes, sir.
- 8 Going to slide 33. SNWA did not calculate a
- 9 correlation between EH-4 and KMW-1, therefore a direct visual
- 10 comparison of the hydrograph of CSVM-4 and KMW-1 wasn't done.
- 11 The visual comparison was done because at the time I could
- not locate the data to actually do the actual analysis. And
- 13 I'll talk about that a little bit later also.
- But the visual comparison found that the
- 15 hydrographs for CSVM-4 and KMW-1 are virtually identical with
- an estimated R-squared value greater than .9, which indicates
- 17 a high correlation between KMW-1 and carbonate wells in the
- 18 Lower White River Flow System with a high level of hydrologic
- 19 connectivity across all of the basins within the Lower White
- 20 River Flow System.
- 21 34. Lincoln-Vidler also claims that there was no
- effect ascribable to the start and stop of the Order 1169
- aquifer test. NCA believes that the contrary is true and
- 24 that there is a high correlation between KMW-1 and carbonate

- The Lincoln-Vidler groundwater rights are junior
- 2 in priority to approximately 98 percent of the groundwater
- 3 rights within the Lower White River Flow System and during
- 4 any curtailment of pumpage within the Lower White River Flow
- 5 System. Assuming that Kane Springs Valley was included, the
- 6 Lincoln-Vidler rights would be among the first in the subject
- 7 to curtailment.
- 8 HEARING OFFICER FAIRBANK: And excuse me really
- 9 quick. Just to let you know, Mr. Flangas, you're at 40 minutes.
- MR. COACHE: We're at 40?
- 12 HEARING OFFICER FAIRBANK: Yes.
- MR. FLANGAS: This is the next slide. Hold on,
 - Bob.

14

- MS. PETERSON: So we objected to slide 36, which is all new analysis as to why the inclusion of KSV is important.
- 18 HEARING OFFICER FAIRBANK: So, based on my review
- of the report, it appears that the first bullet point is
- 20 contained within the report. But based upon my review of the
- 21 substance of the analysis relating to the inclusion of Kane
- 22 Springs Valley, the second two bullet points don't appear to
- be directly contained within the report. Mr. Flangas.

 MR. FLANGAS: They're not essentially contained

Page 1638

Page 1640

- 1 wells in the Lower White River Flow System with a high level
- 2 of hydraulic connectivity across all of the basins within the
- 3 Lower White River Flow System including Kane Springs Valley.
- 4 Below is statements from the following agencies
- 5 which all make various references that are supportive to the
- 6 inclusion of Kane Springs Valley within the Lower White River
- 7 Flow System.
- 8 And I want to make it clear that not every one of
- 9 these agencies specifically state that Kane Springs Valley
- 10 should be in the Lower White River Flow System. But they do
- 11 make statements that indicate that there is a connectivity
- 12 between Kane Springs Valley and the Lower White River Flow
- 13 System.
- The purpose of this slide is to discuss -- We've
- been discussing item A in the State Engineer's questions.
- And this is also going to go in to item E a little bit with
- other things that are of interest. And the reason that this
- 18 is important is that in the event that Lincoln-Vidler
- 19 develops water from KPW-1 and the State Engineer excludes
- 20 pumpage from that well, from the management of the Lower
- White River Flow System, there would be detrimental impactsto existing senior right owned and controlled by NCA and
- other senior water right holders, users within the Lower
- 24 White River Flow System.

- within the report. They're an analysis. I mean, to the
- 2 extent that they're -- They are essentially just analysis.
- 3 They're not really contained in the report. They're just an
- 4 analysis --

5

10

- HEARING OFFICER FAIRBANK: Can you explain to me?
- 6 Because this appears to me to go beyond the scope of the
- 7 Order 1303 limitations, which is really the scientific
- 8 analysis, and this seems to extend more in to the policy
- 9 analysis.
 - MR. FLANGAS: It's a little bit of the other
- 11 matters.
- 12 HEARING OFFICER FAIRBANK: So on that basis, on
- the basis that both it's not contained within the rebuttal
- 14 report doesn't necessarily seem directly related and outside
- 15 of the scope, I'm going to go ahead and sustain the objection
- as to the second two bullet points but overrule the objection
- as to the first bullet point.
- 18 Q. (By Mr. Flangas) Okay. Just limit it, if you
- would, Mr. Coache, to the very first bullet point.
- 20 A. And we apologize. There was a little bit of a
- 21 different interpretation of E on your key points that you're
- 22 interested in.
- So sticking with the first bullet point, assuming
- 24 that the Nevada State Engineer determines that the maximum

Page 1641

- long-term annual quantity of groundwater that may be pumped 1
- from the Lower White River Flow System is 9318 acre-feet. 2
- Lincoln-Vidler would maintain the right to pump 500 acre-feet 3
- from KPW-1 and an additional 500 acre-feet from a separate
- site in Kane Springs Valley, which equates to an additional
- 11 percent of pumpage for a total potential of 10,318 6
- 7 acre-feet of pumpage actually impacting the Lower White River
- Flow System. 8
- Slide 37, please. NCA disagrees with 9
- Lincoln-Vidler's key finding that the trend in water levels 10
- in both KMW-1 and CSVM-4 indicate that waters levels are 11
- still being affected by the 2005 precipitation event. 12
- Lincoln-Vidler well KVW-1 was completed in October of 2005 13
- and the first depth-to-water level reading was collected 14
- sometime in April, approximately sometime in April 2007. 15
- The next slide, number 38, is simply a diagram 16
- 17 showing the area in red that encompasses -- encompasses the
- exceptional 2005 precipitation event. And the middle graph 18 is the KMW-1 showing that they were unable to collect any
- 19 20
- water level samples during that period.
- And then I believe she objected to the next one. 21
- MS. PETERSON: She did. 22
- MR. FLANGAS: Thanks. 23
- MS. PETERSON: 39. So this slide appears to be 24

- MR. HERREMA: Actually we object to both of the 1
- bullets. I don't think either of them are contained in the 2
- rebuttal report. And it's a little bit difficult to 3
- determine because the rebuttal report is framed in terms of
- the eight or nine conclusions. It's not really framed in
- terms of answers to the five questions. But I don't believe
- 7 either of these two points are made in the rebuttal or these
- conclusions. 8

9

- HEARING OFFICER FAIRBANK: Thank you,
- Mr. Herrema. Your objection is noted and I'll go ahead and 10 proceed with how I responded to Mr. Coache with respect to 11
- 12 overrule the objection to the extent that those other bullet
- 13 points but sustain the objection as to that which Mr. Coache 14
 - is willing to go ahead and move on from. Okay. Thank you.
- 15 MR. COACHE: Okay. We're on slide 39 now.
- Robert Coache for the record. 16
- 17 On cross, Lincoln-Vidler stated that they determined the effects of the extraordinary 2005 18
- 19 precipitation event on KMW-1 was made by correlating the
- 20 hydrographs of CSVM-4 and KMW-1. And NCA, we agree, that
- there's a strong correlation between CSVM-4 and KMW-1 and it 21
- 22 was proper for Lincoln-Vidler to determine the effects of the
- extraordinary event in 2005 on KMW-1 by correlating the 23
- 24 hydrographs at CSVM-4 and KMW-1. However, a correlation

Page 1642

5

11

Page 1644

- 1 related to cross-examination during the hearing of the
- Lincoln-Vidler witnesses. And it would be, you know, 2
- inappropriate sur-rebuttal to rebuttal or sur-rebuttal, I 3
- guess. 4
- MR. TAGGART: And can I be heard on this? I 5
- mean, it's been common throughout this hearing for us to ask 6
- witnesses did you hear what so and so said yesterday and do 7
- you agree or do you disagree. So I think we're getting a 8
- 9 little bit in to the weeds on some of these objections.
- HEARING OFFICER FAIRBANK: And, Mr. Taggart, 10
- thank you for your comments with respect to the objection. 11 And based upon our analysis, while it may not directly be 12
- contained within the report, it is within the scope of much 13
- of the testimony that has been asked as these proceedings
- have gone on. So certainly I recognize and will assign the 15
- weight that we give to the testimony within the discretion of 16
- the State Engineer. But I'm going to overrule the objection. 17
- MR. FLANGAS: Go ahead, Mr. Coache. 18
- MR. COACHE: I was going to ask you if we can do 19
- 20 the objection to slide 41 because I think I know the section
- that she's talking about. I'm going to drop that out if that 21 22 will be okay.
- HEARING OFFICER FAIRBANK: That's fine. If 23
- you're comfortable doing that, Mr. Coache, we'll accept that.

- between CSVM-4 and KMW-1 cannot be relied upon to determine
- precipitation impacts and disregard the correlation between
- CSVM-4 and KMW-1 when considering hydrologic impacts from the
- Order 1169 pump test. 4
 - 40. So now we're going to get in to the basis of
- why we're here. And these are the points that the State 6
- Engineer put forward. And I'm hoping we're clarifying 7
- what -- We wanted to address these directly and we've taken 8
- 9 our conclusions and tried to address them directly in to your
- 10 questions of concern.
 - So, question A, our responses are, as shown earlier there's a basis for SNWA's statement that the NCA
- 12 current production wells are probably not within the Lower 13 White River Flow System. 14
- NCA believes that additional work needs to be 15
- done to validate SNWA's multi -- multiple linear regression 16
- analysis with regards to the attributable impacts to the 17 Muddy River Springs area resulting from groundwater pumpage 18
- from NCA's production wells in the Black Mountain 19
- 20 hydrographic basin.
- And I say in here it's important -- And I got to 21
- correct that. I think it's very important for the Nevada 22
- State Engineer to know if the NCA pumpage within the Black 23
- Mountain hydrographic basin is impacting the Muddy River 24

Min-U-Script® (12) Pages 1641 - 1644 Capitol Reporters 775-882-5322

Page 1645

- Springs area. If this pumpage is not affecting the Muddy 1
- River Springs area, we readily admit that's obviously good 2
- for NCA. But, more importantly, that means that the actual 3
- impacts to the Muddy River Springs area are being caused by
- less pumpage than initially thought. So this is a very
- important question that we need to address. 6
- 7 Therefore, NCA supports SNWA's position that the
- current boundary of the Lower White River Flow System should 8
- stay the same pending the water management decisions in the 9
- next phase. 10
- Q. (By Mr. Flangas) So, in other words, Mr. Coache, 11
- if the 9318 includes NCA's production well pumping, that's 12
- one number. But if the 9318 is calculated and NCA is not in 13
- that number then, in fact, that number might be lower? 14
- A. That's correct. 15
- Q. Okay. Thank you. 16
- A. Question B. I told you I would slip by the first 17
- one. The various structures within the Lower White River 18
- Flow System with lower transmissivity values result in a lag 19
- of measurable impacts in some areas but not the overall 20
- impact. These delayed impacts can even be more detrimental 21
- to the Muddy River Springs area, as the impact will take 22
- longer to identify and benefits of any subsequent corrective 23
- action will also take longer to be -- to begin recovery from 24

- Cappaert-type decision to manage spring flow through minimum
- groundwater hydraulic head levels, thus preventing the State 2
- Nevada the ability to manage its own resources. 3
- 4 D. I tried to make this one as clear as I could
- and it seems to get a little complicated sometimes. But this 5
- is with regards to the effects of moving alluvial water
- 7 rights and carbonate water rights and the deliveries of senior decreed rights on the Muddy River. 8
- NCA does not support the transfer of a senior 9 alluvium groundwater rights within the Muddy River Springs 10 11 area to the carbonate system within the Lower White River

12 Flow System as the supply source for new uses.

NCA does support the transfer of senior alluvium groundwater rights within the Muddy River Springs area to the carbonate system within the Lower White River Flow System to upgrade the priority date of existing carbonate pumpage within the Lower White River Flow System but on a one-to-one basis.

If someone has a hundred acre-feet of carbonate water but let's say a 2000 priority date and they're going to be curtailed and they want to go buy some water rights, they could buy a hundred acre-feet of senior alluvium rights and transfer those to the carbonate on a one-for-one basis to upgrade their priority.

1 the impacts.

11

12

- Slide 42. Point C, this deals with the amount of 2
- 3 groundwater that can be pumped from the Lower White River
- Flow System. There has been substantial discussion regarding 4
- the amount of underflow out of the Lower White River Flow 5
- System. And NCA agrees that there is some amount of 6
- 7 underflow. However, NCA is not aware of any location where
- the underflow can be captured by carbonate pumpage within the 8
- 9 Lower White River Flow System without detrimental impact to
- the Muddy River Springs area. 10
 - While NCA does not completely agree with the current pumpage goal of 9318 acre-feet a year, NCA
- understands the complexity. 13
- And I, you know, since I worked there for 30 14
- plus -- almost 30 years and Mr. Ricci worked there for almost 15
- that amount of time, we completely get how complex this is, 16
- okay. And so we understand the complexity of the 17
- determination and potential fluency of the proposed pumping 18
- limit and urge the State Engineer to proceed expeditiously 19
- 20 but with extreme caution.
- And our last bullet point with regards to our 21
- question C. NCA is concerned that a delayed decision with 22
- regards to the management of the Lower White River Flow 23
- System could result in federal action resulting in a

Page 1648

- That would create no additional new effects on 1
- the Muddy River Springs area. And that indeed would create a 2 shuffling of priorities, but it would not create an impact on
- the water rights -- I mean, on the spring. Sorry. 4
- NCA believes that simplified guidelines should be 5
- established for the movement of groundwater within and near 6
- the Lower White River Flow System as part of this process but 7
- not necessarily through the issuance of an order at this 8
- 9 time. I just don't see -- other orders that, you know, we
- 10 have worked on in the years when I was there, it's almost
- impossible to foresee all the things that could pop up and 11
- 12 the little nuances that you didn't think of.

So I think we would have guidelines at first, let

those mature, address some of these issues, and then at some 14

point issue an order that's going to limit pumpage or move in 15

water within the basin.

17 And NCA also supports the change in place of use 18 of Muddy River Spring alluvium rights -- And that could be

manner of use too -- when associated with a conjunctive use 19

- 20 agreement between a holder of Muddy River decreed rights and
- the user of the pumped Muddy River Spring alluvium rights. 21 22
- So if somebody wanted to go change those alluvium rights and
- impact the flow of the Muddy River, which is obviously 23
- impacting senior decreed rights, and they wanted to have an 24

Min-U-Script® (13) Pages 1645 - 1648 **Capitol Reporters** 775-882-5322

Page 1649

- 1 agreement with a holder of these decreed rights and take the
- 2 water out of the ground instead of the river, we're okay with
- з that.
- 4 Am I doing 44?
- 5 Q. We're almost done.
- 6 A. E. Okay. NCA does not believe that the State
- 7 Engineer should proceed with any new aquifer test within the
- 8 Lower White River Flow System. New aquifer test. To see
- 9 verifiable results, any aquifer test would require pumpage in
- 10 the thousands of acre-feet over a period greater than six
- 11 months. It makes little sense to do and conduct an aquifer
- test for less than a six-month period when it's known that
- 13 some impacts in the Lower White River Flow System are delayed
- by a period of three to four months.
- And given the lack of full recovery from the
- 16 Order 1169 aquifer test, the pumpage required by additional
- 17 aquifer test may cause detrimental impacts to the senior
- 18 water rights holders. And that concludes our presentation.
- MR. FLANGAS: I have a procedural question.
- 20 HEARING OFFICER FAIRBANK: Yes.
- MR. FLANGAS: We submitted a significant number
- of exhibits, all of which were utilized in the preparation of
- 23 the report. There was simply no time go through, mark,
- 24 address, and talk about each one. We had 40-some-odd

- 1 did you rely on the Southern Nevada Water Authority
- 2 correlation analysis to assess connectivity within the Lower
- 3 White River Flow System or did you perform any of your own
- 4 analysis?
- 5 A. Both. I reviewed their analysis. I have access
- 6 to the same data that they do. It all came from DWR and it
- 7 was made available for this hearing for this study. I wanted
- 8 to make sure that I could reproduce their results. And in
- 9 certain areas I did my own regression analysis where I --
- where they didn't, to help inform some of the conclusions
- 11 that we arrived at.
- 12 Q. Okay. If you were to -- When I use the word
- 13 disaggregate, do you know what I mean?
- 14 A. No.
- 15 Q. Disaggregate, kind of pull apart the different
- 16 pieces?
- 17 A. Sure.
- 18 Q. Okay. If you were to disaggregate each of the
- 19 hydrographs in to a climate response, pumping response, and
- 20 barometric response, do you think a correlation analysis on
- 21 those individual responses as opposed to the aggregate
- 22 observed water level changes would yield a better correlation
- 23 analysis?
- 24 A. I did not perform that analysis. I focused on

Page 1650

Page 1652

- 1 exhibits. If we had tried to do that, we would have run out
- 2 of time. I would like to offer those exhibits in to
- 3 evidence. I'm not exactly sure how to do that.
- 4 HEARING OFFICER FAIRBANK: So all of the exhibits
- 5 that have been submitted by the participants, except for
- 6 their reports or rebuttal reports, were admitted in to
- 7 evidence by the State Engineer.
- 8 MR. FLANGAS: Thank you.
- 9 HEARING OFFICER FAIRBANK: But the rebuttals --
- the reports and rebuttal reports required the presentation of
- 11 those witnesses for cross-examination.
- MR. FLANGAS: Thank you. That's a weight off my
- 13 shoulders.
- 14 HEARING OFFICER FAIRBANK: All right. So we'll
- 15 go ahead and proceed with the cross-examination. And we have
- allotted seven minutes. And we'll go ahead and start with
- 17 Coyote Springs Investments.
- 18 CROSS-EXAMINATION
- 19 By Mr. Herrema:
- 20 ANSWERS BY MR. DIXON:
- 21 Q. Good afternoon. Brad Herrema on behalf of CSI,
- 22 for the record. Just a couple of questions. I think this is
- 23 most appropriately addressed to Mr. Dixon. Before you --
- 24 When you prepared your portions of the NCA rebuttal report,

- the data and used it in the same manner that they did. I
- 2 have a high level of confidence in their experts. I know
- 3 them very well and I trust the information that they put in
- 4 their report.
- 5 Q. I understand that that's not what you did. My
- 6 question is if you had done that to disaggregate climate
- 7 response, pumping response, barometric response, and then do
- a correlation analysis on those individual responses, thoseindividual pieces, do you think that would yield a better
- 10 correlation analysis than using that aggregated observed
- to conclation analysis than using that aggregated observed
- 11 water level?
- 12 A. Perhaps in some areas. But I didn't -- I didn't
- do that, so I can't comment beyond that.
- 14 Q. Do you know whether the Southern Nevada Water
- 15 Authority analysis that you -- that you reviewed, whether
- 16 they disaggregated those impacts or whether they performed it
- within an aggregate hydrograph?
- 18 A. I do not.
- 19 Q. Could the degree of correlation between two wells
- 20 in the system be predominantly due to pumping while the
- 21 correlation between two other wells in the flow system be
- 22 predominantly due to climate?
- 23 A. No.
- 24 Q. So you believe then that correlation between EH-4

Min-U-Script®

Capitol Reporters 775-882-5322

(14) Pages 1649 - 1652

Page 1653

- 1 and EH-4 or 5B in the Muddy River Springs area would be due
- 2 to the same responses as the correlation between EH-4 and a
- 3 well in the Black Mountains area?
- 4 A. If it's BM-DL-2, that correlation, that R-squared
- 5 value is .95. That's what SNWA got and that's what I got.
- 6 That particular well, absolutely. And I talk about EBM-3 and
- 7 I don't have a high level of confidence in that R-squared
- 8 value of .52 because I acknowledge that there's some noise in
- 9 those water levels. They're obtained manually. They are
- 10 reported sometimes to the nearest foot. So there's some
- 11 issues there. And I acknowledge that.
- 12 Q. Was it your testimony or is it your testimony
- that groundwater wells located in or near fault zones are
- 14 higher-producing wells than those located further away from
- 15 fault zones?
- 16 A. In some cases, yes.
- MR. HERREMA: Okay. I have no further questions
- 18 at this time. Thank you.
- 19 HEARING OFFICER FAIRBANK: United States Fish and
- 20 Wildlife Service? Seeing no questions.
- 21 National Park Service?
- MS. GLASGOW: No questions.
- 23 HEARING OFFICER FAIRBANK: Seeing no questions.
- Moapa Band of Paiute Indians? No questions.

- 1 A. Yes, he has.
- **2** Q. And what is that?
- 3 A. That was SB-47 in 2017.
- 4 Q. And what's the significance of that, in your
- 5 opinion?
- 6 A. That legislation cleared up the issue of whether
- 7 or not the State Engineer could look at the impacts of a
- 8 water right application in one basin on other basins.
- 9 Q. Okay.
- 10 A. And allowed him to conjunctively manage the
- 11 water. And I believe it says conjunctively manage the water
- 12 from any and all sources.
- 13 Q. Okay. Now, I started by asking you about the
- ruling in 2014, 6254 through 60. Since that time there's
- 15 been new data collected, new hydrologic data, collected in
- the Lower White River Flow System; correct?
- 17 A. Yes.
- 18 Q. And do you believe that, the data since that
- time, since 2014, is significant in the analysis of the four
- 20 questions the State Engineer is reviewing today?
- 21 A. Yes.
- 22 Q. Okay. And I want to ask you specifically --
- 23 Well, first, why?
- 24 A. Because it continues -- One, it continues the

Page 1654

Page 1656

- 1 Southern Nevada Water Authority and Las Vegas
- 2 Valley Water District?
- 3 CROSS-EXAMINATION
- 4 By Mr. Taggart:
- 5 ANSWERS BY MR. COACHE:
- 6 Q. Good afternoon. For the record, Paul Taggart for
- 7 the water district and the Southern Nevada Water Authority.
- 8 I want to start with Mr. Coache. And my questions are going
- 9 to center around whether new evidence exists for the State
- 10 Engineer to consider since the issuance of Ruling 6254
- through 59. And do you know what those rulings were?
- 12 A. I believe those were the rulings that denied --
- 13 Hold on. Let me double-check. No, I'm not. Let me put it
- 14 that way.
- 15 Q. Okay. Just Ruling 6254 through 60, are you
- 16 familiar with those at all?
- 17 A. Give me the numbers again. I'm sorry, sir.
- 18 Q. 6254 through 60, which came out after the reports
- were issued on the 1169 pump test.
- 20 A. Yes. These are the rulings that denied all the
- 21 applications.
- 22 Q. Okay. Since that time has the State Engineer
- acquired any additional statutory powers with respect to
- 24 groundwater and surface water?

- 1 increase of knowledge and data known in the Lower White River
- 2 Flow System. Two, it's another four or five years of data
- 3 since the pretty close to the max recovery of the 1169 pump
- 4 test. And it's showing now what's happening in real world
- 5 conditions of the impacts to the springs since we've
- 6 recovered over that four or five-year period.
- 7 Q. And you mentioned recovered a few times there in
- 8 your answer. What's the significance of having an additional
- 9 five to six years of data to understand and recover?
- 10 A. It takes out any question of what the actual
- 11 recovery was and the impacts from the pumping test. The
- 12 farther you go, the better you can determine what the actual
- impacts of the pumping test was.
- 14 Q. And have you developed an opinion on whether, for
- 15 instance, Warm Springs West flows have recovered to their
- 16 pre-test levels as of today?
- 17 A. Yes, I have.
- 18 Q. And what's that opinion?
- 19 A. The Warm Springs West flows spring test levels it
- 20 is not recovered to anywhere actually near those pre-test
- 21 levels.
- ANSWERS BY MR. RICCI:
- 23 Q. Okay. And my question is to Mr. Ricci. Good
- 24 afternoon, sir.

Page 1657

- 1 A. Good afternoon, Mr. Taggart.
- 2 Q. Mr. Ricci, do you have an opinion on whether the
- 3 State Engineer when he issued the groundwater rights to
- 4 parties, including rights that are owned by the Southern
- 5 Nevada Water Authority, in Coyote Spring Valley, whether the
- 6 State Engineer retained the power to limit those water rights
- 7 in the future and reduce the ability of those water right
- 8 owners to pump that water?
- 9 MR. HERREMA: Brad Herrema for CSI. I would like
- to object on relevance to the scope of this proceeding.
 - HEARING OFFICER FAIRBANK: Mr. Taggart, can you
- 12 relate your question to those four primary issues as set
- 13 forth in Order 1303?
- MR. TAGGART: I think it relates to the long-term
- 15 quantity of groundwater that be can be pumped in the five
- basins and whether the State Engineer maintains the ability
- 17 to use that control, use that long-term quantity of water in
- 18 these basins.

11

- 19 HEARING OFFICER FAIRBANK: I'm going to sustain
- 20 the objection, because I think the question as to the
- authority of the State Engineer over any individual water
- 22 right is beyond the scope of these particular proceedings.
- MR. TAGGART: Okay. I think I'm out of time or
- 24 do I get anymore?

- 1 at your slide 40. And your final bullet point there says
 - 2 that it's your position that the current boundary of the
 - 3 Lower White River Flow System should stay the same. And I'm
 - 4 looking more at your slides 25 through 39. I know some were
 - 5 objected to. I'm not going to ask you about the substance of
 - 6 those. Just the heading of each one of those slides is
 - 6 those. Just the heading of each one of those shides
 - 7 inclusion of Kane Springs Valley, is it not?
 - 8 A. Robert Coache. Yes, it is, sir.
 - 9 Q. Okay. So I just want to be clear. Are you
 - 10 recommending the inclusion of Kane Springs Valley in this
 - 11 management area?
 - 12 A. Initially, yes, we are. But we don't think that
 - this is the -- because this was supposed to be mostly for
 - 14 hydraulic data that this was the proper venue to do that.
 - 15 And then we also recognize the importance of getting
 - additional data for Black Mountain. And so I felt that if we
 - 17 made -- if we went against what the hydraulic -- what the
 - 18 significance of this was with collecting hydrologic data and
 - 19 those opinions and then also recommended Kane Springs be
 - 20 brought in but give us more time for Black Mountain, I
 - 21 thought that was pretty hypocritical.
 - 22 Q. Okay. I appreciate that.
 - ANSWERS BY MR. RICCI:
 - 24 Q. There's a substantial amount of institutional

Page 1658

Page 1660

- 1 HEARING OFFICER FAIRBANK: You still have a
- 2 little more time.
- 3 MR. TAGGART: Oh, I do? I thought I heard a
- 4 buzzer. I'm sorry.
- 5 HEARING OFFICER FAIRBANK: Not mine.
- 6 Q. (By Mr. Taggart) Mr. Ricci, to you again. Do
- 7 you believe that the protection of senior water rights on the
- 8 Muddy River is a matter the State Engineer should use to9 determine how much groundwater can be pumped in the Lower
- 10 White River Flow System. Should that number be based upon
- 11 not inflicting with senior water rights in the Muddy River?
- 12 A. Hugh Ricci. I believe the State Engineer is
- 13 required, I believe, as Mr. Coache mentioned with SB-47 that
- 14 he has to look at all sources of water and what the impacts
- are as a result of any pumping.
- MR. TAGGART: Okay. Thank you. No more
- 17 questions.
- 18 HEARING OFFICER FAIRBANK: Moapa Valley Water
- 19 District.
- 20 CROSS-EXAMINATION
- 21 By Mr. Morrison:
- ANSWERS BY MR. COACHE:
- 23 Q. Greg Morrison for Moapa Valley Water District.
- 24 Just a question of clarification for Mr. Coache. I'm looking

- 1 knowledge up there at the table right now. I'll start with
- 2 Mr. Ricci. If you were the State Engineer October 2019 faced
- 3 all the evidence we've been looking at for the last couple of
- 4 weeks, would you include Kane Springs in the management area?
- 5 A. Hugh Ricci. I would have another option. I
- 6 could retire. But I will have to go back to 2002, actually
- 7 2001, when the hearing was held on Coyote Springs Valley as
- 8 far as the Southern Nevada Water Authority applications in9 Coyote Springs Investments. And when that order was written,
- 10 it did not include Kane Springs at that time. And the reason
- 11 I think was that there was nothing going on in Kane Springs.
- 12 Had I had the knowledge that I would today as of a result and
- 13 had to issue Order 1169 again, Kane Springs would have been
- 14 included.
- 15 Q. Okay. Thanks.
- Mr. Coache, what about you, if I posed the same
- 17 question. If you were sitting where Mr. Wilson is today,
- 18 would you want to include Kane Springs in this management
- 19 area?
- MR. COACHE: Yes, I would.
- MR. MORRISON: Thanks. That's all I have.
- HEARING OFFICER FAIRBANK: Lincoln County, Vidler
- 23 Water Company.
- 24 ///

Min-U-Script® Capitol Reporters (16) Pages 1657 - 1660 775-882-5322

Page 1661

- 1 CROSS-EXAMINATION
- 2 By Ms. Peterson:
- 3 ANSWERS BY MR. RICCI:
- 4 Q. Gentlemen, Karen Peterson here representing
- 5 Lincoln County and Vidler Water Company.
- 6 So, Mr. Ricci, just following up on that last
- 7 statement that you made. Mr. Coache indicated that I guess
- 8 it was his recommendation that Kane not be included right now
- 9 in terms of the boundary at this stage. So you disagree with
- 10 that?
- 11 A. Hugh Ricci. No. What I said had I -- if I were
- to issue Order 1169 again and had the information that I had
- available then as there is enough information today I would
- 14 have included it.
- 15 Q. Right. But is it your testimony today that the
- boundary should not be changed? As we are now in this
- proceeding, the last bullet point on slide 40, says that the
- 18 recommendation is, I assumed of Nevada Cogen, that the
- 19 boundaries not be changed.
- 20 A. You know, when we -- Hugh Ricci again. When we
- 21 did this, this was a collaboration among the three of us, and
- 22 there were certain things that we thought of and two to one
- or whatever, however it was ruled, we put it in it. But the
- 24 answer to my question originally that you asked is what I

- 1 MS. PETERSON: All right. Did any of the three
- 2 of you calculate drawdown to the wells owned or controlled by
- 3 NCA from pumping Kane Spring Valley wells?
- 4 MR. DIXON: No.
- 5 MR. RICCI: You're asking each us of us again,
- 6 Ms. Peterson?
- 7 MS. PETERSON: Yes.
- 8 MR. RICCI: No. The answer to that question is
- 9 no.
- MR. COACHE: I'm sorry. I didn't follow that
- 11 question.
- 12 ANSWERS BY MR. COACHE:
- 13 Q. Mr. Coache, did you calculate drawdown to the
- 14 wells owned or controlled by NCA from pumping Kane Spring
- 15 Valley wells?
- 16 A. No, I did not.
- 17 Q. Mr. Coache, did you review the hydrograph of the
- 18 KSVM during the Kane Springs pump test? KSVM-4, sorry, well.
- 19 A. I'm sorry. What did you ask?
- 20 Q. Sorry. It was bad. Did you review the
- 21 hydrograph of the KSVM-4 well during the Kane Springs pump
- 22 test, the aquifer test?
- 23 A. I did.
- 24 Q. And do you agree that the pump test was for 1800

Page 1662

Page 1664

- 1 would do then if I knew what I do know today.
- 2 Q. So do you support that bullet point or not?
- 3 A. Since my name is on the report I would say yes.
- 4 Q. Did any of the three of you calculate drawdown to
- 5 the Muddy River Springs area from pumping Kane Spring Valley
- 6 wells?
- 7 MR. COACHE: I first want to clarify the bullet
- 8 point, the previous bullet point. My position hasn't changed
- 9 in that I believe Kane Springs Valley should be included. I
- don't believe this is the venue for which to discuss that.
- And that's why that bullet point says what it does in
- 12 relation to the next phase.
- The answer to your question is that I did not
- 14 calculate drawdowns of the Muddy River Springs area from Kane
- 15 Springs pumpage.
- MS. PETERSON: Mr. Dixon?
- 17 MR. DIXON: So.
- MS. PETERSON: Did you calculate drawdown to the
- 19 Muddy River Spring area from pumping Kane Spring Valley
- 20 wells?
- MR. DIXON: No. And that wasn't the purpose of
- 22 that regression analysis.
- MS. PETERSON: Mr. Ricci?
- MR. RICCI: No.

- 1 gallons per minute?
- 2 A. I can't -- I believe that's the number but I
- 3 can't say for sure.
- 4 Q. And do you agree that from that well where the
- 5 pump test was conducted that Lincoln-Vidler was awarded 500
- 6 acre-feet which when pumped would be much less than the 1800
- 7 gallons per minute?
- 8 A. Well, it depends on over what time you pump the
- 9 water.
- 10 Q. Well, do you understand that 1800 gallons per
- 11 minute that was a continuous pump test?
- 12 A. Yeah, absolutely. But if you want to take your
- water out over a one-month period it might be 1800 gallons a
- 14 minute.
- 15 Q. Right. But you would have no idea what the plan
- is for the development of the water out of that well, the 500
- 17 acre-feet, do you?
- **18** A. But you didn't ask me that.
- 19 Q. Do you have any idea?
- (The court reporter interrupts)
- THE WITNESS: No.
- 22 Q. (By Ms. Peterson) And you indicate on pages --
- 23 page 18, I think, Mr. Coache, you wrote this section of the
- report, NCA number one. The last sentence there right before

Min-U-Script®

Capitol Reporters 775-882-5322

(17) Pages 1661 - 1664

Page 1665

1

- 1 the footnotes start, that the aquifer test, the 1169 aquifer
- 2 test, clearly indicates that carbonate pumping from the
- 3 northern portion of Kane Springs Valley and -- Sorry --
- 4 Coyote Spring Valley and KSW-1 within Kane Springs Valley
- 5 will impact carbonate aquifer, hydraulic head within the
- 6 LWRFS, which in turn will increase impact to spring flows
- 7 within the MRSA and be detrimental to the existing
- within the wixest and be definited to the existing
- 8 groundwater rights held by NCA. Do you see that?
- 9 A. Yes, I do.
- 10 Q. And so you're indicating that our pumping will
- 11 impact the springs and then will impact Nevada Cogen; is that
- 12 correct?
- 13 A. That's correct.
- 14 Q. So do you agree then that the Nevada Cogen wells
- 15 have a direct hydraulic connection with the springs?
- 16 A. To reach my conclusion on that, they don't have
- to have a one-to-one direct impact. The issue is in the
- 18 whole picture of the management of the system, if NCA has a
- priority of water rights, as many other people do in this
- 20 whole system, so when you look at where the line is going to
- 21 be drawn by the Nevada State Engineer -- There's a numbering
- issue on the well, I understand that. But if the KPW-1 is
- pumped and the pumpage from those wells in that northern
- 24 Kane -- from Kane Springs Valley and/or northern Coyote

- CROSS-EXAMINATION
- 2 By Mr. Donnelly:
- 3 ANSWERS BY MR. COACHE:
- 4 Q. Thank you. Patrick Donnelly for the record. I'm
- 5 not entirely sure who to direct my questions to, so I will
- 6 start with Mr. Coache. But perhaps you can point me in the
- 7 right direction. There are some things in your report that
- 8 you didn't present here today. Did you reference Center for
- 9 Biological Diversity's Order 1303 report prepared by Dr. Tom
- 10 Myers on slide 31 and 34 of your presentation today?
- 11 A. Yes, I did.
- 12 Q. And did you reference our reports in order to
- provide evidence in favor of your arguments?
- 14 A. Yes, we did.
- 15 Q. Did pages one to two of your written report,
- 16 rebuttal report, recommend excluding non-governmental
- 17 organizations from this proceeding?
- 18 A. Yes, it did.
- 19 ANSWERS BY MR. RICCI:
- 20 Q. I guess this is a question for Mr. Ricci. Have
- 21 citizen or non-profit groups been party to Nevada State
- 22 Engineer proceedings in the past? It's a yes or no question.
- 23 A. Yes.
- 24 Q. Are you aware if the Center for Biological

Page 1666

Page 1668

- 1 Springs Valley impact the spring area and have a detrimental
- 2 impact that requires the State Engineer to lower the bar,
- 3 then that subsequently has a detrimental impact to our client
- 4 because that could be an impact on their priority and result
- 5 in them having to curtail pumpage. So it doesn't have to be
- 6 a direct impact from well to well if the bullseye is the
- 7 Muddy River Springs area.
- 8 MS. PETERSON: Thank you.
- 9 HEARING OFFICER FAIRBANK: Thank you.
- 10 City of North Las Vegas?
- 11 CROSS-EXAMINATION
- MS. URE: Good afternoon. Therese Ure
- 13 representing City of North Las Vegas.
- Mr. Dixon, did you complete an independent
- analysis for Garnet Valley carbonate pumping as related to
- 16 the Muddy River Springs area?
- MR. DIXON: So, to answer that question, I
- 18 performed an independent analysis on the carbonate system as
- a whole with a specific focus on Coyote, Kane, and Black
- 20 Mountain area. I did not focus on Garnet Valley
- 21 specifically.
- MS. URE: Okay. Thank you.
- HEARING OFFICER FAIRBANK: Center for Biological
- 24 Diversity?

- 1 Diversity or the Great Basin Water Network has previously
- 2 been party to Nevada State Engineer proceedings?
- 3 A. Yes.
- 4 Q. Does Order 1303 expressly limit the proceedings
- 5 to water rights holders?
- 6 A. I don't recall if it does or doesn't.
- 7 MR. DONNELLY: Mr. Coache, do you have an answer
- 8 to that question?
- 9 MR. COACHE: It does not. And I would like to
- put some perspective in that if I could. If not, then let's
- 11 go to the next question.
- MR. DONNELLY: I would like to finish my
- 13 question. Thank you.
- MR. COACHE: Fine. Excellent.
- MR. DONNELLY: I would ask which one is it?
- 16 Should we be excluded from these proceedings or should our
- data be utilized by you to bolster your arguments?
- MR. DIXON: It wasn't our decision to include
- 19 NGOs. Since they're included, there's some information in
- 20 that report that we happen to agree with.
- MR. DONNELLY: Which of the four questions raised
- by Order 1303 does section one of your written report
- 23 address?

MR. DIXON: That would be item E in the order, in

Min-U-Script® Capitol Reporters 775-882-5322

(18) Pages 1665 - 1668

Page 1669

- the other matter. 1
- MR. DONNELLY: I would like to move to the State 2
- Engineer that you exclude from the record section one of the 3
- Nevada Cogeneration Associates rebuttal report. It is not
- pertinent to the questions asked by the Nevada State Engineer
- in Order 1303 and, thus, is outside the scope of these 6
- 7 proceedings.
- MR. FLANGAS: Do I need to respond to that? 8
- HEARING OFFICER FAIRBANK: You may, Mr. Flangas. 9
- MR. FLANGAS: There's no basis to exclude it. 10
- 11 I'll come back on a rebuttal question and ask a very simple
- question, have non-governmental organizations been excluded 12
- on the basis of standing. And I'm sure the answer is going 13
- to be yes. 14
- 15 HEARING OFFICER FAIRBANK: So, Mr. Flangas, the
- response was that there's no reason to exclude it and you're 16
- 17 going to address it on redirect. I've admitted the report.
- And while we're trying to maintain the focus within those 18
- four issues, the fifth issue was somewhat broad. And for the 19
- purpose of admitting the report in its entirety we're going 20
- to do that. We're not going to alter that, this 21
- determination. 22
- MR. DONNELLY: Thank you. No further questions. 23
- HEARING OFFICER FAIRBANK: Bedroc? 24

- the difference between alluvium groundwater rights and
- carbonate groundwater rights, until that time they're one in 2
- the same. 3

9

22

2

14

- 4 And that's also said with the understanding that
- the State Engineer probably has the right to limit the depth
- of wells, of alluvium wells, so they don't tap to carbonate.
- But the water rights themselves at this time as they sit are
- a different thing. 8
 - MS. CAVIGLIA: Mr. Ricci?
- MR. RICCI: If the boundary stays exactly the 10
- same and the State Engineer does nothing with those water 11 12 rights that haven't been used in the past that are senior to
- 13 some of those that have been used, possibly the State
- Engineer would have no recourse except to go based on 14
- 15 priority.
- Again, getting back to what Mr. Coache says, is 16
- 17 if you look at the 50,000 plus acre-feet that is appropriated
- in these basins, about 9,000 has been used over the last four 18
- or five years, that's 20 percent. So what have those junior 19
- right holders that have used the water for continuous for 20 20
- years, such as the client for which we work, what are they to 21
- do because they are way down the list? 23 So that's a tough decision that the State
- Engineer is going to have to make. If he makes it based on 24

Page 1670

Page 1672

- MS. URE: No questions. 1
- HEARING OFFICER FAIRBANK: Seeing no questions. 2
- Nevada Energy? 3
- **CROSS-EXAMINATION** 4
- MS. CAVIGLIA: Justina Caviglia on behalf of 5
- Nevada Energy. And I have a question for Mr. Coache or 6
- Mr. Ricci. If regulation of groundwater rights is deemed 7
- necessary in the Lower White River Flow System, state law 8
- 9 requires regulation by priority. Are you recommending the
- State Engineer regulate senior certificated alluvial 10
- groundwater rights in favor of junior carbonate water rights? 11
- MR. COACHE: Well, unless he makes, the State 12
- Engineer, makes a ruling and/or there's some other statutes 13
- available to him, there's no difference with regards to the
- alluvium rights in the Lower White River Flow System and the 15
- carbonate rights in the Lower White River Flow System with 16
- regards to priority. 17
- And, so as they sit right now, that's how it is. 18
- And it's unfortunate, because there's also people that are 19
- 20 using their water and spent hundreds of millions of dollars
- to develop projects that, you know, could be in jeopardy 21
- because of this stuff. 22
- So, you know, if the State Engineer wants to make 23
- a ruling order or have the statute changed that he can split

- priority, he's going to have to do that. 1
 - MS. CAVIGLIA: Thank you. I have no further
- 3 questions.
- HEARING OFFICER FAIRBANK: At this time I'll go 4
- ahead and open it up to the Division of Water Resources. 5
- Oh, I'm sorry. 6
- MR. KING: Madam Hearing Officer, Steve King, 7
- Muddy Valley Irrigation Company. We have no questions. 8
- 9 HEARING OFFICER FAIRBANK: And my apologies for
- skipping over you. I think I was looking ahead when I was 10
- putting together my little checklist. Thank you, Mr. King.
- 11 Muddy Valley Irrigation Company has no questions.
- 12 13
 - So at this time I'll go ahead and open it up to the Division of Water Resources staff and the State Engineer
- for questions. 15
- **EXAMINATION** 16
- By Mr. Benedict: 17
- ANSWERS BY MR. DIXON: 18
- Q. Jon Benedict for the record. I think my first 19
- 20 question is probably for Mr. Dixon. You guys, I guess, would
- be the local experts on your own wells and the information 21
- that you've collected there in terms of that I guess what I 22
- call a connection that exists between those wells. And I 23
- just wanted to drill down a little bit deeper with respect to 24

Min-U-Script®

Capitol Reporters 775-882-5322

(19) Pages 1669 - 1672

Page 1673

- that discussion. You've suggested that the production wells 1
- may not be directly connected to the well to the north that 2
- is a monitoring well and you've shown some geologic slides 3
- for some of those wells that suggest they're all in
- carbonate. Am I correct about that?
- A. Yes. 6
- Q. And yet you've also suggested that the data is
- not conclusive with respect to that connection. From a
- geologic perspective you've also shown some maps. But you
- didn't necessarily tie that together. So I just want to get 10
- your opinion on whether you think that the potential for 11
- disconnections between some of those wells is due to 12
- structure, due to lithology? Do you have any data that 13
- suggests explanation? 14
- 15 A. Jay Dixon. So the structure, the map geology and
- the structure out there, provides one piece of information 16
- 17 that suggests it is possible. But relying on geologic maps
- in cross-sections where structures have been identified alone 18
- 19 is not enough.
- And I'd like to add, water level information, 20
- pumping water level, you know, these wells pump, drawdown is 21
- minimal, there doesn't seem to be much of a response at
- BM-DL-2. But the key thing is that EBM-3 monitor that's by 23
- the southern most production well it just has too much 24

- 1 A. The periodic hand measurements, yeah, that's
- right. It is a long period of record but it's fairly noisy.
- 3 O. Fair enough.
- 4 ANSWERS BY MR. COACHE:
- Q. Next question. This may be for Mr. Coache. I
- think you suggested that measurements perhaps of both water
- levels but certainly of Warm Springs West discharge or
- measurements there show a lack of recovery from the 1169
- aquifer test; is that correct? 9
- 10 A. A lack of recovery --
- 11 Q. A full recovery.
- 12 A. -- to the pre-test levels.
- 13 Q. Okay. That's what I was wondering. I was
- wondering if you can characterize whether you think that lack 14
- of recovery is a consequence of the test itself or other 15
- factors or if you have an opinion on them? 16
- 17 A. Well, I have lots of opinions. I think -- I do
- think it's a direct result, the impacts for a direct result 18
- of the pump test, I believe that. And I believe that's 19 clear. 20
- The lack of recovery to the pre-test levels I 21
- believe is a direct response from the very low storativity in 22
- the system and that a chunk of that water, whatever 23
- 24 percentage you want to assign to it, a chunk of that water

Page 1674

Page 1676

- 1 external influence from pumping at that particular well
- because that's an area where the transmissivity appears to be 2
- lower, the specific yield, specific capacity is lower. And 3
- there's just too much uncertainty with that data. So I wish
- I could tie it together more confidently, but I just can't. 5
- Q. Do you think the question or the unanswered 6
- 7 question, I guess, could be answered with a test other than
- 1169 type test to be able to determine those connections or 8
- do you think those issues with regard to that uncertainty are
- also compounded by the need to have a high volume and long 10
- term test to be able to diagnose the problem? 11
- A. Well, here's the thing. We got -- We got a
- 25-year test at NCA. Particularly those two northern most 13 wells they've been pumped. They use all of their water
- rights every year.
- 15
- If I could make one recommendation, and I'll talk 16
- to them about this, I think we need to get transducers in the 17
- two wells that we converted to monitoring wells. I think 18
- that would help at least provide an opportunity to decipher 19
- 20 some of that noise from pumping and maybe resolve what the
- actual response is with more confidence. 21
- Q. Okay. So what you're saying is you've got -- you 22
- don't have the data collected during that pumping to be able 23
- to resolve that out. So you need --

- for the pump test was taken out of storage. That storage
- 2 then reduced the hydraulic head that feeds the spring system
- in the Muddy River Springs area. And since that water was
- taken out of storage, it hasn't recovered sufficiently from 4
- inflow to boost that level up significantly to increase that hydraulic head to the point to increase the flows of the 6
- 7 springs.

5

- 8 Q. Is that the same as saying it hasn't reached
- 9 equilibrium yet?
- A. Well, I don't believe the system has reached 10
- equilibrium. And I don't know if you could ever -- This is 11
- kind of going in the weeds of this a little bit. But I'm not 12
- sure -- When you're looking at a system that's as big as the 13
- Lower White River Flow System and all the things that are 14
- occurring around it, I'm not sure you can ever reach 15
- 16 equilibrium. I think you can manage around a line or an
- 17 area. But I don't think you're ever going to get to a point
- of pure equilibrium in that system. 18
- Q. Got it. I guess maybe a better way to say that 19
- 20 is, so you think the impacts from the 1169 test continue on
- after what we've seen as a recovery at this point. Are there 21
- some influence that exists still from that? 22
- A. I don't think the impacts are continuing. I 23
- think -- I think the impacts have leveled off. What I think 24

Min-U-Script®

Capitol Reporters 775-882-5322

(20) Pages 1673 - 1676

Page 1677

- has happened is that the ability for the system to recover 1
- because of the amount of the water that was taken out of 2
- storage has limited to the recovery. So I don't think that 3
- the water level is still going down from the 1169 aquifer 4
- test. So I think we've leveled off there.
- It's a continuation of how much water is flowing 6
- 7 in to the system to get the carbonate level up to increase
- the hydraulic head in that alluvium to drive that water out. 8
- MR. BENEDICT: Okay. Thank you. 9
- **EXAMINATION** 10
- 11 By Mr. Kryder:
- ANSWERS BY MR. DIXON: 12
- Q. Levi Kryder for the record. The first question 13
- is for Mr. Dixon. On your slide 16, the right-hand panel 14
- 15 where you're showing the correlation between EBM-3 and EH-4,
- what are the linear horizontal features that are present in 16
- the scatter data? 17
- A. That is a reflection of hand measurements that 18
- don't have a lot of resolution in them. And I looked at that 19
- and it's -- they rounded it to the nearest foot. So there's 20
- several months where it's the same level. 21
- Q. Okay. Thank you. And in your -- in any of the
- analyses that you did here, did you look at the response time 23
- of the system or the delay time in response across the 24

- 1 A. I relied on other stakeholders' reports regarding
- that information. Those are the references I provided. And
- I'm familiar with the statements that they made. And it 3
- seemed reasonable to me. So, no, I don't have anything
- beyond that though, unfortunately.
- Q. Are you -- Is it your belief that all the water
- from Rogers and Blue Point is sourced from recharge in the
- Muddy Mountains?
- A. A portion perhaps. But, you know, I think other 9
- stakeholders commented on the fact that the response at those 10
- springs from Order 1169 pumping wasn't there. I don't deny 11
- that a portion of that water is definitely coming from 12
- 13 carbonate rock, just like the pumping wells at NCA are coming
- from carbonate rock. That's carbonate rock that the wells 14
- 15 are starting to drill in. But that doesn't mean necessarily
- that the water that's there is being removed from the same 16
- 17 system that we are talking about in the LWRFS because of the
- geologic structures and features between, such as the Muddy 18
- Mountains. 19

HEARING OFFICER FAIRBANK: Okay. So we are 20

- nearly out of time. So I'm just going to quickly go through 21
- and see if there -- We can do just a couple of minutes for 22
- 23 recross if there are anybody. Coyote Springs Investments,
- any additional questions? Seeing none. 24

Page 1678

2

10

Page 1680

- system, the pumping signals? 1
- A. When I did this simple regression analysis for 2
- CSVM-4 versus EH-4, first of all, I tried to reproduce SNWA's
- results to make sure I could reproduce that. And then I saw
- the three -- It could have been five months. It could have 5
- been two months. Whatever. I did not disagree with their 6
- assessment that there was three months. That was a 7 reasonable explanation for why that -- why that water level 8
- 9 CSVM-4 responded with a bit of a delay. So only there. I
- didn't see that type of delay anywhere else when I was
- 10
- looking at these correlations. 11
- MR. KRYDER: Okay. Thank you. 12
- **EXAMINATION** 13
- By Mr. Sullivan: 14
- ANSWERS BY MR. DIXON: 15
- Q. Adam Sullivan. In your rebuttal report, one of 16
- your sections is responding to the National Park Services 17
- discussion or recommendation to include the entire Black 18
- Mountains area. And I'm wondering if -- Well, first, you use 19
- 20 the geologic analysis and then you refer to a water chemistry data that would support not including Black Mountains area. 21
- 22 And just a specific question is do you have another citation
- that's not referred to here that this water chemistry data 23
- came from? 24

- US Fish and Wildlife? Seeing none. 1
 - Let me do it this way. Are there any
- participants that wish to have about two minutes for recross?
- Okay. So I see Lincoln County and Southern Nevada Water 4
- Authority. I'm not seeing any other participants. 5
- So we'll go ahead and start with the Southern 6
- 7 Nevada Water Authority and Las Vegas Valley Water District.
- And, given our time frame, I'm going to go ahead and give you 8
- 9 two minutes, Mr. Taggart.
 - **CROSS-EXAMINATION**
- By Mr. Taggart: 11
- Q. I have to think about my questions first before 12
- the clock starts. So this question I think is to Mr. Ricci 13
- but also Mr. Coache. A proposal has been made by my client 14
- to use the Warm Springs West gage and the 3.2 flow at that 15
- 16 gage as a control on how much groundwater can be pumped. Do
- you understand that my client has made that proposal? 17 18
 - MR. COACHE: Yes, sir.
- MR. TAGGART: And I heard in your testimony you 19 20
- alluded to a case called Cappaert or Cappaert, depending on how it's pronounced. But I want to just ask you to explain a
- 21 little bit more about why is -- why is the -- do you believe 22
- the need to utilize a control at Warm Springs West of a 23
- certain flow rate as a control on groundwater pumping, is 24

Min-U-Script® Capitol Reporters 775-882-5322

(21) Pages 1677 - 1680

Page 1681

- that comparable to what needs to occur at Cappaert at Devil'sHole.
- 3 MR. COACHE: In my belief absolutely. And I
- 4 believe it's actually even more relevant than what happened
- 5 at Devil's Hole. At Devil's Hole the water didn't flow at
- 6 all, doesn't flow. They didn't have any water rights. And
- 7 it's simply a -- It's not even a water right. It's a water
- 8 elevation maintenance above -- below the washer. And so they
- 9 were given that right to maintain that water level at level X
- 10 to maintain water on the shelf to where the Devil's Hole pup
- 11 fish can breathe. There's, let's say, a one-foot decline in
- water level just like it would be detrimental to the Moapa
- dace, one-foot level in Devil's Hole eliminates probably 50,
- 14 60 percent of the breeding area for the fish. And that's why
- 15 I put it in there. I really believe that they're directly
- 16 related on what can happen if we don't get our hands around
- this and manage this system.
- MR. TAGGART: And Mr. Ricci, do you have anything
- 19 to add to that?
- MR. RICCI: No.
- MR. TAGGART: Okay. One other question is in
- 22 Cappaert was the State Engineer required to do what he did or
- 23 did he have the choice ahead of time to manage the system
- 24 itself?

- 1 with, if these obligations are met within the Muddy River
- 2 Springs area, there is no evidence suggesting impacts would
- 3 propagate north of and beyond the Lower White River flow
- 4 boundary as currently proposed by the State Engineer. Do you
- 5 see that?
- 6 A. I do.
- 7 Q. Okay. And, Mr. Dixon, you wrote that?
- 8 A. Yes.
- 9 Q. All right. And are you aware that in Kane
- 10 Springs Valley in Ruling 5712 the State Engineer granted a
- 11 thousand acre-feet of water rights to Lincoln and Vidler but
- 12 he required that the pumping of those water rights, 500 be at
- the existing production well, and 500 acre-feet be pumped
- 14 from a future well to be developed under the applications,
- which is about seven miles away. Were you aware of that?
- 16 A. Yes.
- 17 Q. And would you agree that that's reasonable
- 18 management by the State Engineer of the Kane Springs Valley
- 19 hydrographic basin?
- 20 A. No. Because in that same ruling he also said
- 21 there was a hydraulic connection with Coyote Spring Valley.
- 22 Q. And there are some questions to Mr. Coache about
- new evidence in the record before the State Engineer. And
- 24 I'm wondering where the SNWA model is with all that new

Page 1682

Page 1684

- 1 MR. COACHE: In Cappaert he was required to do
- 2 what they did. There was an opportunity to manage some of
- 3 the rights beforehand. They didn't take that complete
- 4 opportunity. But Cappaert took all decision making out of it
- 5 for the State Engineer.
- 6 MR. TAGGART: All right. Thank you.
- 7 HEARING OFFICER FAIRBANK: Lincoln County,
- 8 Vidler.
- 9 CROSS-EXAMINATION
- 10 By Ms. Peterson:
- 11 ANSWERS BY MR. COACHE:
- 12 Q. Gentlemen, if you could turn to page 19 of your
- 13 report, section six. I think, Mr. Coache, you said you wrote
- this section. Do you have that in front of you?
- 15 A. I'm sorry, ma'am. Did you say section six?
- 16 Q. Yeah, section six on page 19.
- 17 A. I did not write this portion.
- 18 ANSWERS BY MR. DIXON:
- 19 Q. Okay. So who ever wrote this portion, the
- 20 question is addressed to them. There's a recommendation
- 21 there that the Moapa dace will be protected if there is
- 22 certain management of the Lower White River Flow System and
- 23 sustainable levels of pumping and the decreed rights also on
- 24 the Muddy River will be protected. And then the section ends

- 1 evidence in it?
- 2 MR. TAGGART: Objection.
- 3 (The court reporter interrupts)
- 4 HEARING OFFICER FAIRBANK: Mr. Taggart's
- 5 objection was as to the --
- 6 MR. TAGGART: Vagueness. What model exactly?
- 7 HEARING OFFICER FAIRBANK: Yes. Question as to
- 8 vagueness regarding the use of the term SNWA model.
- 9 MS. PETERSON: I can rephrase. There's new --
- 10 There's -- Do I get to rephrase?
- 11 HEARING OFFICER FAIRBANK: Yes. Finish your
- 12 question.

13

- MS. PETERSON: Thank you.
- You had questions from SNWA about the new
- evidence that had been developed -- Yes, to you, Mr.
- 16 Coache -- since I guess 2012. Do you recall that line of
- 17 questioning?
- MR. COACHE: I recall that line of questioning.
- 19 I do not remember them mentioning a model.
- MS. PETERSON: Right. Do you know if SNWA has developed any kind of model with all of that new data?
- MR. COACHE: I do not.
- MS. PETERSON: Okay. Thank you.
- 24 HEARING OFFICER FAIRBANK: All right. Given the

Page 1685

- 1 fact that I haven't seen any other participants express an
- 2 interest for additional questions, we'll go ahead and open it
- 3 back up to -- Oh, I'm sorry. I'm going to open it back up to
- 4 the Division of Water Resources staff.
- 5 EXAMINATION
- 6 By Mr. Sullivan:
- 7 ANSWERS BY MR. DIXON:
- 8 Q. Just one point of clarity in your rebuttal report
- 9 on page six and also on page seven. On the Y-axis on both of
- 10 those charts, it appears that there is a typo and the decimal
- point was removed from the units on the Y-axis; is that
- 12 correct?
- 13 A. Feet above main sea level, is that what you're
- 14 talking about?
- 15 Q. Feet above main sea levels. So from the bottom
- 16 goes 1562 and then 1563 and then 1563 again. Should that be
- 17 1563.5?
- **18** A. Point-five, yep. I cut off the decimal.
- 19 Q. Okay. That was done on Figure 4 and also Figure
- 20 5?
- 21 A. Yep. Good catch.
- HEARING OFFICER FAIRBANK: Okay. So we'll go
- ahead and open it up to Mr. Flangas for redirect. And I'm
- 24 going to give you seven minutes. It's a little bit more but

- 1 explain -- You still provided data, so I need you to explain
- 2 to this panel here, are you telling them to ignore the
- 3 information on EB-3 or are you saying that the findings in
- 4 EB-3 are important? What's your point with regard to EB-3?
- 5 A. I believe they're important. But I -- I can't
- 6 draw any conclusions on the data with a hundred percent
- 7 certainty because of the obvious influence from pumping in
- 8 the manner in which the resolution in the water levels that
- 9 are being reported. So that -- those two things right there
- 10 definitely affect the R-squared value in the regression
- 11 analysis.
- 12 Q. Can you ever draw anything with a hundred percent
- certainty in hydrology, sir, really?
- 14 A. Well, I guess not.
- 15 Q. So I guess what I'm asking now, this is
- 16 important, this is an important point. I don't mean to make
- 17 light of it. But I just want to make sure that we're clear
- 18 here. When you say that you don't have a high degree of
- 19 confidence, those of us who are lay persons wonder if that
- 20 means should it be disregarded or should it be considered?
- 21 A. You know, if that R-squared value was .7, .8, you
- 22 know, I would -- The fact that it's so much different. I did
- put the hydrograph in here, you know. The water levels
- 24 definitely show response to pumping, but there is overall

Page 1686

Page 1688

- 1 there was some delay with respect to the objections.
- 2 MR. FLANGAS: I won't need that. Just a couple
- 3 of questions hopefully.
- 4 REDIRECT EXAMINATION
- 5 By Mr. Flangas:
- 6 ANSWERS BY MR. DIXON:
- 7 Q. Let's just clarify a couple of points.
- 8 Mr. Dixon, is it the position of the three members up there
- 9 that Kane Springs should be included in the State Engineer's
- 10 consideration of the Lower White River System?
- 11 A. Yes.
- 12 Q. And why is that?
- 13 A. There's a hydraulic connection based on
- 14 observations made before, during, and after the Order 1169
- 15 test that clearly demonstrate it. At that location, at
- 16 KPW-1, very specific at that location. I don't know what
- would happen if they pumped up the north end of the valley.
- 18 I don't have any information up there.
- 19 Q. Okay. Thank you. In response to Mr. Benedict's
- 20 questions you commented that there was noise in the well at
- EB-3. Do you remember that?
- 22 A. EBM-3 yes.
- 23 Q. I realize there's noise and I realize you said
- you don't have a great degree of confidence. But can you

- 1 trends. This is a more diagnostic tool. And it's because of
- 2 the dramatic difference between the results, you know .95
- 3 versus .52. By definition .52 does indicate some
- 4 correlation, but it's significantly different than the nearby
- 5 well, you know, three quarters of a mile away BM-DL-2, which
- 6 is a high correlation to EH-4b. It's the difference between
- 7 those two
- 8 Q. So the entire difference can't be explained just
- 9 by, because there's hand measurements and just because
- there's a rounding, is that what you're saying?
- 11 A. Right. There's something different between those
- 12 two wells, something causing the response to be that much
- 13 different.
- 14 Q. Last question. And this is a question for the
- panel generally. Are you aware of circumstances where
- 16 non-water right holders have been excluded from hearings on
- 17 the basis of standing? Mr. Ricci, in your experience? Is
- 18 the question clear?
- MR. RICCI: I can't -- I can't recall that I -- I
- 20 couldn't say with a hundred percent certainty one way or
- 21 another.

775-882-5322

- MR. FLANGAS: Okay. Mr. Coache?
- MR. COACHE: Yes. Water right holders that do
 - not file protest and try to get in to the hearing process

Min-U-Script® Capitol Reporters

(23) Pages 1685 - 1688

Page 1689

- 1 subsequent to the -- not subsequent to, but after the protest
- 2 period is expired, have been excluded all the time.
- 3 Q. (By Mr. Flangas)
- 4 ANSWERS BY MR. DIXON:
- 5 Q. Mr. Dixon, have you ever experienced a situation
- 6 where folks who do not have water rights in the area in the
- 7 basin that is subject to hearings have been excluded on the
- 8 basis of standing?
- 9 A. Not beyond the situation that Mr. Coache just
- 10 mentioned. You know, our process is transparent. It gives
- people a right to protest, right. And it doesn't matter who
- 12 you are, you have that right.
- 13 Q. But isn't that the reason why we had .1 in our
- 14 rebuttal report?
- 15 A. Right. We feel that the stakeholders who have
- 16 the most on the line here are the people who have invested to
- 17 resources, the people who rely on that water to run their
- business or to -- The 8500 people in Overton and Logandale,
- 19 the Moapa Valley Water District is required by law to deliver
- 20 water. Those are stakeholders. The public interest is by
- 21 law protected by the Fish and Wildlife and the Park Service.
- That's their job. And it's also the job of the State
- 23 Engineer.
- 24 Q. Okay. And that is the reason for the inclusion

1 sworn in.

3

4

9

- 2 HEARING OFFICER FAIRBANK: Thank you, Mr. King.
 - (The witness was sworn in)
- 5 TODD ROBISON
- 6 Called as a witness on behalf of
- 7 Muddy Valley Irrigation Company, having been first duly sworn
- 8 Was examined and testified as follows:

10 DIRECT EXAMINATION

- 11 By Mr. King:
- 12 Q. Good afternoon, Mr. Robison. Can you please
- state and spell your name for the record.
- 14 A. Todd Robison, T-o-d-d R-o-b-i-s-o-n. I'm the
- 15 president of the Muddy Valley Irrigation Company here
- 16 representing the shareholders.
- 17 Q. Thank you, Mr. Robison. And did you prepare or
- 18 direct the preparation of the Muddy Valley Irrigation Company
- 19 Exhibit Number 1?
- 20 A. I did.
- 21 Q. Are there any changes to that exhibit that you
- would like me to identify for the record?
- 23 A. There is. There's a couple of typographical
- 24 errors.

Page 1690

Page 1692

- 1 of the .1 in the rebuttal report?
- 2 A. It was.
- 3 Q. Okay. We don't have any -- We don't have
- 4 anything -- We're not out to get the NGOs in any particular
- 5 reason. And I say we meaning Nevada Cogeneration Associates.
- 6 A. That's correct.
- 7 MR. FLANGAS: Okay. Thank you. I have no
- 8 further questions.
- 9 HEARING OFFICER FAIRBANK: Thank you. So we will
- 10 go ahead and take a ten-minute break. We'll get started
- around, make it 2:45-ish, a little bit thereafter. And we'll
- 12 get started with the Muddy Valley Irrigation Company.
- 13 (Break was taken)
- 14 HEARING OFFICER FAIRBANK: We will continue with
- the Muddy Valley Irrigation Company.
- MR. KING: Thank you. Good afternoon. Steve
- 17 King here for Muddy Valley Irrigation Company. This
- afternoon I'm going to present for the hearing Mr. Todd
- 19 Robison, who is the chairman/president of the Muddy Valley
- 20 Irrigation Company.
- The company filed one exhibit in its August 15th,
- 22 2019, rebuttal report. And Mr. Robison will be going over
- 23 that for the proceeding this afternoon.
- So, in order to begin, if the witness may be

- 1 MR. KING: And, if it please the hearing officer,
- 2 I would be prepared to identify those specifically. On page
- 3 one, paragraph two, at line six, there is a missing word,
- 4 specifically after the words State Engineer's options in view
- 5 of, the word that is missing should then be inserted and that
- 6 word is what. And that will then complete that sentence.
- 7 And then there is another clerical error,
- 8 typographical error, that the company is aware of. And that
- 9 would be on page three. And that is in Roman numeral section
- 10 two at sub three. The first line, which reads, the long-term
- 11 annual quantity of groundwater that may be purged from the
- 12 Lower White River Flow System. The word should be pumped,
- 13 not purged.
- So with the permission of the hearing officer, we
- would like those to be entered in to the record. Are there
- any other corrections that you're aware of, Mr. Robison?
- THE WITNESS: Those are the corrections, yes.
- MR. KING: Okay. Thank you.
- 19 HEARING OFFICER FAIRBANK: Those exhibits --
- 20 Those exhibits will be admitted.
- 21 Q. (By Mr. King) And was Muddy Valley Irrigation
- 22 Company's rebuttal report filed pursuant to State Engineer
- 23 Interim Order 1303?
- 24 A. Yes.

Min-U-Script® Capitol Reporters (24) Pages 1689 - 1692 775-882-5322

Page 1696

Page 1693

- 1 Q. And is Muddy Valley Irrigation Company's
- 2 participation in this proceeding to confirm its status as a
- 3 holder of senior decreed water rights relative to the
- 4 questions presented by the State Engineer regarding
- 5 consideration of conjunctive management plan for the Lower
- 6 White River Flow System and the fully decreed Muddy River?
- 7 A. Yes.
- 8 MR. KING: Madam Hearing Officer, I would move
- 9 that the Muddy Valley Irrigation Company Exhibit 1 be
- 10 admitted in to evidence.
- 11 HEARING OFFICER FAIRBANK: It's so admitted.
- MR. KING: Thank you.
- 13 Q. (By Mr. King) Mr. Robison, could you please
- 14 provide a brief history of your membership and board of
- 15 director responsibilities as president/chairman in relation
- to the Muddy Valley Irrigation Company?
- 17 A. Yes. I currently serve as president and chairman
- 18 of the board of directors of the Muddy Valley Irrigation
- 19 Company. We're a non-profit Nevada corporation that operates
- 20 an irrigation system in the Lower Muddy River Basin. And
- 21 I've served in the capacity of board of director for close to

company is a non-profit. I think if I'm recalling, the

not for profit company. Would that be accurate?

Q. And so I just wanted the record to reflect that

Thank you. So approximately how many

company is incorporated under the laws of the State of Nevada

1895 and in its articles of corporation it said it will be a

it's not the specific more recent, within the last several

decades, section of the Nevada Revised Statutes which allows

for, quote, non-profit corporations to be incorporated in the

shareholders are there in the Muddy Valley Irrigation

Q. Are Muddy Valley Irrigation Company shareholders

the beneficial owners of the Muddy Valley Irrigation

Company's decreed water rights in the Muddy River and

president of the company, do you believe that the Muddy

Valley Irrigation Company has a duty to preserve and protect

entitled to the water according to their individual

proportionate interests and their shares owned?

O. As a member of the board of directors and

- 22 30 years and been a chairman for the last 15 or 16 years,
- 23 something like that.

A. That's correct.

state; is that correct?

That's correct.

A. Approximately 250.

Company?

21

22

23

24 Q. For clarification, you just mentioned that the

- 1 its corporate assets, specifically, its senior decreed water
- 2 right for the use of Muddy River water?
- 3 A. Yes.
- 4 Q. This is the first day you've been here attending
- 5 these proceedings that have been going on since Monday of
- 6 last week; is that accurate?
- 7 A. That's correct.
- 8 Q. Okay. With that being said, are you aware of
- 9 other participants in this proceeding who own shares in Muddy
- 10 Valley Irrigation Company? If you do, can you please
- 11 identify those shareholders for the record?
- 12 A. Yes. CSI, Vidler Water, Moapa Valley Water
- 13 District, Southern Nevada Water Authority are all
- 14 shareholders.
- 15 Q. Thank you. So you named -- Two of those four are
- 16 Nevada political subdivisions. Do you recall if there are
- any other Nevada local government/political subdivision
- 18 entities owning Muddy Valley Irrigation shares and who are
- 19 those shareholders?
- 20 A. There is Overton Power District, Clark County
- 21 representing the Township of Overton and Logandale.
- 22 Q. All right. And how about are there any State of
- 23 Nevada agencies or entities that are shareholders in Muddy
- 24 Valley Irrigation Company?

Page 1694

- 1 A. I believe there's two. Nevada Department of
- 2 Wildlife and also the University of Nevada Reno Board of
- 3 Regents.
- 4 Q. All right. And so for all of those shareholders
- 5 and all the shareholders in the combined 250, from what I
- 6 understand your testimony, is your responsibility as one of
- 7 the board of directors president the governing body of the
- 8 Muddy Valley Irrigation Company to protect those valuable
- 9 senior decreed water right interests in the company; is that
- 10 accurate?
- 11 A. That's correct.
- 12 Q. All right. And is that -- would that protection
- 13 interest, that obligation, be about with regard to how many
- shares an individual shareholder owns or whether they are a
- private or a public entity?
- 16 A. It has no bearing on that.
- 17 Q. Thank you. Now let's -- May I turn your
- 18 attention to the Muddy Valley Irrigation Company rebuttal
- 19 report. In the rebuttal report is just a four-page letter
- 20 that you signed as the chairman, it should also have
- 21 identified you as the president, I believe. Is that
- 22 accurate?
- 23 A. Yes.
- 24 Q. And MVID did not present an independent

r ago roor

Min-U-Script®

A. Yes.

Capitol Reporters 775-882-5322

(25) Pages 1693 - 1696

Page 1697

- 1 hydrologic or related scientific analysis report with respect
- 2 to the four specific Lower White River Flow System issues and
- 3 questions identified in Interim Order 1303, did it?
- 4 A. That's correct.
- 5 Q. So can you please tell us how Muddy Valley
- 6 Irrigation Company's rebuttal report answered those
- 7 questions?
- 8 A. Yes. We believe that as an irrigation company
- 9 that the senior groundwater rights take precedent over any
- 10 other rights --
- 11 Q. Excuse me, Mr. Robison. May I interject? I
- 12 believe you said senior groundwater rights. Did you mean to
- 13 say surface water?
- 14 A. Surface water rights. I apologize for that.
- 15 Yes. We believe that the senior adjudicated rights in the
- decree take precedent over any other rights in the system.
- 17 Q. And that is your understanding that at least one
- 18 of the central purposes of these 1303 proceedings is to
- 19 determine whether depletions caused by junior groundwater
- 20 right development may impair or affect the senior decreed
- 21 surface water rights?
- 22 A. That is correct.
- 23 Q. Thank you. So, on the specific questions, I
- believe the first question had to do with the geographic

- 1 Q. And when you say the upper rights, I want to just
- 2 see if I can get you to clarify that a bit. So in the Muddy
- 3 River decree, that's entered in 1920; is that correct?
- 4 A. That's correct.
- 5 Q. And as I'm just recalling in these provisions
- 6 that all the water rights that were determined, the relative
- 7 rights adjudicated to determine that decree were found to be
- 8 found -- found to be appropriated, placed to beneficial use
- 9 before 1905; is that accurate?
- 10 A. That's correct.
- 11 Q. And do you also know that under the decree the
- river is divided in to two sections, the upper and the lower;
- 13 is that accurate?
- 14 A. That's correct.
- 15 Q. And when you say the upper rights, you're not
- 16 necessarily referring to the decreed rights in the river.
- 17 Are you more accurately referring to any possible depletions
- 18 by spring flow?
- 19 A. Yeah. That's our only gage that we have is
- 20 actual flow that shows up at our diversion point. And any
- 21 diminished flow from that is a concern to us.
- 22 Q. And is it true that in the decree the Nevada
- 23 district court judge determined that as to all the water that
- 24 reaches the diversion point, as you said, and I think that

Page 1698

Page 1700

- 1 boundary of the State Engineer's Lower White River Flow
- 2 System. And the Muddy Valley Irrigation Company did not
- 3 disagree with the State Engineer's determination as set forth
- 4 in Order 1303, did it?
- 5 A. We did not.
- 6 Q. Okay. Thank you. Then as to the next three
- 7 questions. Can you just please identify, just in a summary
- 8 way, the concurrence that Muddy Valley Irrigation Company
- 9 raised in its rebuttal report?
- 10 A. Yes. I think, I believe to answer the next three
- 11 points, our concern is driven from the reduced stream flows
- in the Muddy River, which the end result is at our point of
- diversion that we have a reduced flow. And the concern is,is that the upper rights have a great impact on our lower
- is that the appearing have a great impact on our lower
- 15 rights. And being able to identify the problems that are
- risen from that is outside the scope of our ability, and we
- 17 rely heavily on the State Water Engineer to assist us with
- 18 that.
- And, clearly, we're a small company that is an
- 20 end right user. And we do not have any hydrological
- 21 expertise in the upper basin to make any kind of
- 22 determination as to what's causing the reduced stream flow.
- 23 So our purpose in our letter today I think clearly spells out
- that our concern is protecting our senior water right.

- 1 would be at wells siting, that the Muddy Valley Irrigation
- 2 Company is entitled to take and divert all of that water for
- 3 the benefit of its shareholders and others?
- 4 A. That's correct. I think it actually has a little
- 5 stronger language than that. It says we're obligated to take
- 6 it.

13

- 7 Q. Obligated to take it. I think you're right.
- 8 A. And put it to beneficial use.
- 9 Q. It's a long decree. It incorporates the relative
- 10 determinations of the State Engineer. It actually has a
- 11 Supplemental Exhibit B to it that confirms the rights of all
- 12 the holders in the Muddy River.
 - Now, as I remember also, that decree has some
- 14 specific language that states that the Muddy River by the
- 15 appropriation and placing to beneficial use of the holders of
- 16 the rights determined in the decree has been fully consumed
- and exhausted and that it's fully appropriated; is that
- 18 correct?
- 19 A. That's correct.
- 20 Q. I think there's some language in the decree that
- 21 talks about that there's a prohibition on any further
- 22 development on the sources or the spring heads. Is that your
- 23 recollection?
- 24 A. Yes, it is.

Min-U-Script® Capitol Reporters (26) Pages 1697 - 1700 775-882-5322

Page 1704

Page 1701

- 1 Q. And so that would be kind of consistent then with
- 2 the language about fully consuming and exhausting. And so
- 3 that language, does that tell you that any -- there would be
- 4 no further appropriations available for river or spring flows
- 5 in the Muddy River system?
- 6 A. That's my understanding.
- 7 Q. All right. Thank you. And is that the way since
- 8 your tenure and association with Muddy Valley Irrigation
- 9 Company the company has operated with regard to the water
- 10 rights adjudicated to the company?
- 11 A. That's correct.
- 12 O. And is it not also true that below the division
- 13 between the Upper and the Lower Muddy River that the company
- 14 is actually directed to effectively manage those flows and
- all the water that reaches the diversion point for the
- benefit of the shareholders?
- 17 A. That's correct.
- **18** Q. But you're not an attorney so you don't know
- 19 how -- you just understand how the decree works and as a
- 20 president of the company?
- 21 A. That's correct.
- 22 Q. And this is an unusual company in some ways in
- 23 Nevada, would you agree that it's a shareholder company that
- owns water rights for the benefit of its individual

- 1 conservative and a cautionary way to protect those assets?
- 2 A. That's correct.
- 3 Q. Because the company has no independent hydrologic
- 4 or scientific technical analysis, does it?
- 5 A. No, we do not.
- 6 Q. And the company doesn't own any groundwater
- 7 rights, does it?
- 8 A. No.
- 9 Q. So the company's interest are for the State
- 10 Engineer to always keep those rights as a baseline that are
- 11 necessary to be protected in these proceedings as it
- 12 considers the questions presented in the possible conjunctive
- management of the Lower White River Flow System; is that
- 14 correct?
- 15 A. Yes.

22

- MR. KING: Thank you, Mr. Robison.
- Madam Hearing Officer, I believe this would be
- 18 the -- conclude the direct examination for Muddy Valley
- 19 Irrigation Company of Mr. Robison. And we would like to
- 20 reserve whatever time might be appropriate for redirect after
- 21 cross-examination.
 - HEARING OFFICER FAIRBANK: Thank you, Mr. King.
- 23 And you have approximately an hour and 40 minutes remaining,
- so we'll go ahead and reserve that for you.

Page 1702

- 2 A. Yeah, the irrigation company does hold those

shareholders; is that accurate?

- 3 rights.
- 4 Q. Okay. Thank you. So can you explain, and I
- 5 think you have, that the company is relying on the State
- 6 Engineer to enforce the rights that were decreed by the
- 7 Nevada District Court in 1920 to the Muddy Valley Irrigation
- 8 Company, as to why the company joined -- not joined, but 9 concurred with some of the analysis that was presented in
- actually certain sections in the July 3rd, 2019, report by
- 11 Southern Nevada Water Authority. I think you already
- mentioned one reason for us as far as budget and surface
- water assets of the company unrelated to groundwater assets.
- 14 Would that be accurate?
- 15 A. That's correct.
- 16 Q. I think you stated that as the president of the
- company, one of the board of directors, that there's an
- 18 obligation to protect the assets of the company which for the
- 19 benefit of the shareholders?
- 20 A. That's correct. We represent all shareholders.
- 21 Q. So that being said, would it be a fair statement
- 22 that the decision to concur in the specific technical
- 23 scientific hydrologic positions that were -- that SNWA had in
- particular sections of its July 3rd report were done as a

- 1 MR. KING: Thank you.
- 2 HEARING OFFICER FAIRBANK: All right. We'll go
- 3 ahead and open it up for cross-examination. And for this
- 4 we'll go ahead and limit it to seven minutes per participant.
- 5 And we'll start with Coyote Springs Investments.
- 6 CROSS-EXAMINATION
- 7 By Mr. Herrema:
- 8 Q. Good afternoon, Mr. Robison. I'm Brad Herrema,
- 9 counsel for CSI.
- 10 A. Okay.
- 11 Q. Just a few very quick questions for you. You
- signed the irrigation company's rebuttal report; is that
- 13 correct?
- 14 A. I did.
- 15 Q. Were you qualified as an expert witness in these
- 16 proceedings at all?
- 17 A. I think as stated we don't have any expert
- 18 witnesses, per se. And as a representative of the company I
- 19 signed it.
- 20 Q. Okay. Did the irrigation company engage in the
- 21 services of any technical expert in preparing its August 15
- rebuttal report?
- 23 A. No.
- 24 Q. You mentioned earlier that a number of parties to

2. To a mentioned earner that a number of parties to

Page 1705

- 1 these proceedings are shareholders in the irrigation company.
- 2 Do you recall that?
- 3 A. Yes.
- 4 Q. Okay. Who is the irrigation company's largest
- 5 shareholder?
- 6 A. By actual certificates, Southern Nevada Water
- 7 Authority.
- 8 Q. Okay. And the others that you mentioned, CSI,
- 9 Vidler, Moapa Valley Water District, they are all minority
- shareholders; is that correct?
- 11 A. Yeah, they own a portion of the shares. To my
- 12 knowledge, exactly how many, I'm --
- 13 Q. None of them are majority shareholders?
- 14 A. No.
- 15 Q. You mentioned the irrigation company's points of
- diversion. Do these points of diversion include points
- 17 downstream of Glendale?
- 18 A. Yeah. Downstream of the Glendale gage.
- 19 Q. And you also talked about or you distinguished
- between an upper basin and a lower basin. Can you tell me
- 21 what the point of demarcation is for --
- 22 A. When we talk as long-time residents, we talk
- about the Upper Muddy and the Lower Muddy.
- 24 Q. And what separates those two?

- 1 Q. Okay. And so do you consider any groundwater
- 2 pumping that depletes water from the river or water that
- 3 could have gotten to the river to be a conflict with that
- 4 surface water right?
- 5 A. It can be, yes.
- 6 Q. Okay. Now, I think you mentioned to me one time
- 7 that a shovel in one share at the head waters is better than
- 8 ten shares at the tail waters.
- 9 A. Yeah, I did.
- 10 Q. Can you describe what you mean by that
- specifically with respect to the Muddy River?
- 12 A. Yeah. That's kind of an old farmers wives tail
- that if you control the water at the head of the ditch you'll
- 14 get all of your water and the guy at the end of the ditch a
- 15 lot of times gets what's left over. And, you know, a lot of
- 16 this is in the same regard to potential over pumping or usage
- of water beyond the ability to maintain the stream of the
- 18 river. It can happen. If during the test pump we've seen a
- 19 decrease in the stream flows. And in regards that's what I
- 20 mean by that is the person that's upstream of us can
- 21 definitely control what happens to us.
- 22 Q. And when you say the test, do you mean the 1169
- 23 pump test?
- 24 A. That's correct.

Page 1706

Page 1708

- 1 A. The freeway. The Glendale gage.
- 2 MR. HERREMA: Thank you very much. No further
- 3 questions.
- 4 HEARING OFFICER FAIRBANK: United States Fish and
- 5 Wildlife Service? Not seeing any questions.
- 6 National Park Service?
- 7 MS. GLASGOW: No questions.
- 8 HEARING OFFICER FAIRBANK: Seeing no questions.
- 9 Moapa Band of Paiute Indians? No questions.
- Southern Nevada Water Authority and Las Vegas
- 11 Valley Water District?
- 12 CROSS-EXAMINATION
- 13 By Mr. Taggart:
- 14 Q. Good afternoon. For the record, Paul Taggart for
- 15 the water authority and the district. Just to clarify, SNWA
- is not a majority shareholder either; correct?
- 17 A. That is correct.
- 18 Q. All right. So I might have to repeat a few
- 19 things just to set up this next question. So I heard your
- 20 testimony to be that there's a decree and the decree divides
- 21 the water in the river at the Glendale gage. So do you
- 22 consider any water that gets to that point to be the
- 23 company's water?
- 24 A. Yes.

- 1 Q. Okay. And in this situation though, that one
- 2 share and a shovel upstream could be somebody with a well in
- 3 the groundwater system; right?
- 4 A. That's correct.
- 5 Q. So do you think the State Engineer can determine
- 6 the long-term quantity of groundwater that can be pumped from
- 7 the Lower White River Flow System without taking in to
- 8 consideration MVIC's water right?
- 9 A. No.
- 10 Q. You're aware, are you not, that in the last few
- 11 years there's a power plant that's not operating anymore in
- the Overton area; right?
- 13 A. Yes, I'm aware of that.
- 14 Q. And so there was alluvial pumping for that power
- plant for a series of years from what we sometimes in these
- 16 proceedings have referred to as the LDS water and the power
- 17 company water; right?
- 18 A. That's correct.
- 19 Q. Now, in the years since that water has stopped
- 20 being used for the power plant, have you seen a change in
- 21 river flows?
- 22 A. Yes.
- 23 Q. Could you describe that?
- 24 A. Yeah. A little bit complicated. When the river

Vol. IX **DIVISION OF WATER RESOURSES** October 03, 2019 Page 1709 Page 1711 flow in the summer months decreased that well siting, we -are done before lunch, then we'll go ahead and open it up for 1 Well, let me back up. In the early 1960s, the irrigation public comment. If we're not done until the lunch time, then 2 company took on a huge task of creating a reservoir to store we'll return after lunch for public comment. But public 3 water that was not mostly benefitted in the winter months to comment will follow the conclusion of the presentation by be able to supplement the summer months. And over the period stakeholders who have submitted rebuttal reports. And at of time, as the stream flows diminish or go back up, we that time then we'll also address any other administrative or 6 7 constantly are adjusting from an operational standpoint the 7 procedural matters that we have remaining. And so we'll see everyone tomorrow morning. Thank you. flow coming out of Bowman Reservoir to maintain a level of 8 8 consistency for our shareholders. Obviously it was (Hearing concluded at 3:19 p.m.) 9 9 shareholder water that went in there and the benefit was back 10 10 to the shareholders. 11 11 Since the pumping, the alluvial pumping, has 12 12 stopped, then that frequency of adjustment seems to have 13 13 leveled out a little bit. Did I answer your question? 14 14 15 Q. Yes. I mean, do you think there's more water in 15 the river now? 16 16 A. No. 17 17 MR. TAGGART: Okay. Great. I have no further 18 18 questions. Thank you. 19 19 HEARING OFFICER FAIRBANK: Moapa Valley Water 20 20 District? Seeing no questions. 21 21 Lincoln County, Vidler? Seeing no questions. 22 22 City of Las Vegas? 23 23 MS. URE: No questions. 24 24 Page 1710 Page 1712 STATE OF NEVADA HEARING OFFICER FAIRBANK: Center for Biological 1 Diversity? No questions. 2 COUNTY OF WASHOE 2 Georgia Pacific Republic? Seeing no questions. 3 3 Nevada Cogeneration Associates? Seeing no 4 I, CHRISTY Y. JOYCE, Official Certified Court questions. 5 Reporter for the State of Nevada, Department of Conservation Bedroc? 6 and Natural Resources, Division of Water Resources, do hereby 6 MS. URE: No questions. 7 7 HEARING OFFICER FAIRBANK: And Nevada Energy? 8 That on Thursday, the 3rd day of October, 8 MS. CAVIGLIA: No questions. 9 2019, I was present at the Legislative Counsel Bureau, Carson 9 HEARING OFFICER FAIRBANK: No questions. 10 City, Nevada, for the purpose of reporting in verbatim 10 I will open it up to the Division of Water stenotype notes the within-entitled public hearing; 11 11 12 Resources staff and the State Engineer. Okay. Seeing no 12 That the foregoing transcript, consisting of pages 1597 through 1711, inclusive, includes a full, true and questions on our end, Coyote Springs Investments, do you have 13 13 correct transcription of my stenotype notes of said public 14 any further questions? 14 hearing. 15 And Southern Nevada Water Authority? 15 16 All right. Well, thank you very much. We'll 16 Dated at Reno, Nevada, this 4th day of 17 conclude the proceedings with the Muddy Valley Irrigation 17 October, 2019. 18 Company. 18 19

Capitol Reporters

Before we conclude for the day, I wanted to go

ahead and address a couple of just kind of procedural

administrative matters. So tomorrow morning we will go ahead

and get started with Bedroc. And then at the conclusion of

the two hours allocated for Bedroc and for cross-examination,

then we'll get started with Nevada Energy. And then if we

- 1 CARSON CITY, FRIDAY, OCTOBER 4, 2019, A.M. SESSION
- **2** ---oOo---
- 3 HEARING OFFICER FAIRBANK: Good morning. So this
- 4 is the continuation of the hearing regarding the
- 5 administration of the Lower White River Flow System and Order
- 6 1303. And this morning we're going to go ahead and proceed
- 7 with our final two participants and their presentations as
- 8 well as cross-examination of those participants.
- 9 And we'll start the day off with Bedroc. And so
- 10 at this point I'll go ahead and turn it over to Ms. Ure.
- But before we get started, when we're concluded
- 12 with the presentation of the participants, we'll go ahead and
- 13 address some final administrative matters before we proceed
- 14 to public comment.
- So, Ms. Ure.
- MS. URE: Thank you. Good morning. Thank you.
- 17 Therese Ure representing Bedroc. And today Mr. Dixon is also
- 18 here with me, so if we could swear him in, that would be
- 19 great.
- 20 (The witness was sworn in)
- 21 ///
- 22 ///
- 23 ///
- 24 ///

5

- 1 objections, I think we've resolved all of that, and so he'll
- 2 be admitted.
- 3 MS. URE: Thank you.
- 4 Q. (By Ms. Ure) Mr. Dixon, turning to Bedroc
- 5 Exhibit 2, did you assist in preparing the report on behalf
- 6 of Bedroc?
 - 7 A. I did.
 - 8 Q. Okay. And did you prepare a presentation for
- 9 today's proceeding?
- 10 A. Yes.
- 11 Q. Can you please walk us through that?
- 12 A. Yes. Turning to slide two. I want to start off
- by tying this presentation to the rebuttal report issues that
- were identified in the Bedroc rebuttal report. I'll go in
- order as they are listed in the report.
- First off, exclusion of the White River Flow
- 17 System north of Coyote Spring Valley. I'm not going to spend
- much time on that. It's been discussed by plenty of other
- stakeholders. I think it's pretty clear that there's no
- 20 reason to include. Hydrology data doesn't support it. I
- 21 think that was a recommendation based purely on an agenda to
- impede the SNWA project. There's really no basis for it.

 Moving on to the content that I'm going to spend
- 24 most of my time talking about today in this presentation, as

Page 1718

Page 1720

- 1 JAY DIXON
- 2 Called as a witness on behalf of
- 3 Bedroc, having been first duly sworn,
- 4 Was examined and testified as follows:
- **6** DIRECT EXAMINATION
- 7 By Ms. Ure:
- 8 Q. Good morning, Mr. Dixon. Can you please, turning
- 9 to Bedroc Exhibit 1, give us a brief background of yourself?
- 10 A. As I mentioned yesterday, I've got a Master's
- 11 degree in civil engineering from the University of Nevada,
- 12 Las Vegas. Over 25 years experience as a hydrologist here in
- 13 Nevada. I got a Nevada PE, a Nevada hydrologist, and I only
- 14 work on Nevada projects.
- 15 Q. And, Mr. Dixon, were you offered as an expert in
- hydrology and waters rights in this proceeding?
- 17 A. Yes.
- 18 Q. Have you been qualified before the State
- 19 Engineer?
- 20 A. Yes.
- MS. URE: Okay. And so we would offer to qualify
- 22 for this proceeding Mr. Dixon as an expert in hydrology and
- 23 water rights.
- HEARING OFFICER FAIRBANK: And as there were no

- 1 identified in my rebuttal report. Number two, management
- 2 considerations for certain areas with access to alluvial
- 3 aquifers. Alluvial pumpage in the Muddy River Springs area
- 4 versus basin fill alluvial pumpage in north Coyote Spring
- 5 Valley. There is a difference and I will discuss that.
- 6 Effects from carbonate in Muddy River Springs
- 7 area alluvial pumping on basin fill alluvial wells on north
- 8 Coyote Spring Valley.
 - And, finally, I'll mention just in closing, I'll
- 10 discuss in closing, movement of water rights between the
- 11 Muddy River Spring area alluvial and carbonate wells in the
- 12 LWRFS.

9

13

775-882-5322

- Slide three. Quick overview for Bedroc. In
- terms of location, it is located just north of the Clark
- 15 County line. We're in Lincoln County. Three parcels
- totalling 560 acres, obviously in Coyote Spring Valley, what
- we consider the northern part. Specifically it's situated
- 18 near the western edge of the Pahranagat Wash about a thousand
- 19 feet north of the confluence of Pahranagat and Kane Springs
- 20 Washes.
- 21 Slide four. Overview map. You see where we are
- 22 relative to the northern part of the LWRFS, Coyote Spring
- Valley, specifically. And you'll see the magenta-colored
- outline. That is the three parcels totalling 560 acres

Min-U-Script® Capitol Reporters

Page 1721

associated with Bedroc down at the -- You can see at the 1 mouth of the Kane Springs Wash just off of US 93.

Slide five. So, to begin with, we thought it was

- important to acknowledge why Bedroc is here. Bedroc was not
- a participant in the working group meetings that preceded
- this administrative order. I think the reason for that is 6
- 7 Bedroc has the most senior underground rights in the LWRFS
- with a priority of 1919. 8

A hundred percent of Bedroc's Coyote Spring pumping is within the basin fill alluvium. That's very

Bedroc's water rights are a critical asset for 12 13 their business, multiple businesses. The business is thriving and expansion plans are underway. So decisions that 14 15 are made in the LWRFS because of where this project is situated could potentially impact Bedroc. And they really

16 17 need to have a seat at the table. The outcome of management decisions in the LWRFS 18

may affect their ability to obtain additional water 19 resources. I want to be very clear about that. The business 20

is thriving. And, in order to expand, they're going to need 21

more water. 22

clear. It's a fact.

2

3

9

10

11

Next slide, slide six. So the image on the left 23

is a current aerial. And this ties in to the historical

Valley. In this area that I've outlined right here is where 1

I'm going to spend pretty much all of my time discussing 2

groundwater conditions. 3

4 Moving over to the image on the left, you can see

all the dots are the various -- And consistent throughout 5

this presentation, green dots represent alluvial monitoring

7 wells. The labels here, it's difficult to see, but those are

groundwater elevations. Blue dots are carbonate monitoring

wells and pretty decent coverage. There's very extensive 9 coverage of alluvial monitoring wells at the site. There's 10 11

more than 20 wells there, monitoring wells. And those wells 12 are associated with compliance requirements for their land

13 fill.

14

15

16

17

18

19

Wells, carbonate and alluvial monitoring well to the north, that's CSVM-7 that we've heard a lot about. And then carbonate and alluvial monitoring well a few miles to the -- about five miles to the south right along US 93. So that's the extent of where I'll be discussing groundwater conditions today.

Q. And, Mr. Dixon, when you said this area, you're

talking about the dotted blue line that's delineated on the 21

left-hand side of the map and then it's blown up to the 22

right; is that correct? 23

24 A. That is correct. And I also want to point out

Page 1722

Page 1724

information that was filed on the vested claim. This claim 1

has not been adjudicated, so it is a claim. You can see 2

- remnants of the historical tunnel that is described on the 3
- proof, pipeline conveying water to a golden pond that is 4
- there today. Image on the left is from August 1945. This is 5
- the historical Butler Ranch from the old US 93, so it's a 6
- little east of where the current US 93 is. But what you can 7
- see there is land being worked, producing. Those are large 8
- 9 trees and those large trees got water from somewhere.

Q. And, Mr. Dixon, the image on the right is the 10

1945 picture; is that correct? 11

A. Correct, yes. Real briefly, the claim identified

on that proof is underground percolating water Sheep Range 13

Mountains. Claim diversion rate of .5 CFS. 14

Moving on to slide seven. So getting in to the 15 specifics of the groundwater conditions that I alluded to at 16

the beginning. I will spend most of the rest of the time 17

discussing north Coyote Spring Valley groundwater conditions 18

based on -- This is not based on any fancy modeling. This is 19

20 based on real data that is publically available to anyone.

Bedroc pumping and water level responses locally. And then 21

Bedroc's groundwater source, capture, and impacts. 22

Slide eight. Okay. The image on the left is the 23 LWRFS basins. You can see where we are within Coyote Spring that using as a base map the Rowley 2017 geology map that

we've seen throughout this hearing. I'll reference several 2

times during this presentation the Gass Peak Thrust fault and

its effect on groundwater conditions here as well as the now 4

infamous highway fault, normal fault that's mapped parallel

to US 93 here. The Delamar thrust and the Kane Springs fault 6

zone coming down this way. 7

Slide eight -- or nine. Excuse me. This was 8

9 some information that was presented in the CSI July 2019

report. And I got to acknowledge I did not confirm their 10

delineation of recharge zones and their calculation of 11

12 elevation ranges pertaining to certain recharge coefficients.

So I just took their information as it was presented. I 13

focused -- This is the entire extent of their recharge 14

calculation. I focused on zones one, two, three, and four. 15

Just intuitively, it looks like those are the four zones that 16

17 could contribute recharge in this area of Coyote Spring Valley. And, again, the magenta boundaries are Bedroc. 18

Moving on to slide ten, this is a table from

20 CSI's report. I've highlighted the four zones shown here.

21 I'm also showing the four methods used to estimate recharge.

22 I focused on Maxey-Eakin 1949. I assumed based on their

description and testimony, that it is, indeed, the 23

Maxey-Eakin recharge coefficients based on 1936 Hardman maps. 24

Min-U-Script® (3) Pages 1721 - 1724 Capitol Reporters 775-882-5322

19

Page 1725

- 1 That is a valid method for calculating recharge. That's how
- 2 Eakin did it back in 1946. I ignored these two methods here.
- 3 And CSI did acknowledge this, their experts acknowledged this
- 4 during their presentation.
- 5 Q. And, Mr. Dixon, when you say you ignored these
- 6 two sets of data here, that's the middle that's been crossed
- 7 out on the table; is that correct?
- 8 A. Yes. So the first one that I ignored is
- 9 Maxey-Eakin 1949. And the reason I ignored it is because it
- 10 appears, based on what they put in here and what I heard them
- say, that the precipitation was calculated using PRISM and
- it's been widely accepted that that's not an acceptable
- method for estimated recharge in the great basin.
- Also, the second method that I ignored is Nichols
- 15 2001. That work has been discredited. It generally
- overestimates, in some cases grossly overestimates, recharge
- in some basins. So I ignored it.
- I did include the Epstein. So it's still a
- 19 pretty wide range. And all I did, as you can see on the
- 20 right, is I just took the average for those four zones,
- 21 Maxey-Eakin, Epstein, 2004. It's 750. That seems
- reasonable. But I want to tie it in to groundwater
- 23 conditions in the forthcoming slide.
- So let's move on to slide 11. Okay. So the

- 1 that we see that we are capturing that is driving the
- 2 groundwater conditions that we observed at Bedroc is
- 3 originating from the Sheep Range. There's reasons for that
- 4 and I'll put that altogether in the coming slides. But there
- 5 is -- based on groundwater observation.
 - But there's also a geologic reason for this. And
- 7 going back in time, you know, the first question I asked
- 8 myself is why would someone develop this land here. If
- 9 you've been in Coyote Spring Valley, there's not much
- 10 evidence of water, natural, except here. That's what they
- saw in the early 1900s. There's a reason they stopped here
- and settled here and worked this land. And there's a reason
- 13 it continues today. This is where shallow groundwater is
- 14 visibly present and obviously shown in the observation data
- that is widely available.
- 16 Q. And here is being the area at Bedroc; is that
- 17 correct?

6

- 18 A. Correct.
- 19 O. Okay.
- 20 A. So going back to section FF, what I've circled
- 21 here is this -- It's shown as a -- These are sedimentary
- 22 rocks. And basically, essentially, it's a lower clastic
- 23 confining unit and sedimentary rocks consist of quartzite and
- shale. It comes out like a shelf. Now, if you remember,

Page 1726

Page 1728

- 1 image on the left is the same general area I've been
- 2 discussing, north part of Coyote Spring Valley. What I've
- 3 done here is put -- incorporated using the GIS data that was
- 4 published in the Wilson 2019, this is Bedroc Exhibit 21. He
- 5 mapped carbonate potentiometric head throughout Clark County.
- 6 Unfortunately, he stopped at Clark County. I wish he would
- 7 have gone further north, but he didn't.
- 8 So the image on the left was my interpretation.
- 9 All I did was simply, I took his contours and extended them
- 10 north. I didn't just do it blindly. As I mentioned earlier,
- 11 there is a carbonate monitoring well right here, there is a
- 12 carbonate monitoring well right here, and there's one to the
- north. So I used that data current carbonate water levels toinfluence where I terminated these contours.
- 15 Q. And that's the image on the right, the --
- 16 A. Correct. Yes, that's right. The labels as shown
- are carbonate groundwater elevation.
- All right. Moving on to slide 12. Again, this
- 19 is the Rowley geologic map. You can see where the Bedroc
- 20 property is relative to section LL. I'm going to talk a lot
- 21 about this section.
- But before I get to that, I want to focus your
- attention to about 18 miles south, section FF and section EE.
 - 4 So the conceptual model here is that the recharge coming --

- 1 there was a lot of discussion last week about CSVM-5. It's a
- 2 little further south of here and it is on the other side as
- 3 mapped here the Gass Peak Thrust. But this shelf that's
- 4 sitting out could be the reason why alluvial waters are
- 5 rising by seven feet down there since that well was put in.
- 6 It's capturing recharge and it's just sitting there. It
- 7 can't get through this shelf down in to the carbonate rocks.
- 8 That's very obvious down here.
- As we move to the north, section EE, this shelf
- 10 is still present.
- 11 Q. And, Mr. Dixon, when you talk about this shelf
- are you referring to the cross-sections and the area that's
- shown in green?
- 14 A. Shown in green. It's identified as sedimentary
- 15 rocks.
- 16 Q. Thank you.
- 17 A. So, moving on to slide 13, this is section LL.
- 18 It goes right through Bedroc. This is the Sheep Range. This
- shelf doesn't go out into the -- This is alluvial fill. This
- 20 shelf does not extend out to here. So the same processes are
- occurring here as they are further to the south. But when
- 22 the recharge, mountain block recharge, gets in to the
- 23 alluvium, it has only one way to go, down and to the east.
- 24 And when it goes down, it doesn't encounter this relatively

Min-U-Script®

Capitol Reporters 775-882-5322

(4) Pages 1725 - 1728

Page 1729

- 1 impermeable confining unit. As it gets further to the valley
- 2 margin, it daylights or almost daylights and it actually --
- 3 There are springs. There have been springs through time.
- 4 And this is where the Bedroc site is. This is where the
- 5 water, alluvial water, daylights.
- 6 Now I want to focus on groundwater conditions.
- 7 I'm kind of building the conceptual model here, recharge from
- 8 the Sheep Range, near surface groundwater at Bedroc, because
- 9 of geologic conditions. This is a zoomed-in version of that,
- again, the Rowley base map, Wilson 2019 carbonate extended
- 11 carbonate groundwater contours.
- 12 Q. And you're on slide 14?
- 13 A. Sorry. This is slide 14, yes. Again, the green
- dots are alluvial groundwater elevations. Blue dots are
- 15 carbonate groundwater elevations.
- And the thing to note here is that carbonate
- 17 groundwater elevation as mapped here is on the order of 2100
- 18 feet above main see level. However, at the Bedroc site, the
- alluvial groundwater lip, there's a sharp gradient in the
- alluvium and there's a reason for that and I'll get to that,
- 21 25 to 2400. It's about a 350 foot difference. Alluvial
- 22 groundwater levels are 350 feet higher than the underlying
- carbonate aquifer levels. Water doesn't go up.
- So let me advance to slide 15. Staying with this

- 1 feet deep. Through the Bedroc site, obviously. And then I
- 2 continued south and I terminated this line down here at
- 3 CV-VF-1 where there is an alluvial monitoring well and a
- 4 carbonate monitoring well right next to each other.
- 5 The second profile line goes from west to east.
- 6 Obviously I don't have any alluvial groundwater elevation
- 7 information here. So I had --
- 8 Q. And here is the far west side of that line; is
- 9 that correct?
- 10 A. Yeah. From west of Bedroc. So I didn't try to
- interpret it or I just didn't show any alluvial water level
- 12 elevations in that area. Of course I got a vast amount of
- data here and I connected it to two SNWA monitoring wells
- 14 located on both sides north and south of the Kane Springs
- 15 Wash fault zone. These are alluvial monitoring wells.
- Let's go to slide 18. This is, again, this is
- 17 the north/south profile line. I started it at CSVM-7. So to
- 18 the north we have the Pahranagat shear zone at the north end
- 19 of Coyote Spring Valley. This is not a model. All I did was
- 20 connect dots. It's really simple. Alluvial groundwater
- 21 elevation. It goes up. Water does not flow uphill.
- 22 Recharge is not coming from Pahranagat to the north in this
- area. It does not flow uphill. It can only be coming from
- one place. And I'll show you in the next profile.

Page 1730

1

8

Page 1732

- 1 theme of our conceptual model Sheep Range recharge west to
- 2 east. These are alluvial, the red lines are locally derived
- 3 alluvial groundwater levels, contours. And, as you can see,
- 4 25 to 2400 feet over this short distance, a hundred-foot drop
- in alluvial groundwater levels. The reason -- And then onceyou get on the other side of US 93, they drop precipitously,
- 7 a sharp drop. The reason is that water is hitting that
- 8 highway fault and falling off west to east.
- 9 Moving on to slide 16, these are groundwater
- contours that I generated from the 20, 25 or so, alluvial
- 11 monitoring wells at the Bedroc site. And you see how they
- tie in with the regional level water levels. Again, 25 to
- 13 2400 feet. Image on the left. And as you move to the right,
- 14 350 feet higher groundwater elevation in the alluvium than
- 15 the carbonate.
- Let's move on to slide 17. So now I got all of
- 17 this groundwater contours, I've used existing information. I
- 18 didn't create anything new. It was all data provided to me
- 19 by Bedroc and publically available sources from DWR,
- 20 generally. So I just drew two simple profile lines.
- The first one we'll talk about I call the
- 22 north/south line. I started at CSVM-7 because I had known
- data. I take it through an old stock well, CS, Inc., they
- 24 actually had water levels on DWR's site. It's only a hundred

- The blue line is the carbonate groundwater level.
- 2 Relatively flat, indicative of the very high transmissivity
- 3 that has been well-documented here. But it flows from north
- 4 to south. It's a fact that carbonate recharge comes from the
- 5 north and goes to the south, generally. But the flow
- 6 direction, as you saw in those contours, are from west to
- 7 east. But this is a north/south line.
 - Alluvial groundwater here at the Bedroc site very
- 9 close to the surface. We cross the highway normal fault
- south of the site. And then it starts dropping off when you
- get down to the south end of that line where the two
- monitoring wells are. Again, I want to highlight 350 feet
- difference between alluvial and carbonate water levels.
- Go to slide 19. Same image. Just as a reminder
- 15 I want to talk about the west line now. It starts here. It
- 16 goes from west to east.
- Let's go to slide 20. I don't have any data on
- 18 the alluvial water levels here, so I didn't connect any dots.
- 19 I did extend the carbonate line from the Sheep Range. We get
- 20 to the -- we cross the Gass Peak Thrust. I have water level
- 21 information once we get to the Bedroc site starting to note
- 22 the sharp drop in gradient. We cross -- This is a typo.
- 23 This actually is the highway fault at the Kane -- not the
- 24 Kane Springs. Not the Kane Springs strike slip is not even

Min-U-Script® Capitol Reporters (5) Pages 1729 - 1732 775-882-5322

Page 1733

- what it is. It's just a typo. But there is a fault between 1
- the Bedroc site and this SNWA monitoring well. And you can 2
- see as a result the gradient gets even steeper as we go 3
- across that fault. 4
- It is very important to note what happens here. 5
- So, obviously, alluvial water is recharging carbonate across 6
- 7 that Kane Springs and Delamar thrust fault zone.
- Q. So, Mr. Dixon, just for the record, you had on 8
- your slide where it said highway normal fault and then you 9
- had Kane Springs strike-slip fault. So is your testimony 10
- that where it says Kane Springs strike-slip fault should be 11
- deleted? 12
- A. Delamar thrust. 13
- O. Oh, it should be --14
- A. Yeah. That's a typo. 15
- Q. Okay. And then the area that you're focusing on 16
- is delineated in red around the horizontal distance around 17
- 25,000l is that correct? 18
- A. Yes. So, obviously, I forgot to mention this. 19
- The X-axis is distance from the start to the end of each 20
- profile line in feet. Groundwater elevation or surface 21
- elevation in this case and groundwater on the Y-axis. 22
- Okay. So let's move on to slide 21. This is an 23
- 24 oblique view of Coyote Spring Valley just south of the Bedroc

- to west -- or west to east. Excuse me.
- Let's move on to slide 23. So now I'm focusing 2
- on groundwater conditions locally at the Bedroc site. This 3
- is Bedroc's pumping over time at the bottom. The hydrographs
- are a composite of their observation wells for the industrial 5
- facility with the longest period of record going back to 6
- 2003. So something happened between 2003 and 2006. Water
- levels rose in the order of ten feet or so. Unfortunately
- there's no data between '03 and '06. But there's two reasons 9
- for this, I believe. You've heard one, throughout this 10 11
 - hearing, this 2005 recharge event.
 - Going back to what I talked about earlier, I
- 13 mentioned CSVM-5, that alluvial monitoring well, and it
- responded to that 2005 event. There was, I believe, it was 14
- two or three foot rise in water level from that event in the 15
- alluvium. And it's located about the same distance from the 16
- 17 Sheep Range as we are. So there's no reason -- I believe
- that could have had an effect. But I think the other reason 18
- for this is 2003 is when they put that unlined storage pond. 19
- It's not a very good way to manage water. Because not only 20
- was it evaporating, it was also infiltrating back in to the 21
- ground. So they're recycling their water. But it probably 22
- contributed to this sharp rise in water levels. 23
- But more importantly here is how the water levels 24

Page 1734

12

Page 1736

- 1 site. And this simple Google Earth profile from west to
- east. And I'm going to talk more about this feature, this 2
- topographic feature on the west side of the site. It's 3
- important because it plays a role in their water management 4
- system, their ability to move water around. It's an elevated 5
- area, embankment, natural embankment, where they put storage 6 ponds, two storage ponds. The first one was put in around 7
- 2004, 2003 time frame. It's unlined. So remember that, 8
- 9 unlined storage ponds, up here on this embankment. This is
- the storage pond that I showed earlier about in the center of 10
- the site at the toe of the embankment, moving to the east 11
- where it becomes relatively flat until it goes up the other 12
- side of 93, which I'm not showing here. 13
- Okay. So let's -- One more thing I want to point 14
- out. Note this area of white surface soils and green right 15
- here. These are phreatophytes. And the white soil is an 16
- indication of shallow groundwater evaporating. And these are 17
- evaporites, the residual from shallow groundwater 18
- evaporating. This is natural ET. 19
- 20 So let's move on to slide 22. Zoomed-in view of
- what I just explained. This is, it's hard to see here, but 21
- this is a huge pond. When it's full, it stores about 13.7 22
- feet of water. That's the head in it. And the other older, 23
- unlined, storage pond right here known as Lake Lindsey, east

- have responded as the system has essentially reincorporated.
- Over the last five years it's been relatively stable even 2
- though their pumping has been fairly constant.
- 4 Q. Okay. So for the record it looks like you have
- two data sets for, like, one for 2004 and one for 2006. And
- then the gap of data is between 2006 and 2011-ish; is that 6
- correct? 7
- 8 A. Yes.
- 9 Q. Thank you.
- 10 A. There are a few water level readings in 2005.
- 11 You know, that pond had been constructed in 2003. And then,
- 12 of course, the wet year of 2005. I think these water levels
- were already rising because of the infiltration introduced 13
- from the up gradient side of the site. But I can't rule out 14
- that the alluvium didn't respond to that recharge event at 15
- the same time. And we're just simply reaching -- going back 16
- 17 in to equilibrium from continued pumping as a result of those
- two events, a wet year and an installation of an unlined 18
- storage pond. 19
- Okay. Slide 24. Close-up view of the Bedroc 20
- site again. Same wells. Now I want to focus your attention 21
- to this well right here, CSV-3000M. That's the SNWA 22
- monitoring well north of the Kane Springs fault zone. And 23 then CSVM-4, this is a carbonate well. You've heard a lot

Min-U-Script® (6) Pages 1733 - 1736 Capitol Reporters

775-882-5322

24

Page 1740

Page 1737

about it on the other side. It's located right here. These wells are pretty close to each other, as you can see.

2 So the orange plot is a hydrograph. And pay no 3

- attention to this early data. That's when I was actually as
- a consultant for SNWA, I oversaw the construction and 5
- development of this well. We did a development test at the 6
- 7 beginning. And it had a very noticeable response, as you can
- see. But it's continued to rise. But, again, it's on the 8
- other side of the Kane Springs fault wash zone. Continuous 9
- rise in water levels. No response, no obvious response, to 10
- Order 1169 pumping. 11
- CSVM-4 here. And you can see a completely 12
- different response in the alluvial water levels on that side 13
- of the fault versus carbonate water levels on this side of 14
- the fault. 15

1

- Q. And what is that and this? 16
- A. This side is -- The monitoring well on the left 17
- is the alluvial monitoring well. And then I guess that side 18
- would be CSVM-4 carbonate well on the right. 19
- Okay. Let's move on to slide 25. Same image on 20
- the left. Now I'm showing CSVM-4 levels just like the 21
- previous slide. Order 1169 pump test. CSVM-4, sorry. It's
- blue shown right here. It's the bottom hydrograph. 23
- Obviously this response has been well-documented and 24

- used an ET range for phreatophytes incorporating the 1
- influence from shallow groundwater evaporating .2 to .3 feet 2
- per year, pretty low. If you were to multiply that range by
- 2200, you come up with an estimate of groundwater that could
- be potentially captured without pulling water out of storage.
- That's ET capture we hear a lot about, four to 600 acre-feet
- of that 750 acre-feet of recharge. So that's my rough water
- budget for this area. 8

Again, current and additional potential basin 9

fill alluvial pumping in north CSV would capture ET. It's 10

clearly demonstrated here. If we were pumping more than just 11

12 the ET, we would see water levels dropping west of Bedroc. 13

Excuse me. East of Bedroc. It's not happening. Water 14 levels are actually rising.

As soon as pumping exceeds what can be captured with ET, you start pulling water out of storage, those water levels down gradient will start declining. But they're

So let's -- I'll wrap up with my summary and conclusions, slide 28. Again, the entire White River Flow System should not be included in the LWRFS. I don't need to spend any more time on that.

What I want to focus on is numbers two and three.

So, as indicated in Bedroc's rebuttal report, our position is

Page 1738

15

16

17

18

19

20

21

22

23

24

10

11

12

- 1 discussed extensively in this hearing. What I'm more
- interested in is what happened up at the north. This is 2
- CSVM-7, an alluvial monitoring well. It actually rose during 3
- the test. Probably, you know, there's -- this well was put 4
- in in, I think, 2004. You don't see much there in terms of 5
- the wet year in 2005. But it rose and it looks like it's 6
- pretty level since the end of the Order 1169 pump test. 7
- Let's move on to slide 26. This is another 8
- 9 oblique view looking south at Coyote Spring Valley, US 93,
- from north to south you can see Bedroc here just west of US 10
- 93 and extensive evaporites -- evapotrans -- ET is occurring 11
- here near surface groundwater. A lot of salt residual here 12
- basically encompasses the Bedroc site. 13
- And I've mapped, just did a rough estimate of the 14
- area that I believe is influenced by this evaporation and the 15
- phreatophytes, 2200 acres. That's just a rough estimate in 16 GIS. 17
- Let's move on to slide 27. So in terms of a 18
- water budget at this local level, I explained how I arrived 19
- 20 at that 750 acre-feet from zones one, two, three, and four in
- the CSI report. 21
- Estimated current land area. As I mentioned with 22
- phreatophytes and shallow groundwater that is evaporating 23
- based on physical evidence at the surface, 2200 acres. I

- 1 that transfers of senior alluvial rights from the Muddy River
- Springs area should only be considered on a case-by-case 2
- basis so as to not impact senior existing rights. So in 3
- theory, transfers could occur here. But, remember who has 4
- the most senior rights. Location matters. And I'm talking 5
- about alluvial basin fill. I'm not talking about carbonate. 6
- Number three, alluvial pumping from north Coyote 7
- Spring Valley does not appear to be connected with the Muddy 8
- 9 River Springs area. That was -- I didn't talk much about it,
 - but that should be obvious from the information that I
 - presented. Other stakeholders have indicated the same.
 - A significant portion of alluvial pumping
- captures ET not recharging the carbonate aquifer. We 13 demonstrated why that is so. And if it weren't the case, 14 water levels would be dropping. And they're not. So I'll 15
- conclude there. Thank you. 16
- MS. URE: Thank you, Mr. Dixon. With that we 17 would move to admit all of Bedroc's exhibits. 18
- HEARING OFFICER FAIRBANK: The exhibits outside 19
- 20 of Mr. Dixon's initial report at NCA Exhibit 1 have already been admitted. And NCA Exhibit 1 rebuttal report is 21
- admitted. 22
- UNIDENTIFIED SPEAKER: Bedroc. 23
 - HEARING OFFICER FAIRBANK: Excuse me. Bedroc.

Min-U-Script® (7) Pages 1737 - 1740 Capitol Reporters 775-882-5322

24

Page 1741

- Thank you. 1
- MS. URE: And one final matter, Mr. Dixon, before 2
- this hearing started there was some notation of an objection 3
- to your reports related to the differences in your opinions
- for Nevada Cogen versus Bedroc. Can you explain how they are 5
- not in conflict? 6
- 7 THE WITNESS: Yes. So obviously, as you heard
- yesterday, and as you saw on the Bedroc -- Excuse me -- NCA 8
- rebuttal report, we focused on carbonate pumping, carbonate 9
- monitoring, and the effects in the Muddy River Springs area. 10
- I didn't spend much time on that here because it's 11
- irrelevant. I focused on the alluvial basin fill alluvium in 12
- north Coyote Spring Valley, specifically how that affects 13
- Bedroc's pumping now and in to the future. So there's no 14
- 15 conflict. In fact, I didn't even sign Bedroc's report. I
- was busy with NCA. I didn't have time. I did review it and 16
- 17 edit it. I contributed to it, absolutely. And I support a
- hundred percent what was put in that report. 18
- MS. URE: Thank you. And with that we will 19
- reserve the remainder of our time for redirect. 20
- HEARING OFFICER FAIRBANK: Okay. You have about 21
- 39 minutes left. So with that we will go ahead -- And just 22
- as a -- just for a correction on the record and make sure 23
- that the record is clear. It is Bedroc Exhibit Number 2, 24

- 1 A. Oh, yeah. Lincoln County line is, it might be
- right around in here.
- 3 Q. I think you got it. And then the northern
- portion of the CSI property almost comes up to the Bedroc
- properties; correct, sir?
- A. Actually I do not know that.
- 7 Q. All right. The red arrow reflecting the Sheep
- Range recharge, it's true, is it not, that the highway fault,
- as it's been called, causes an impediment to the groundwater
- flow in an east/west direction? 10
- 11 A. It definitely influences groundwater flow. Our
- groundwater levels drop off precipitously as they go across 12
- 13 that fault. So it definitely affects groundwater flow.
- MR. ROBISON: Thank you. I would like to show 14 15
- you exhibit, State Engineer Exhibit 50. May I approach? HEARING OFFICER FAIRBANK: Yes, you may. 16
- MS. URE: Do you have one for me? 17
- Q. (By Mr. Robison) Are you familiar with State 18
- Engineer Exhibit 50? 19
- A. Yes, sir. 20
- Q. And turning to page 12 of that -- And the numbers 21
- are hard to read on the bottom -- it's the groundwater 22
- pumpage inventory, Coyote Springs Valley, number 210, do you 23
- see that, sir? 24

Page 1742

- which was the rebuttal report that's been admitted. MS. URE: Thank you.
- 2
- HEARING OFFICER FAIRBANK: And so we will go 3
- ahead and move on to cross-examination. And first is Coyote 4
- Springs Investment. And there's seven minutes. 5
- **CROSS-EXAMINATION** 6
- By Mr. Robison: 7

1

- Q. Good morning, Mr. Dixon. My name is Kent
- Robison. I'm co-counsel for CSI.
- A. Good morning. 10
- Q. Could you bring up slide 15, please. Well, I've 11
- got 15 as a map showing a Sheep Range recharge. There we go.
- Would you tell us, Mr. Dixon, how close neighbors we are by 13
- depicting where CSI development is relative to Bedroc
- property? 15
- We just lost the map. There you go. Your 16
- property is basically on the northwest corner of the CSI 17
- development? There we go. 18
- A. There we go. Jay Dixon for the record. So 19
- Bedroc is located right here. Are you talking about the 20
- current development for CSI? 21
- Q. Yes, sir. The Lincoln County corner northwest. 22
- A. Well, the golf course is down here.
- 24 Q. Right. And CSI property goes up to the north?

1 A. Yes, sir.

5

13

- 2 Q. And the acres or duty allotted to Bedroc is 315?
- MS. URE: I'm going to object to this line of 3
- questioning as it's outside the scope of his presentation. 4
 - MR. ROBISON: We've been talking all day about
- the pumpage from Bedroc and that's what I'm addressing. 6
- MS. URE: We did not talk about the water rights 7
- or the duties. 8
- HEARING OFFICER FAIRBANK: So the objection is 9
- based upon it being outside the scope of the direct 10
- examination on the basis that the specific question is 11
- relating to specific water rights and duties? 12
 - MS. URE: Correct.
- HEARING OFFICER FAIRBANK: Mr. Robison. 14
- MR. ROBISON: Excuse me. I believe the witness 15
- has testified extensively about the pumpage at the Bedroc 16
- facility with regard to alluvial wells and this is directly 17
- pertinent to that testimony. 18
- HEARING OFFICER FAIRBANK: I'll go ahead and 19 permit it based upon that association. 20
- Q. (By Mr. Robison) Does State Engineer Exhibit 50 21
- indicate that there's been some over pumping by about 200 22
- acre-feet per year? 23
- 24 A. So that's water pumped based on meter readings.

Page 1744

Page 1745

- We -- We believe our duty from the unadjudicated vested claim
- is 343. And we -- Some of that, you saw those fields there.
- O. Yes, sir.
- 4 A. There is a net irrigation there. That's not what
- we consume. That's what we pump. The State Engineer's
- office has the results of a water balance model showing what
- 7 the net consumptive use is.
- Q. Is that the 559.5? 8
- A. No, it's not. That's what's pumped. That
- includes recycled water from the ponds as well as what is 10
- going back in to the ground. 11
- MR. ROBISON: Very well. Thank you much. That's 12
- 13 all we have.
- HEARING OFFICER FAIRBANK: Thank you. 14
- United States Fish and Wildlife service? Seeing 15
- no questions. 16
- National Park Service? Seeing no questions. 17
- Moapa Band of Paiute Indians? No questions. 18
- Las Vegas Valley Water District and Southern 19
- Nevada Water Authority? 20
- **CROSS-EXAMINATION** 21
- By Mr. Taggart: 22
- Q. Good morning, Mr. Dixon. My name is Paul 23
- Taggart. I represent the Southern Nevada Water Authority and

- direct testimony was relating solely to the water budget of
- the alluvial aquifer. 2
- MR. HERREMA: I think both the direct testimony 3
- and his rebuttal report, the scope.
- HEARING OFFICER FAIRBANK: Mr. Taggart. 5
- MR. TAGGART: Yes. I'll rephrase and I think it 6
- will be clear. How much time do I get?
- HEARING OFFICER FAIRBANK: You have five and a 8
- half minutes right now. 9
- MR. TAGGART: Okay. Thank you. 10
- Q. (By Mr. Taggart) Mr. Dixon, part of your 11
- 12 testimony was the estimates of recharge in the Sheep Range
- 13 and how much of that recharge hinders the alluvial system; is
- that correct? 14
- 15 A. Yes.
- Q. And that information that you talked about, that
- recharge value was based on a water budget approach to
- determining the availability of water in that alluvial basin;
- is that correct? 19
- 20 A. Yes.
- Q. And so I guess my question is do you think that 21
- same water budget approach that you used and are relying on 22
- in the alluvial system should also apply in the carbonate 23
- system or shouldn't the carbonate system rely on water level 24

Page 1746

Page 1748

- the Las Vegas Valley Water District.
- A. Good morning. 2
- 3 Q. Do you consider the alluvial system that your
- client's wells are located in to be a separate aquifer from
- the carbonate aquifer? 5
- A. I do. 6
- Q. And do you -- have you heard discussions in these 7
- hearings about the use of water budgets to manage the 8
- carbonate aquifer? 9
- A. Yes. 10
- Q. Do you believe that water level data and response 11
- data is a more appropriate type of evidence to use than water
- budget data for the carbonate aquifer itself? 13
- MR. HERREMA: Brad Herrema on behalf of CSI. I 14
- don't believe Mr. Dixon particularly in his testimony for 15
- Bedroc touched on anything other than the alluvial aquifer in 16
- the Bedroc area. He didn't get in to carbonate aquifer water 17
- budgets. 18
- MS. URE: And on behalf of Bedroc I'll join in 19
- 20 that objection.
- HEARING OFFICER FAIRBANK: So the objection is 21
- that the question was outside the scope of the direct 22
- examination in that it is discussing water budgets of the 23
- carbonate aquifer, whereas the original testimony or the 24

- data? 1
- MR. HERREMA: Same objection. 2
- MS. URE: And we will join in that. 3
- MR. TAGGART: I think it goes directly to your 4
- question about the impact of the 1169 pump test on the
- aquifer, the second inquiry that you asked. 6
- MR. HERREMA: Whether the question is relevant to 7
- the four questions is not what our objection is in regard to. 8
- 9 Our objection is that this is beyond the scope of what his 10 rebuttal report and his testimony here today cover.
- MR. TAGGART: Well, and this is not a death 11
- penalty case. It's an informal proceeding that I'm asking 12
- the witness a simple question that we're wasting more time on 13
- objections than we are on simple answers. 14
- HEARING OFFICER FAIRBANK: So to the extent that 15 Mr. Dixon can go ahead and answer the question, I'll permit 16
- 17 the question.
- THE WITNESS: So the reason I talked about 18
- geology before I arrived at that number is because geology 19
- matters. And recharge in some areas contributes more to 20
- alluvium than carbonate rock. I think I laid the foundation 21
- for that. I have no opinion on a basin scale what influence 22
- Sheep Range recharge may or may not have on the regional 23
- carbonate system. I focused on this area because the water 24

Min-U-Script® (9) Pages 1745 - 1748 Capitol Reporters 775-882-5322

Page 1749

- 1 specifically observable its measurements support it. And
- 2 I'll leave it at that.
- 3 Q. (By Mr. Taggart) Thank you. Do you believe
- 4 there's sufficient water in the alluvial system for the
- 5 quantity of water rights that your client owns?
- 6 A. Yes.
- 7 Q. Do you believe there's more water in the alluvial
- 8 system than what your client owns or requires?
- 9 A. Yes.
- MR. TAGGART: Okay. That's all I have. Thank
- 11 you.
- 12 HEARING OFFICER FAIRBANK: Moapa Valley Water
- 13 District? Seeing no questions.
- Lincoln County, Vidler Water Company?
- 15 CROSS-EXAMINATION
- 16 By Ms. Peterson:
- 17 Q. Hello, Mr. Dixon.
- 18 A. Hello.
- 19 Q. So this is just a housekeeping matter. Are you
- signing the report for Bedroc under your PE? I thought all
- 21 expert reports had to be signed.
- 22 A. Did you see the report?
- 23 Q. I did.
- 24 A. I didn't sign it.

- 1 Is it Bedroc's intention to have this
- 2 presentation admitted in to evidence?
- 3 MS. URE: I believe all the presentations, the
- 4 slides, were admitted as demonstrative exhibits and that the
- 5 reports are in as exhibits. And then Mr. Dixon's testimony
- 6 will be part of the record. That's my understanding of these7 proceedings.
- 8 MS. HARRISON: So this will simply be considered
- 9 as demonstrative?
- 10 HEARING OFFICER FAIRBANK: The -- As with all of
- the power point presentations that weren't submitted in
- 12 advance of the hearing and marked as exhibits, those will be
- 13 retained in the hearing record. And these are the
- 14 proceedings of the State Engineer and for the purposes of
- 15 either the testimony or presentation of information will be
- 16 considered by the State Engineer. And what weight to assign
- to it will be within his discretion.
- MS. HARRISON: Okay. Thank you.
- 19 HEARING OFFICER FAIRBANK: Nevada Cogeneration
- and Associates? Seeing no questions.
- 21 Muddy Valley Irrigation Company?
- MR. KING: No questions.
- 23 HEARING OFFICER FAIRBANK: Seeing no questions.
- Nevada Energy?

Page 1750

Page 1752

- 1 Q. I know. So I'm just kind of wondering why you
- 2 are allowed to, I guess -- You're not going to sign the
- 3 report on your opinions that you expressed today?
- 4 A. If I were asked to sign it now I would.
- 5 Q. Okay. And then you just had a question from
- 6 Mr. Taggart about if there was more water in the alluvial
- 7 than what your clients needed. Do you remember that?
- 8 A. Yes.
- 9 Q. And would you say that that water supply, I
- 10 guess, or source in the alluvial is an adequate and
- 11 sustainable supply of water?
- 12 A. It appears to be, based on water levels.
- 13 Q. For Bedroc's use and possibly other uses?
- 14 A. Correct.
- MS. PETERSON: That's all I have. Thank you.
- 16 HEARING OFFICER FAIRBANK: City of North Las
- 17 Vegas?
- MS. URE: No questions.
- 19 HEARING OFFICER FAIRBANK: No questions.
- 20 Center for Biological Diversity? No questions.
- 21 Georgia Pacific Republic?
- MS. HARRISON: Good morning, Mr. Dixon. This is
- 23 actually a question for counsel. Sylvia Harrison on behalf
- 24 of Republic and Georgia Pacific.

- 1 MS. CAVIGLIA: No questions.
- 2 HEARING OFFICER FAIRBANK: No questions.
- 3 So at this time I will open it up to the State
- 4 Engineer and Division of Water Resources staff.
- 5 EXAMINATION
- 6 By Ms. Barnes:
- 7 Q. Michelle Barnes for the record. Can we go to
- 8 slide 24. And I just want to make sure that I heard you
- 9 correctly when you were talking about this slide. I believe
- 10 you mentioned CSVM-4 in your testimony, but the graph on the
- 11 right is labeled CSVM-7.
- 12 A. Yes, you are correct. It's the next slide that
- was CSVM-4. This is, right, the blue line is CSVM-4. CSVM-7
- 14 up here north of the site. Thank you for allowing me to
- clarify that. Obviously it's in the alluvium, as we have
- seen throughout this hearing, carbonate levels generally
- decline during this time. The only levels rising are in the
- 18 alluvium and certain areas like this.
- 19 Q. Looking at your figure on the left, the CSVM --
- 20 Okay. That is alluvium.
- Can we go to slide 25? Thank you for clarifying
- 22 that. Did you happen to compare CSVM-3 to CSVM-4 in your
- 23 analysis? I was just curious since they're both alluvium --
- or they're both carbonate.

Min-U-Script® Capitol Reporters 775-882-5322

(10) Pages 1749 - 1752

Page 1753

- 1 A. Carbonate. I did not. I recall seeing CSVM-3
- 2 shown in other presentations during this hearing. And it
- 3 showed a similar response, although rather muted and delayed.
- 4 Q. Okay.
- 5 A. Because of the structure between it and Muddy
- 6 River Spring area. And there's a lag present in both wells.
- 7 MS. BARNES: Okay.
- 8 HEARING OFFICER FAIRBANK: All right. So we have
- 9 time still available. We'll open it back up for additional
- 10 questions by the participants. Are there any other
- 11 participants, rather than going through the list? I see
- 12 Southern Nevada Water Authority and Las Vegas Valley Water
- 13 District. Are there any other participants that have further
- 14 questions?
- Not seeing any other, so Mr. Taggart.
- MR. TAGGART: How much time?
- 17 HEARING OFFICER FAIRBANK: I'll give you five
- 18 minutes
- MR. TAGGART: Okay. Thank you.
- 20 CROSS-EXAMINATION
- 21 By Mr. Taggart:
- 22 Q. Good morning again, Mr. Dixon.
- 23 A. Good morning.
- 24 Q. Slide 23 of your power point, do you have that?

- 1 water levels in the alluvial aquifer; correct?
- 2 A. That's right.
- з Q. Okay.
- **4** A. Do you want to know why?
- 5 Q. No. And then let's go back to page ten. And I
- 6 would love to, but I only have five minutes or probably three
 - 7 now. The original estimate of recharge of Maxey-Eakin for
- 8 the recharge zones that are where your client is was 130
- 9 acre-feet; is that right?
- 10 A. That's right.
- 11 Q. But you believe that a reliable recharge estimate
- 12 for that same area is ten times that amount, 1370 by Epstein?
- 13 A. No. I think that's a bounding range. I think
- 14 the Maxey-Eakin numbers are probably too low. If that were
- the case, we would see water levels dropping.
- 16 Q. Okay. So 750 is your -- you've averaged the two?
- 17 A. Yeah. Because I think Epstein is too high and
- 18 Maxey-Eakin is too low.
- 19 Q. Okay. And so 750 is the maximum amount of
- 20 recharge you think is available in the area where your
- 21 client's pumping could occur; is that true?
- 22 A. That's my estimate, yes.
- MR. TAGGART: That's all. Thank you.
- 24 HEARING OFFICER FAIRBANK: At this time I will go

Page 1754

Page 1756

- 1 A. Yes.
- 2 Q. So this depicts the wells in the alluvium that
- 3 are pumped by your client; is that correct?
- 4 A. Yes. These are not pumping wells. These are
- 5 observation wells, shallow observation wells, associated with
- 6 the commercial operation.
- 7 Q. What would you consider to be the average annual
- 8 amount of groundwater depletion from your client's wells?
- 9 A. Groundwater depletion?
- 10 Q. I want to get past the question that you were
- 11 asked about pumpage versus secondary recharge. What do you
- think that pumping is actually taking out of the system at
- 13 the moment?
- 14 A. At the moment?
- 15 Q. In net.
- 16 A. Yep. So based on my water balance model total
- 17 consumed 349 acre-feet. And that is because they took 20
- 18 acres out of production.
- 19 Q. Okay. But groundwater levels in the alluvial are
- 20 declining during that time period; correct?
- 21 A. This goes up through 2018. The last label on the
- 22 X-axis is 2019. But that's a shift. I don't have 2019
- 23 pumping data in there yet.
- 24 Q. Okay. But from 2013 to 2019 there's declining

- 1 ahead and open it back up to Division of Water Resources
- 2 staff and the State Engineer.
- 3 MS. COOPER: Christi Cooper for the record. Can
- 4 you guys hear me okay?
- 5 HEARING OFFICER FAIRBANK: We can hear you,
- 6 Christi. Thank you.
- 7 MS. COOPER: Okay.
- 8 EXAMINATION
- 9 By Ms. Cooper:
- 10 Q. Did you look at any other alluvial well water
- 11 levels in the Lower White River Flow System to see if those
- water levels may be declining or not?
- 13 A. I mentioned CSVM-5. It's about 16 or 17 miles
- south on the west side of 93. I know you know where that is.
- 15 It's an alluvial well and it has rising groundwater levels.
- 16 I didn't put it in here. It's pretty far from the site. But
- that's another area that I looked. Beyond that, I didn't
- 18 look at -- There's not much alluvial monitoring beyond this
- area in the LWRFS right now.
- 20 O. CSVM-5 is carbonate?
- 21 A. No. It's alluvium, I believe.
- MS. COOPER: Okay. Thank you.
- 23 ///
- 24 ///

Page 1757

EXAMINATION 1

- By Ms. Barnes: 2
- O. Michelle Barnes for the record. Can we go back
- to slide 24. Based on our previous questions I just want to
- make sure I'm still on the same page as you, Mr. Dixon.
- A. Sure. 6
- 7 Q. So now understanding that this graph is for
- CSVM-7 and CSV-3009M and slide 24 is CSVM-4 and CSVM-7,
- you're trying to demonstrate that -- I guess, are you trying
- to demonstrate that flows on the west side of the fault are 10
- trending similarly as opposed to wells for groundwater 11
- elevations on the east side and west side of the fault? 12
- A. Showing a disconnect between the alluvium and the 13
- carbonate there. 14
- Q. Okay. 15
- A. And a connection similar responses on that side 16
- of the fault in north Coyote Spring Valley for the alluvium. 17
- MS. BARNES: Okay. Thank you for clarifying. 18
- HEARING OFFICER FAIRBANK: All right. Ms. Ure, I 19
- will go ahead and open it back up to you for redirect if you 20
- have any. 21
- MS. URE: Can I have a moment to confer with my 22
- co-counsel? 23
- HEARING OFFICER FAIRBANK: You may. 24

- redo that with your microphone on?
 - THE WITNESS: Thank you. Felling, F-e-l-l-i-n-g. 2
 - 3 Q. And, Mr. Felling, were you retained by Nevada
 - Energy to complete a rebuttal report?
 - 5 A. Yes, I was.
 - 6 Q. And in preparation for this hearing did you
 - create a power point?
 - 8 A. Yes, I did.
 - 9 Q. Can you please go through your power point?
- 10 A. Yes.

11

12

17

18

19

20

21

22

23

24

Madam Hearing Officer, State Engineer staff, I'm happy to be here at the end of this very long hearing. I

know you've heard a lot of evidence. Most of it I think 13

very, very good. I'll try to be succinct and clear in 14

presenting my four answers to your questions. 15 16

The questions were, the geographic boundary of the flow system, what was the information that was obtained from the Order 1169 aquifer test, the effects of movement of the water from the alluvial to the carbonate aguifer. And at the end of it the total amount of groundwater that could be pumped manually from the Lower White River Flow System.

So I'll start with the geographic boundary of the connected groundwater surface water systems compiled in the Lower White River Flow System. I'll talk about the pros and

Page 1758

Page 1760

- MS. URE: We have no further questions on 1 redirect.
- 2
- HEARING OFFICER FAIRBANK: Okay. All right. 3
- Well, then let's go ahead and take about a ten-minute break 4
- and we will reconvene at 9:40 with the Nevada Energy 5
- presentation. Thank you. 6
- (Break was taken) 7
- HEARING OFFICER FAIRBANK: Okay. We will 8
- continue the hearing with Nevada Energy. Ms. Caviglia. 9
- MS. CAVIGLIA: Justina Caviglia on behalf of NV 10
- Energy. May I please have Mr. Felling sworn? 11
- (The witness was sworn in) 12

13

18

- RICHARD FELLING 14
- Called as a witness on behalf of 15
- NV Energy, having been first duly sworn, 16
- Was examined and testified as follows: 17
- **DIRECT EXAMINATION** 19
- By Ms. Caviglia: 20
- Q. Mr. Felling, can you state and spell your last 21
- name for the record? 22
- Richard Felling. Last name F-e-l-l-i-n-g. 23
- HEARING OFFICER FAIRBANK: Mr. Felling, will you 24

- cons for Kane Springs Valley, Lower Meadow Valley Wash, and
- the Black Mountains area in the Las Vegas Valley shear zone. 2
- This is an image modified from SNWA Exhibit 22. 3
- This is Rowley geologic map and my modifications here. This 4
- shows Kane Spring Valley. And all I did here was I drafted 5
- on top of the existing geologic map the Kane Springs Wash 6 7
- fault zone. And then I also drafted in this basin bounding fault that was basically interpreted from the two geophysical 8
- 9 surveys, the CSAMT survey, which had lines that ran parallel
- to the northeast and to the southwest of that inferred fault. 10
- And then there was a gravity survey that showed that there 11
- was a gravity well just to the southwest of the mouth of Kane 12
- Spring Valley. And I agree that that evidence is fairly 13
- compelling that there is a range front structure there. 14

To the succinct figure I added this big blue 15

- arrow. This is the direction of groundwater flow in Kane 16
- Springs Valley pretty much agreed to by all the experts. 17
- Vidler's expert agreed to it. Other experts agree that water 18
- flows from northeast to southwest and that would be the 19
- recharge in the basin. It would flow in carbonate rocks. It 20
- would flow in the volcanic rocks. It might flow in the 21
- alluvium. 22
- We have range-fed boundary structures on both 23
 - sides of Kane Springs Valley clear down to the center of the

Min-U-Script®

Capitol Reporters 775-882-5322

24

(12) Pages 1757 - 1760

Page 1764

Page 1761

valley. The geologic map indicates that many of them also 1 have left lateral strike-slip fault like the Kane Springs 2

Wash fault. 3

4

5

6 7

13

14 15

16

17

18

The basin boundary is down here just at the edge of this last outcrop on the southwest part of Kane Springs Valley. And that's where Vidler-Lincoln County's production well is.

So the question is, is this recharge in Kane 8

Spring Valley flows from northeast to southwest. And however 9 much flow that is, it ultimately makes it in to Coyote Spring 10 Valley where it joins the regional flow and heads southward 11

towards the Muddy River Springs. 12

And this cross-structure here, it may impede flow, but it's not a barrier to flow. Whatever the recharge is in Kane Springs Valley is going to make it over, around, or through that fault. There's no other option. It doesn't go anywhere else. No one is suggesting that it goes anywhere else. So that water ultimately makes it in to the Lower White River Flow System.

19 So in terms of pros and cons, can Kane Springs 20 Valley -- can it be managed without including it in to the 21 Lower White River Flow System joint management area? And in 22 our rebuttal report, I suggest that yes, it could be. 23

Alternatively, we've heard a lot of evidence this 24

there was flow in the carbonate. And although it's hard to

see on this slide, this area here from where I have this blue

area and my laser, to the west is carbonate. And it has been

suggested that there might be flow from north to south in the

carbonate in the Lower Meadow Valley Wash and that might

contribute to discharge of the Muddy River.

7 Now, there is a monitoring well north of the

Muddy River Springs. That is CSV-2. And water levels there

are about 18 feet lower than at Pederson Spring. But still

those water levels are higher than the Big Muddy Springs. So 10 is there a potential for a flow? Yes. Are we certain that 11

12 flow exists? There's really nothing close to enough

evidence.

But if one of the parties that owned the water rights in the Lower Meadow Valley Wash wanted to go up on the carbonate and pump water, then the State Engineer would have to then consider would that be conflicting with existing rights.

These are very old groundwater rights relative to the Lower White River Flow System, as the expert for Nevada Cogen pointed out, including the joint management area could bring about some issues.

Finally, the Black Mountains area and the Las 23 24 Vegas Valley shear zone. So this is the same basin map. I

Page 1762

13

14

15

16

17

18

19

20

21

22

week that is, you know, fairly compelling evidence to include

it in to the White River Flow System joint management area, 2

considering that it's in a shared carbonate aquifer, it 3

responded to the 1169 aquifer test, it's right on the 4

boundary, and pumping there would in fact, we could argue, 5

ultimately capture water that flows south in the Lower White 6

7 River Flow System. So there's some compelling arguments both

ways. 8

Min-U-Script®

9

10

11 12

13

14

I want to talk about the Lower Meadow Valley Wash. Now, this figure is from the base map that I got off of NDWR's website. And I just -- I needed to have something that had basin boundaries on it and kind of showed where things were. So this is Lower Meadow Valley Wash is this basin here bounded by this green line. This big spring

symbol is the headwaters at the Muddy River springs area. 15 And water flows from north to south. 16

And in the water budget that the State Engineer 17 accepted for the Delamar, Dry Lake, and Cave Valley hearing, 18

it was recognized that there is some flow from Lower Meadow 19

20 Valley Wash that flow south and ultimately probably

contributes to the Muddy River above Glendale to the extent 21

that that water contributes to the Muddy River, capture of 22

that water might conflict with existing rights. 23

There was also discussion about whether or not 24

got it from the State Engineer's website. And it shows in

blue, carbonate rocks. In tan, sedimentary rocks. And then

in very light color, alluvial rocks.

I also drafted on, liberally, the basin 4

boundaries. So the north center part of the slide, and this

is slide ten, that's Garnet Valley. To the southwest Las 6

Vegas Valley. To the east is California Wash. And to the 7

southeast is the Black Mountains area. And then I also 8

drafted on the Dry Lake thrust fault and the Las Vegas Valley

share zone, which isn't exposed because it's covered by alluvium.

11 12

10

13

14

15

16

I have shown on here BM-DL-2 and that's the monitoring well near Nevada Cogen's pumping center. BM-DL-2 tracks very well with the rest of the carbonate. Many of the other carbonate wells, including EH-4, clearly shows that at BM-DL-2 you're part of the Lower White River Flow System.

KBN-4, that data it's difficult to determine 17

really what they're measuring. I would not recommend that 18 you separate that pumping center from the Lower White River 19 20 Flow System unless somebody could prove to you that it was not connected. And that evidence doesn't exist. 21

As far as the carbonate rocks in Las Vegas 22

Valley, I'm not recommending that you extend the system down 23 to Las Vegas Valley shear zone, but there really is no data 24

Capitol Reporters

(13) Pages 1761 - 1764

Page 1765

in the carbonate terrain in Las Vegas Valley. Now, shouldsomeone with a water right in the Las Vegas Valley want to

someone with a water right in the Las Vegas Valley want to
 move it up in to these carbonates, then you would have some

- 4 data and you would have to make a decision on what to do
- 5 here. Now, again, you could manage it without including it
- 6 in the Lower White River Flow System management area. But at
- 7 this point in time I don't think that it's necessary. But
- it's samething that we may way may need to look at in the
- 8 it's something that we may -- you may need to look at in the9 future.

So now I'll get in to the information obtained from the aquifer test and subsequent to the test and the

12 Muddy River headwater spring flow as it relates to recovery

since the completion of the test.

14 15

16

2

3

4

5

6

7

8

9

10

11

12

13

15

16

17

18

19 20

21

So I have six bullets here. I'm going to kind of talk about all of them together. I agree that maximum recovery to the extent that it could occur was reached two or three years after completion of the aquifer test, certainly

- three years after completion of the aquifer test, certainly by 2016. Water levels continue to decline in most areas.
- 19 Coyote Spring Valley, Garnet Valley, California Wash, the
- 20 Black Mountains area, the water levels continue to decline.
- 21 Water levels in the Muddy River Spring area or at least at
- 22 EH-4, which is most closely tied to surface water discharge,
- are approaching or have reached steady state at least for a
- period of time. And we'll look at that in detail because

you can judge for yourself whether that line matches the data

steeper at first and then lowering out a little bit at theend.

Then we have 2005 recharge event where water

5 levels recovered and then you basically have a recovery from6 that impulse. But over the next five years water levels

7 continued to decline. And I drew a line through that data.

8 But I think that line is that west steep angle than the first

9 line. Then we have the Order 1169 aquifer test and 2011-12

finished in early 2013. And then a couple years of recovery.And then we have this last few years of water levels at EH-4

that we've had so much discussion about. The staff can judgefor themselves whether those water levels are rising, falling

or flat. But we'll take another closer look at it.

So I drew these line segments in here and discussed what were the main effects on the system. By no

means is this everything that's gone on. We have other recharge events. We have pumping that has -- We have pumping that is not steady. We have pumping locations that are moving all over the place. But, nevertheless, these line segments pretty much match that data.

So, just for curiosity, I plotted flows at Warm Springs West. And I just laid it on top of that same

hydrograph. You know, these line segments. I did not -- I

Page 1766

15

16

17

18

19

20

21

22

23

24

11

12

13

14

15

16

17

18

1 that's been discussed quite a bit.

Warm Springs West over that same period of time approaching steady state. Muddy River Spring area total discharge steady or in the last few years for measurements increasing. All of that said, we need more time to observe the system to really be certain that we are in fact reaching equilibrium in the Muddy River Springs area. There is evidence, but it's not compelling one way or the other. But

So this is a hydrograph of EH-4. That's the blue line. And this extends all the way back to 1987. And then the orange bars, that's carbonate aquifer pumping. And so this is the hydrograph. And then I took the liberty of drawing line segments through portions of this data. And I'll talk about -- I'll talk about each of those segments.

we'll go through it and take a look at it.

So this first segment, this flat line here, that was before there was really any significant pumping. We'll call that -- I call it dynamic equilibrium. Dr. Myers thought that there was a decline early and then we had a recharge event and then it recovered. And dynamic equilibrium, more or less pretty flat.

Pumping really accelerated in about 19 -- I

Pumping really accelerated in about 19 -- I
believe that's 1990. And then for ten years we see a decline
in EH-4 and a decline -- I drew a line through the data and

did not change those line segments. I just laid the data on
 there and I scaled it so that it would not be -- so it scaled

there and I scaled it so that it would not be -- so it scaledappropriately.

And, you know, the data, it matches fairly well.

We see initial pumping. We see recovery from the recharge

event. We see another decline. Although here we see quite a
bit of deviation between 2005 and 2012 than the Order 1169

8 aquifer test and you see recovery and now you see Warm

Springs West with the same line segment I drew through EH-4and it matches that data fairly well also.

So then I said, well, what is this telling us.

So I just -- I took those line segments and I said, well, what if I just lined them up. So I took the steady state segment prior to pumping, the initial pumping signal between the recharge event of 2005 and the Order 1169. I did -- I simply took my mouse and copied that segment and I dragged it down to kind of line up with the previous segment. I did the same for the post Order 1169 aquifer test. I simply copied that line and I dragged it down and then I draw that dashed

that line and I dragged it down and then I drew that dashed

20 line that kind of mimics all of that data. To me that looks

21 like, you know, that looks like the drawdown from a long-term

aquifer test. And in effect I think that's what we'reseeing.

23 seeing 24 I'm

I'm not saying that this represents all the data.

Page 1768

But it does match fairly well with the data. And I think in the long term it tells us something very important about capture.

23

We had a long discussion about EH-4 since 4 5 completion of the test. In the upper right corner I have taken a screen shot from SNWA's Exhibit 81. And you can see 6 7 that there is a trend line that was drafted by SNWA through that same data. And counsel made a point of asking many of 8 the expert witnesses whether that showed a decline. And many 9 just said, yeah, yeah, that looks like a decline. Well, I'm 10 saying that I don't think that line represents that data 11 for a couple of reasons. There is high annual periodicity 12 13 here, almost a foot from annual highs to annual lows. And it's a short record. It's just a few years. But if you want 14 15 to draw a line through that data, you have to start it and end it in the same month because of that annual periodicity. 16

17 This little line segment starts in April, April of 2016. April is the high point in each and every one of 18 these years in water levels. But at the end of that line, 19 and it's shown in this little legend up here, that was 20 January. January isn't the low. But January is about 21 midway. So if you wanted to draw a trend line through these 22 data, you need to start it and end it in the same month. And 23 that line doesn't. But, again, staff can see the data and 24

Page 1771

Finally, we had a lot of talk about drought and climate signals. I think in the Lower White River Flow

3 System all of our climate signals are due to precipitation

4 just in Climate Division 4 and not in Climate Division 3.

5 Climate Division 3 supplies most of the water to the Lower

6 White River Flow System. But because in Climate Division 3,

7 which is in Pahranagat Valley and Delamar Valley, the heads

there are about 900 feet higher than they are at our northern
most well in Coyote Spring Valley. So there's a 900-foot

head gradient between Climate Division 3 in Pahranagat Valley
and in Coyote Spring Valley. So we've got 900 feet of head.

Now, let's say we have a drought in Climate Division 3 and water levels drop two feet, let's say. We have water level data and we don't see that. But if it did drop two feet, well, then instead of having a 900-foot gradient, there would be an 898-foot gradient. If water flowed through that whole section uniformly, then we would see whatever that is, two over 900, that would be the loss of contribution from the northern basin, which is essentially nothing.

This figure shows -- And this is out of a previous hearing. But it's in the Nevada State Engineer Exhibit 250. SNWA also had a similar exhibit and they showed just winter precipitation, which I think even -- works even

Page 1770

12

13

14

15

16

17

18

19

20

21

22

23

24

they can see whether or not they believe that that trend line or my trend line adequately represent the data.

2 So we see that, I believe anyway, that water 3 levels and the Muddy River Spring flows look like they're kind of equilibrating. This figure is from SNWA's Exhibit 5 22, although I think it's in their primary exhibit as well, 6 7 their initial report. And it shows flow of the Muddy River at the Moapa gage. And what they did is they simply measured 8 9 flow at the Moapa gage and then they added to it what the diversions were to get at what the real discharge of the 10 system is. And a lot of those diversions were groundwater 11

the system.

And we can see here that since 20 -- since the end of the Order 1169 aquifer test, flows recovered like we would expect, but then they kept recovering so that in 2018 flow of the Muddy River at Moapa when you consider diversions was 32,000 acre-feet compared to the long-term average of 34,000 acre-feet. So that's just 2,000 acre-feet less than pre-development. So this also supports the other data that,

pumping by NV Energy and exported from the region so that

there is no recharge. It's literally taken straight out of

it's a short record. And I think we need more time to know for sure. All of these data are telling us the same story.

you know, maybe we're getting close to steady state. Again,

1 better. But this is EH-4 again. This is precipitation in

2 the orange bars. And you can see in wet years you have a

3 rise in water levels. In dry years you don't see that much

4 of a decline or any I think measurable decline. But you do

5 see a wet year signal. And I think that explains, you know,

all of the climate signal in the Lower White River FlowSystem. That is precipitation in the Lower White River Flow

8 System.

So the third question -- I think this is the
third one -- is the effects of moving the water rights
between alluvial wells and carbonate wells and deliveries of
senior decreed rights to Muddy River, verbatim that's the
question. Many parties answered this question and said, oh,
you can't move these alluvial wells, we'll have too much
pumping. But that's not the question.

The question is what will happen when you move the alluvial wells to the carbonate and its effect on senior decreed rights. We agree that alluvial pumping captures river flows quickly, almost one to one, but certainly not totally one to one. That just hardly ever occurs. Alluvial pumping lowers the water table in the alluvium in the ET areas and so some ET is captured. But I don't want to dwell on that point. It's a small amount.

But the model simulations and our observations

Page 1772

16

17

18

19

20

21

22

23

24

Page 1773

- indicate that carbonate pumping captures less river flow than 1
- alluvial pumping at all points in time. That's the question 2
- and that's the answer. The effect of moving water rights 3
- from alluvial wells to carbonate wells will have a less --
- will have less of an effect on senior decreed rights. 5
- So I have worked and evaluated many of these when 6
- 7 I was a staff of the State Engineer's office and our criteria
- was always the same. What is the effect of pumping at the 8
- current point of diversion and compare it to pumping at the 9
- proposed point of diversion and affects our existing rights. 10
- 11 That was the criteria. That's what we used.
- So the answer to this question is moving alluvial 12
- 13 pumping to the carbonate will have less of an effect on
- senior decreed rights in the Muddy River. We're not talking 14
- about flows in, or contributions to, or endangerment of the 15
- habitat of Moapa dace. That's not one of the questions. 16
- 17 We're not talking about having more pumping than there was
- before. That's not part of the question. 18
- Anyway, our observations on the effects of flow 19
- also support this conclusion. So I'll look at the modeling 20
- result of Dr. Waddell. He had three simulations: Simulation 21
- one on the left, simulation two in the middle, and three on 22
- the right. And I'll just go through it briefly. 23 In simulation one, most of the pumping was in 24

- And I think you've heard that from many of the experts.
- 2 Water can't be pumped without impacting senior rights, so
- really the perennial yield approach no longer works.
- Conjunctive management approach could work. Others have
- proposed a safe yield or a system yield. But I think
- conjunctively you have to look at how much water is there.
- And at some point you have to ensure that senior water rights
- are protected. Water budgets still matter. And I'll talk 8
- about that quite a bit. 9

All carbonate pumping will capture spring

11 discharge and Muddy River flow. There is no getting away

12 from that.

10

19

2

3

13 Counsel asked several of the experts can you capture -- can you capture discharge without affecting the 14

Muddy River? And they said no. I absolutely agree. I don't 15

know how one would go about capturing any subsurface 16

17 discharge to the extent that it exists. I wouldn't know

where to place it. I don't know where it occurs. All 18

carbonate pumping is going to capture some Muddy River flow

and spring flow as well. 20

Current pumping regime may have reached 21 equilibrium in the Muddy River Springs area. I think we need 22

23 more time for sure to know, because we just don't have any

24 room for error at this point in time.

Page 1774

- Coyote Spring Valley and the Muddy River Springs area. But,
- most importantly, 6900 acre-feet of that pumping was 2
- alluvial. 3
- In the middle simulation, the alluvial pumping 4
- was reduced to 2200 acre-feet. And then simulation number 5
- three, alluvial pumping was 1300 acre-feet. And most of the 6
- pumping was moved south in to California Wash, Garnet Valley, 7
- and the Black Mountains area. 8
- And for each of these simulations in the model, 9
 - flow of the Muddy River at Glendale increased with when you
- go from simulation one to simulation two to simulation three. 11
- 12 So these simulations support my conclusion moving water to
- the carbonate will have less of an effect on senior decreed 13
- rights. 14

10

- And just, you know, on the X-axis, this goes out 15
- to 500 years. 16
- So, the long-term annual quantity of groundwater 17
- that may be pumped from the flow system, including the 18
- relationships between the location of the pumping and 19
- 20 discharge of the Muddy River Springs and the capture of the
- Muddy River flow. 21
- So the state has always had a perennial yield. 22
- We have one for every basin. Unfortunately, perennial yield 23
- is no longer applicable in the Lower White River Flow System.

- Page 1776
- So I want to talk a little bit about --1
 - HEARING OFFICER FAIRBANK: Mr. Felling, if I may
 - interrupt you for just one moment.
- MR. HERREMA: Brad Herrema on behalf of CSI. If 4
- we go back to slide 21, there are a couple of bullets at the 5
- bottom there which Mr. Felling didn't touch on but you can 6
- 7 read them on the handouts that have been passed out. They
- get in to the 3.2 CFS trigger under the 2006 MOA. And there 8
- 9 wasn't anything in Mr. Felling's rebuttal report that talked
- about that the MOA or the 3.2 CFS trigger or even pumping in 10
- the carbonate beyond current pumping. His opinion was that 11
- 12 if pumping continued at the levels that, it related to
- pumping continuing at the levels it's at right now. 13
- HEARING OFFICER FAIRBANK: To summarize your 14 15
- 16
- 17
- the rebuttal report; correct? 18
- MR. HERREMA: Yes. And I think we get to those 19 points at slide 34 as well. 20
- HEARING OFFICER FAIRBANK: Okay. So, at this 21 point, your objection is noted and we'll address those when 22
- we get to those further slides. Thank you. 23

objection for those that are listening remotely and from afar, it was that the last two bullet points on slide 21 are beyond the scope of the analysis and opinions proffered in

MR. HERREMA: Thank you.

Min-U-Script® (16) Pages 1773 - 1776 Capitol Reporters

24

775-882-5322

Page 1777

1

THE WITNESS: Okay. So the question of whether all groundwater discharges at the Muddy River Springs, if

that is in fact the case, this hydrograph shows this is

- really the source of water to wells. And when you only have
- only a river to capture that waterfront and on the Y-axis 5
- it's the fraction of pumping and on the X-axis it's time. 6
- 7 And we can see here that when water is initially pumped, all
- of the water comes out of storage and that's this red line. 8
- And that over time water captured from storage decreases 9
- until essentially water levels maintain, they're steady. And 10
- that over time inversely you have groundwater -- you have 11
- river capture. That's water from capture. And that would be 12

13 in this case the Muddy River.

If all the water that discharges in the White 14

15 River Flow System discharges at the Muddy River Springs area

and the Muddy River, this is -- this is -- this is the 16

- 17 hydrograph that one would use. You would have a one-to-one
- capture. There would be no getting away from it. Absolutely 18
- no way around it. It would be one to one and just be a 19
- matter of when. 20

1

2

3

- However, I think the data is showing us that 21
- there's something else going on. This hydrograph, which is a 22
- little bit difficult to read. Again, it shows storage 23
- 24 capture in the line that starts on the top and it goes to the

I do want to point out that this is not the

- boundary of the Lower White River Flow System. The boundary 2
- is up here around -- at the east side of California Wash. 4
 - But the Recon recharge at least in the Black
- Mountains area is less than a hundred acre-feet. So there's 5
- really not a lot of local contribution.

7 So down here at the lower end of this table from

- the same exhibit, Mr. Harrill estimates what the discharge 8
- is. So for the Lower Meadow Valley it's a thousand. For 9
- Black Mountain area one, three, four, and five. And that 10
- would be one here is north of Rogers and Blue Point and then 11
- 12 three is most of the eastern end. Four is the southeast.
- 13 And five is southwest. He estimates essentially no boundary
- flux, just from local recharge. 14

And these were -- these were data that 15

Dr. Waddell tried to match in his groundwater flow model. 16

17 That's why he included them in his molding report. So these

are the boundary fluxes from Dr. Waddell's model. They don't 18

19 match one for one. He doesn't label them the same way. But

it's in the same area. 20

So for the Muddy River he estimates 580 21

acre-feet. We'll ignore the Virgin River. East of Rogers 22

fault, 250. Rogers fault to Black Mountains, 560. East of 23

24 Black Mountains, that big area was only 47. South 1200. And

Page 1778

- bottom. And then there are three lines that start in the 1
- lower left and go to the upper right. 2
- The top line is total capture from all resources. 3
- And this is just demonstrative. It's not intended to 4
- represent our system. It's just to show you what I think 5
- could be going on. 6

Min-U-Script®

- The next, the middle line that rises from the 7
- lower left, that's river capture. And on this particular 8
- 9 figure, it says evapotranspiration, but it could be any other
- capture. It could be capture of subsurface outflow. It 10
- could be induced recharge. It could be, you know, whatever 11
- 12 else is there to capture. The sum of the captures will add
- up to the total capture. And that's the top line. 13
- What I believe is that the evidence is showing us 14
- that there is more than one capture occurring. 15
- So let's just look and see what kind of evidence 16 17
- do we have for subsurface discharge in the Lower White River
- 18 Flow System. So this figure is from Dr. Waddell's
- groundwater flow model that was submitted as State Engineer 19
- 20 Exhibit 280. But it was for a previous hearing. And it
- shows the segments. And they would be Lower Meadow Valley. 21
- There's a Virgin River Valley. And then Black Mountains 22
- area, one, two, three, four, and five. And for each of these 23
- segments Mr. Harrill estimated boundary flux. 24

Page 1780

- bottom of lake is 300. And the total number is 3,000
- acre-feet. It's not a big number, but it doesn't quite match
- Harrill's estimate. 3
- But you can see that the model shows that there's 4
- some water discharging. He did not believe it was 5
- significant. And perhaps it is not. We really still don't 6
- know. 7

11

Capitol Reporters

- This figure, and I'll touch on this, we're just 8
- 9 looking at -- I just want to point out what kind of evidence
- 10 we've seen in the past. This is from SNWA's report four, the
 - Delamar, Dry Lake, and Cave Valley hearings.
- 12 And just as a background, in order to try to
- estimate recharge in all of the basins, first SNWA went and 13
- to the extent that they could, they measured discharge and 14
- estimated discharge and then had a discharge water budget. 15
- 16 And then from that they distributed recharge based on a
- 17 precipitation and a recharge coefficient that they felt was
- appropriate for the White River Flow System, and the state 18
- 19 agreed.
- 20 As part of that hearing, they introduced a --
- evidence to support flow south from the Muddy River Springs 21
- 22 and the Muddy River area, south from the Muddy River Springs
- area to California Wash and bypassing the Muddy River. And 23 24

they brought in evidence. They had a number of wells in the

(17) Pages 1777 - 1780

Page 1781

6

area. They had a transmissivity estimate, not so much from

- the local wells because they didn't really have that data. 2
- So they brought in estimates from elsewhere. So they had 3
- transmissivity, they had width, they had a thickness, and 4
- they had a gradient. And that's all you need to estimate 5
- flux. And they estimated 9900 acre-feet. 6

1

7

8

Andrew Burns testified last week and I think he

kind of walked it back a little bit and said he wasn't that

- confident with the transmissivity estimates. I don't 9
- disagree. But the state accepted that discharge. And this 10
- 11 discharge was then in the recharge estimate spread out
- 12 through the Lower White River Flow System.
- 13 Ironically, to the west of that segment, there is
- a section of carbonate rock with a lot of north/south 14
- structure. And I thought, and I think now, that if 15
- subsurface flow occurred, it would have occurred through the 16
- carbonate rock. But there's no data there, so there's 17
- nothing to support how much flow that might have been. So, 18
- anyway, that was the number was 9900 acre-feet. 19
- I just want to look here at -- this is the south 20
- and eastern boundary of the Lower White River Flow System. I 21
- drew this red line in on top of the Harrill boundary fluxes. 22
- That red line -- There's a scale bar. That scale bar is 30 23
- miles. That red line is 35 or 40 miles long. There's a head 24

- that there wouldn't be some subsurface outflow. We don't
- know how much it is. Nobody knows how much it is. But there 2
- is likely some. And I think that our water level and flow 3
- 4 data are telling us that perhaps there is -- at least there's
- something else that's being captured. 5
 - So, again, these were the figures. This is
- 7 capture. Currently, we're still losing water from storage in
- the Lower White River Flow System. As we lose more and more
- water from storage, we capture more and more subsurface 9 outflow. That's -- That's what these hydrographs tell us. 10

We have -- This upper figure, it doesn't match 11

12 our observations. Our water levels -- Our water level trend

13 in EH-4, we're down here, we're down here, which tells us we

14 should have captured most of our pumping from discharge but

we don't. What we see is that the discharge capture is 15

leveling or even decreasing. We've seen an increase in flow 16

17 of the Muddy River. That's not the way the system should

behave, according to these rules. 18

What I am suggesting is that we're perhaps out 19 in -- I'm showing the lower right figure. We're showing 20

water levels at least in the Muddy River area leveling out 21

but our capture of the river isn't up here at this high 22

23 number. It's somewhere else. It's something less.

So this is the hydrograph. This is EH-4. It

Page 1782

24

6

8

Page 1784

- difference from the Lower White River Flow System carbonate
- to Lake Mead. Heads in the Lower White River Flow System 2
- carbonate are about 1800 feet above sea level. Lake Mead is 3
- about 1100 feet above sea level and dropping. Nobody has --4
- So that's 700 feet of head differential. 5
- MR. TAGGART: We're just going to lodge an 6
- objection that none of this information is in the report. 7
- This exhibit is not in his report. The line that he's drawn 8
- 9 on it is not on the report. The section on Harrill is not in
- the report. None of this information is coming from his 10
- report. It's all been generated for this power point. So on 11 12 this particular slide we object to testimony being offered
- with respect to opinions that are opined in the report. 13
- HEARING OFFICER FAIRBANK: Thank you, 14
- Mr. Taggart. So your objection is that the slide and the 15
- testimony associated with the slide is beyond the scope of 16
- the report that was submitted. And your objection is noted.
- And the State Engineer will assign the weight of the 18
- testimony when the totality of the evidence is considered in 19
- 20 this matter.

17

- THE WITNESS: Okay. I'll continue. Anyway, 21
- there's 700 feet of head differential. There's no evidence 22
- that the rocks around the periphery of the Lower White River 23
- Flow System are impermeable. There's no reason to believe

- shows that our capture, at least in the Muddy River Springs
- 2 area, which is our area of primary concern, is leveling out.
- Our river flow of the Muddy River at Glendale, we're not
- seeing that -- Our pumpage is seven or 8,000 acre-feet a 4
- year. We're not seeing that capture. In the Muddy River our 5
- waters levels are leveling out, but we're not seeing the capture and we should be seeing it. Something else is being 7
 - captured.

There is a time factor here. But we do see that 9

the system has responded relatively quickly. And I don't 10

think that we're seeing something happening in one area and 11 12 not seeing it in another area.

Other areas are still -- Our other areas are 13

still losing storage. So in the top we've got Coyote Spring 14

Valley. In the top figure we see -- we are seeing continued 15

16 decline. The next line down, that's EH-4. We can argue

about that forever. The middle line of that is TH-2. Then 17

we see Garnet Valley and then BM-DL-2 in the Black Mountains 18

area. And we still see a bit of a decline. We're still 19

losing storage in those areas. 20 These are two figures from SNWA's report and I'll 21

just touch on them real quickly. The bottom one is a 22 computed capture of the Muddy River based on Warm Springs 23

West discharge. So they use their regression analysis to try

Min-U-Script® (18) Pages 1781 - 1784 Capitol Reporters 775-882-5322

Page 1785

- 1 to estimate what capture of the Muddy River would be. And in
- 2 their evidence they showed a very high correlation between
- 3 Warm Springs West flow and Muddy River flow. And you can see
- 4 that capture, which is this green part of the Muddy River, is
- 5 increasing over time.
- 6 So I actually went to their table and I saw what
- 7 that capture was computed at. And I typed them on here. And
- 8 you can see from 2010, 2,000 acre-feet. In 2011 it's 3,000.
- 9 And then as you get up to 2015, it's 5,000, 5,000, 5600,
- 10 5400. And that's capture. That's computed from Warm Springs
- 11 West flow.
- But when you look at their actual measurements,
- that's not what you see. So I agree that the regression has
- 14 a high correlation, but the computed numbers don't match the
- 15 measured numbers. And when you have that disagreement in
- 16 information, I would always go with the measurement over a
- 17 calculation.

19

- And this is the -- SNWA's multiple linear
 - regression. This goes to the question that none of the
- 20 party -- none of the other parties tried to answer this
- question. So they tried. And I think there are issues with
- 22 it. But, nevertheless, it still needs to be done. And
- 23 nobody else tried to do this.
- So I'll -- There was an issue with it and we

- 1 important for the state to answer that question about what
- 2 are the effects of pumping in all of these different areas.
- 3 Because right now we really don't know.
- 4 Q. (By Ms. Ure) Mr. Felling, you're about 45
- 5 minutes in.
- 6 A. Thank you. Okay.
- 7 MR. HERREMA: Brad Herrema for CSI. These are
- 8 the conclusions that we think are beyond the scope of
- 9 Mr. Felling's rebuttal report.
- 10 HEARING OFFICER FAIRBANK: Ms. Caviglia.
- MS. CAVIGLIA: While we don't say the 3.2 CFS, we
- do in our report on page seven state that Nevada Energy does
- 13 not rebute the arguments of SNWA and US Fish and Wildlife
- 14 Service and it's likely that all pumping in the Lower White
- 15 River Flow System, perhaps Kane Springs, and Lower Meadow
- 13 Kivel Flow System, perhaps Kane Springs, and Lower Meado
- Valley Wash will ultimately impact the springs.
- So, the spring number of 3.2 is not in our
- 18 report, however, the impact to those springs has been stated
- in our report
- MR. HERREMA: The conclusion at the bottom of
- 21 page five is that future pumping at current rates and
- location will result in minimal future water level decline in
- 23 the Muddy River Springs area or significant decrease, and
- 24 it's minimal significant decrease in the flow of Warm Springs

Page 1786

Page 1788

- 1 brought it up on cross and I just want to get it on the
- 2 record here. This is the multiple linear regression for
- 3 California Wash. It shows 1.7 feet of decline in 2015 when
- 4 pumping the California Wash was 411 acre-feet. The
- 5 regression line on the bottom shows water levels in EH-4 to
- 6 flows of the Muddy River Spring. And there's a slope here.
- 7 That slope is .157. So you simply multiply 1.7 times 1.7.
- 8 And that number .267 would be the expected decrease in
- 9 discharge at Warm Springs West.
- Well, they have another regression for Warm
- 11 Springs West flow to Muddy River flow. And they have it in
- their table, 6.1 in Exhibit 7. And the ratios are here on
- the right and they range from .074 I think to .081. But in
- 14 their own analysis they ended up using Tom Eakin's ratio of
- 15 .076. And that's what I used here.
- So, when you add it all up, this .267 decrease in
- 17 flow at Warm Springs West should translate in to 2500. 3.51
- 18 CFS decrease or 2500 acre-feet of decrease in discharge of
- 19 the Muddy River due to that 400 acre-feet of pumping. Well,
- 20 we know that can't happen. The capture can't be more than a
- 21 hundred percent. So there was a mistake somewhere. I don't
- 22 know where. I don't know about any of the other regression
- analyses or about any in the other basins. However, I will
- say that this is approach is important and it would -- it's

- 1 West or in Muddy River. The MOA is never mentioned nor is
- 2 the 3.2 trigger.
- 3 HEARING OFFICER FAIRBANK: Well, I agree that the
- 4 MOA or the 3.2 trigger is not specifically addressed in the
- 5 report. There's been some liberty in terms of participants
- 6 testifying as to particular matters. And, again, as I stated
- 7 before, the State Engineer will make a determination as to
- 8 what, if any, weight to assign to this.
- 9 So for the purposes of this particular line of
- testimony, we'll permit it and any weight will be determinedwhether or not it's assigned any value by the State Engineer.
- MR. HERREMA: Thank you.
 - HEARING OFFICER FAIRBANK: Your objection is
- noted. Thank you.THE WITNESS: Okay. So I'll continue. Currently
- 16 flows at Warm Spring West are just a little more than 3.2
- 17 CFS. Those are provisional data. And we are at a low time

of the year. So we would expect them to increase. But there

- 19 is really not much more room to decrease flow at Warm Springs
- 20 West. And we think that any significant additional pumping
- 21 from the carbonate aquifer will likely result in that trigger
- being reached. And it's possible that with the current
- 23 pumping that trigger will be reached. That we don't know for
- 24 sure.

17

18

19

That 3.2 CFS trigger may not be appropriate if pumping occurs from less well-connected areas. Some of the parties have various that are probably less well-connected. If your trigger is at your discharge point, by the time you reach that trigger and your pumping has taken a long -- your

23 24

4

signal has taken a long time to get there, that trigger is 6 7 not properly placed. It's too late. Finally, the memorandum of agreement probably

8 needs to include all water users to be of real benefit in the 9 future. 10

So I'll just go to my summary. There are pros and cons to adding the various basins to the joint management in the Lower White River Flow System. There has been a lot of evidence on Kane Springs Valley. We put in our report that the State Engineer could manage Kane Springs Valley without including it in the Lower White River Flow System. There has been an abundance of very compelling evidence. And we now say that we should include Kane Springs Valley in the joint management area.

As far as the Lower Meadow Valley Wash, that evidence is less compelling. Recovery from the Order 1169 aquifer test was complete within two or three years after pumping. Water levels continue to decline every where except perhaps in the Muddy River Springs area, where that water

area and flow data are telling us that we're not having

one-to-one capture. But I want to put it in to context of 2

the big picture. SNWA has made an argument that perhaps the

most that you could pump is 6,000 acre-feet and keep the

trigger level at Warm Springs West about -- above 3.2 CFS.

Our current pumping is rate is whatever, 7500 to 8,000

acre-feet of carbonate pumping. That's not a lot more. I

don't think that these data disagree with SNWA's conclusion 8

all that much. But I do think that we need a little more 9 time to know for sure. 10

If future pumping occurs in less well-connected areas along the periphery of the main carbonate aquifer, pumping effects, drawdown, and stream capture will be delayed in the Muddy River Spring area as will recovery.

We need to continue to monitor flows and water levels during under the current pumping regime for at least a year or more. Warm Springs West flows are just over 3.2 CFS. There is no room for additional stresses in the system at

Lastly, it is in the state's interest, contrary to the opinion of an expert for US Fish and Wildlife Service, it is absolutely in the state's interest and all of the water users to protect the Moapa dace. I think it's very important to honor that 3.2 CFS trigger at Warm Springs West. And it

Page 1790

level decline is imperceptible, we'll call it, over the last 1 2 two years.

Flow at Warm Springs West and the Muddy River 3 appear at the time being to be stabilized under this current pumping regime. There have been changes. But for the most 5 part it's been fairly steady at about 8,000 acre-feet of 6 7 carbonate pumping.

We agree that more time is needed to make sure. 8 Pumping from the carbonate anywhere in the Lower White River

Flow System will capture Muddy River flows. With that, we 10 also agree. 11

12 Subsurface outflow is likely, given the vast extent of the southern and eastern perimeter of the flow 13 system. 14

No evidence has been put forward that rocks 15 bounding the Lower White River Flow System are impermeable. 16

The subsurface flows exist. It is possible to capture a 17

portion of this outflow resulting in less than a 18

drop-for-drop capture of the Muddy River. 19

20 And I think our data is actually showing us that.

We have many lines of evidence. And I think they're showing 21

22 us that maybe that drop-for-drop capture of the Muddy River

is not occurring. 23

Observed water levels in the Muddy River Spring 24

Page 1792

is very much like the Devil's Hole issue. Water levels in

Devil's Hole dropped. The habitat of the Devil's Hole pup

fish was imperiled. And a federal district court judge 3

decided how much water needs to be in Devil's Hole. We could 4

very easily have the same situation in the Muddy River 5

Springs area if flows in the Muddy River Springs dropped and 6

imperiled the Moapa dace. And then we would have a federal district judge managing water in Nevada and not the state. 8

9 And I think it's for the benefit of all of the users that the

state continue to manage these water resources and not a 10

federal court judge. And that's all I have. Thank you.

12 MS. CAVIGLIA: We would request that Nevada Energy Exhibit 1 be admitted in to evidence. 13

HEARING OFFICER FAIRBANK: Exhibit 1 is so admitted.

MS. CAVIGLIA: And we would also echo SNWA's request for additional briefing. As Mr. Felling indicated, one of our opinions has changed through the course of this hearing.

HEARING OFFICER FAIRBANK: Excellent. Thank you. 20

All right. We'll go ahead and commence 21

cross-examination, starting with Coyote Spring Investments. 22

You have seven minutes. 23

24 ///

Min-U-Script® (20) Pages 1789 - 1792 Capitol Reporters 775-882-5322

Page 1793

- 1 CROSS-EXAMINATION
- 2 By Mr. Herrema:
- 3 Q. Thank you. Brad Herrema with CSI for the record.
- 4 Good morning, Mr. Felling.
- 5 A. Good morning.
- 6 Q. A few questions. Hopefully I'll be brief.
- 7 Figure one of your rebuttal report.
- 8 A. I don't have that report.
- 9 Q. I think you do if you just scroll down. It's
- 10 slide 12.
- 11 A. Okay.
- 12 Q. This shows carbonate pumping in the Lower White
- 13 River Flow System. Does this include carbonate pumping in
- 14 Garnet Valley that occurred in the 1990s?
- 15 A. It may not. We heard evidence earlier that there
- 16 might be some pumping in Garnet Valley. I took this pumping
- 17 data from SNWA's exhibit.
- 18 Q. Okay. Based on your statements that climate
- 19 doesn't play a large role in groundwater level decline, do
- you have an opinion as to the drop in groundwater levels at
- 21 EH-4 prior to pumping in Coyote Spring Valley?
- 22 A. I'm sorry. But I don't see a drop. Oh,
- beginning -- And I'll point to -- This is slide 12. At this
- point in -- I'm sorry. But I can't read the date, but

- 1 pumping in other portions of the Lower White River Flow
- 2 System with respect to the Muddy River Springs area be
- 3 considered when assessing impacts to groundwater levels in
- 4 the Muddy River Springs area?
- 5 A. I'll say that -- I'll say that ultimately they
- 6 should, but that evidence is not in existence at this time.
- 7 Q. Could we go to your hypothetical hydrograph.
- 8 This is figure three in the rebuttal report. Based on the
- 9 dotted line shown in this figure and the groundwater level
- declines that occurred prior to 2005 -- And 2005 is an
- 11 important demarcation here because that's when pumping in
- 12 Coyote Spring Valley began. It appears that steady state is
- 13 being reached due only to carbonate pumping in the Muddy
- 14 River Springs area. Would you agree?
- 15 A. No.
- 16 Q. And why is that?
- 17 A. I think that -- Well, the way you stated the
- 18 question, it was due to pumping only in the Muddy River
- 19 Springs area. If that question is as you posed it, I think
- 20 it's due to -- I disagree. I think it's the effect in the
- 21 Muddy River Springs area due to pumping every where.
- 22 Q. Whatever carbonate pumping there was in the Lower
- 23 White River Flow System at the time?
- 24 A. Yes.

Page 1794

Page 1796

- 1 it's 1996. This drop that starts in 1996?
- 2 Q. Yes.
- 3 A. I believe that's from all regional carbonate
- 4 pumping.
- 5 Q. Whatever pumping was happening at that time
- 6 including pumping in Muddy River Springs area?
- 7 A. Absolutely.
- 8 Q. If the EH-4 declines prior to 2005 were due to
- 9 that existing carbonate pumping, do you have an opinion as to
- whether steady state conditions existed prior to 2005?
- 11 A. Yes, I do have an opinion.
- 12 Q. And what is that?
- 13 A. I don't believe steady state conditions had been
- reached prior to 2005.
- 15 Q. Based on the impact of pumping Arrow Canyon wells
- on groundwater levels in spring flow, did you determine the
- 17 relative impact of groundwater level decline due to pumping
- 18 in Muddy River Springs area versus pumping in Coyote Spring
- 19 Valley?
- 20 A. No.
- 21 Q. In Muddy River Springs area versus pumping in
- 22 Garnet Valley?
- 23 A. No.
- 24 Q. In your opinion should location and magnitude of

- 1 Q. Okay. And so then would you answer then that if
- 2 you look at all of the Lower White River Flow System
- 3 carbonate pumping that steady state was being reached at that
- 4 time?
- 5 A. Only in the Muddy River Springs area.
- 6 Q. And how does this conclusion or this what we've
- 7 just discussed here, how does this relate to your opinion
- 8 that all carbonate pumping, or your disagreement, I guess,
- 9 with the water authority's conclusion that all carbonate
- pumping in the system will have a one-to-one impact on
- springs in the Muddy River Springs area?
- 12 A. To the extent of the one-to-one impact, I
- disagree that the evidence does not support that at this
- 14 time.
- 15 Q. Okay. And I'd like to shift gears a little bit
- to the quantity of water that is leaving the system as
- 17 subflow.
- 18 A. Okay.
- 19 Q. Your statement in your report is that it's
- 20 possible that 10,000 acre-feet per year could exit the system
- 21 to the Las Vegas Valley or to lower portions of the Black
- Mountains area or Lake Mead. Do you recall that?
- 23 A. I do.
- 24 Q. Does that statement also support your opinion

Min-U-Script®

Capitol Reporters 775-882-5322

(21) Pages 1793 - 1796

Page 1797

- 1 that not all pumping has a one-to-one impact -- not all
- 2 carbonate pumping within the Lower White River Flow System
- 3 has a one-to-one impact on the springs in the Muddy River
- 4 Springs area?
- 5 A. Yes. That was part of the basis for that
- 6 conclusion.
- 7 MR. HERREMA: Thank you. No further questions.
- 8 HEARING OFFICER FAIRBANK: United States Fish and
- 9 Wildlife Service? Seeing no questions.
- National Park Service? Seeing no questions.
- Moapa Band of Paiute Indians? No questions.
- Southern Nevada Water Authority and Las Vegas
- 13 Valley Water District?
- 14 CROSS-EXAMINATION
- 15 By Mr. Taggart:
- 16 Q. Good morning, Mr. Felling.
- 17 A. Good morning.
- 18 Q. I understand your opinion regarding the system
- and whether it's in equilibrium or not. Is the increasing
- 20 flows or decreasing flow deficit in the Muddy River in recent
- years one of the factors that you used in making that
- 22 determination?
- 23 A. It was one of the pieces of evidence, yes.
- 24 Q. Okay. And if you could turn to slide 16, please.

- 1 Q. Okay. I want to ask you about a statement that
- 2 you made regarding the standard that was used when -- This
- 3 was about moving alluvial rights to carbonates, okay.
- 4 A. Uh-huh.
- 5 Q. So the standard that was used when you move a
- 6 water right is to look at the impacts from pumping at the
- 7 existing point of diversion versus impacts at the proposed
- 8 point of diversion. And I think you said that moving some
- 9 alluvial rights to carbonate pumping may have less of an
- 10 impact on existing rights than the existing pumping. Is that
- 11 a fair statement?
- 12 A. Yes.
- 13 Q. Okay. And isn't it true though that the standard
- 14 for a -- standard in Nevada is whether there is an impact to
- existing rights at all, not whether there's less of an
- 16 impact?
- 17 A. I don't believe so.
- 18 Q. Okay. When you were talking about the 9900
- 19 acre-feet of underflow or subflow or whatever we call it --
- 20 I'm looking for a slide here -- you're aware, are you not,
- 21 that the analysis that SNWA did at the time and the one that
- you're relying upon, and it's shown on page 26, slide 26,
- that was a water budget approach for the entire White River
- 24 Flow System in order to determine the recharge and discharge

Page 1798

Page 1800

- 1 Would you agree with me that the declining MR flow deficit in
- 2 2017 to today is depicted on that chart where the red section
- 3 gets smaller towards the right end of the graph; correct?
- 4 A. Correct.
- 5 Q. And you're aware that the -- your client, the
- 6 power company, has decommissioned a power plant and there's
- 7 significantly less pumping in the alluvial system during that
- 8 time period; right?
- 9 A. Yes, I am.
- 10 Q. So would you agree with me that part of the
- 11 reason for the increased flows in the river or the decreased
- 12 flow deficit is the reduction in the pumping in the alluvial
- aquifer by the power company?
- 14 A. I really wouldn't -- I think that you've taken
- that diversion in to consideration. And that is that blue
- area. So I don't -- I don't agree with that as a factor in
- 17 those estimates of discharge of the Muddy River at Moapa.
- 18 Q. Okay. Do you agree that the reduction of
- 19 groundwater pumping for the power plant has resulted in
- 20 increased Muddy River flows?
- 21 A. Yes, I do.
- 22 Q. And would you agree with me that -- Were you
- 23 present during Mr. Robison's testimony yesterday for MVIC?
- 24 A. No.

- 1 amounts in 15 plus groundwater basins; correct?
- 2 A. Yes.
- 3 Q. And so it was not an analysis that was done to
- 4 determine the impact of the 1169 pump test; correct?
- 5 A. It was not.
- 6 Q. Okay. And at that time there were two separate
- 7 Darcy flow calculations that were proposed by SNWA, one that
- 8 was accepted by the State Engineer and one that was rejected;
- 9 correct?
- 10 A. Yes, that's correct.
- 11 Q. And the 9900 acre-foot cross-section that you
- described in Darcy flow calculation, that was based upon an
- alluvial transmissivity calculation; correct?
- 14 A. Uh-huh, yes.
- 15 Q. And the cross-section that was postulated by SNWA
- to be a carbonate subflow with carbonate transmissivity of
- 17 8600 acre-feet, that was denied by the State Engineer;
- 18 correct?
- 19 A. Yes. That was flow from the Coyote Spring Valley
- 20 to Hidden Valley. And the evidence showed that there was a
- 21 water level at the south end of Coyote Spring Valley that was
- 22 higher and it looked like there was a groundwater divide. So
- 23 it wasn't accepted.
- 24 Q. All right. Do you -- New topic now. What is

Page 1801

- 1 your view on whether the State Engineer needs a groundwater
- 2 model constructed now in order to make the determinations
- 3 that are required or that are asked under Order 1303? Can
- 4 the 1303 increase be answered without a groundwater model and
- 5 just based upon the stress data from the Order 1169 pumping
- 6 test and the recovery data from that pumping test?
- 7 A. So there is a groundwater flow model that was
- 7 A. So there is a groundwater flow moder that was
- 8 constructed by federal agencies. And, try as they might,
- 9 they really weren't able to replicate the system very well.
- They underestimated a lot of the effects. And it wasn't
- because they didn't try. I just think it's a very difficult
- system to model. I think at this stage our observations are
- enough to make future decisions. And so, no, I don't agree
- 14 that a model is necessary.
- 15 Q. Okay. Could you turn to slide number 32, please.
- 16 And just quickly, you made a comment during your testimony
- 17 that the -- And I don't remember exactly what it was. But I
- 18 wanted -- it had to do with the difference between these two
- charts and the values depicted on the charts. Do you
- 20 recognize that in the lower pane, which is Figure 6-3,
- 21 there's a symbology there that indicates MRSA discharge
- 22 capture. And so this is showing discharge, which is more
- 23 than just stream flow. And then do you notice that up in the
- top panel that that is just showing stream flow? Does that

- 1 estimates like this, I think the actual data are somewhat
- 2 ambiguous and then you need a longer period of record.
- 3 MR. TAGGART: Thank you.
- 4 HEARING OFFICER FAIRBANK: Moapa Valley Water
- 5 District? Seeing no questions.
- 6 Lincoln County, Vidler?
- 7 CROSS-EXAMINATION
- 8 By Ms. Peterson:
- 9 Q. Thank you. Mr. Felling, Karen Peterson
- 10 representing Lincoln County Water District and Vidler Water
- 11 Company. Did you calculate drawdown to the Muddy River
- 12 Spring area from pumping Kane Spring Valley wells?
- 13 A. No, I did not.
- MS. PETERSON: Thank you. That's all the
- 15 questions I have.
- 16 HEARING OFFICER FAIRBANK: Center for Biological
- 17 Diversity?
- 18 MR. DONNELLY: Thank you.
- 19 CROSS-EXAMINATION
- 20 By Mr. Donnelly:
- 21 Q. Patrick Donnelly, Center for Biological
- 22 Diversity. Mr. Felling, is there a commonly-accepted
- 23 definition of steady state?
- 24 A. I have never really thought about it in those

Page 1802

Page 1804

- 1 make sense?
- 2 A. I see that.
- 3 Q. One last question at least for now is on the
- 4 slide before that. Do I get to ask it?
- 5 HEARING OFFICER FAIRBANK: Ask your question.
- 6 MR. TAGGART: Okay.
- 7 You testified about slide number 15 and I want to
- 8 ask you, you indicated that a trend line should be based upon
- 9 a -- using the same value from each month if you want to
- 10 develop a trend line. And so I have two questions, I guess.
- 11 Well, I can't have two questions. Did you do that and did --
- and would it be appropriate in your view if the high point in
- the hydrograph in a given year were used as the recovery
- point, if you will, in that year and then the trend line
- based upon that high point in the data set in a given year?
- THE WITNESS: So, I'll answer the first question
- 17 first, did I do it. I drew the line in general through the
- 18 middle of the data. Perhaps I should have angled it up more
- 19 I think to match that data.
- And your second question, could you draw a line
- 21 across the high point is no more valid than drawing a line
- 22 across the low point, in which case you would have opposing
- 23 trend lines. So you can draw the line anywhere you want.
- 24 When you have a short period of record and a high period of

- 1 terms of whether there's a commonly-accepted definition or
- 2 not.
- 3 Q. Is there any definition that you use to define
- 4 steady state?
- 5 A. Well, I would use the definition of that things
- 6 are steady, that they are neither increasing nor decreasing.
- 7 Q. What things would be neither increasing or
- 8 decreasing?
- 9 A. Whatever is -- Whatever you're trying to assign
- 10 that term to.
- 11 Q. So, in this case in your usage of it, in your
- presentation, what did you mean?
- 13 A. That in this particular case of the Warm Springs
- 14 West area that we were no longer seeing the change in water
- 15 levels, we were no longer seeing a change in Warm Springs
- 16 West discharge, and we were no longer seeing a appreciable
- 17 change in flows of the Muddy River over the last two or three
- 18 years.
- 19 Q. How long of a steady measurement would be
- 20 necessary to qualify as steady state?
- 21 A. I don't know.
- 22 Q. But it is less than three years worth of data?
- 23 Let me rephrase the question. You were using less than three
- years worth of data to say this system is in a steady state?

Min-U-Script®

Capitol Reporters 775-882-5322

(23) Pages 1801 - 1804

Page 1808

Page 1805

- 1 A. I am saying that a system appears to be reaching
- 2 steady state over -- and over the last two or three years is
- 3 roughly at steady state. But that is not to say that it will
- 4 continue that way in the future. And that's why I say I
- 5 think we actually need to observe the system for a bit
- 6 longer.
- 7 Q. So, I mean, I guess I'm a little confused. If
- 8 it's in a steady state that implies that the decision is
- 9 made, it's steady and will not be changing based on current
- 10 conditions. But you're saying we need to get more data to
- 11 ascertain that?
- 12 A. I'm saying that if we want to be certain that
- 13 steady state conditions are in fact occurring now and forever
- in to the future under the current pumping regime, two or
- three years of observations aren't enough.
- MR. DONNELLY: Thank you. No further questions.
- 17 HEARING OFFICER FAIRBANK: And I neglected to ask
- 18 City of North Las Vegas.
- MS. URE: No questions.
- 20 HEARING OFFICER FAIRBANK: No questions.

Technologies and Georgia Pacific. Good morning, Mr. Felling.

summary of conclusions and recommendations, I think slide 35

and 36. 35, you note that subsurface outflow is likely. So

my question is hypothetically if pumping captured only at that subsurface outflow how would that square with your final

conclusion in the previous slide that pumping from the

carbonate aquifer anywhere in the Lower White River Flow

posed. If pumping could just capture subsurface outflow,

then that's what it would capture and it wouldn't capture

HEARING OFFICER FAIRBANK: Nevada Cogeneration

Q. Hello, Mr. Felling. Steve King for Muddy Valley

System would capture Muddy River flows?

MS. HARRISON: Okay. Thank you.

Associates? Not seeing any questions.

CROSS-EXAMINATION

Muddy Valley Irrigation Company?

A. So I'll answer that question strictly as it was

- 1 Q. Slide 11 of your presentation, the first bullet,
- 2 maximum recovery reached in 2016.
- 3 A. Yes.
- 4 Q. So I have a question. I think it's a
- 5 clarification in answer to a question to your presentation on
- 6 this slide. And I believe what I heard was along the lines
- 7 that after the 1169 pump test the maximum recovery was
- 8 reached in 2016 to the extent it could recover or to the
- 9 extent it could something else. And I wasn't clear as to
- that, the latter part of that sentence. And could you please
- tell us what you meant by that statement, please?
- 12 A. Yes. And I'll use slide 12 to explain. We see a
- long-term trend of decline beginning in 1996 or 1995
- 14 continuing through today. And that is due to, I believe,
- 15 regional carbonate pumping. We have the Order 1169 aquifer
- 16 test. And the Order 1169 aquifer test couldn't recover the
- 17 pre-pumping levels because there's a regional decline. So
- you have to superimpose your recovery on the regional trend.

 So we can't -- You basically -- We don't go above that line.
- 20 And that helps us define that regional trend. So full
- 21 recovery didn't occur and couldn't occur because we have this
- 22 regional decline.
- MR. KING: Thank you.
- 24 HEARING OFFICER FAIRBANK: Bedroc?

Page 1806

- 1 MS. URE: No questions.
- 2 HEARING OFFICER FAIRBANK: Seeing no questions,
- 3 then we'll go ahead and open it up to Division of Water
- 4 Resources staff and the State Engineer.
 - EXAMINATION
- 6 By Mr. Sullivan:

5

- 7 Q. Regarding some of the uncertainties about bypass
- 8 flow and the potential for capturing that versus the effect
- 9 on the Muddy River Springs area, how important do you think
- 10 it is to know exactly the amount and the location of this
- subsurface that started out in the Lower White River Flow
- 12 System for the State Engineer to effectively manage the LWRFS
- 13 over time?
- 14 A. Well, I don't think it's important, and that is
- in part fortuitous, because I don't think one will ever know
- the amount or the location. It's just simply -- The studies
- 17 that would be required would be prohibitive. I don't think
- 18 we'll ever know.
- We may know that some occurs if with more time we see that capture is not at one to one. It's just something
- that we could observe. And in that case we could just simply
- 22 say it looks like we're capturing something else. The
- evidence I think currently supports that. But I wouldn't
- 24 go -- go too far afield with it. I just think that would

Min-U-Script®

24 A. Hello.

Capitol Reporters 775-882-5322

(24) Pages 1805 - 1808

Page 1809

- 1 be -- we need to be certain, and particularly in this flow
- 2 system where we're already right at the limit of what we
- 3 think, you know, we can pump just based on the Warm Springs
- 4 West.
- 5 MR. SULLIVAN: Okay.
- 6 EXAMINATION
- 7 By Ms. Barnes:
- 8 Q. Michelle Barnes for the record. On slide 18 you
- 9 show a figure with I believe the Division 4 Climate. And I
- 10 had a question for you. In your opinion and experience do
- 11 you think it's better to identify impacts of climate and
- 12 precip using the annual totals or, you know, intensity and
- duration of specific storms, understanding we have data
- 14 limitations with that?
- 15 A. We've had evidence presented in previous hearings
- and in this hearing a little bit about that very issue. And
- there's been, I think, good evidence presented that a winter
- 18 season precipitation may be a better indicator than annual
- 19 precipitation just in terms of the observed effect on water
- 20 levels.
- MS. BARNES: Thank you.
- HEARING OFFICER FAIRBANK: Ms. Cooper.
- 23 ///
- 24 ///

- 1 determinations. But we've also seen hydrographs that other
- 2 scales saw. So I'm actually using that knowledge to make
- 3 this description. So we have Coyote Spring Valley. I think
- 4 we see a continued decline in water levels.
- 5 The next panel down is EH-4. We've had that
- 6 discussion. Hard to see a decline over the last few years.
- 7 The next one is TH-2. TH-2 compares so closely
- 8 with EH-4 that it's scary. I don't know that I see a decline
- 9 in the last few years at TH-2. But I think we have looked at other California Wash levels and we still see that decline.
 - The next one down that's Garnet Valley. I don't
- think there's any question that we see a continued decline there.
- And the last one at the very bottom, that's
- 15 BM-DL-2. I actually had it in my presentation, BM-DL-2 and
- 16 EH-4 hydrograph on the same figure. And one can really see
- 17 they separate after the Order 1169 aquifer test where BM-DL-2
- 18 is continuing to decline. Even if you don't see it that well
- 19 here, when you place this hydrograph, BM-DL-2, on top of
- 20 EH-4, you can really see that they separate after the test.
- 21 And it's still declining.
- 22 Q. So follow up to the same question, GV-1 and
- 23 BM-DL-2 still declining, what is your opinion on the reason
- 24 for that?

11

Page 1810

Page 1812

- 1 EXAMINATION
- 2 By Ms. Cooper:
- 3 Q. Hi. Christi Cooper for the record. Mr. Felling,
- 4 I have a couple of questions, please. On slide four of your
- 5 presentation, you overlaid what you agree with as evidence
- 6 for the Kane Springs range front fault. Is that true?
- 7 A. That's correct.
- 8 Q. Sorry. I didn't hear the response.
- 9 A. Yes.
- 10 Q. Okay. Thank you. What is your opinion on the
- 11 so-called highway fault?
- 12 A. I'll just have to say that I didn't really
- research it, so I really don't have an opinion.
- 14 Q. Okay. So going to slide 31, please. You say in
- 15 your presentation that water levels in general in the Lower
- White River Flow System have continued to decline in most
- 17 areas. Could you just walk me through these five hydrographs
- 18 to tell me your opinion on each one and what you think?
- 19 A. Well, I can't read my slide, so I'll have to look
- 20 up here. And, as I recall, the upper -- the upper hydrograph
- 21 I believe is Coyote Spring Valley. And I just look at the
- 22 last four years since the recovery of the Order 1169 aquifer
- 23 test. And I think that there is a decline there. From this
- 24 figure, the scale is really not good for making these small

- 1 A. I think that water levels are declining
- 2 everywhere because of groundwater pumping.
- 3 Q. Carbonate and alluvial pumping?
- 4 A. I don't think that alluvial pumping is having any
- 5 effect on the carbonate aquifer, at least not in the Muddy
- 6 River Springs area. I think that Coyote Spring Valley it
- 7 could be a little more complicated.
- 8 Q. Okay. My last question kind of going and tying
- 9 all of this in, so in your report you talk about this
- 10 carbonate pumping rate of seven to 8,000, maybe you mentioned
- 11 differently in your presentation, but something similar to
- that. Do you have an opinion on your -- the total alluvial
- and carbonate pumping that should -- that should be nearly
- 14 steady state as you would say?
- 15 A. Well, in terms of pumping from the alluvium in
- 16 the Muddy River Springs area, evidence is that that pumping
- 17 doesn't affect the Muddy River Springs but it does affect the
- 18 Muddy River. And the evidence is also very clear that it
- 19 captures river flow. And to the extent of, you know, how
- 20 much you can pump, I think you could pump as much as you're
- 21 prepared to mitigate. I think mitigation ultimately is
- 22 necessary.

775-882-5322

- 23 Q. Well, like, the 9,000 in the order from, total,
- the Lower White River from 2017, do you believe that the

Min-U-Script® Capitol Reporters

(25) Pages 1809 - 1812

Page 1813

- total number needs to be drastically lower than that?
- 2 A. I'm sorry. I didn't really understand that
- 3 question.
- 4 Q. So in the Order 1303 there's the appendix table
- 5 that shows in 2017 there was a little over 9,000 total
- 6 acre-feet --
- 7 A. Yes.
- 8 Q. -- of pumpage in the Lower White River. So would
- 9 your number total be drastically lower than that or is
- that -- is that number okay at this point?
- 11 A. Well, there's two areas pumped. So, again, the
- 12 pumping is from the alluvium. It shows -- conflicts in very
- short order with senior certificated rights. And to the
- extent that that conflicts with those rights, ultimately I
- think it may need to be mitigated.
- 16 Carbonate pumping also will need to be mitigated
- to the extent of that conflict. Like I said, I don't think
- 18 you can pump anything without basically capturing river flow.
- 19 So, to the extent that there is that conflict, it would need
- 20 to be mitigated.
- I think ultimately the amount of water that can
- be pumped isn't so much a function of conflict. It's a
- 23 function of what effect will it have on habitat of the Moapa
- 24 dace. So to that extent I don't know. I don't think we have

CROSS-EXAMINATION

- 2 By Mr. Taggart:
- 3 Q. I just want to pick up on what's on the screen,
- 4 Figure 5-5. You were asked about Garnet. And that was
- 5 compared to Muddy River Springs area. There is a
- 6 significantly different pumping stress in those basins in
- 7 recent years, specifically in Garnet. There's continuing to
- 8 be pumping for power generation whereas in Muddy River
- 9 Springs area there's been a considerable decrease in pumping;
- 10 right?

1

- 11 A. Well, as I recall, pumping in the Muddy River
- 12 Springs area decreased last year. That's carbonate pumping.
- And I'm not -- I'm addressing alluvial pumping. But in
- 14 Garnet Valley I think the number has been -- it's bounced
- around a little bit. But I think it's been fairly steady the
- 16 last few years or several years. There was an increase maybe
- 17 four years ago. But since then I think it's been relatively
- 18 steady.
- 19 Q. Okay. And in your report you make a statement
- that picks up on some of the things that were just being
- 21 discussed. This is on page eight. And it has to do with
- depletions of the Muddy River. It says a depletion of the
- 23 Muddy River with this amount of pumping, and it's reflecting
- 24 the seven to 8,000 acre-feet of carbonate pumping that you

Page 1814

Page 1816

- 1 that number yet. We have an estimate from SNWA that's it's
- 2 four to 6,000. We have my evidence that suggests it might be
- 3 a bit more. And I think we need to observe the system longer
- 4 and try to make the right call.
- 5 MS. COOPER: Thank you. That's all.
- 6 HEARING OFFICER FAIRBANK: Okay. We have a
- 7 little bit of time for recross. Coyote Springs Investment,
- 8 do you have any recross? Seeing no.
- 9 US Fish and Wildlife Service? Seeing none.
- National Park Service? None.
- Moapa Band? None.
- Southern Nevada Water Authority, Las Vegas Valley
- 13 Water District?
- MR. TAGGART: One.
- 15 HEARING OFFICER FAIRBANK: That's it. You get
- 16 one.
- MR. TAGGART: Did I just say that? How will I
- build this in to one question?
- 19 HEARING OFFICER FAIRBANK: To be fair, I'll give
- 20 you four minutes.
- MR. TAGGART: I don't think I'll need that much
- 22 time.
- 23 ///
- 24 ///

- 1 just talked about. The depletion of the Muddy River with
- 2 this amount of pumping appears to be on the order of 2300 to
- 3 3750 acre-feet and is not increasing. And my question is,
- 4 one, is that -- would you agree with me that that value is,
- 5 even if at steady state, that would be a consistent impact or
- 6 conflict with water rights on the Muddy River and that it has
- 7 to be mitigated?
- 8 A. I do agree.
- 9 MR. TAGGART: All right. Thank you.
- 10 HEARING OFFICER FAIRBANK: Moapa Valley Water
- 11 District? Seeing no questions.
- Lincoln County, Vidler? No further questions.
- 13 City of North Las Vegas?
- MS. URE: No questions.
- 15 HEARING OFFICER FAIRBANK: Center for Biological
- 16 Diversity? No questions.
- Georgia Pacific Republic? No further questions.
- Nevada Cogeneration Associates? Seeing no
- 19 questions.
- 20 Muddy Valley Irrigation Company? No questions.
- 21 And Bedroc?
- MS. URE: No questions.
- HEARING OFFICER FAIRBANK: No questions, okay.
- And then I'll just open it back up to Division of Water

Resources and staff. 1

EXAMINATION 2

By Mr. Sullivan: 3

Q. You mentioned in your testimony about using EH-4

- as a trigger and the possibility that it's, in a sense, too
- late to use that as a trigger because it's too close to the 6
- 7 area to be protected. But looking at the hydrographs and the
- close hydraulic connectivity throughout the region, there 8
- is -- EH-4 is no closer in a sense than, say, TH-2 or some 9
- other sites. So do you have any more thoughts on that 10
- comment to elaborate on the effective triggers? 11
- A. So I think that EH-4 or Warm Springs West flow 12
- 13 and the trigger at 3.2 would still work under the current
- pumping regime whether -- I think all the wells that we 14
- 15 currently pump from they were in areas that had an immediate
- effect or impact seen from the Order 1169 pumping test. And 16
- 17 I think the reverse is also true. That pumping affects the
- Muddy River Springs area in a relatively and equal amount of 18 19
- That said, I think that pumping in less 20
- well-connected areas, it might be appropriate to have 21
- triggers that are wells that measure water levels that are 22
- between Warm Springs West and where those pumping centers 23
- 24 might be so that you then do have an advanced warning instead

- of the solver used by and replied upon by the Division of
 - Water Resources and the State Engineer in Ruling 6165 through 2
 - 6167. This exhibit serves to replace Nevada State Engineer 3
 - Exhibit 222, which we've removed, as that was an earlier
 - version of the Excel solver but it was not the actual solver
 - utilized by the Division of Water Resources in making those 6
 - 7 decisions relating to those particular rulings.

Additionally, the sign-in sheets from these 8

proceedings for the last ten days will be marked as Nevada State Engineer Exhibits 336 through 346, which will include today's sign-in sheet from Las Vegas.

And then also all the presentations, all the power point presentations that were provided as demonstrative exhibits, will be on line in the State Engineer's website at water dot NV dot gov under the news tab. And then there under the Lower White River Flow System tab. And then it will be contained within the folder Order 1303 hearing documents.

And, finally, there were requests that, by the Southern Nevada Water Authority and Las Vegas Valley Water District, that were joined by the Coyote Springs Investments participants and the Nevada Energy seeking permission for the State Engineer to entertain written closing statements and proposed orders.

Page 1818

- of waiting until the effects are seen at Warm Springs West,
- at which time turning off the wells may not have an immediate 2
- effect and those effects might be delayed for some period of 3
- time. 4

8

- So that you want to put your -- you want to put 5
- your trigger level or your monitoring point somewhere between 6
- 7 that pumping in Warm Springs. Did that answer your question?
 - MR. SULLIVAN: Yes. Thank you.
- 9 HEARING OFFICER FAIRBANK: Okay. We'll go ahead
- and open it up for redirect if there's any further. So no 10
- further redirect. 11

Min-U-Script®

- All right. Well, then we will go ahead and 12
- conclude the taking of presentation and information from the 13
- participants in these proceedings. And so we'll go ahead and
- address a few administrative matters. 15
- First, we -- And one of those administrative 16
- matter is, Mr. Felling, you were proffered as an expert, 17
- without objection. And so on that basis you've been 18
- qualified as an expert in these proceedings. And so that 19
- 20 qualification will be limited to these proceedings based upon
- the fact that there was no objection. 21
- So we also want to address that there is a new 22
- exhibit, Nevada State Engineer Exhibit 335, which is an Excel 23
 - solver for the White River Flow System. That was the version

- So the State Engineer will accept written closing 1 statements, not to exceed 20 pages, from the participants. 2
- And the State Engineer will further accept written public
- 4 comment from members of the public whom have not participated
- in these proceedings. And any closing statement or written 5
- public comment must be received by the State Engineer by the 6
- 7 close of business or 5:00 p.m. on Monday, November 4th, 2019.
- So that's essentially 30 days from today. The State Engineer 8 9 is got going to solicit or accept proposed draft orders.

MR. HERREMA: Thank you. One question on that. Do we know when the transcripts will be final?

HEARING OFFICER FAIRBANK: I anticipate the transcripts will be final -- I don't have a final question or final answer to that question, but I estimate that they should be available within the next couple of weeks. And it sounds like it might be as soon as the end of next week.

MR. HERREMA: Thank you. 17

MR. TAGGART: Would the State Engineer be willing to consider at all 60 days? We have an argument in Ely of the groundwater project on the 15th of November that we're going to be spending a lot of time getting ready for. And so I would just like to make that request.

HEARING OFFICER FAIRBANK: That will be fine. We'll be similarly-situated. We're not going to be writing

24

Capitol Reporters 775-882-5322

(27) Pages 1817 - 1820

Page 1821 anything. 1 MR. DONNELLY: Did you say there's archive video 2 available that I can look up? 3 HEARING OFFICER FAIRBANK: Yes. So the video 4 archives from these proceedings are also available on that 5 same folder where the power point presentations will be 6 7 located. So that's the LWRFS tab under the news tab in the Order 1303 hearing documents folder. And that document is 8 titled LWRFS recording links. And it's a PDF document. And 9 then imbedded in the PDF document are hyperlinks to the video 10 recordings. 11 And 60 days. So that will extend the time for 12 the submission of the written closing statements to December 13 3rd. So close of business on December 3rd. And we'll do 14 15 that for both written public comment as well as those written closing statements. 16 And so, finally, before we conclude this 17 proceeding, we will go ahead and open it to public comment. 18 Ask we'll start by asking Ms. Christi Cooper in Las Vegas if 19 there is anyone present in Las Vegas for public comment. 20

MS. COOPER: There is no one present.

anybody jumping up for such.

HEARING OFFICER FAIRBANK: Is there anyone

present in Carson City for public comment? Not seeing

RE: 9/23/2019 – 10/3/2019 NDWR Hearing Transcript Corrections

To Whom it May Concern:

Our office represents the City of North Las Vegas ("City") in the matter currently before Nevada Division of Water Resources and titled In the Matter of the Administration and Management of the Lower White River Flow System Within Coyote Spring Valley Hydrographic Basin (210), a Portion of Black Mountains Area Hydrographic Basin (215), Garnet Valley Hydrographic Basin (216), Hidden Valley Hydrographic Basin (217), California Wash Hydrographic Basin (218), and Muddy River Springs Area (AKA Upper Moapa Valley Hydrographic Basin (219)).

A hearing was held by the Nevada Division of Water Resources from September 23, 2019 through October 4, 2019 to which your office provided transcription services. Our client's expert, Dwight Smith's testimony was taken on October 1, 2019. Mr. Smith offers corrections to the transcript relating to his testimony as outlined in Attachment A.

If you have any questions, please contact our office at (775) 786-8800.

Very truly yours, SCHROEDER LAW OFFICES, P.C.

mm he

Therese A. Ure
