1 CARSON CITY, NEVADA, MONDAY, SEPTEMBER 23, 2019, A.M. SESSION

2 -000-

3

4 HEARING OFFICER FAIRBANK: Let's go ahead and go

- 5 on the record. Good morning. So this is the time and place
 6 set for the hearing in the matter of Lower White River Flow
 7 System in the Order 1303 proceedings.
- 8 My name is Micheline Fairbank, I will be the
- 9 hearing officer today. And with me is the staff from the
- 10 Division of Water Resources. We have Tim Wilson, acting State
- 11 Engineer. We have Adam Sullivan, Deputy State Engineer. Levi
- 12 Kryder who is our chief of our hydrology section. Jon
- 13 Benedict who is one of our hydrologists. Christi Cooper who's
- 14 staffed out of our Las Vegas office who's a geologist and
- 15 familiar with and works quite extensively in the Lower White
- 16 River Flow System area.
- 17 With me also is Melissa Flatly who is the chief
- 18 of our hearing section. Michelle Barnes, the supervising
- 19 professional engineer of our hearing section. And
- 20 Bridget Bliss who is the basin engineer for the Lower White
- 21 River Flow System basins.
- Just as a couple preliminary remarks. I wish to
- 23 go ahead and remind everyone that this proceeding is for the
- 24 express purpose of providing the State Engineer a concise

- SION 1 is not for an adversarial or contested proceeding, it's to
 - 2 provide the State Engineer a robust record in which to analyze
 - 3 all of the data and conclusions that are being provided to our
 - 4 office.
 - 5 Cross-examination this afternoon will be limited
 - 6 to 14 minutes for the participants and we will have an audible
 - 7 alarm at the end of that time period. We're going to go ahead
 - 8 and take two breaks today, the first one will be about two
 - 9 hours in around 10:30 and then we'll take another ten-minute 10 break this afternoon.
 - 11 Additionally, time left this afternoon after
 - 12 those -- the participants are provided their time for
 - 13 questioning will be reserved for the State Engineer and his
 - 14 staff to ask questions.
 - And if there's additional time remaining at the
 - 16 end of the day before we have to conclude at 4:30, then we may
 - 17 open that up for additional questions by participants and
 - 18 cross-examination. But we do have to conclude at 4:30. We
 - 19 have to be -- everyone has to be out of the legislative 20 building no later than 5:00 today and that's pursuant to LCB's
 - 21 requirements.
 - 22 Additionally, if you plan on leaving documents or
 - 23 materials in the office at the conclusion of -- excuse me, in
 - 24 the hearing room the conclusion today, if there's anything

Page 6

Page 8

- 1 summary of the salient conclusions set forth in the Order 1303
- 2 reports and rebuttal reports and to direct our office to the
- 3 evidence and analysis that is supportive of that testimony.
- 4 I want to just reiterate, and we've been trying
- 5 to make this clear, that this is not a contested or
- 6 adversarial proceeding. The scope of this proceeding is for
- 7 the limited purpose of addressing those four issues plus the
- 8 fifth.
- 9 And while that fifth issue is we're on it is not
- 10 intended to expand the scope of this hearing into making
- 11 policy determinations with respect to management of the Lower
- 12 White River Flow System basin's individual water rights, those
- 13 different types of things, because those are going to be
- 14 decisions that would have to be made in subsequent proceedings
- 15 should they be necessary.
- Additionally, just to go ahead and provide some
- 17 procedural matters. This morning we'll be starting with
- 18 Coyote Springs Investments, they were going to have half of
- 19 the time today and today we have a total of about seven hours.
- So they're going to have approximately three and
- 21 a half hours today to go through all of the presentation of
- 22 the conclusions and reports and evidence on behalf of CSI as
- 23 well as for cross-examination.
- And again the opportunity for cross-examination

- 1 that you -- is confidential or is something that you don't
- 2 want to have publicly accessible you will need to take that
- 3 with you. While the room is locked up there's no guarantee of
- 4 security or anything of that nature.
- 5 Let's see, finally, when it comes to the
- 6 cross-examination of the witnesses, I just want to go ahead
- 7 and just make it very clear, the expectation on behalf of the
- 8 State Engineer and staff is that the witnesses are being
- 9 responsive and courteous to the time during those that are
- 10 cross-examining.
- We understand that this is a limited time period
- 12 and so we want to have -- we are going to conduct this hearing
- 13 in a manner to allow a fair opportunity for individuals to ask
- 14 questions of witnesses.
- And if there's any perceived effort to stall or
- 16 to draw out the time of a cross-examining party, then we're
- 17 going to go ahead and address those matters. Because those --
- 18 this is intended to be a fair opportunity and really the focus
- 19 of this is to provide the State Engineer with the most
- 20 comprehensive evaluation of the data.
- Also as a reminder, the proceedings are available
- 22 to be viewed on the internet via the legislative website. And
- 23 we also have it being cast down to the Las Vegas legislative
- 24 offices as well.

Min-U-Script® Capitol Reporters (2) Pages 5 - 8
775-882-5322

Page 9

- And so with that being said, we'll probably go a 1
- 2 little bit about maybe five minutes into the lunch hour so we
- may take a little less than 60 minutes for lunch today just
- because I want to make sure CSI has their full time. And I'm
- going to go ahead and open up to Coyote Springs Investments
- for the presentation of their case. Thank you.
- MR. HERREMA: Good morning, my name is
- Brad Herrema, I'm counsel for Coyote Springs Investment. As a
- logistical -- in terms of logistics, to begin with, we'd like
- to reserve 30 minutes for redirect and so we'll plan to make
- our presentation this morning in three hours. 11
- In terms of the presentation, we have two 12
- different pieces, the first is a presentation on the 13
- conclusions that were in the initial CSI report filed in July
- and the second is the presentation on the conclusions in the 15
- rebuttal report that was filed in August. 16
- 17 We think that the first part should take about
- two hours and the second part one hour. And maybe that will 18
- align with our break schedule as well. 19
- So I want to first thank the State Engineer for 20
- the opportunity to have the authors of CSI's reports here
- today to be able to highlight the salient conclusions of their
- responses to the Order 1303 questions.
- The panel will explain the conceptual model of 24

- 1 Springs Valley. And that local recharge from the sheep range
- 2 is contained west of the carbonate block which limits its
- 3 contribution to the Muddy River Springs area.
- 4 The panel members will also summarize their
- observations regarding the reports and information submitted
- by other stakeholders.
- 7 And finally, the panel members are here to answer
- 8 all of your questions to ensure that you fully understand
- their findings and observations.
- So with that, I'd like to have our panelists 10
- 11 please introduce themselves by stating and spelling their
- 12 names for the record.
- 13 MR. REICH: Good morning, my name is
- 14 Stephen Reich, last name is R-E-I-C-H. I'm a principal with
- Stetson Engineers and I'm a registered engineer and
- professional geologist in the state of California.
- 17 MS. MORAN: Good morning, my name is Jean Moran,
- J-E-A-N, last name M-O-R-A-N. I am a hydrogeologist with
- 19 Stetson Engineers, a senior hydrogeologist with many years of
- 20 experience. I'm here to test -- to support the testimony
- 21 today.
- 22 MR. CARLSON: Yes. My name is Norman Carlson,
- 23 spelled C-A-R-L-S-O-N. And I'm chief geophysicist at Zonge
- 24 International. We have offices down in Tucson and up here in

Page 10

Page 12

- 1 the Lower White River Flow System and the work that's been
- done this year to assist the State Engineer in understanding
- 3 the system, including new study regarding geology creating
- 4 flow paths within the system and focused analysis of recharge
- in the Coyote Springs area.
- The panel will highlight those salient 6
- conclusions of their answers to the State Engineer's four 1303
- questions, including that the State Engineer's Order 1303
- boundary for the flow system may be used so long as there is
- accounting for resources in the Lower Moapa Valley. 10
- That in reviewing the Order 1169 test data, that 11
- data demonstrates the climatic conditions dominate the water
- level signature and carbonate wells and geologic structures
- ontrol the occurrence of movement of water within the system.
- That there's roughly 12,000-acre-feet per year of 15
- evapotranspiration and 19,700-acre-feet per year of subsurface 16
- outflow from the Lower White River Flow System. 17
- That new calculations estimate 5,280-acre-feet 18
- per year of local recharge from the sheep range within the
- 20 Coyote Springs Valley. That the impacts of pumping within the
- 21 flow system are dependent on their location.
- That the faults identified in 2017 and confirmed 22
- by work done in April of this year define a structural block
- 24 that creates western and eastern compartments in the Coyote

- 1 Reno. Or in Reno further up. And I'm here to testify on the
- 2 geophysical survey that was done in April of 2019.
- MS. PALMER: My name is Molly Palmer, M-O-L-L-Y, 3
- 4 P-A-L-M-E-R. I'm a registered civil engineer and I'm a senior
- 5 engineer with Stetson Engineers.
- DIRECT EXAMINATION 6
- MR. HERREMA: Thank you. Mr. Reich, just as a 7
- 8 matter of housekeeping, are you familiar with the document
- 9 labeled as CSI Exhibit Number 1, which has been in shorthand
- labeled CSI July 3, 2019 Order 1303 report?
- ANSWERS BY MR. REICH: 11
- 12 A. Yes, I am.
- Q. Did you prepare that report or was that report
- prepared at your direction?
- 15 A. The report was repaired at my direction with
- members from my team Stetson Engineers and working with Zonge 16
- 17 International.
- Q. And is that report a true and correct summary of 18
- your conclusions regarding the State Engineer's five questions 19
- 20 for this hearing?
- 21 A. Yes, it is.
- Q. Are you familiar with the document that's been 22
- marked as CSI Exhibit 2 and the shorthand reference to that 23
- document as August 16, 2019 rebuttal report? 24

Page 13

- 1 A. Yes, I am.
- Q. Did you prepare that report or was that report 2
- prepared at your direction? 3
- A. The report was prepared at my direction with
- members of the same team.
- MR. TAGGART: Madam Hearing Officer, 6
- Paul Taggart, Southern Nevada Water Authority. Have the
- witnesses been sworn in? 8
- HEARING OFFICER FAIRBANK: They have not. We 9
- should probably do that. Thank you, Mr. Taggart. 10
- 11 (Witness panel sworn.)
- MR. HERREMA: Does that cover the questions we've 12
- already answered or do we need to go back? 13
- HEARING OFFICER FAIRBANK: I think we're good. 14
- 15 Thank you.
- MR. HERREMA: Okay. Thank you. 16
- 17 I think you were indicating, Mr. Reich, that you
- did prepare the rebuttal report or it was prepared at your 18
- direction? 19
- ANSWERS BY MR. REICH: 20
- A. Yes, I did. It was -- it was -- we prepared it 21
- as a team, so we prepared it together with the same members of
- the July 3rd report. 23
- 24 Q. And is the rebuttal report a true and correct

- was actually in the wildlife refuge with also members of the 1
- Fish and Wildlife Service. So we've been able to perform 2
- field investigations of the area to help form some of our
- 4 opinions.
- Q. And following that -- that work you prepared the 5
- reports, Exhibits 1 and 2; is that correct?
 - 7 A. Yes. In -- we then prepared our July 3rd report
- which was in response to the -- the four questions issued in
- Order 1303 in order to help provide information to the State 9
- Engineer and his staff that -- that provides understanding of 10
- a conceptual model, you know, really one of our -- our goals 11
- was to -- to be able to provide scientific and technical 12
- 13 information to help -- help others really form an opinion on
- how water occurs and moves through the basin. 14
- 15 So that was presented in our July 3rd report.
- And then continuing we then prepared the August 16th report as 16
- 17 a rebuttal report to the other -- other reports that were
- issued by the other parties in the July 3rd report. 18
- 19 Q. Mr. Reich, did you also prepare a document that
- was submitted to the -- it's labeled as CSI Exhibit Number 4,
- June 13, 2019 submittal of May 31, 2019 technical report and 21
- large lot, Village A map? 22
- A. Yes. We prepared that report in May of 2019 in 23
- 24 order to -- that was kind of the beginning -- our initial

Page 14

Page 16

- summary of the team's conclusions regarding the -- the report
- submitted by the other parties and their conclusions to the 2
- State Engineer's five questions for this hearing?
- A. Yes, it is. 4
- Q. All right. Thank you. 5
- Turning your attention to slide number 1, which 6
- is shown up on the screen. Mr. Reich, can you please explain 7
- what you were tasked to do in this case? 8
- 9 A. Yes. Stetson was originally hired in early 2018
- to look at the results from the Order 6255 and the Order 1169 10
- pumping tests and then to assess the results of that and then 11
- investigate more into the geology and the occurrence of 12
- movement of groundwater in the Lower White River Flow System. 13
- We then proceeded to participate in some of the
- public meetings that took place in 2018 and I believe early 15
- 2019 and as well as perform geologic investigations in the 16
- field itself. 17

21

- We went out and we visited -- we visited, we did 18
- some geologic mapping along some of the faults and formations 19
- 20 that exist out there. We visited monitoring wells and
- production wells throughout the area. And -- and also drove through many of the different basins that comprise of the 22
- Order 1303 administrative basin. 23
- One of the field trips we met earlier this year 24

- 1 presentation of our conceptual model. So to look at the
- availability of water in the Coyote Spring Valley, you know, 2
- that was -- that was the initial report that where we 3
- introduced a lot of the understanding that we have of the 4
- scientific information that we've assessed over the years --5
- over the -- over the last couple of years. 6
- So that -- that report was -- is -- I believe 7
- that was May 31st; correct, of this year?
- Q. Yes, May of this year.
- 10 A. May of this year, yes.
- 11 Q. If you could switch to slide 2. Mr. Reich, could
- you please describe what the panelists are going to present to 12
- us today? 13
- A. Yeah, you know, we're also very appreciative of 14
- the opportunity to present the findings to the panel. We've 15
- really been able to, you know, get together I think with a lot 16
- of great resources that -- that have been able to form these 17 18
 - opinions.
- And so we're going to kind of walk through in a 19 20 step wise fashion kind of the logic which has helped develop
- our opinion, we want to present that to you today. 21 You know, some of the issues -- and not 22
- necessarily issues, but some of the factors that we really 23
- come to understand is presented in this outline. And that's 24

Min-U-Script® (4) Pages 13 - 16 Capitol Reporters 775-882-5322

20

21

22

23

24

8

really -- you know, starting with the basic understanding of
the geology and the geologic structure of the area and how
that affects the occurrence of movement of water.

You know, we -- we really took the order very seriously and -- and we went out and looked for new data. So that's when we worked with Zonge International to go out and do geophysical investigation. That geophysical investigation that we'll discuss is -- is -- has really provided a lot of information that allows us to confirm some of the other data that's been presented by others.

So, you know, I think a lot of the folks that are more technically based have heard about Page and other geologists who have really been working in the area over the last 20 or 30 years that have formed geologic maps or cross sections.

So -- so as we talk about how structure controls the occurrence of movement and water, it's really important for us to go out there and to perform this geophysical analysis. So we're going to talk about that. And then how that moves into the movement of water.

Again, some of the things that we're going to
talk about are the heterogeneity of the aquifer, how the
structures affect that aquifer and then move into climate and
a little bit about how the climatic signature is seen and how

1 the geologic units and the extent of the -- of the regional

2 aquifer, carbonate aquifer in eastern Nevada and for -- for,

3 you know, for purposes of today I've identified where Ely is

4 up in the north. And you can see the boundary starting from

5 Ely coming down towards Lake Mead and the area.

That's the -- we call that the modified Colorado

7 River Basin. We -- we relied on the State Engineer's

8 description and list of basins and his basin identification

9 map. And those would have been concluded, Cave and Dry Lake 10 in that -- in that lower -- or in that Colorado River basin as

11 defined by the State Engineer.

We also wanted to show you where -- where the White River Flow System is. So again, you know, we're today talking about Order 1303 administrative basin. And what we're looking at here, you can see the boundary within the screen a little bit better.

What that boundary is of the entire Lower White River -- of the White River Flow System. And then finally, on top of this we want to show you of course where we are today and what we're going to really focus our discussion on.

You know, it's important for me to show you this because these are the -- these are the units, this is the area. And every -- I think that we need to look at the large conceptual picture of the entire carbonate aquifer so that we

Page 18

Page 20

- 1 that's a common feature in a lot of the groundwater levels.
- 2 So we're going to go through. And I know a lot of the staff,
- 3 a lot of us have all looked at these groundwater levels for
- 4 many years.

4

6

8

9

10 11

12 13

14 15

- 5 But, you know -- and I think germane to this
- 6 hearing today is what -- what have we learned since the end of
- 7 the Order 1169 tests? What have we learned since -- since the
- 8 reports were submitted in June of 2013?
- 9 So we're going to talk about that. And then we 10 want to wrap that up into a conceptual model. So in order to
- -- to really provide the -- the State Engineer with the
- information he needs to make decisions.
- We want to wrap that into the conceptual models
- 14 and the groundwater budget and then -- and then summarize our
- 15 conclusions. So that's kind of a short overview of what we'd
- 16 like to talk about today.
- 17 Q. If we could turn to slide 3. Mr. Reich, can you
- 18 describe what we're looking at in slide 3, please?
- 19 A. Yeah, slide 3, and hopefully it comes out better
- 20 on your screen than it does on the projector, but, you know,
- 21 what this is, a lot of the work that we based was -- was from
- |22 a rally in 2017.
- And we talk about that a lot in our report, but
- 24 what I really wanted to do was to -- to use this slide to show

- 1 can talk specifically about what we're going to address today,
- 2 and that's that flow in the middle of the White River Flow
- 3 System.
- 4 So together we can see that, you know, that we
- 5 have different boundaries and different extents that we're
- 6 going to talk about. We're also going to focus in too on --
- 7 as you can see I've identified this cross section EE.
 - So as we go through today the cross section EE,
- 9 which was -- or EE prime, I should be more exact, is -- is
- 10 information that was published by Rowley again in 2017, which
- also sets up some of the understanding and ideas of structure
- in the area.
- 13 Q. Mr. Reich, you've been talking about a series of
- slides labelled slides 3, 4, 5 and 6; is that correct?
- 15 A. That's correct. I -- 6 is the summary of all the
- 16 different basin boundaries -- or slide 6 is a summary of all
- the different basin boundaries that we put together.
- 18 Q. If you could advance to slide 7?
- 19 A. So slide 7 is a blowup of the Lower White River
- 20 Flow System. And if you look on your -- if you look on your
- 21 screen you can see that I've really -- we've generalized it,
- there's different units and there's different ages of
- 23 formations.
 - And what's important in here that we wanted to

Min-U-Script® Capitol Reporters (5) Pages 17 - 20 775-882-5322

24

Page 21

- point out was the -- the carbonate aquifer and the carbonate 1
- where it outcrops. So this is a surface map. So, you know, 2
- when we look -- if you look across that cross section EE you 3
- can see on the left that blue section along the top, that's --4
- that's a sheep range, and we're going to talk a little bit 5
- more about that today. 6
- 7 So the sheep range is a -- is a carbonate
- aquifer. The basin fill material is that yellow. There's 8
- volcanic formations that we talk about that are located
- further in the north, that's represented by the pink. 10
- 11 And then, you know, there's some older
- sedimentary, you know, plastic rocks that are shown in brown, 12
- which are down closer towards the -- the downgradient portion 13
- of the Lower White River System Flow System down towards the 14
- 15 Lower Moapa.
- Q. If you could advance to slide 8. Mr. Reich, what 16
- 17 are we looking at here?
- A. Well, slide 8, I -- I mentioned earlier before 18
- there was that cross section of E -- of EE prime that was 19
- presented by Rowley. So the purpose of presenting this cross 20
- section is to -- is to give an understanding of some of the 21
- different both faults and structure that exist within the 22
- Lower White River Flow System, specifically associated with 23
- that EE prime cross section. 24

- how you move across cross section EE prime, the relationship
- between the different geologic lithologic units and the
- faulting, so...

9

- 4 Q. If we could advance to slide 9, what does this
- show us, Mr. Reich?
- A. Well, you know, I keep talking about this idea of
- a -- of a conceptual model. And -- and when -- when we do
- in-house -- and every basin that we worked on we always tend 8
 - to put -- we always put together a conceptual model.

A conceptual model is important for us to 10

understand, you know, where the water occurs, how does a 11 12 recharge occur, where may there be evapotranspiration,

13 groundwater outflow. So -- so this is -- this is just a

conceptual model, it's our general understanding of where 14

15 we're going to start from in order to talk about, you know,

how we can account for the different flow. 16

17 So -- so as you see in this we have -- we have these different layers, these lithologic units as you go from 18

the bottom to the top. And -- and what those are are really 19 different sequences of carbonates. 20

In general, they're older -- older carbonates on 21

the bottom, you know, and they -- and they move up to younger 22

23 carbonates on the surface.

And they're -- they're -- you know, I always like 24

Page 22

- 1 So if you start on the left near EE you can see
- the sheep range up top. And then as you go across later on 2
- this morning we're going to talk about thrust faults, the 3
- faults that have the -- it's identified there right near the 4
- elbow range, there's a gas peak thrust, we want to talk about 5
- 6 that. 7 And then as we move across there's more types of
- normal -- normal faulting which is associated with extensional 8
- 9 tectonics. So each of these different ideas we're going to --
- we're going to touch on how today in terms of how they affect 10
- the occurrence of movement of water. 11
- What was important to slow on this slide is 12
- really -- I mentioned in our introduction about doing the 13
- geophysics, so where it's labeled as CSAMT, that's a control 14
- source geophysics method that we use to identify some of these faults that were introduced by Rowley. So -- so -- and 16
- others, but they're summarized by Rowley in his report. But again, it's really -- what we wanted to do 18
- was to go out and use these geophysical techniques in order to 19
- 20 identify, you know, A, that they exist and where they existed.
- So -- so again, that's -- those two arrows kind of point to 21
- the extent of our survey. 22

15

17

- Also, we put on this the location of the Muddy 23
- River Springs area to give you an understanding of, you know,

- to go back. I try -- I don't want to get too longwinded on
 - the historical geology section, but I think in terms of why 2
 - 3 we're here today, it's important to understand, you know,
 - those older formations on the bottom are 500 million years 4
 - old, they started 500 millions years ago and a lot of those 5
 - carbonates were deposited during the Paleozoic period. 6
 - And then -- and then after they were deposited we 7
 - had different forms of tectonics that affected those. So we 8
 - 9 had -- we had compressional tectonics that happened, you know,
 - 10 140 million years ago, those compressional tectonics formed
 - thrust faults and thrusts -- we were -- we were pushing --11
 - and, you know, in the basic form we're literally pushing some 12
 - rocks on top of the other and that's where we get some of 13
 - these thrusts faults. 14

15

24

- And that's depicted by the gas peak thrust fault on the left. So -- so that fault itself was more than -- was
- 16 approximately 140 million years ago. 17
- And then as the system -- or as time went on, 18
- what we see today is really a -- a result of the basin and 19
- 20 range extensional tectonics. And so the extensional tectonics 21
- is really what pulled some of these formations apart. And that pull apart of that extensional tectonics created what we 22
- call normal faulting. 23
 - And then normal faulting is identified in this

Page 24

Page 25

- 1 figure. So we have older compressional faults, which is a
- 2 thrust fault. We have newer normal faults, which is an
- 3 extensional environment. And then approximately about 10
- 4 million. So those started about 20 million years ago,
- 5 those -- those extensional and normal faultings.
- And then about 10 million years ago, you know, is
- 7 really -- really the beginning of the formation of the
- 7 Tearry -- Tearry the beginning of the formation of the
- 8 mountains that we see today where they were up -- or they were
- 9 -- they were turned and erosion occurred and the basin flow10 started to occur.
- So -- so that's kind of a, you know, a short,
- very short history of -- of some of the geologic processes
- that have occurred since about 500 million years ago.
- 14 Q. Mr. Reich, you mentioned thrust faults and normal
- 15 faults. Why are these faults important?
- 16 A. Well, you know, we largely relied on a
- 17 description by Rowley, you know, who went through and, you
- 18 know, did kind of a comprehensive analysis on the relationship
- of how these faults are with the occurrence of water.
- So in a -- in a compressional fault or in a
- 21 thrust fault there's a lot of forces that really push -- push
- 22 these different formations together and then they tend to be
- 23 tighter and less permeable.
- In extensional faulting we tend to have a little

- 1 how these faults can help us determine that direction of flow
- 2 and the occurrence of flow in the area.
- 3 Q. Mr. Reich, you've been just now describing a
- 4 slide marked number 10 labeled preferred flow paths along
- 5 exceptional faults; is that correct?
- 6 A. Yes, it is.

14

- 7 Q. Did you see evidence of preferred flow paths
- 8 within -- in wells within the Coyote Springs Valley?
- 9 A. Yeah, we investigated the -- the pump test of
- 10 different wells in Coyote Springs Valley and you can see
- 11 faults -- wells that are located, you know, close to faults
- 12 have a very high production rates where faults by some -- by
- some other wells have lower production rates.
 - We also looked at, you know, changes in water
- 15 levels across those faults and how there may or may not be
- 16 impact, you know, as -- from pumping on one site compared to
- water levels on the other site.
- So there's -- so there's different evidence that
- 19 we've used to, you know, we can -- that we've used to observe
- 20 the impact of those faults.
- 21 Q. You've mentioned a few times that your analysis
- 22 started with the faults that were described by Rowley. What
- 23 did you do to -- to further analyze those faults?
- 24 A. Well, again, it was -- it was important for us in

Page 26

Page 28

- 1 bit more of a pull apart and it creates different zones. We
- 2 create a core zone, and that's depicted by the red here and
- 3 that's a -- kind of a fault. We would get deposits of gouge
- 4 and so forth that's in the center of the fault. And then we
- also get damage zones along the side. So you can imagine, you
 know, we have these extensional forces, things are turning and
- 7 twisting and pulling apart. And then along the sides you can
- 8 get this -- this kind of damage area. And that's depicted by
- 9 the green.
- And according to Rowley what we see is where the
- 11 damage zones are and carbonated records the -- it provides for
- 12 kind of preferred pathways, higher permeabilities along those
- damage areas. And -- and in essence also the -- the flow in a
- 14 perpendicular manner across the fault, that tends to be
- impeded because of the fault gouge that exists along that
- 16 fault.
- So we have both, you know, this kind of preferred
- 18 pathways through this damage zone which tend to see some -- we
- 19 see some of the higher transmissivities and higher values of
- 20 productivities of the wells in these damage zones.
- And then -- and then a perpendicular direction we
- see more of a -- they can act as barriers or they're -- or
- 23 they're, you know, some -- some type of barrier to that flow.
- So it's important to understand, you know, really

- 1 order to provide the information to the State Engineer of how
- 2 we view the conceptual model, the location of these faults
- 3 becomes very important. Not only the location but just the
- 4 existence themselves.
- 5 So in order to verify their extension and their
- 6 location we -- we employed Zonge International to perform a
- 7 geophysical investigation of the area to identify and locate
- 8 those faults. And -- and here today Mr. Norm Carlson who's
- 9 our chief geophysicist has come to help explain that -- the
- 10 survey that was performed.
- 11 O. Good morning, Mr. Carlson.
- 12 ANSWERS BY MR. CARLSON:
- 13 A. Morning.
- 14 Q. If you could advance to slide 11. Mr. Carlson,
- 15 could you please describe for us the geophysical survey that
- you were engaged to run?
- 17 A. Yes, we were -- we were contracted to run a
- 18 resistivity survey called CSAMT. Resistivity information is
- very useful because different materials conduct electricitydifferently.
- So core spaces in a material in a rock affect the
- 22 resistivity. The fluid that's in the core spaces affects it,
- 23 the TDS of the fluid affects it, temperature, these all affect
- 24 the resistivity of the subsurface. By making measurements of

The -- there are a lot of methods you can use to measure resistivity in the subsurface. And the one you choose to use depends on the -- what the surface environment is, how deep you want to see, the background resistivities you might encounter, how much culture there is, are there pipelines, are there power lines?

So all of those affect which resistivity method you use. There are of course other geophysical methods like seismic and gravity, those -- those are measuring different physical properties of the subsurface.

But since groundwater affects the resistivity so much, that's one of the reasons why we use resistivity methods in both the vast majority of our groundwater work.

The CSAMT stands for controlled source audiofrequency megnetotellurics, which is why you never see that written out. You see CSAMT. The CS -- well, CSAMT is kind of a subset of -- of a method called magnetotellurics.

And the idea there is that you measure an electric field on the ground and you measure the magnetic field on the ground at the same location. And if you do this at different frequencies you can calculate a resistivity at different depths.

give you a kind of a physical layout of everything. In the 1 upper right is -- it's labeled transmitter source. What we do 2 is lay out a long insulated wire on the ground. It might be 4 4,000 or 5,000 feet long, just -- just literally laying on the ground. And then it's grounded HN with a bunch of metal stakes or metal plates so it has good electrical contact with 6

We transmit an alternating current into that. To get deep data we transmit it at a lower frequency, say about one hertz so it's changing polarity once every second. And for the shallow information we go to high frequency. And that -- for these surveys it was 8,192 hertz. So it's alternating polarity 8,192 times per second.

So we measure a whole suite of frequencies and then use that to calculate a resistivity at all these different depths.

Q. If we could advance to slide 12. Mr. Carlson, is 17 this type of geophysical survey accepted by the scientific 18 community as a valid tool to map the subsurface? 19

A. Yes. Actually the -- for example, the Rowley 20 report, the 2017 report and the map and such that everybody 21

relies on so much, that report includes more than 20 lines of 22 AMT data, the -- the audiofrequency magnetotellurics, which is 23

exactly what we did from at least five different valleys. 24

Page 30

The CS in CSAMT means controlled source. And 1 that -- that means that we actually transmitted the signal 2

that we were measuring. Put out the motor generator set and 3

- the transmitter equipment and transmitted the signal. 4
- Sometimes you'll see it labeled as just AMT, audiofrequency 5
- magnetotellurics. That implies that you're only measuring a 6 certain frequency range. 7

You can also forget about the use of a 8

transmitter and you just measure the naturally occurring electromagnetic signals that are generated by lightning on the other side of the planet literally and by the solar storms that are affecting the upper stratosphere, there's these EM fields going on all the time.

So you can either measure those, make that your source or you can put out your own source which you have control of. And that's what we did for this survey.

The CSAMT method was first developed theoretically back in the mid-'70s and became commercially available as a tool back in the early '80s.

Since that time, it's -- it's used most commonly in minerals exploration because it has very good lateral resolution. And then the last 20 years or so more and more in the groundwater and geothermal fields.

The bottom part of this slide is a sketch just to 24

1 Most of that is work done by the USGS.

They happen to use a different equipment system than we did. So they transmitted some signal and then they also measured the naturally occurring signals.

Our -- our own experience with geo -- well, 5

geophysics in general, we've been in business for 47 years, 6

7 you know, I looked back at the records, in the past ten years

8 we've done about 1600 different geophysical surveys, gravity, 9 seismic, CSAMT, MT magnetics. Out of those 1600 surveys about

10 350, 360 of them were CSAMT or MT, this magnetotellurics. So

11 it's a -- as I say, commonly used method, particularly in the

12

And we've been doing this specific kind of survey 13 for about -- about 38 years since we started building 14 equipment for it. 15

On the next slide, slide 13, this is a list of some of the other groups in most cases national agencies that use our equipment and do CSAMT and things like that. So the USGS has several surveys, several systems. Sandia, Idaho, Lawrence Livermore, all the national laboratories.

We sell the equipment to government agent -foreign government agencies, they use them in their -- their equivalent of the USGS in their countries. And then many private mining companies and groundwater companies and

Min-U-Script® (8) Pages 29 - 32 Capitol Reporters 775-882-5322

Page 33

environmental firms use the equipment as well, so... 1

- So it is indeed a well-established tool, very 2
- well-accepted peer -- peer-reviewed results, everything. So 3
- 4 it's -- it's not a -- it's not a black box kind of secret
- proprietary thing that gives you wonderful results. 5
- Unfortunately, because of the money involved and 6
- the oil and minerals, you get a lot of black box geophysics. 7
- But this is -- this is definitely not black box, well 8
- reviewed, peer reviewed, plus we paint our boxes white, so... 9
- Q. If you could advance to slide 14. Mr. Carlson, 10
- what did you do in the Coyote Spring Valley? 11
- 12 A. Yes. In Coyote Spring, in 2019 specifically, we
- ran three survey lines. The station spacing along the lines 13
- was 200 feet. So every 200 feet we were making measurements 14
- of those electric and magnetic fields at a variety of 15
- frequencies. 16
- 17 So that -- and we covered 13.8 miles on those
- three lines. So it works out to about 369 specific individual 18
- measurement points to give us resistivity at different depths. 19
- Q. Could we advance to slide 15? Does this slide 20
- show those three survey lines? 21
- A. Yes, this is -- this shows the three survey lines
- we did for Coyote Spring and sort of zero in -- sort of in the 23
- center of Coyote Spring Valley. The very northern nose of the 24

surface. 1

12

13

19

20

21

22

23 24

- Up on line A, A ran across a small kind of 2
- isolated sort of island of limestone, that's that blue, it's 3
- labeled MD. And then line B right at the very nose of the 4
- Arrow -- Arrow Canyon Range ran over a little bit of 5
- limestone, same -- same unit. 6
- 7 And then line C is in -- as I said is entirely
- over basin fill. The dotted lines that you see there are
- faults as shown on the Rowley map. So we have on -- on the 9
- west running right through the labeled line B there you can 10 11
 - see a dotted line fault.

Parallel to that is a blue line on the Rowley map that indicates a -- sort of a secondary, a less important fault right up against the limestone. As we move further east we see another fault parallel to the first one right -- right on the eastern edge of the limestone.

Then we see what's probably part of a basin bounding fault as we go further -- further, sort of about -first the east end of line B about a third of the way in.

Then on line C we crossed two faults that are oriented north, call it north 60 east. But all of those are shown as dashed lines indicating that they're -- that's where the geologists have placed them based on what they can see on the surface someplace else, but by dashing them they're

Page 34

Page 36

- 1 Arrow Canyon Range is just about dead center in this slide.
- We did lines A and B, those were east/west lines running at --2
- running through there. 3
- We've labeled only every fifth station on these 4
- lines because you can't pack all the labels in there, it's 5
- very tight spacing. Because one of our targets were faults. 6
- Sometimes faults or fault zones can be very narrow. So we 7
- needed good lateral resolution. 8
- 9 We had -- we couldn't put a station out once
- every mile or once every half a mile because we may jump right 10
- over a fault and never see it. 11
- Lines A and B were the east/west lines. As you 12 see there B is almost right in the middle. And line C is 13
- oriented -- more of a different orientation. And that's 14
- crossing the Pahranagat Wash where it sort of takes a bend 15
- towards the southeast and goes on towards Moapa. 16
- In this next slide, which is slide 16, what we've 17
- done is just overlay the line locations onto the Rowley map 18
- for this area. And colors kind of fade out a little bit, but 19
- 20 basically the bulk of the survey, most of lines A and B and
- all of line C are over basin fill. 21
- So everything is hidden, all the bedrock is 22
- invisible. And that's -- that's the reason you do geophysics 23
- is you're trying to see something that you can't see at the

- basically admitting okay, this is a good guess, but we -- we
- don't know. Those are all concealed faults.
- 3 O. Could we advance to slide 17? What does this
- show, Mr. Carlson?
- 5 A. These are the results in cross section form for
- the CSAMT survey. This is the final result. 6
- So what we're looking at is along the top of the 7
- plot is the surface of the ground. And you can see it's basic 8
- 9 -- mostly flat. And the station numbers, again, this every
- fifth one or tenth one is shown for clarity. 10

And then down the side we're looking at 11

elevations. We're looking downward through the earth. If you 12 can see it on your screens, the elevation in feet is down on 13

the left side and in meters is down the right side. 14

And then the color shading is the resistivity, 15

that's what the final computer model came up with for all of 16 these measurements we made. We shade high resistivity 17

material towards blue and we shade low resistivity, meaning it

18 conducts electricity better, towards red. 19

20 Though the first thing you notice on this

particular slide is that big block of blue sort of towards the 21

center of the line. That's where this line A crossed over 22

that little isolated -- little island of limestone. And 23

limestone is often very high resistivity. It's -- so that's

As we go further towards the east you can see some high resistivities, that dark blue on the very far end, that's where this line crossed over a small outcrop dolomite.

5 Good correlation what we do know at the surface at least. But6 the rest of the line of course is just basin fill.

If we could go to slide 18. All we've done here is sort of tilted the world for you. We have the Rowley map draped on top of the US digital -- USGS digital elevation map.

So you get kind of a perspective. You can see how the data,how the results line up with the map.

And we can see the -- the blue high -- high resistivity feature right in the middle lined up nicely crossed over that little island of limestone. And the blue on the east end where it crosses a little tiny nose of the dolomite sort of crossing over in high resistivity ground.

And then out in the basin we see some more low resistivity values, the yellows and reds. And what we've also put on here is the -- what's -- what's on here is where Rowley put those faults, these dotted lines. The solid line farthest to the west is the highway, so don't -- don't interpret that as a fault.

And we see good agreement with what we see on the ground. We see interesting things in the data. For example,

west end of line 1 does look like good data when we look at
all the stations individually. So we have faith on that end
of it.

Out there on that very end around 1500 to 2,000 we do see a fault that's not shown on the Rowley map. And here I think we can go to line B, which would be slide 19.

So this is line B, this is the one that crosses the nose of the Arrow Canyon Range. And they're -- as we would expect nice high resistivities, dark blue right there in the center as we go over that -- that little nose of the range. It looks very similar to the -- to line A. We see low resistivities on either side of it. That's -- that's all quite good.

One thing to notice though is on this map the eastern concealed -- the fault that was east of the -- of the blue, the high resistivity stuff on line A, it was quite a ways away from it on this line, it is actually right up against it. Which made sense and looks like a fault to us.

There's also a fault shown on the western edge of that blue nob. And that makes sense to us, that looks like a fault too, there's big change in resistivity as you go from west to east. The Rowley map also has a concealed fault about a quarter of the way from the western end of the line kind of out there in the middle of nowhere.

Page 38

in that basin fill you can see that -- we see a lot of low resistivity material, which would -- you know, if you were interpreting this brine we'd say that's -- okay, that's basin

3 interpreting this brine we'd say that's -- okay, that's basin

4 fill or that's some of the volcanics, some water present,5 things like that.

You can see that -- if we look on the west side versus the east side of that central limestone island the two sides are different. We see two -- two distinct layers on the east side and then those low resistivities, all that conductive material kind of thickens and plunges as you get towards that basin valley fault.

On the west side we see weakly two layers. And one of them drops off fairly deep and the other stays horizontal. It's a little hard to see on this screen but probably easier on here, but towards the end of the west line around stations 1900 to 2500 or so there's some construction going on for -- for Coyote Springs and the data was -- was affected by what we call cultural effects. Anything out there that conducts electricity or radiates noise causes us problems.

So there's a -- there's kind of a little tiller feature out there that looks unrealistic and that's because it is unrealistic, it's -- it's the effects of culture.

The last 1,000 -- 1500 feet to 2,000 feet the

Page 40

We don't see a fault there. We think -- we thinkthat fault is -- is misplaced and should be further west.

3 Actually around station 2000 on this in the deep data you'll

4 see a change from -- from sort of medium to dark blue towards

5 green. That indicates to us a fault out on this west end of6 line B.

Rowley's map, if we jump to the eastern side of the -- of the nob Rowley's map shows a concealed fault there right about halfway between the nob and the east end of the

line. And we would put that fault based on the changes in resistivity as you go from west to east about 500 to 1,000

12 feet further west. Otherwise it's well placed. You can see

where the -- the resistivities change from fairly dark blues

to light blues and then to greens, that's where we see that.

15 Q. If we could advance to slide 20. What does this show, Mr. Carlson?

17 A. Yes. This is similar to the line A, that line A

18 plot that just draped the Rowley map onto the digital

elevation file. So it gives you kind of a 3D perspective. So we're looking -- looking to the north looking kind of downward

as if we're a couple thousand feet in the air.

And you can see that the western fault on the
Rowley map, that western dotted line running along the surface

24 in the middle there, doesn't really line up with a change in

Min-U-Script® Capitol Reporters (10) Pages 37 - 40 775-882-5322

Page 41

1

resistivity. But the change in resistivity further to the 1

west around station 2000 or so is definitely there. 2

The -- the black dotted line on the Rowley on the 3

east side of that little nob does indeed line up exactly where 4

we would put it as a very significant fault. 5

And then further to the east, that basin bounding

fault that we saw just -- just saw a little bit of on line A, 7

we can see that kind of in the middle of the eastern half of 8

line B and very well-defined change in resistivity there. So 9

that fault is in good agreement. 10

6

11 So what -- what we're seeing is three faults on

the Rowley map, two of which agree well with the CSAMT data 12

and the western line should be moved further out to the west 13

to about station 1500 to 2000. 14

15 Q. Advancing to slide 21. Does this show the

results of your work on line C? 16

17 A. Then -- yes, on line C, that's the one that runs

in a different direction, it's kind of southwest up to 18

19 northeast, crosses Pahranagat Wash. And after it makes the

bend there by the nose of the Arrow Canyon Range. 20

This is interesting in that it shows concealed 21

faults very well defined as we go from the west end of the 22

line towards the east down in the deep data we see the dark 23

blues showing high resistivity and changes to light blues and 24

BY MR. HERREMA:

2 Q. If we could advance to slide 22?

3 A. Slide 22 shows the line, seeing data with the

perspective again. This time we're looking west, so north is

to your right. We have the CSAMT cross section there and you

can see the dotted lines coming -- extending away from it in 6

7 good agreement with those big changes from lighter blue to

darker blue. And then the Arrow Canyon Range, you can see 8

that just above the cross section. 9

But really the key point here is very -- very 10

good agreement with the Rowley interpretation of the area. 11

Again, this line crossed it off at all -- this is all. All of 12

13 the structure in geology is -- very good. Thank you. HEARING OFFICER FAIRBANK: Thank you, 14

15 Mr. Carlson.

BY MR. HERREMA: 16

Q. Okay. Advancing to slide 23, what does this

show, Mr. Carlson?

A. Yes. This -- this sort of summarizes our view of 19

the faults after the CSAMT. Down here, this is the nose of 20

the Arrow Canyon Range that we've been talking -- talking 21

about, barely even visible and it doesn't really even show up 22

on much of the topographic maps, is the little limestone 23

24 island that Rowley drew there. So this is line A crossing

Page 42

2

5

13

14

1 then into greens. The whole central section of this line is lower 2

resistivities, not as dark blue, not as -- more green. 3

And then where Rowley puts a concealed fault as 4

we move further east we see a big change to the darker blues. 5

So the -- the agreement on this line between 6

7 CSAMT and Rowley are very good. Plus we see that the whole

central section of this line, which is actually a couple of 8

9 miles is lower resistivity than the ends of the line.

Basically what we see often in large fault zones 10 and we've seen this type of thing in the Horst and Graben-type 11

structures. So the western third of this line and the eastern 12

third are the Horst -- part of the Horst and Graben in your 13 geology. And the central section is the down dropped lower 14

resistivity. Or it's a very broad fault zone. 15

HEARING OFFICER FAIRBANK: Ms. Caviglia? 16

MS. CAVIGLIA: Hearing Officer, Justina Caviglia 17

from NV Energy. Do we have a pointer or something that's 18

easier to follow the map section? It's hard --19

MR. CARLSON: I forgot mine today. I'm sorry. 20

MR. ROBISON: I have two and four dead batteries.

HEARING OFFICER FAIRBANK: I will take that as a 22

no. But thank you. 23

21

24

Page 44

that little limestone island. 1

And then extending on out, that's -- that's

probably the extension of the Basin Valley fault. Line B and 3

the nose of the Arrow Canyon Range. 4

Rowley had faults extending from this side on up

and out and then another fault extending up here. And then 6

that secondary fault, the one shown in blue extended up to 7

about here and stopped. 8

9 What we see is a very narrow band of high

resistivities between these -- from here to here with the 10 11

faults right up against the high resistivity line.

So don't see a fault out here. But as you 12

recall, on line B and the little more weakly on line A you saw

a fault out here on the west end.

This orientation when you line up the fault we 15

see here and the one you see here is almost identical to the 16

orientation of these two, which is about north 30th west, 17 north 30 west. And then the other fault that we saw in Rowley 18

intersected line A up here where we crossed a little bit of 19

20 dolomite and intersected line B down here. There's no

outcrop, but a very nice change in resistivity. 21

Q. Mr. Carlson, if there's anyone who might wish to 22 read the transcript of this proceeding later, could you 23

please --24

Min-U-Script® Capitol Reporters 775-882-5322

(11) Pages 41 - 44

Page 48

Page 45

2

1 A. Oh.

- Q. -- when you're using the pointer just describe on
- the figure what you're pointing out?
- A. Right. Sorry. So, the -- and we've shown our
- faults where we place them as dashed lines. We know -- we
- know where they are next to the -- next to the limestone, we 6
- can see them in the data in between the lines. We dashed them
- because we're assuming they go there. 8
- And on line C in the lower right of the slide you 9
- can see line C crossing two Rowley faults, those faults are 10
- shown as dashed black lines. And again, those occurred right 11
- where we see them. 12
- 13 Also on the map we see well locations. We have
- MX-5, which is -- you can see in aerial photos and it's almost 14
- 15 exactly on top of one of the faults, the eastern fault.
- CSI-2, which is very, very close to the same fault. And then 16
- 17 CS-1 -- CSI-1 is in between two -- two faults out in the
- middle sort of near the golf course on this slide. 18
- MR. TAGGART: Madam Hearing Officer, is there an 19 exhibit to reference for this slide? 20
- MR. HERREMA: Mr. Taggart, if I can direct your 21
- attention to the upper right-hand corner of the slide it's got
- 22
- a reference. And each of the slides have references from 23
- where this information is taken from. 24

- those faults has shifted significantly west of where Rowley 1
 - put it.
- We see other weakly -- weakly apparent faults, 3
- but the main ones that we're worried about would cross line A 4
- and B, in particular the far western fault is the Rowley fault 5
- that shifted quite a ways west. 6
- 7 And line C was in very good agreement with the
- Rowley map. Those were our summarized results for CSI.
- Q. Thank you, Mr. Carlson. 9
- Mr. Reich, as part of your team's work, did you 10
- review the climate and precipitation in the Lower White River 11
- 12 Flow System?
- 13 ANSWERS BY MR. REICH:
- A. Yes, we did. One of the -- one of the things 14
- 15 that I mentioned earlier before was the impact of climate.
- So one of the -- one of the things that I asked 16
- 17 Ms. Molly Palmer to do was to review the available data that
- we used to characterize the climactic conditions in the Lower
- White River Flow System. So maybe -- maybe Ms. Palmer could 19
- help explain a little bit about what we -- what we found. 20
- Q. Okay. Advancing to slide 25. Ms. Palmer, can 21
- you tell us what data you looked at to characterize climate in 22
- 23 the Lower White River Flow System?

24

16

Capitol Reporters 775-882-5322

Page 46

- MR. TAGGART: We can't find this in Exhibit 2, 1
- 2 so...

23

- HEARING OFFICER FAIRBANK: Mr. Taggart, I believe 3
- it's also maybe at CSI, Exhibit 13. 4
- MR. TAGGART: Thank you. 5
- MR. HERREMA: Thank you, Ms. Fairbank. 6
- BY MR. HERREMA: 7
- O. Mr. Carlson, moving to slide 24, what does slide 8
- 24 show us?
- A. Yes, slide -- slide 24 is a list of the 10
- summarized results of the CSAMT survey. First of all, the 11
- CSAMT data did show good valid realistic results. 12
- During the course of the survey the equipment 13
- does -- does its own internal checks every time it sets up at
- a station. The field critique can see the data coming in so 15
- he knows if a wire is suddenly broken and things like that. 16
- We didn't experience any equipment problems. No 17
- unusual weather conditions, thunderstorms of course with all 18
- the lightning really -- really drive us crazy. 19
- 20 We had no weather problems, no equipment
- problems. So we look at this dataset as -- as a good 21
- realistic valid dataset. And the data seemed to be providing 22 us with specific locations for faults that were identified as
- concealed on Rowley. It also indicates that at least one of 24

- ANSWERS BY MS. PALMER: 1
- A. Yes. There are two maps on this slide, the small 2
- map in the upper right corner is showing the climate divisions
- for the state of Nevada. There are four divisions as defined
- by the National Oceanic and Atmospheric Administration which 5
- defines climate divisions in the United States. 6
- So the Lower White River Flow System is shown on 7
- both maps. And you can see that it's located mostly within
- division 4, which is the southern extreme climate division.
- 10 NOAA maintains climate records for the climate divisions that
- date back to 1895. 11
- They're also showing a single point station in 12
- Pahranagat Valley for -- which we're showing that one because 13
- it's upgradient of the Lower White River Flow System. It has 14
- data going back to 1964. 15
 - In general, for each climate division, the
- records in that division are based upon records at individual 17
- stations in that division throughout history. 18
- And as I said, for the division before goes back 19
- 20 to 1895. In general, the precipitation stations that are
- located in the Lower White River Flow System are at lower 21 22
- elevations, typically less than 5,000, more like 2,000 and 3,000 feet on the valley basin floor, not up in the 23
- mountainous areas. 24

Min-U-Script®

(12) Pages 45 - 48

Page 49

1

- And we reviewed all of the precipitation stations 1
- from the Lower White River Flow System. There are no 2
- long-term stations that are located at high altitude in the 3
- 4 basin.
- Q. Ms. Palmer, could you speak up just a little bit 5
- so the reporter can hear you?
- A. Yeah, um-hum.
- Q. And I believe you used an acronym in your -- in
- your summary, NOAA, could you describe for the reporter what
- that stands for? 10
- 11 A. Yes. That's National Oceanic and Atmospheric
- Administration. 12
- 13 Q. Thank you. Advancing to slide 26, Ms. Palmer,
- what -- can you describe the data that's displayed on this 14
- slide? 15
- A. These are two graphs that show cumulative 16
- 17 departure for the two climate records that I discussed on the
- previous slide. Both graphs show in blue bars the annual 18
- 19 precipitation, the top is showing you the annual precipitation
- on a calendar year basis for the division 4 climate division. 20
- The lower graph is showing you the annual 21
- precipitation on the calendar year basis for the Pahranagat 22
- Wildlife Refuge Station. And the blue bars as I said are 23
- total precipitation per year. 24

- BY MR. HERREMA:
- 2 Q. Please continue, Ms. Palmer.
- 3 A. Thank you. So the black lines are cumulative
- departure from mean. What they show are that when there is an
- increasing slope that indicates a wetting trend and when there 5
- is a decreasing slope there is a drying trend. 6
- 7 So we can point out a few features of the
- climatic trends on the top graph. You can see that there is 8
- approximately a 30-year drying trend that starts in about 1945 9
- to 1975, you can see that the line declines on the top graph. 10
- You can also see some shorter increasing wetting 11
- trends where the vine has an upward slope. That occurs for 12
- 13 about a ten-year period in the early part of the graph and
- then again from about a 20-year period from 1967 to about 1985 14
- 15 -- sorry, that's a ten-year period there.
- And so that tells us how the precipitation 16
- changes over time. 17
- Q. Okay. If we could advance to slide 27, 18
- Ms. Palmer, could you describe the data shown on this slide? 19
- A. Yes. The top graph is a repeated graphic from
- the previous slide 26 and just a cumulative departure from 21
- mean curve for the climate division 4. 22
- 23 The arrows show you the period of record that has
- 24 been blown up and shown on the bottom graph. The bottom graph

Page 50

Page 52

- The straight line should be sort of like a red or 1
- pink color is showing you the average annual precipitation on 2 a calendar year basis for the period of record for each 3
- respective record. So the top one is the average for the 4
- division 4, the lower bar -- the lower average is for the 5
- Pahranagat Wildlife Refuge Station. 6
- And the black curves that you see are what we 7
- refer to as cumulative departure from mean. And those lines 8
- 9 track the deviation from average over the period of record for each respective record or station.
- 10
- And the black lines, the cumulative departure or 11
- CDM curves are extremely helpful for characterizing trends in 12
- the basin. Trends in precipitation as we look --13
- MR. TAGGART: We're going to lodge an objection
- to the expert conclusions by this witness. We think it's 15
- improper for her to describe facts and data without any 16
- interpretation of this would require an expert opinion and --17
- HEARING OFFICER FAIRBANK: Your objection is 18 noted and we'll go ahead and allow the testimony and the State 19
- 20 Engineer will assign the value based upon the decisions that
- were made at the hearing on the voir dire of witnesses and 21
- 22 it's recognized that Ms. Palmer's not -- has not been admitted
- as an expert in these particular matters. 23
- 24

- is showing you monthly precipitation records for the extreme southern climate division 4. 2
- So it starts in January 1998 and goes through 3
- December of 2018. And it's showing you the monthly total 4
- precipitation for that climate division. 5
- You can see that there are some months that have 6
- significant amounts of precipitation. For example, in early 7
- 1998 there's one month that has more than four inches per
- 9 month. You also see months with bottom precipitation in 1998,
- 10 2004, 2005 and 2010.
- HEARING OFFICER FAIRBANK: Mr. Donnelly? 11
- 12 MR. DONNELLY: Thank you.
- HEARING OFFICER FAIRBANK: Please state your name 13
- for the record, please. 14
- MR. DONNELLY: Patrick Donnelly, Center for 15
- Biological Diversity for the record. The previous slide's 16
- data is quite different from what's in the filed report. On 17
- the second chart displayed in the previous line. That's a 18
- different chart that's not in the filed report. 19
- HEARING OFFICER FAIRBANK: Thank you. We'll note 20 that. 21
- BY MR. HERREMA: 22
- Q. Turning to slide 28, Ms. Palmer, does this slide 23
- accurately summarize the data being collected?

Min-U-Script® Capitol Reporters 775-882-5322

Page 53

6

12

1 A. Yes. The data that we collected was for -- we

- used this -- the division 4 climate data to characterize 2
- precipitation in the Lower White River Flow System. 3
- 4 We showed two cumulative departure from mean
- graphs to show the trends, wetting and drying and normal over
- the period of record at those stations. We showed that there 6
- were wetter than normal conditions occurring in 1998, 2004,
- 2005 and 2010. 8
- And we also note that there was a downward trend 9
- in 2006 to 2014. And the monthly data showed us that 10
- precipitation primarily occurs during the winter months. 11
- 12 Q. Thank you, Ms. Palmer.
- 13 Mr. Reich, in your introduction you talked about
- the movement of groundwater and the carbonate aquifer. Would 14
- 15 you elaborate on some of the hydrogeologic principles that you
- 16
- ANSWERS BY MR. REICH: 17
- A. Yeah. In order to understand some of the 18
- hydrogeologic parameters that we talk about and that really 19
- 20 control that occurrence of movement of water, Ms. Moran from
- our office reviewed some of the available information that --21
- that describes the -- the flow occurring. 22
- So, for instance, we looked at a Theis analysis 23
- just to understand what we might expect from impacts in -- in 24

- would be the effect at a spring located the distance of 1
- Pederson Spring from those two pumping centers. 2
- The relationship that the equation gives us is 3
- drawdown, pumping rate, what's also needed is the 4
- transmissivity and the storage and time. 5
 - If one piece of that is missing you can solve for
- 7 the other pieces in the equation. The assumptions though make
- in very, very simple, it needs to be a homogeneous aquifer, 8
- infinite, no boundaries, uniform thickness and no recharge 9 from any source, that the well is fully penetrating, that the 10
- screen interval is open to that full saturated thickness. 11

And that the well is a hundred percent efficient.

13 It doesn't lose anything in the well drawer storage. And that the potential metric surface is flat. 14

This is a very idealized system in that all water 15 pumped is from storage. And what it will give us is what the 16

17 shape of that cone of depression is that goes out into the

aquifer from a well pumping. So that's the beauty of this 18 equation, though it's very simplified in its method. 19

It helps us -- it conceptually see -- okay, well, 20

what would happen if I don't know really how those faults are 21 behaving and if I don't really know what the recharge is and 22

23 everything else is the same, what is happening there? 24 What the map shows is we took the average, a

Page 54

Page 56

- a sample case of something similar to the carbonate rock 1 aquifer. 2
- So I'm going to let Ms. Moran describe her 3
- findings. 4

7

- Q. Ms. Moran, we have slide 29 in front of us.
- Could you please describe for us what this shows? 6
 - ANSWERS BY MS. MORAN:
- A. Yes. So I was asked to look at the Theis 8
- solution and look at probably drawdowns from a pumping well
- within the Coyote Springs area and the -- the -- the -- close 10
- to -- sorry, I got a little sidetracked. Close to Pederson 11
- Springs. 12
- So what the Theis solution is, it's a 13
- nonequilibrium well equation. It was -- when it came on the
- scene for hydrogeology in 1935 it finally answered some of the 15
- major concerns that were at that time is how do you correlate 16
- drawdown in a well to the pumping rate? What does that mean 17
- and how does that characterize the hydraulic properties of the 18
- aguifer around it? 19
- 20 But it is a very simple equation, there's a lot
- of more complex equations that have grown out of it from then. 21
- 22 But this is also the equation of the SeriesSEE used by the
- Fish and Wildlife Service, so we decided to stay with the 23
- Theis equation looking simply at two wells pumping and what

- two-year average pumping rate for MX-5 location, which you'll
- see over here. And it is pumping 5,217-acre-feet per year, 2
- it's 11.5 miles away from the observation point, which is 3
- around Pederson Springs or VH-4. 4
- 5 The other pumping well we're going to talk about
- is at Arrow Canyon, and it will be pumping 3,000-acre-feet per 6
- year at over two years. And it is 2.5 miles away from an 7
- observation point. 8
- 9 So with the Theis equation again we're just
- looking at a simplified how that cone of depression propagates 10
- over time from that kind of pumping in an aquifer that's 11
- 12 homogeneous across it.
 - The next slide, please. So the first well
- pumping, it's pumping the 5,217-acre-feet per year two years, 14
- 11.5 miles away. It causes a drawdown, its cone of 15
- depression, you're only see half of that cone in this graphic. 16
- 17 But that cone of depression is -- causes a .289 feet drawdown
- at that observation point. 18
 - The next slide.
- 20 Q. Could you please -- sorry, for the record, just
- identify slide you were just speaking about? 21
- 22 A. Oh, thank you. So that was slide 30 that looked
- at the well 11.5 miles from the observation point. 23 24

The next slide, 31, looks at a well that is only

SE ROA 52974

Min-U-Script® (14) Pages 53 - 56 Capitol Reporters 775-882-5322

13

19

Page 60

Page 57

- 1 2.5 miles from an observation point pumping less, but it has a
- 2 greater impact because of where it is in the cone of
- 3 depression. So it's just 2.5 miles away. It's causing a
- 4 .46 feet drawdown at that observation point.
- 5 The next slide. What's nice with the Theis
- 6 equation is you can add different cones of depression
- 7 together. You can also put in image wells that could simulate
- 8 recharge or could simulate a boundary, but in this case we did
- 9 not simulate any -- anything that would affect the cone of
- 10 depression.
- So this has two wells pumping. You can see that
- the cone of depressions coalesce somewhere around the
- 20,000 feet or the 30,000 feet. But the -- the full drop at
- 14 the Pederson Spring observation point would be 0.74 feet. So
- it sums the two together if it has no other influences.
- 16 Q. Here you're referring to which slide?

in the 3200 gallons per minute.

storage to supply it to the well.

- 17 A. I'm referring to slide 32.
- 18 Q. Thank you.

22

23

subsurface.

- 19 A. The next slide. So in summary of this simple
- 20 equation, it shows the relative impact of pumping wells
- 21 located at different distances from an observation point.
- And it's based on that the aquifer's homogeneous,
- so it has the same value of transmissivity in storage that a
- 24 well pumping about 1800 gallons per minute but only located

2.5 miles would have a greater impact at the observation point

than a well that was located 11.5 miles but pumping a lot more

aquifer -- how groundwater occurs and moves within the aquifer

storativity, it's the storage of water in the pour space and

how much water from that pour space will yield to a well.

What transmissivity is is the movement of water.

It's the saturated thickness times the hydraulic conductivity.

So it describes how quickly water will move through the

aerial extent but a shallower cone of depression because its

pulse can move out through the aquifer to retrieve water from

cone of depression and the cone of depression doesn't go out

as far. It's still the same amount of water coming out of

storage, but the shape of the cone of depression is different.

have a higher storage there will be a shallower cone of

depression because the water will be released from storage.

Similarly with the storage coefficient, if you

When there's a higher T there will be a larger

When there's a lower T, it draws a -- a deeper

of the storage and transmissivity, the occurrence is

That's what storage -- that storativity coefficient is.

The two components that describe how the

- 1 It doesn't have to go as deep to retrieve that water to -- to
- 2 pump it from a well. And with a lower storage you would get a
- 3 deeper cone of depression.
- 4 Again, it's all about how the water has to come
- 5 from somewhere to come out of the well. And it's coming from
- 6 that generation of a cone of depression.
- 7 So basically what I put together for this Theis
- 8 equation is to explain how it works and then how different
- 9 wells, different pumping rates, how that would affect at an
- 10 observation point.

12

14

- 11 Q. Thank you, Ms. Moran.
 - Mr. Reich, turning your attention to slide 34,
- can you describe what slide 34 includes?
 - ANSWERS BY MR. REICH:
- 15 A. Yeah, slide 34 is kind of a summary of the
- 16 observations we've made of -- of the groundwater levels. I
- 17 think we spent the last hour or so, you know, talking about,
- 18 you know, some of the basic geology and the location of the
- 19 faults and the occurrence of movement and the hydrology.
- So now that we've created that foundation we
- 21 wanted to move forward and apply that to the observations that
- we've seen in the water levels.
- So -- so really, you know, if -- if -- and we're
- 24 going to go through this in a second, but it's really kind of

Page 58

- 1 looking at different segments. We want to look what would
- 2 occur prior to Order 1169, what did we see during 1169, what
- 3 we have seen since.
- 4 So -- so before I do this I was wondering if I
- 5 could present a demonstrative aid that might help everybody
- 6 kind of locate where they are with respect to each of the
- 7 wells, because it gets -- it gets complicated with referring
- 8 to different well locations.
- 9 MR. HERREMA: Ms. Fairbank?
- 10 HEARING OFFICER FAIRBANK: That will be fine.
- MR. HERREMA: We've prepared a figure that shows
- 12 the well locations.
- ANSWERS BY MR. REICH:
- 14 A. Well, I think the one in your right hand would be
- better for this conversation.
- MR. ROBISON: Okay.
- MR. REICH: I wonder if it would be better --
- 18 maybe a little bit closer over here. Because I don't want to
- 19 block anybody's view.
- MR. ROBISON: This better?
 - MR. REICH: Maybe in just lean it up against --
- 22 without the easel maybe we could just lean it up against the
- 23 tray towards the State Engineer.
 - HEARING OFFICER FAIRBANK: Actually, I think if

Min-U-Script®

Capitol Reporters 775-882-5322

21

24

(15) Pages 57 - 60

Page 64

Page 61

- we could put it there, that way then it can also be viewed on 1
- the camera so individuals who are viewing from Las Vegas as 2
- well as on the internet can see. 3
- MR. REICH: Okay. If we just move it. The only 4
- problem is it blocks the -- so let me just -- let me do this. 5
- What --6

12 13

1

- 7 MR. ROBISON: This way. Towards you.
- MR. WILSON: Like this of. Perfect. 8
- MR. REICH: That's fine. So what I wanted to do 9
- is summarize how we bring things together. So maybe I can 10 11
 - show that in the next slide.
 - HEARING OFFICER FAIRBANK: If I may just ask a quick clarifying, this is a demonstrative of the different
- well locations within Coyote Spring Valley? 14
- 15 MR. REICH: Coyote Spring and Muddy River area
- and part of Garnet Valley in the southern portion. So it's 16 17 really -- it's a -- it's a -- it's just an accumulation or a
- presentation of the location as we talk about it. 18
- 19 Because, you know, I realize, you know, our staff
- 20 and our group is -- we get so involved in understanding where
- these wells are, but it's important as we go through this 21
- discussion that we can see exactly where they're located. So 22
- that's -- this is really just a demonstrative to -- to allow 23
- us to go back and reference exactly where wells are with 24

- talked about '04, '05 rainfall event. We can see that there's 1
 - a reaction or a response in the groundwater level. In '05 2
 - there's a jump up. And then again, there's a further decline.
 - 4 There's a -- there is a decline in the
 - groundwater level until 2010. There's a small bump in the 5
 - water level due to the rainfall event in 2010. And then
 - 7 average conditions -- what appear to be average conditions
 - from say 2015 to the present. 8
 - If we overlay that with the CDM curve that
 - Ms. Palmer introduced, again, we see that same formation, that 10
 - same characterization. 11

9

- 12 This particular graph, which is slide 36, shows
- 13 again the -- the -- kind of the dotted groundwater level line
- on the top is -- is the water level at MX-4, the solid black 14 15 line is the CDM curve that we introduced earlier.
- The gray bars are annual precipitation. The blue 16
- 17 bars are monthly precipitation. And the -- the pink line
- going across horizontal is the average of the period of record 18
- 19 for -- for the precipitation at southern extreme division 4.
- 20 So, you know, we see the same characterizations,
- we see -- again, back to '98 a response in the water level, a 21 decline down to '04, '05 rainfall event response. And so 22
- 23 there's a lot similarities between these two curves.
- So we don't only see this in Coyote Spring 24

Page 62

- respect to other well locations.
- So what -- what we're looking at on the screen on 2
- slide 35 is MX-4. So MX-4 is located about 300 feet away from 3
- MX-5 pumping well. And you can see it on the demonstrative, 4
- but it's in Coyote Spring Valley. So one of the things that 5
- we see in MX-4 water levels is its relationship to 6
- 7 precipitation.
- So you can see Ms. Palmer described --8
- characterized what the precipitation events have been in the
- past. And what's remarkable here is when we see the 1998 10
- event, over four inches of rainfall. 11
- So on the left we have precipitation axis and 12
- measured in inches. On the right we have elevation. And that 13
- right axis relates to the hydrograph that we'll be discussing.
- We're going to go through a lot of these hydrographs today. 15
- And so the theme is always going to be the elevation and/or 16
- pumping in some cases or precipitation in other cases on the 17
- left axis. 18

19

21

- But for right now the black line on the top is
- 20 associated with the black axis on the right and the blue bars are associated with the precipitation axis on the left.
- Again, 1998, we don't have data prior -- we don't 22
- have groundwater level data prior to 1998, but we see the 1998 23
- was a wet event. We have a decline in stream flow. We've all 24

- Valley, but we also see this in the Muddy River Spring area.
- So we can do the same for EH-4. If you -- if you can see the 2
- 3 chart, EH-4 is down near the -- near Muddy River Springs area
- 4 and you can see that this also is showing the carbonate water
- level, the black line along the top, the hydrograph measured 5
- in elevation on the right axis and then monthly precip. 6
- 7 So -- so we see almost an identical similarity in
- 8 EH-4 that we just saw in the MX-4 well. And again, when we
- 9 overlay that with the cumulative departure from mean and we
- add annual precipitation, it's the same general, you know, 10
- trend that we see going on. 11
- 12 We have a high rainfall again in '98, some
- decline, a response in '04 and '05 to a wet event decline, you 13
- know, basically from '06 down to 2013, that's punctuated by a 14
- high rainfall event in 2010 and then average conditions from 15
- '15 to '17 -- or '15 to -- '15 to the present. 16
- 17
- Q. And, Mr. Reich, in regard to well EH-4 you've 18
- been referring to slides 37 and 38; is that correct? 19
- 20 A. That's correct. 38 meaning EH-4.
- MR. TAGGART: For the record, we object. I don't 21
- think this in their report. And unless it's offered for 22
- demonstrative purposes, that's fine, unless they can point to 23
- where this diagram is in the report. 24

(16) Pages 61 - 64 Min-U-Script® Capitol Reporters 775-882-5322

Page 65

MR. HERREMA: So these slides are a summary of a compilation, it's different pieces of reports and exhibits

that have either been presented or admitted. We intend at theend of the day to ask that the State Engineer accept the

- 4 end of the day to ask that the State Engineer accept the
- 5 slides as a part of the record, but we weren't intending to
- 6 offer them as evidence themselves.
- 7 HEARING OFFICER FAIRBANK: And for the purposes
- 8 as being offered as demonstrative exhibits in the summary
- 9 compilation of data, we will accept them.
- Mr. Herrema, is there -- are there copies of your presentations available and where are they located?
- MR. ROBISON: On the table on the other side of the room.
- 14 HEARING OFFICER FAIRBANK: Okay. So there's
- copies of the presentation on the table over there? Thank you
- 16 very much.
- MR. TAGGART: If I can just for the record, and I
- understand your ruling, we will abide by it, I just want to
- 19 clarify whether this is in their exhibits or not, just for the
- 20 record so we know whether this is something different. If it
- 21 is we object to it being admitted as evidence and obviously
- 22 counsel said they will not offer it in evidence. But if it's
- in their exhibits we would just like to know where it is.
- 24 HEARING OFFICER FAIRBANK: And if I understand

- 1 this.
- 2 However, it is being provided as a source of the
- 3 presentation today. And so to the extent it gets included in
- 4 the State Engineer's record, it may be included in the State
- 5 Engineer's record to the discretion of the State Engineer.
- 6 However, it is not being offer -- it's not going to be
- 7 accepted as an exhibit by CSI in these particular matters.
- 8 MR. TAGGART: I understand --
- 9 HEARING OFFICER FAIRBANK: Mr. Taggart, your 10 objection is noted, but we're on a tight time frame and that's
- 11 the ruling of the State Engineer right now. Thank you.
- BY MR. HERREMA:
- 13 Q. Could we please advance to slide 39? Mr. Reich,
- what does slide 39 show?
- 15 A. 39 are some -- are wells that I use for
- observation of data prior to the beginning of the Order 1169aquifer test.
- So one of the -- one of the steps that we went
- 19 through was as I explained before, was to really truly
- 20 understand the data and see what -- what -- what those data
- 21 prior to the tests showed.
- I think unfortunately -- I wish I could sit here
- 23 in front and say we have a very long period of record that --
- 24 that would characterize this area. I think what we'll see

Page 66

Page 68

- 1 correctly, it's a summarization or a compilation of documents
- 2 which is reflected in the upper corner of their slides, which
- 3 is -- if I understand correctly from prior statements from
- 4 counsel, is that's the -- where the source data is located and
- 5 if I understand it's a demonstrative exhibit?
- 6 MR. HERREMA: Yes.
- 7 HEARING OFFICER FAIRBANK: So that's -- that's
- 8 what it is at this point and it's not being offered as
- 9 evidence or as an exhibit, it's being offered for
- 10 demonstrative purposes?
- MR. HERREMA: Yes. So we would like it made part of the record so that it can be referred to in the transcripts
- 13 being reviewed.
- MR. TAGGART: Those are two different things. It can't be part of the record if it's not an exhibit.
- MR. HERREMA: It's a demonstrative exhibit.
- MR. TAGGART: It can't be part of the record if
- 18 it's not offered and accepted --
- HEARING OFFICER FAIRBANK: So, Mr. Taggart, we will go ahead, it's being presented, all the participants have
- 21 it available as a copy of it. It's being proffered for
- 22 demonstrative purposes.
- And as the State Engineer stated previously, the
- 24 State Engineer will assign what, if any, weight to provide to

- 1 today is that there is somewhat of a limited amount of data,
- 2 but I wanted to present that today and show you how we came to
- 3 our conclusions regarding what we see prior to the order of
- 4 1169 aquifer test.
- 5 So, maybe I can jump to slide 40. And what slide
- 6 40 shows is a groundwater level of response in the MR -- in
- 7 the Muddy River Springs and EH-4. So there's a lot going on
- 8 in this graph. And I think I've introduced each one kind of
- 9 on a step wise fashion.
- But I've -- I've shaded out the blue area. And
- that numping was acquiring in Coyota Springs Walley
- that pumping was occurring in Coyote Springs Valley.
- And so what I want to do today with you is
- explain what I see prior to the beginning of pumping in Coyote
- 15 Springs Valley. So what I'm going to do is focus on the
- information that's located on the left side of the graph.
- And as we look at the information on the left
- 18 side of the graph, I -- I want to repeat what I said before,
- and that is we've seen that that trend, that groundwater trendreflects climactic conditions.
- And we see that, we used EH-4 as an example
- before, but we see it again in this graph 2, that solid line
- 23 is that CDM curve, that black solid line. And in this case
 - what the green lines are, the green bars is pumping in -- it's

Min-U-Script® Capitol Reporters (17) Pages 65 - 68 775-882-5322

Page 69

carbonate pumping in the Muddy River Springs area. 1

- So what that green is showing is monthly pumping 2
- from 1998 I believe up into 2019, it's showing that that 3
- pumping was in the Coyote Spring -- in the Muddy River Spring 4 5
- And what we're looking at in this is the seasonal 6
- response. So now instead of looking at the climatic response
- over periods of five or seven years, what I want to kind of 8
- focus in on is that annual response. 9
- And you can see that annual variation in that 10
- 11 hydrograph at the top. It -- it -- it's high in the
- 12 wintertime and early spring and then it's low in the late
- 13 summer and early fall.
- And you can see how that kind of follows the 14
- 15 peak pumping, so the top green bar would be the peak pumping.
- And what I've shown on this slide is that period. 16
- So there's two vertical lines. There's two 17
- vertical lines, and they kind of represent the time between 18
- 19 the peak pumping, which is the green. That would be the first
- vertical line you see on the left and then the minimum 20
- groundwater level, which would be the second vertical line or 21
- the parallel vertical line just to the right of the first. 22
- So really, all that is doing is demarking kind 23
- 24 of a time delay between when peak pumping occurs in the Muddy

- period by two vertical lines between when peak pumping occurs,
- which is the top of that green bar, and when minimum 2
- groundwater levels are observed, which is the vertical bar on 3
- 4 the right.
- And if you remember a little bit, it's gotten a 5
- little bit wider, so that gap is getting a little bit longer. 6
- 7 You know, it kind of makes sense. You're getting further
- away. The impacts take longer. There is a time delay between 8
- peak pumping and draw-down. 9
- So this is fitting our conceptual model, and it 10
- supports the idea that pumping in the -- in Muddy River 11
- 12 Springs area is impacting groundwater levels at UMVM-1 as
- 13 shown in Slide 41.

14

19

- If we go a little bit further upstream as
- 15 shown -- or upgradient. I should be careful. Upgradient in
- Slide 42. Slide 42 is CSVM-6. CSVM-6 is now located north of 16
- 17 MX-5 in the Coyote Springs Valley. And the green bars
- represent, again, pumping in the Muddy River Springs area. 18
 - The blue area, again, is when pumping was
- occurring in the Coyote Springs Valley. 20 So we looked at this, and we tried to ask 21
- ourselves why are we seeing a seasonal response to early time 22
- groundwater levels in the Coyote Spring Valley, especially in 23
- CSVM-6. 24

Page 70

Page 72

- 1 River Springs area and when we see minimum groundwater levels.
- So, again, you know, it's this annual variation 2
- that we relate to pumping. Pumping goes up, groundwater 3
- levels go down. Pumping reduces, and you see a response in 4
- that groundwater level. 5

10

- So this is -- I think it's pretty standard. We 6
- all have seen the signature before. But what -- what it 7
- allows us to do is to see what does it mean in the area that 8
- 9 we're -- we're discussing today.
 - So if I move further upgradient, if I move from
- EH-4 and now I'm looking at UMVM-1. UMVM-1 monitoring well is 11
- located at the northwestern end of the Muddy River Springs 12
- area right before you go into Coyote Spring Valley. 13
- Again, you know, we see that same trend in the 14
- long-term kind of climatic conditions of drying and wetting. 15
- And unfortunately, because of lack of data -- or I should say 16
- lack of period of record, we're really missing that early time 17
- just because of when these wells were built. But we see the 18
- same thing. We see this annual variation. 19
- 20 And that annual variation is, again, due -- if
- we look to the left, if we look to prior to when pumping 21
- occurred in the Coyote Spring Valley, we see that that annual 22
- variation is occurring in -- in the -- in the UMVM-1. 23
- And, again, what I've done is I've demarked that 24

- 1 And so we saw what happened in VH-4, and we saw
- how that -- and also as shown in UMVM-1 and now, in CSVM-6 2
- with the available data, we see the same thing. We see that
- there's a seasonal variation prior to when pumping was 4
- initiated. 5
- So it really got us understanding that, you 6
- know, this -- that this pumping center in the Muddy River 7
- Springs area has impact as far north into this -- the area of 8
- CSVM-6, which is the -- kind of the eastern portion of Coyote
- 10 Springs Valley just north of MX-5 as shown on the
- demonstrative aid. 11
- So we kept going further upgradient. And this 12
- is CDVF-2. And CDVF-2 is even that much -- it's further 13
- upgradient in Coyote Spring Valley. And, again, if we can 14
- look on the demonstrative aid, and what we see again is --
- 15 is -- is the same -- is what's actually missing in this, and 16
- that is that seasonal variation. 17
- So one of the reasons that I hesitate is because 18
- one of the things I want to point out here is that there was a 19
- 20 screen failure or a hole in the casing, and so the data after
- October -- I believe it was October 2011 in Figure 4- -- was 21
- Again, we're just focusing on that early time 23
 - data prior to pumping in the Coyote Springs Valley. So this

it 43? -- for CEVF2, we're not really looking at that data.

Min-U-Script® (18) Pages 69 - 72 **Capitol Reporters** 775-882-5322

22

Page 76

Page 73

- 1 kind of raised a question: Why are we seeing that seasonal
- 2 response on the eastern side of Coyote Springs Valley but not
- 3 necessarily seeing that seasonal response on this further
- 4 well, CEVF-2.
- 5 So with that, that went to help us understand,
- 6 you know, what the impact of these faults and
- 7 barriers may be along the -- along -- within the Coyote
- 8 Springs Valley.
- 9 Q. Okay. Advancing to Slide 44.
- 10 A. So as I mentioned before -- we looked at kind of
- 11 before, that was before the 1169. That's what we observed and
- when we observed declining water levels during and somewhat
- after the 1169 tests.

going on.

fairly constant.

seen at MX-5.

- So what I want to do today is kind of want to
- 15 focus again on some of these monitoring wells, and I'm going
- 16 to be specific in looking at MX-4, UMVM-1, EH-4 as we go kind
- 17 of down gradient from MX-5 down towards the Muddy River
- 18 Springs area. So, again, the red lines that are showing the
- 19 location of some of the monitoring wells I want to discuss.
- For instance, if we look at the next slide, which
- 21 is Slide 45, Slide 45 is MX-4. As I mentioned before, MX-4 is
- 22 located about 300 feet or so from MX-5. The yellow represents
- 23 the period of the Order 1169 tests.
- The blue bars represent pumping in Coyote Spring

Spring Valley pumping, not Muddy River.

those bars and those -- the bars themselves represent Coyote

So you can see during the aquifer test how much

that increased in 2011 and 2012, that big increase. And you

can see how MX-5 continued to pump all the way out through

April of 2013. So even beyond the Order 1169 aquifer test,

and what was reported, you know, that MX-5 still had pumping

One of the observations we see in MX-4 is that,

you know, during -- during that early part of 2013 when MX-5

was -- was continuing to pump, the groundwater levels remained

And then after -- after that MX-5 was shut down,

you can see how MX-4 reacts immediately to that shutdown.

There's a jump in the hydrograph. It jumps straight up.

down for repair for different purposes, you can see that

there's an immediate response in the groundwater level. So we

feel good that MX-4 is really -- is responsive to what's being

So -- so now, we went further down-gradient, and

as shown on Slide 46, which is CSVM-1. Now, CSVM-1 is also

very nearby. We can see on the graph here CSVM-1 is almost

You also see in 2011 and 2012 when MX-5 was shut

- 1 immediately down-gradient of the MX-5 pumping well. We see a
- 2 lot of the same characteristics that I just talked about at
- 3 MX-4.
- 4 Besides the fact that, you know, we have that
- 5 seasonal response that we see that we talked about earlier, we
- 6 have the long-term climatic response, but we also have that
- 7 response due to MX-5. So in MX-5, you can see in 2011 and
- 8 2012 when it shuts down, there's a response by that
- 9 hydrograph, you know, kind of jumping up. The early part of
- 2013, you see a flat hydrograph. At the end of 2013 at the
- end of those blue bars, there's a jump up in the groundwaterlevel.
- So, you know, again, we can -- we can see that
- 14 CSVM-1 is tied together with what we see in the other areas.
- So -- so we kept moving further down-gradient as
- shown in Slide 47.

 And when we go down 47, this is UMVM-1, and
- 18 UMVM-1 is, again, a lot of the same characteristics. And I
- 19 don't want to, you know, keep saying the same thing but, you
- 20 know, the -- the drawdown in early 2013, you know, that still
- 21 continues. But, you know, it's not as flat as it was.
- You know, recovery -- there seems to be some of
- 23 type of recovery response in UMVM-1 that's different than what
- you see in MX-4 and CSVM-1. But you still can see the

Page 74

- 1 seasonal pumping signature and can see -- and you see the
- 2 drawdown recovery.
- 3 So there's no question that, you know, we see
- 4 impacts from MX-5 into -- into Muddy River Springs area, which
- 5 is where -- where UMVM-1 is located.
- 6 HEARING OFFICER FAIRBANK: Mr. Donnelly.
- 7 MR. DONNELLY: Thank you.
- 8 Patrick Donnelly, Center for Biological
- 9 Diversity. For the record, we'd like to object to all these
- 10 charts being included. All these charts are citing CSI
- 11 Exhibit 1. They're not in CSI Exhibit 1. This certainly
- 12 feels like evidence, and we have not had a chance to review
- 13 this before.
- 14 HEARING OFFICER FAIRBANK: Your objection is
- 15 noted. Thank you.
- MR. HERREMA: Miss Fairbank, if I may, there was
- an e-mail that you sent out on August the 29th which talkedabout PowerPoints and what they might include and when they
- 19 should be produced.
- There's a Question Number 5 that talks about
- 21 PowerPoints that are a summarization of the expert report
- 22 taking data or analysis of hydrographs of other data in the
- reports, and that's what we have put together in our
 - PowerPoint.

Valley. So now -- I kind changed a little bit. Now we're on

Min-U-Script® Capitol Reporters (19) Pages 73 - 76 775-882-5322

Page 80

Page 77

- It talks about those -- that particular question 1
- talks about those as demonstrative exhibits and that they can 2
- be produced and provided to everyone at the time that they're 3
- 4 being presented.
- MR. TAGGART: And just for the record, I would
- like to add that we've done this for decades, and absolutely, 6
- a demonstrative can summarize expert conclusions. A 7
- demonstrative should not make new experts, and that's the 8
- basis for our objection. 9
- HEARING OFFICER FAIRBANK: And that objection is 10
- noted, Mr. Taggart. 11
- 12 MR. TAGGART: Thanks.
- HEARING OFFICER FAIRBANK: Thank you. 13
- BY MR. HERREMA: 14
- 15 Q. Mr. Reich, you were last speaking about Slide 47,
- which is relating to Well UMVM-1. 16
- 17 A. Yeah. So I think I explained UMVM-1 that this is
- at -- located at the kind of the northwestern portion of the 18
- 19 Muddy River Springs area, and you see the same type of
- 20 response.
- And then we go further down-gradient in Slide 48, 21
- we show EH-4. So EH-4, again, is -- you know, it's a longer 22
- period of record. You can see that longer hydrograph. But, 23
- you know, we start to see that even at the end of -- of the 24

- again, I think, is very much tied to the pumping we see in 1
- MS-5. There's a -- there's a flat level in the early 2013. 2
- There is an immediate response in -- in May of 2013 after
- MX-5's pumping is shut down. We see the seasonal variability
- that we talked about before. 5
 - And also in -- in 2011 and 2012, you see the
- 7 response in the groundwater level due to the -- the shutdown
- of the MX-5 pumping. 8
- So, you know, CSVM-6, we go further north from 9
- that and -- or upgradient. And as we look at Figure 51, we 10
- look at CEVF-2. And, you know, I got to -- CEVF-2 is it's 11
- just unfortunate that the well doesn't show us -- doesn't have 12
- 13 data later on up to present due to the failure of the well 14 itself.

6

- But, you know, what's interesting about this is, 15
- you know, what we -- what we don't see. And we don't -- we 16
- 17 don't see an immediate response in 2011.
- And as I mentioned before, we -- and this is 18
- 19 supported by the fact that we don't really see that seasonal
- 20 response due to the pumping in the Muddy River Springs area,
- but we do see a seasonal response to the pumping in the Coyote 21
- Spring Valley area. 22
- 23 As we'll get on to later today or right now in
- 24 Slide 52, you know, we look at other pumping that occurred,

Page 78

- say, on the west side of the -- of the structural block that 1
- we pointed out before. 2
- So, you know, groundwater pumping on the west 3
- side, we talk about CSI-1 and we talk about CSI-3, and we 4
- include CSI-4. You can see how there's a responsiveness to 5
- the water level graph at CEVF-2 and seasonal variation pumping 6
- from these other wells. 7
- So as we then continue to move further north, you 8
- 9 know, we want to look at CSVM-4. So CSVM-4, which is at the
- outflow area of -- or the top part of the Coyote Spring Valley 10
- near the King Spring Valley, again, what's really interesting 11
- 12 here is we don't really see any seasonal response.
- But we do see the climatic response, and the 13
- climatic response is -- you know, when we plot that with the 14
- cumulative departure for mean curve, you can see that there's 15
- an increase, you know, following the '04-'05 wet period. 16
- 17 There's an upward trend in the groundwater
- levels, and then there's a decline down to 2013, 2014, and 18 then groundwater levels have remained fairly stable from 2015 19
- 20 to the present.
- So, you know, this -- this, you know, helped form 21
- 22 and support our conceptual model. This model that allows us
- to understand what -- you know, what the impact of some of 23
- these barriers are; where is the flow is occurring; how flow 24

pumping, of the MX-5 pumping in 20 13, you know, you start to

see a recovery. You start to see an uptick in the groundwater 2 level. 3

- 4
- So, you know, why we've submitted that, you know, there's a relationship in the hydrologic connection between 5
- Coyote Spring Valley and Muddy River Springs area, you know, 6
- 7
- as we get further away, we start to see the impacts of other
- issues, whether they be recharge or groundwater flow. But, 8
- 9 you know, there's -- there's different
- characteristics that help us understand and explain, you know, 10
- that movement of water. 11
- So, you know, this is just important to see how, 12
- you know, we can relate pumping in Coyote Springs Valley to 13
- impacts in the Muddy River Springs area. 14
- So, you know, if we -- if we move on, this was 15 the area that we looked at down-gradient. We also looked 16
- upgradient. So, now, what I would like to do is walk you 17
- 18 through some of those wells, observation wells that we looked
- at moving upgradient in Coyote Spring Valley. 19
- 20 So in this particular case, in 49, I'm just kind
- of showing you -- if we start at the bottom and work our way 21
- 22 north, that's going to be the order of my presentation for water level graphs. 23
- So on page 50, I'm showing CSVM-6. And CSVM-6, 24

Page 84

Page 81

1 may or may not occur across those barriers. But, you know,

2 these data and the other data in -- in the Coyote Spring

3 Valley were used to assess that.

4 And so moving on to Slide 54, in the upper left,

we're looking at CSVM-4, which we just talked about; the lower

6 left, which is CSVM-5 -- 3. Sorry. And that's right at the

7 base of the Pahranagat wash or the northern end of the Coyote

8 Springs Valley.

9 Again, it's very similar to the CSVM-4 in the

sense that you see a recovery and you see a decline, and what is happening in that area, CSVM-5 is located south of the MX-5

pumping on the west side of the valley. It's located below

the sheep range in an area that is also controlled by faults,

and we see something completely different.

15 We see something that's in a -- in a different

16 characterization of increase in groundwater level going --

17 going up, which we haven't seen -- you know, today, we've

looked at a lot of water levels, and so we have to ask ourselves: Why is this different. Why do we have some

9 Ourserves. Why is this different. Why do we have soil

20 different characterization of CSVM-5 that we don't see in the

21 other wells?

And that's -- and that's a question where it can

be explained by, you know, either a purge stone, a fault

barrier, crossed areas, and it really elicits the need to find

v, 1 conceptual model that these barriers, these faults, these

2 normal faults that were described by Rowley that we identified

3 in our geophysical survey really impact and control that

4 occurrence and movement of water throughout the area.

5 And so, you know, we come to the conclusion based

6 on these data that basically, you know, that the barrier to

7 flow or that the faults and the structural block and the

8 geology that exist, you know, act to -- to isolate the western

9 and eastern portions of Coyote Spring Valley.

10 Q. Mr. Reich, you're referring right now to

11 Slide 55; is that correct?

12 A. 55, yes.

HEARING OFFICER FAIRBANK: Mr. Herrema, we're almost at 10:30. Is this a good time to take a ten-minute

15 break?

MR. HERREMA: We've got about ten more slides, so

17 I think we can.

18 HEARING OFFICER FAIRBANK: Let's go ahead and

take a ten-minute break, and we'll start back promptly in tenminutes.

21 (Recess.)

HEARING OFFICER FAIRBANK: We're going to go

ahead and go back on the record.

So, Mr. Herrema, you may proceed.

Page 82

1 out more about this area because this is -- this is unique to

2 what we've looked at in this basin.

3 So we're -- you know, as we are today, we're

4 still -- we're still looking at that and explaining why

5 that -- that change is occurring.

6 But then again, CSVM-2, as we move down towards

7 Hidden Valley, we see the same characterization of seasonal

8 water levels, but we don't see the response from the MX-5

9 pumping.

10

So to summarize all this, and I've done that in

11 the next slide, again, we -- we've seen this trend. Long-term

12 climatic conditions impact the groundwater levels. I think

we've seen that in all these different groundwater hydrographs

14 that we've looked at today.

And I -- what's most interesting to us in our

16 investigation was -- is really how the pumping in the Muddy

17 River Springs area affects the eastern portion of Coyote

18 Springs Valley.

So, again, how is that -- why is that something

20 that -- you know, how does that occur and why is it contained

21 in that eastern portion? And that's -- you know, and why,

22 similarly, do we not see that seasonal impact on the western

23 side of the Coyote Springs Valley.

So -- so, you know, that helps and support our

1 BY MR. HERREMA:

2 Q. Mr. Reich, we have Slide Number 56 projected on

3 the screen here. Would you please tell us what Slide 56 shows

4 us?

5 A. Yeah, we kind of ended before the break talking a

6 little bit about a summary of our observations on the water

7 levels, so I just want to continue about some of those, just

8 summarizing what our observations were, you know, after --

9 during and after the aquifer test.

So some of the points that -- that I want to push

out is really that during the -- during the aquifer test, you

12 know, we could really see that -- that CSVM-2 -- CSVM-2,

13 CSVM-3, CSVM-4, CSVM-5 -- and I know we jumped back into these

14 numbers again, but they're really -- they really show a

15 different environment.

You know, it's really a different hydrogeologic

17 and geologic environment. And characterization of water

18 levels from those wells are different than what we saw on the

19 eastern side is what we saw on MX-5 and the CSVM-1 and, you

20 know, the CSVM-6 in the northern Muddy River area and the

21 UMVM-1.

You know, we're really looking at -- at

23 something, a characterization. And when we look at those

24 water levels, we can see that there's different environments

and a different geologic framework that's affecting those. 1

So as we move on this morning, you know, that's something that's important to us to convey to your office to -- to think about as you put together your own conceptual

5 model, how these really affect that occurrence of movement of 6

water throughout the system.

2

3

4

7

8

11

12

13

14 15

16

17

18

19

20

13

So, you know, moving on, I think is -- what I really wanted to kind of end with is that -- that same point is just we really see this long-term variability in water

level that's connected to the climate. 10

I think it's -- it's -- it's obvious throughout all the wells, you know, that we've talked about today, except that CSVM-5 which I indicated we're still looking at. But the other water levels' response where we see an increase from '98, an increase in '04-'05 and a long-term decline in average conditions, it's really evident as we look throughout those hydrographs and we see how climate plays a role. You know, pumping plays a role. Climate plays a role. There's all these different things that we have to consider when we start to describe and characterize this.

So it's just something to think about and -- for 21 your consideration as -- as you think about managing the 22 resources in this basin. 23

24 Q. Mr. Reich, you're referring right now to

how do -- how do we have enough information to be able to describe and understand where those impacts are going to be?

And we -- we suggest that a groundwater budget is a tool that allows us to begin to be able to inventory those resources, to be able to figure out, you know, where those impacts are going to occur. How much can we give up? And so -- so what we did was -- was we outlined each one of those types of fluxes or inflows, and we did that for the Lower White River Flow System.

So in Figure 59, what we're showing here is -- is the budget is some of the flux terms that we have for the groundwater flow budget for the Lower White River Flow System. I -- you know, I have another demonstrative that just might

I know a lot of us are pretty comfortable with all the basins, and maybe we can just change that one out for that one. Just so everybody -- as we talk about names and we talk about places, I think it's important for everybody here to understand where those places are and where those valleys are.

And so, you know, as I talk, what I'm showing in the -- in the PowerPoint presentation is a summary of the geology. I use this figure to demonstrate where that budget and how those budget terms occur.

Page 86

Page 88

Slide 57; is that correct?

A. Yes. Slide 57.

Q. Moving to Slide 58, Mr. Reich, how did you

address answering the State Engineer's Question 3 regarding

the long-term annual quantity of groundwater that may be

pumped from the Lower White River Flow System? 6

7 A. You know, we took an approach of -- of developing

a groundwater budget for the Lower White River Flow System.

We think -- or we know that budgets are important planning

tools that we use for understanding, you know, all the 10

different fluxes that affect the available resources.

11 When I talk about fluxes, you know, we talk 12

about groundwater inflow. We talk about local recharge,

evapotranspiration, spring flow, surface flow. Each one of 14

these fluxes, each one of these terms, you know, is what we 15

16 use to quantify what the resources are.

So as we make changes in the future, we go back 17

18 and we look at those different items, and we say: How are we

affecting those? How may we be affecting evapotranspiration? 19

20 How may we be affecting groundwater discharge? How we may

affecting surface flow because, you know, pumping -- pumping 21

22 and groundwater development is going to affect something.

It's -- it has -- there's no -- there's no free 23

lunch there. So if you take water out in one place, you know,

1 As I talk about names, you can reference the

demonstrative here to make sure when I -- that you can 2 3

associate those with physical places and locations.

But, you know, in terms of the flux terms that we 4 5

have, we talk about groundwater inflow and regional

groundwater inflow. 6

And so what our office did was we kind of 7

performed a literature research. We didn't go out and develop

9 new data for groundwater -- regional groundwater flow.

Rather, we went out and relied on studies done by others. And

we reviewed a lot of those studies.

We reviewed studies that looked at deterring mass balancing, carbon-14 dating, recharge analysis, precip runoff, and Maxey-Eaken from the 60's, and we really went to a great extent to see the kind of information that was out there.

And in order to get something that we could present to you, present to the State Engineer for their use in planning, we ended up relying on an SNWA 2007 report that also used those data.

And we chose that report because it was fairly comprehensive. It was fairly comprehensive, and we felt that we could use that as a good budget that would be, you know, somewhat balanced because it was all from the same report.

So we didn't feel like, you know, it -- it would

Min-U-Script®

15

16

17

18

19

20

21

22

23

have to -- you know, there's no mixing and matching from different reports. 2

And so in short, what that report identified and 3 you can see in these -- in these dark blue lines, there was regional groundwater inflow from Pahranagat Valley. There was regional groundwater inflow from Delamar area and regional 6 groundwater inflow from Kane Springs, regional groundwater inflow from the Lower Meadow Wash. 8

And the regional groundwater inflow from the Lower Meadow Wash was identified to occur into both -- into both the Muddy River Springs area and the California Wash.

9

10 11

12 13

14

15

16 17

18

19

20

5

10

11

12

13

14

18

19

20

21

And so when we talk about the groundwater recharge or the groundwater regional flow, we talk about those as being sources of -- of that groundwater flow.

We also -- we also looked at values from groundwater outflow from the area. So, you know, in the same report, we looked at groundwater outflow from the California Wash area into lower Moapa, and we looked from -- and also identified groundwater outflow from -- into the Black Mountains area.

So there was specific areas that identified where 21 there was reasonable inflow into the system and regional 22 outflow into the system. So you can see on this map -- and we 23 also summarized it in a budget. 24

perspective, what was existing overall. 1

So when we summarize this and we look at this 2 together in this budget, you can see the total outflow is about 62,200-acre-feet, and the total -- I'm sorry. Total inflow, excuse me, is 62,210-acre-feet, and the total outflow 5 is 63,630. 6

So when I use this budget to say to -- in our conclusions that there's upwards of 30,000-acre-feet of available groundwater in the Lower White River Flow System, this is the basis for that presentation or this is the basis for that conclusion.

And where that number comes from is looking at the total amount of evapotranspiration and groundwater outflow out of the basin, so we can talk about this later. But I wanted to provide with -- you where those values are coming from.

17 Q. Advancing to Slide 61, Mr. Reich, what is the importance of local recharge from the Sheep Range? 18 A. Well, the local sheep -- the local recharge from 19

the Sheep Range is an important component in our conceptual 20 model and what we've been talking about today because the 21

local -- the local recharge is -- is really occurring off of 22 23 the Sheep Range. And what we've done today is -- is we

decided that, you know, it would be good to provide an 24

Page 90

Page 92

So you can see in Slide 60 -- Slide 60 kind of is 1 the old classic groundwater budget that a lot of us have been 2 3 using and looking at for our whole lives. So you can see that all the places in the -- and the terms that I just mentioned 4 are outlined with the addition of local recharge.

So not only do you have this regional groundwater 6 7 inflow into the Lower White River Flow System, you also have local recharge, local recharge occurring on the Coyote Spring 8 9 Valley -- I mean, on the Sheep Range in the Lower Meadow

Mountains, you know.

Now, we didn't make an estimate because the -because published estimates from recharge from the Lower Meadow Mountains and from Arrow Canyon and other areas were not available.

So we didn't add anything, but what we really 15 focused on was using those values from that 2007 report to put 16 together this balanced budget. 17

For instance, in the outflow terms, we also used their estimates of evapotranspiration: How much evapotranspiration is in California Wash, how much may be in the Muddy River Springs area.

And it's important to remember these were 22 presented as predevelopment, so it might not be what's there 23 today but certainly, from a predevelopment groundwater budget

1 independent analysis.

The independent analysis would allow us to use 2

the most up-to-date and modern techniques. And if I may be 3

allowed, I'd like to have Miss Palmer talk about the analysis 4

that she did with regards to precipitation and recharge from 5 the Sheep Range. 6

MS. PALMER: Right. Thank you.

We reviewed the literature, as Steve said. We 8 9 selected several empirical precipitation recharge models from 10 the literature, and we applied those using the most recent spatial data for the State of Nevada. 11

We used something that's called PRISM, a gridded raster data, which is a spatial dataset for outer general precipitation. And the PRISM stands for precipitation elevation regressions on independent slopes model.

It's developed -- the PRISM dataset has published in literature since about 1994, and it's been developed by research from Oregon State University. They produce a variety of spatial climate datasets for use in the western -- well, all the over the United States.

So we used this spatial information on precipitation in our geographic information system or GIS software to look at each of these areas that you see in the figure on the slide. And each of those areas, we broke them

Min-U-Script® (23) Pages 89 - 92 Capitol Reporters

775-882-5322

up into recharge zones, and we used the spatial data to compute the average annual precipitation in each zone.

And then we applied the coefficients and

parameters from the literature -- from the models that are in the literature, and we came up with a range that's 5280 to 7380-acre-feet per year. 6

Again, we also went back through the literature to put those numbers in context, and that's in one of the appendix to our July 3rd report. There is a table that shows that we reviewed more than a dozen numbers. They ranged from 1900 acre per year to 14,000-acre-feet per year.

MR. REICH: Thank you.

1

2

3

8

10

11

12

13

14

15

16 17

18

19

11

12

13

15

16

17

18

19

So that was an independent analysis of the local recharge in the Sheep Range that was prepared for this area. And what we did next was we used that to focus in on a groundwater budget just for the Coyote Springs Valley.

So now what you're looking at is just a -- a new budget different than what we looked at before. But, you know, what would be the budget for just the Coyote Spring Valley?

20 And, again, we look at the same terms, which is 21 groundwater inflow and local recharge. We now have an 22 independent number for local recharge, and then outflow, of 23 course, would be the groundwater outflow out of the Coyote 24

Page 95

previous studies had also identified up to a thousand 1 acre-feet of evapotranspiration. So the total inflow and 2

total outflow based on our analysis for the Coyote Springs 3

4 Valley is 55,980-acre-feet as shown in Slide 64.

BY MR. HERREMA: 5

Q. Sir, I -- again, in summary, could you please 6 7 summarize the responses to the State Engineer's Order 1303

questions, and could we bring up Slide 65, please.

A. So Slide 65 is really just a summary of a lot of 9 things that we've talked about today. But our -- specifically 10 directed to answering your question, and, you know, we really 11 looked at this as an opportunity to provide you with as much 12 13 information and observations and new data that we have.

So -- so, through that process, you know, we believe that the Order 1303 boundary that was identified can be used, but resources will need to be accounted for.

And those resources are not just as I've shown on my slide here in the Lower Moapa Valley how much outflow is there from the basin, you know, because of what's going on downstream but also to be able to determine, you know, and account for the inflow, the regional groundwater flow, that flow that's coming in through Pahranagat and Delamar and Kane and Lower Meadow Valley Wash. All of those need to be considered as -- as kind of, you know, impacts to the flow

Page 94

Page 96

1 Spring Valley, evapotranspiration, and any surface water out.

So we -- we used this updated precipitation 2

3 runoff analysis. We tightened up our boundary just for the

purposes of discussing the Coyote Spring Valley today in order 4

to develop the groundwater budget that's shown in Slide 64. 5

So Slide 64 is slightly different. It's just for 6

7 a description of -- to support our conceptual model, but you

can see that the inflow -- very similar terms, if not 8

9 identical, from Pahranagat, Delamar and Kane for 22,400,

24,100-acre-feet. 4200-acre-feet from Kane. 10

And then local recharge, because we had an estimate, we now have an independent estimate of local recharge for the Coyote Spring Valley of 5280.

And then in terms of outflow, we have outflow into the Muddy River Springs area which is 37,800, which is identical to what we had in the previous budget or -- as based on -- it's based on the same information that we used for the previous budget. And then outflow out towards Hidden and Garnet Valley.

20 Now, that number is based on -- on the 2007 SNWA study, but we've adjusted it in order to provide you with a 21 balanced budget for the Coyote Spring Valley. 22

You can see under predevelopment conditions and 23 the previous -- the previous -- it was interesting. The 24

1 system.

14

15

16

17

18

19

20

21

22

23

24

2

5

But using the flow system boundary as defined in

Order 1303 is -- is a plausible way to -- that we recommend 3

that the State Engineer can do that. 4

The information from the Order 1169 aguifer test,

you know, there's -- there's two big things that we provide 6

7 with you today, and that is that the climatic conditions play

a large role, a signature in the water levels that we look at 8

9 today. And that needs to be considered, and it's something

that -- something that we've learned since -- since that Order 10

1169 pump test. 11

12 And also, it's the structure. It's the -- it's

the -- it's the geologic structures that are defined by normal 13 faults that support, you know, and support preferred pathways 14 and flow ways for water and also help to create barriers 15 through development of -- of those faults as well as 16

17 structural blocks.

18 are -- those are some of the -- the new information or 19 20 information that, you know, need to be considered when looking 21 at pumping in the Lower White River Flow System.

The long-term quantity of water that can be 22 pumped, I just -- I just recently finished with you on 23 Slides 62 -- I mean, excuse me, 64 and the previous budget

And so, you know, keeping those in mind, those

Min-U-Script® Capitol Reporters 775-882-5322

Page 97

9

10

11

12

14

15

17

18

19

23

24

9

13

slide. 1

8

9

10

11

12

13

14

15

16

17

18

But, you know, 11- -- there's 11,900-acre-feet of 2 predevelopment evapotranspiration and 19,700-acre-feet of 3 subsurface outflow in the Lower White River Flow System, and

we also identified 52- -- 5,280-acre-feet of local recharge in 5 6

the Sheep Range.

So, you know, these are values that can be used for -- for you to determine on managing pumping in the Lower

White River Flow System in the future.

The effects of moving water rights between aquifers, we didn't address necessarily water rights that -and I apologize if we missed that, but we -- we instead, you know, addressed the physical relationships between pumping in alluvial wells and pumping in the carbonate aquifer.

And what we really found was, you know, pumping from the carbonate wells in the Muddy River Springs area really -- and pumping from the alluvial wells really have almost a direct impact on the surface flow and spring levels in the Muddy River system area.

19 But what I also want to conclude from this is 20 that -- you know, and this is reason why we brought forward 21 today the groundwater budget is that, you know, pumping --22 pumping is -- anywhere within the Lower White River Flow 23 24 System is going to affect something, and it's going to affect

total pumping in Coyote Spring Valley of up to 5,280-acre-feet. 2

So, you know, it's really -- using the available 3

information and the new information that we provided you with 4

today, that will allow you to look at that -- those stresses 5

and those -- those physical properties of the rock and the 6 7 movement of water to help form your decisions about total

pumping in the Lower White River Flow System.

MR. HERREMA: Miss Fairbank, this concludes the first part of our presentation regarding the direct -- or the report. We're going to change who it is that's going to be questioning to do the next part of our presentation.

Could I have a time check? 13

> HEARING OFFICER FAIRBANK: Yes. You are about two hours and 26 minutes into your presentation thus far.

MR. HERREMA: Thank you. 16

MR. ROBISON: Miss Fairbank, I think I did not leave the State Engineer's office with the slides for the rebuttal presentation. May I?

HEARING OFFICER FAIRBANK: Thank you. So you 20 have provided us the slides for the rebuttal presentations. 21 Thank you. 22

MR. ROBISON: And they were on the table for distribution.

Page 98

groundwater outflow. It's going to affect evapotranspiration.

It's going to affect surface flows. 2

But really, what needs to be considered is -- is 3

where the location of that pumping is and where those effects 4

will occur when that pumping takes place. 5

So -- so I hope that we presented that 6

information for your consideration today to see how that 7

pumping can be managed based on the impacts that you're 8

9

Q. Turning your attention to Slide 66. What do we 10

have here? 11

A. Well, the -- this question in Order 1303 was

specific to other matters relevant to the State Engineer. And 13

a lot of that, I've kind of addressed just in my last slide 14

presentation. 15

But, you know, I really wanted to point out again 16 that going out and getting new information, going out and 17 getting the -- performing the geophysical survey, identifying 18

the faults, locating these pathways and barriers and 19

20 developing a structural understanding of the amount of water

or the currents and that movement of water really supports the 21

22 conceptual model that we've been talking about all day that

we've presented to you and, you know, how -- how that can be 23 used to support, you know, pumping in Coyote Spring Valley, a

HEARING OFFICER FAIRBANK: And those two are 1

available on the table? 2

MR. ROBISON: They were. I think they've been 3

taken up by other participants. 4

HEARING OFFICER FAIRBANK: Okay. Just one quick 5 matter if I may, Mr. Herrema. It didn't appear that you 6

actually sought to have the -- Exhibit 1 and 2, the report and 7

rebuttal report, admitted. 8

The State Engineer's prehearing notice or the

hearing notice stated that -- it identified the all the 10

exhibits the State Engineer was admitting as well as the 11

12 order, with respect.

But the State Engineer has not admitted any of

the reports, and so I just wanted to ask if that's something 14

that you wanted to have admitted in this matter. 15

MR. HERREMA: Yes, Brad Herrema for CSI. I read 16 the report as saying it to needed to be verified or the order 17

saying it needed to be verified and submitted to cross before 18

they were admitted, so I was planning to move that they be 19 20

admitted at the end of the day. HEARING OFFICER FAIRBANK: Okay. Thank you. 21

MR. HERREMA: We do certainly want them admitted, 22 23

MR. ROBISON: Thank you. 24

Page 101

- 1 DIRECT EXAMINATION
- 2 BY MR. ROBISON:
- 3 Q. Good morning, all. My name is Kent Robison. I'm
- 4 counsel -- co-counsel for Coyote Springs, and I am going to
- 5 ask our panel backwards questions with regard to the CSI
- 6 rebuttal report and some of the findings and analysis you did
- 7 in that respect.
- 8 Start with you, Mr. Reich. Would you please
- 9 summarize for us all what you reviewed with respect to this
- 10 part of your assignment?
- 11 ANSWERS BY MR. REICH:
- 12 A. As part of our assignment, we reviewed the
- 13 reports that were submitted by other parties to the Order 1303
- 14 July submittal.
- So -- so we -- we limited that review to the
- information that was provided in those reports.
- 17 Q. Are you prepared to give your analysis and
- 18 observations with respect to those other reports, sir?
- 19 A. Yes, I am.
- 20 Q. Because of the limitation of time, I'd like you
- 21 to first give us a summary of your findings overall if you
- 22 would, please.
- 23 A. You know, I'm going to -- I'm going to spare the
- 24 State Engineer to repeat what I just said to him for the last

- 1 whether we agreed with all the different aspects or disagreed
- 2 with some of the aspects of those rebuttal reports.
- 3 O. That overview is reflected on Rebuttal Slide
- 4 Number 3, sir?
- 5 A. That's correct.
- 6 Q. Would you then direct your attention to Rebuttal
- 7 Slide Number 4.
- 8 Can you tell us how you believe that your
- 9 findings may differ from previous conceptual considerations to
- which the State Engineer has been submitted or subjected?
- 11 A. Yeah. You know, in summary, it's the impact of
- the hydrologic conditions on the available water resources and
- the climatic variability.
- And -- and more importantly, I just mentioned the
- word heterogeneity, but it's really the differences in the
- 16 past is how -- how homogenous the aquifer may or may not be.
- 17 How much does it affect pumping in one location versus
- 18 observations in another location.
 - You know, we need to consider that the Lower
- 20 White River Flow System administrative boundary is on the
- 21 order of a thousand square miles. So we have a
- thousand-square-mile basin that we're looking at and, you
- 23 know, what -- what are some of those differences? And I think
- 24 it's a fundamental difference on how we view that -- that

Page 102

- 1 two hours because hopefully, most of that got through -- or we
- 2 as a group were able to present that to you.
- I do want to -- I do want to emphasize the fact,
- 4 you know, that we used the available data that we could find
- 5 to present those findings with you.
- 6 So what we found in the rebuttal reports was we
- 7 not only looked to see what information was provided in those
- 8 that would represent and support or change our minds or change
- 9 views. So we were looking for new information.
- 10 We looked at those reports and determined, you
- 11 know, how do they -- how do they support or how do they
- 12 provide information that would say, hey, listen, you know,
- there is a different view that needs to be looked at.
- So in short, in summary, you know, we disagreed
- 15 with the findings of -- of, you know, A, how much water can be
- 16 pumped and for what reasons. And that goes back, really, to
- the idea that we want to get across and that we found as
- 18 evidence in our information that the aquifer is heterogeneous;
- that there are barriers that exist; that climate affects
- 20 streamflow -- affects groundwater levels. And -- and putting
- 21 that all together, you know, how -- how -- how do all these
- 22 fit together?
- So that was -- that was kind of our -- you know,
- 24 the basis for our review. And then that led us to determine

1 basin.

19

- 2 You know, is it homogenous or are there
- 3 heterogeneities in there that cause different changes and
- 4 different issues or difference fluxes to occur. Is there
- 5 spring flow here? Is there outflow into the Black Mountains
- 6 area? Is there flow on the western side and, you know, can
- 7 pumping in one area affect or not affect pumping in another?
- 8 And that gets to the, you know, impact of faults
- 9 and structural components: How important are those
- and structural components. How important are those
- 10 components? You know, how important are those faults? You
- know, how are they barriers to flow or conduits to -- and to create preferred pathways.
 - So it's really -- it's really that which -- which
- 14 formulates our opinion on the amount of water that can be
- pumped from the Lower White River Flow System.
- 16 Q. Would you, with regard to Rebuttal Slide
- Number 4, focus on the third bullet point and elaborate on
- 18 that, sir.

13

- 19 A. The impacts of -- on Slide 4, I'm reading about
- 20 the impacts of faults and structural components on groundwater
- 21 flow.
- So, you know, when I'm talking -- I -- faults are
- 23 the normal faults. We went back and in the beginning of our
- 24 direct presentation, we -- we brought up the idea that

Min-U-Script® Capitol Reporters (26) Pages 101 - 104 775-882-5322

Page 105

- 1 extensional faults, extensional tectonics create these normal
- 2 faults that create preferred pathways. We clearly showed, you
- 3 know, the support for that -- that opinion and where that came
- 4 from.
- 5 And then looking at our observations of -- of
- 6 different transmissivities and well properties and information
- 7 from the -- from the wells and the pumping wells we have in
- 8 the Coyote Springs area, we could see that.
- 9 And then in the geophysics, it's really the
- 10 geophysics that we did to confirm what Rowley had suggested in
 - 2017: That these -- these faults exist and that -- you know,
- 12 the continuation of that Arrow Canyon Range, that structural
- 13 block.

11

- So how do we define -- how do we really know that
- 15 those are there and now, how do we really feel confident that
- that supports our conceptual model? So it's really a
- 17 combination of that, which is different, I think, than what
- 18 the State Engineer has considered in the past.
- 19 Q. These are differences since the 1169 aquifer
- 20 test, sir?
- 21 A. Yes.

22 Q. The four bullet points on this particular slide?

geophysical investigation.

Authority?

7 A. Yes, we did.

column.

- 23 A. Yes. The 1169 aquifer test, which completed at
- 24 the end of 2012, and the reports were written in June of '13,

certainly, you know, we relied a lot on recent data as well as

the State Engineer's office by the Southern Nevada Water

Slide Number 5, please. Could you just describe the structure

of that summary with your columns going from left to right.

do was to organize our rebuttal in the sense of, you know,

what were the questions being asked in Order 1303 -- you know,

how each of the different parties responded to that and then

just comments or remarks regarding that, which is the last

So as we -- as we look at this slide, you know,

I've organized it into geographic boundary status as from top

to bottom on the left column; status of aquifer recovery;

annual quantity of groundwater that may be pumped; you know,

impact of pumping on the Muddy River Flow and the movement of

slide is a summary of what we found and -- and I think the

So -- so this is -- this is -- this particular

water rights between aquifers.

the data that we performed ourselves in the form of a

Q. Did you review the initial reports submitted to

Q. All right. And if we could look at Rebuttal

A. So from left to right on Slide 5, what I tried to

- 1 most important thing that -- that we saw that we really
- 2 disagree with is the amount of groundwater that can be pumped
- 3 from the -- from the groundwater system.
- 4 And so it's really that disagreement which is
- 5 based on some of our differences in the understanding of how
- 6 climatic conditions and how structural barriers and -- and
 - 7 faults are characterized.
 - 8 Q. No dispute with respect to SNWA's findings on the
 - 9 geographic boundaries?
- 10 A. You know, we agree with SNWA with regard to those
- 11 boundaries. The SNWA report identified the no change from the
- 12 State Engineer boundary and that, you know, the only -- and
- so -- so we -- we don't disagree with that.
- 14 Q. Is it a disagreement with respect to the status
- of aquifer recovery, the second item on your summary?
- 16 A. You know, I -- I -- I think that the -- what's
- 17 really important is that they -- they identify the fact that,
- 18 you know, recovery occurs during extraordinary events similar
- 19 to '04 and '05.
- And so my -- my remark to that -- and so we -- so
- 21 SNWA is providing and acknowledging that those hydrologic
- events have an impact on the resources that we see in the
- 23 Lower White River Flow System, and the only comment I make to
- 24 that is that, you know, the wet hydrologic condition is part

Page 106

- Page 108 of any boundary. I mean, it's part of any hydrologic balance
- 2 to hydrologic cycle.
- 3 So when you consider management in this area,
- 4 such things as, you know, wet years, you know, wet years like
- 5 '98, wet years like '04 and '05 and wet years like 2010 all
- 6 need to be considered when -- when determining the status of
- 7 the aquifer recovery.
- 8 Q. The Water Authority determines in its report that
- 9 the annual quantity of groundwater that can be pumped is
- between 4- and 6,000-acre-feet per year.
- Do you agree with that?
- **12** A. No, I do not.
- 13 Q. Please explain why.
- 14 A. You know, I really -- I really believe that the
- 15 evidence provided by -- in their report did not support
- 16 pumping that's occurring -- that -- the amount of pumping that
- 17 can occur from the carbonated rock.
- **18** Q. For what reasons?
- 19 A. Well, the best way to show this would be to look
- 20 at Slide 8.
- 21 Q. Rebuttal Slide 8, please.
- 22 A. Right. So Rebuttal Slide 8, which is -- you
- 23 know, I kind of quote that the -- the -- the summary, which
- says that "if the conflicts with senior water right holders
- Min-U-Script® Capitol Reporters (27) Pages 105 108

775-882-5322

Page 112

Page 109

- are adequately addressed, the total annual groundwater 1
- production should be managed between 4,000 and 6,000-acre-feet 2
- over the long run." 3
- And the basis for that is presented in the report 4
- in Section 6.2.4 which -- which compares the contribution of
- Warm Springs West Flow to the Muddy River Flow. 6
- So it's a -- it's an analysis where they identify
- that approximately seven percent of the flow at the Muddy --8
- and I should be careful. It's not the Muddy River Flow but
- the discharge from the Muddy River Springs area. 10
- So, really, what -- what their analysis looked at 11
- was a flow from the Warm Springs West compared to the 12
- 13 discharge from the Muddy River Springs area.
- And in that -- in that analysis, they assume that 14
- 15 approximately seven percent of the discharge from the Muddy
- River Springs area is due to contributions from the Warm 16
- 17 Springs West Gauge.
- Q. Does the Water Authority explain why it does not 18
- include the alluvial pumping? 19
- A. No, they do not. 20
- Q. Do you think that should be considered in this 21
- analysis?

1

- A. I think that the State Engineer asked to
- understand how much -- the quantity of water that can be

- left axis at approximately 3.82 -- I guess that's pretty 1
- precise, but 3.82 is the estimated predevelopment flow in the 2
- Warm Springs West Gauge.
- 4 And as that flow decreases down to zero -- you
- can -- you can see zero on the bottom. If you go over on the
- right axis, that also equates to 3.82. So that's a
- 7 relationship between, you know, flow on the left axis and
- decrease in flow on the X axis. So the X axis is really how
- much does the flow decrease. 9
- So on the upper axis or on the upper line, we see 10
- that -- we see that that red line or orange line, that's 11
- actually discharge from the Muddy River at the Moapa gauge. 12
- 13 And it, too, but you read it off the right axis.
- So at the top, it's 50.2. So you can see that 14
- basically, it correlates with 50 CFS, which is predevelopment 15
- flow in the Muddy River. 16
- 17 And so then, as we as look at the table that was
- presented, you can see that what it -- basically, what it 18
- 19 shows is that when there's a 1.12 drop in CFS drop in flow at
- 20 Warm Springs West, which is -- you know, you can read it off
- the X axis. 21
- If you go over to 1.12 and then up, you can see 22
- that that's that 1.12 CFS decrease from 3.82 down to 2.7; that 23
- it results in a flow reduction in the Muddy River Springs -- I 24

Page 110

- pumped from the Lower White River Flow System, and the
- analysis presented in 6.2.4 addressed pumping from the 2
- carbonate aquifer. 3
- So -- so I think that, yes, the alluvial pumping 4
- should be considered, maybe not in this analysis but in a 5
- response to the State Engineer. Alluvial pumping should be 6
- addressed. 7
- Q. In the third bullet point on the bottom of 8
- Rebuttal Slide 8, you refer to the Water Authority's use of
- linear relationship. 10
- Could you explain, please. 11
- A. Yeah. I think the best way to show that would be 12
- on Slide 9. 13
- So what Slide 9 shows is a graphical 14
- representation of a table that they presented in the July 15
- report. So the table in the July report related decreases in 16
- flow at Warm Springs West to decreases in flow or discharge 17
- from the Muddy River Springs area. 18
- So -- so we've chosen to -- for this analysis to 19
- 20 use the Moapa gauge as kind of a de facto discharge from the
- Muddy River Springs area. But what we've shown on this graph 21
- 22 is the axis on the left is the flow at the Warm Springs West.
- And the blue line is the Warm Springs West flow. 23
- So, for instance, if you -- if you look on the 24

- mean, from the discharge from the Muddy River Springs area
- from 15 CFS. 2
- And that's read by looking at the 50.2 down to 3
- the approximately 35 CFS. So that's the data that's presented 4
- in -- in their report. And as discussed in that report, then 5
- that 15 CFS drop would be a decrease of approximately 6
- 10,000-acre-feet. 7
- The numbers that they present to get to the 4,000 8
- 9 to 6,000 is -- is basically addressing the amount of flow
- decrease when Warm Springs West would decrease from 3.82 down 10
- 11 to 3.2.
- 12 So I think it's important to understand that the
- analysis that they presented for the 4,000 to 6,000 range is 13
- based on this linear relationship. If you were to continue 14
- this linear relationship down to the right, you can see that 15
- when there's more and more flow decrease, that there's a 16
- direct decrease in the flow at the Muddy River. 17
- And -- and that's the part that I think is -- is 18
- flawed in their analysis in the sense that it doesn't account 19 for a non-linear relationship of contributions that would 20
- occur from the alluvial aquifer. 21
- Q. And is there contributions from the alluvial 22
- aguifer to the Muddy River? 23
- 24 A. Yes.

Min-U-Script® (28) Pages 109 - 112 **Capitol Reporters** 775-882-5322

Page 116

Page 113

- 1 Q. Accounted for by SNWA?
- 2 A. Not in this analysis, no.
- 3 O. With respect to SNWA's report that CSI did not
- 4 ignore groundwater levels in CSV production wells, do you
- 5 recall that area of the report?
- 6 A. Yes, I do.
- 7 Q. Do you agree with that?
- 8 A. No, I do not.
- 9 Q. I'm referring to Rebuttal Slide Number 10.
- 10 Would you please explain.
- 11 A. So there's a statement in the report that the
- 12 hydrographs of the three CSI wells and CSVM-1 exhibit the same
- shape and general decline occurring during the two-year
- 14 aquifer test and the responsive MX-5 shutdown and restart in
- the middle of the stake. And so they're staking, it was
- unmistakable, and we ignored that.
- And, you know, my response to that is, no, we did
- 18 not ignore that but, in fact, that SNWA ignored the specific
- 19 temporal distribution of pumping from the different CSI wells.
- So, in fact, when you look at those wells, you
- 21 have to take into account the pumping that's occurring on the
- west side and the pumping that's occurring on the east side of
- 23 that block in order to understand why those production wells
- 24 support -- support our analysis.

- 1 A. Right.
- 2 Q. Go ahead and explain.
- 3 A. So Rebuttal Slide Number 12 shows you how we
- 4 viewed those similarities. You can see -- again, I don't want
- 5 to -- and, you know, so there's some of this information on
- 6 this graph.

12

- 7 But as you look at it, the bars on the bottom are
- 8 individual pumping in the Coyote Springs. Gray is pumping
- 9 from CSI-1. Yellow is pumping from CSI-2. Blue is pumping
- 10 from CSI-4, and green is pumping from CSI-5. And -- and then
- 11 kind of orange-pink is CSI-3.
 - So we can see -- and I believe that we've all
- 13 looked at this hydrograph many times today. And what the --
- 14 what we -- what we're presenting here is the fact that MX-4,
- 15 CSVM-6, and UMVM-1 are all responding identically.
- What I've done here for presentation purposes is
- 17 I want to make sure that we're not showing the true elevation.
- 18 It's important for everybody to understand what these are is
- 19 these are hydrographs that are all shown on -- based on the
- same scale, but they've been offset so that we can show you
- 21 exactly how they compare.
- It's just an important -- the right axis -- it's
- 23 important to understand that we're not trying to say that
- 24 these are the actual evaluations but rather, they're relative

Page 114

- CSI-1, -3, and -4, those -- those wells that are
- 2 located on the west side, they do behave differently than
- 3 those wells that are located on the east. I'm going to show
- 4 you that in a second.

1

- 5 But also, I wanted to point out that, you know,
- 6 we're not alone in this. Others have also identified that
- 7 there is a lack of information or lack of data that really
- 8 supports any type of hydraulic connection between -- between
- 9 the west and the east side.
- But if you look on 11, on Slide 11 -- you know,
- 11 the purpose of Slide 11, again, is to remind everybody where
- 12 all these wells are.
- So we look at the carbonate production wells, and
- 14 those are in blue: CSI-4, CSI- -- CSI-3. I'm kind of going
- down and CSI-3, CSI-1, CSI- -- and MX- -- MX-5. So we look at
- 16 those wells and we also look at those monitoring wells which
- 17 is UMVM-1, which is the upper part of the Muddy River Springs
- **18** area. CSVM-1 or -- and also CSVM-6 -- no, I'm sorry, MX-4 and
- 19 CSVM-6. Those are the monitoring wells that I want to show
- 20 you in the next slide.
- So when we look at Slide 12 --
- 22 Q. Let's refer to these as rebuttal slides so
- 23 they're different than the ones that you previously -- so this
- is Rebuttal Slide Number 12, please.

- 1 change in elevations from one to another.
- 2 So I think, you know, this really shows that.
- 3 And then we go ahead and we look at CSI-2, so when we throw on
- 4 the available data from CSI-2, we can see that it too also
- 5 behaves quite similarly to CSI-1 -- I mean MX-4, CSVM-1,
- 6 CSVM-6 and UMVM-1.
- 7 It's the same things that we talked about today.
- 8 It's -- it's the recharge in '05 event that you see the rise
- 9 in groundwater levels. It's a decline over the -- over the
- long period down to 2013 at the end of the test.
- It's a -- you know, it's a slight pump up in 2010
- due to the recharge event in 2010 and then flat conditions
- kind of over the last four or five years. But what's really
- 14 important that we look at is -- is also that -- that response
- that occurred in 2011.
- So -- so, you know, the data, I think, are pretty
- 17 remarkable that, you know, we have these observation wells and
- 18 monitoring wells, and we can compare, you know, nearby
- 19 production wells. They're all -- they're all pretty much
- 20 behaving the same.
- 21 And --
- 22 Q. Can I interrupt because I think we have
- approximately ten minutes left, and I want to cover some
- 24 ground with you.

Min-U-Script® Capitol Reporters (29) Pages 113 - 116 775-882-5322

Page 120

Page 117

- 1 What you have now displayed is Rebuttal Slide 13;
- 2 correct, sir?
- з A. Right.
- 4 Q. And that's slide from which you were just
- 5 testifying?
- A. That's correct.
- 7 Q. And the significance of Rebuttal Slide 14 to this
- 8 hearing is what, sir?
- 9 A. The significance is is that the characterization
- 10 of the other production wells: CSI-1, CSI-3, and CSI-4 are
- 11 different than what we see when we compare CSI-2, MX-4,
- 12 CSVM-1, and CSVM-6.
- 13 Q. Does that reflect the significance of the block
- 14 that you referred to?
- 15 A. The block?
- 16 Q. The fault.
- 17 A. Oh, the fault. I'm sorry. Yes, it reflects the
- 18 importance of the structural block that exists between the
- 19 west and eastern sides of the Coyote Spring Valley.
- 20 Q. How so?
- 21 A. Because it works to isolate the hydraulic
- 22 connection between the two.
- Again, we go back to this idea that these nominal
- faults -- not just those along the block, but other normal

- 1 the -- one of the things that we want to point out here is
- 2 that they identified that steady-state conditions were not
- 3 reached in EH-4 until late 2015, and spring flow and
- 4 streamflow were relatively constant.
- 5 And I apologize for that typo where it says 2017
- 6 to 2017. It should be 2015 to 2017. So that's -- that's an
- 7 error I made.
- 8 Q. In the first bullet point?
- 9 A. In the first bullet point.
- 10 Q. Thank you.
- 11 A. So one of the things that -- that really kind of
- struck us was that it doesn't really account for local
- 13 pumping. And so this is, again, you know, what -- what is the
- 14 impact of local pumping on nearby spring flow and nearby
- 15 observation wells and how does that get taken into account
- 16 when you're trying to assess, you know, what -- what the --
- 17 what the resources are and how those resources react along
- with that and climatic conditions. I think that's best
- 19 described in Slide 17.
- 20 Q. Rebuttal Slide 17, please.
- 21 A. I'm sorry. Rebuttal Slide 17.
- And in Rebuttal Slide 17, you can see that, you
- 23 know, we -- we -- the green bars along the bottom are pumping
- 24 in carbonate wells in the Muddy River Springs area, and the

Page 118

- 1 faults that we've identified -- create these preferred flow --
- 2 flow ways and pathways.
- And that in a perpendicular direction, we see
- 4 that not only the faults but also the structural blocks can
- 5 act as barriers to groundwater flow in a perpendicular
- 6 direction.
- 7 Q. Did you analyze the reports submitted to the
- 8 State Engineer's office by the United States Fish and Wildlife
- 9 Service?
- 10 A. Yes, we did.
- 11 Q. And would you take a look at Rebuttal Slide 15
- and explain your analysis and findings, please.
- 13 A. We looked at the Fish and Wildlife report, and,
- 14 again, we disagreed with the assessment of the amount of
- 15 groundwater that can be pumped from the Lower White River Flow
- 16 System.
- And I think that, you know, a lot of the basis
- 18 for our disagreement really comes down to the importance of
- 19 the hydraulic variability that we see in the system and how
- 20 groundwater levels are driven by that hydraulic variability.
- 21 Q. With respect to Rebuttal Slide 16, does that show
- 22 the analysis that you just referred to with respect to FWS's
- estimate of groundwater availability?
- 24 A. Yeah. I think it does. And I -- I think one of

- 1 squiggly line on the top with the hydrograph with the annual
- 2 variability, that's something that we've looked at for the
- 3 EH-4 before. And then, of course, the straight solid black
- 4 line is the cumulative departure from mean.
- 5 But what really struck out from us on this is the
- 6 fact that from 2013 to 2014, average pumping from those
- 7 carbonate wells in the Muddy River Springs area is about
- 8 1442-acre-feet. But when we get to 2015 and 2017, that
- 9 average pumping has increased to about 2700.
- So you can see that when you look at the
- 11 hydrograph, if anything, there's been a slight recovery with
- increased pumping rate in that, but in that near vicinity of
- the Muddy River Springs area.
- But, again, while pumping plays a big role in
- describing, you know, the characteristics of a hydrograph,
- 16 it's also the -- the climate that can't be ignored on how that
- 17 also affects it.
- 18 Q. This might be a question better suited for one of
- 19 your colleagues, but was the Series C's analysis reliable in
- 20 your opinion?
- 21 A. You know, I -- Miss Jean Moran reviewed the
- 22 hydrogeologic aspects of both the Theis and the SeriesSEE, so
- 23 I'm going to defer to her to answer that question.
- MS. MORAN: The SeriesSEE is a spreadsheet

Min-U-Script® Capitol Reporters (30) Pages 117 - 120 775-882-5322

Page 124

Page 121

adaptation of handling the Theis curve, and it is developed bythe USGS. And it calls upon a Fortran code to solve for the

3 distribution of drawdown based on pumping.

And I did not do SeriesSEE. I mean, I do

5 numerical modeling and fairly complex models, but I do not do

6 this particular analytical tool.

7 So I did do the simplified Theis equation, as I

8 presented earlier, and I showed that as a cross-check, looking

9 at the SeriesSEE, if you had two wells pumping and their

distances and their two-year average pumping that was during

11 that pumping test, what effect would be at roughly VH-4.

How the report goes with SeriesSEE, it's an

appendix, and it's Appendix A. It is a really -- it's a good

14 analysis of things other than we do not have all of the data

to cross-check it.

4

19

But when I cross-checked it with my very simple model, it showed that it had more influence from a well

pumping further away than a well that was closer.

So the -- the simple cross-check that I did

20 didn't check out with the SeriesSEE. I have no way of knowing

21 what the -- the -- the assumptions were that were used.

22 Clearly, we probably used different T's and different S's,

23 which were the hydraulic properties. But we would have used

24 the same, and it should have been relatively the same for

1 A. Yes, I disagree with that value because, again,

2 it's these hydraulic barriers and flow paths that, you know,

3 that support pumping in different parts of the Lower White

4 River Flow System, as I've shown in my previous water budget,

5 upwards of 30,000-acre-feet per year.

HEARING OFFICER FAIRBANK: Mr. Robison, just to

7 let you know that you're at your three hours if you wanted to

8 reserve your 30 minutes for rebuttal.

MR. ROBISON: I'm going to intrude on the

10 redirect time for three minutes or less.

HEARING OFFICER FAIRBANK: Sounds good.

MR. ROBISON: Mr. Reich, would you please turn

your attention to Rebuttal Slide 25 and tell us what your

14 analysis is concerning the report of the Moapa Valley Water

15 District.

6

9

11

ANSWERS BY MR. REICH:

17 A. I'm sorry. We reviewed the -- the Moapa Valley

18 Water District report. And for the most part, what we found

19 was that we disagreed that the carbonate aquifer is in

20 somewhat of a steady-state condition.

So if you turn to Slide -- Rebuttal Slide 26,

22 they're stating that the aquifer is in a somewhat steady-state

condition, and while they don't specify an amount of

24 groundwater that may be pumped, they do state that, you know,

Page 122

1 those values.

The figure I'm referring to is in the 2013 July

3 report from Fish and Wildlife Service, and it's Page A.4-2.

4 What it shows is Arrow Canyon's contribution to EH-4's

5 drawdown would have been 0.7, and then MX-5 was 1.2.

6 So that's opposite just doing a cross-check. So

7 though I don't know SeriesSEE inside out, it's still the

8 simplified Theis equation, and to my knowledge, it didn't have

9 any recharge in it and it didn't have any boundaries in it

that could have been handled with image wells.

To my knowledge, that wasn't done. So I don't

12 have the full answer, but it put in question how this works.

13 Q. Would you please put up Rebuttal Slide Number 19

and let's turn our attention to the National Park Service.

Mr. Reich, did you analyze their initial report and find flaws in it?

17 ANSWERS BY MR. REICH:

18 A. Yeah, I reviewed the National Park Service

19 report, and one of the comments that they make in their report

20 is that gravity data should not be ignored when defining the

21 geometry of some of these basins.

22 Q. Do you agree with their suggestion that there's

less than 14,500-acre-feet per year available for the

24 administrative unit?

1 based on the -- Order 1303 that the current amount of pumping

2 corresponds to a period of time in which spring flows have

3 remained relatively constant and have not demonstrated a

4 continuing decline.

So, again, I wanted to stress the fact that

6 carbonate -- carbonate levels and spring flow in the Muddy

7 River system are driven by climatic conditions -- we've seen

8 that signature throughout today -- and that structural

9 features and heterogeneities also affect this -- affect

10 understanding and decisions that can be made regarding whether

we're in -- whether we're in steady-state conditions.

And also, importantly, we have seen similar rates of decline in -- in spring flow at the -- at the Muddy River

14 Springs.

5

12

13

I think it's -- if you go back and you look at

16 the record, you can see that, you know, following wet periods

in '99 and 2000, we saw rates of decline. While -- while the

18 minimum levels did not reach what we've seen, certainly the

rates themselves, we do see those rates of decline.

20 So understanding that hydrologic condition with

21 respect to how pumping -- pumping and recharge affect spring

22 flow -- and spring flow, I think, is really fundamental to

23 understanding the system.

24 Q. Mr. Reich, we have had an estimate of 4- to

Min-U-Script® Capitol Reporters 775-882-5322 (31) Pages 121 - 124

Page 125

- 1 6,000-acre-feet per year given by the Water Authority, 9318 by
- 2 Fish and Wildlife, something less than 14,5 from the Park
- 3 Service, and year similar, estimating that up to
- 4 30,000-acre-feet of availability for groundwater pumping in
- 5 the administrative unit.
- 6 Please explain why these -- your number is a
- 7 better number to be used by the State Engineer's office?
- 8 A. Well, I believe we brought forward today a set of
- 9 data and information that the State Engineer can use to assess
- and develop his own conceptual model and water budget.
- So what we've done today is we've provided that
- 12 information that provides a complete picture. I believe that
- 13 others have not provided that understanding of how the system
- works, where groundwater flows, how -- what it affects.
- You know, and that's something different, and I
- think -- you know, we hope that the State Engineer will
- 17 consider the data that we presented today and understand why
- 10 year think that that information can be used to access a numeric
- 18 we think that information can be used to assess a pumping
- number that can be used for the area.
- MR. ROBISON: Thank you, sir.
- 21 We'll submit this part of our case.
- HEARING OFFICER FAIRBANK: Thank you. So we have
- about 15 minutes until we're going to go ahead and break for
- 24 lunch. So if we want to go ahead and we can start -- the

- 1 swear in the witness?
- 2 HEARING OFFICER FAIRBANK: He's not a witness.
- 3 He's an attorney asking questions.
- 4 SPEAKER FROM THE AUDIENCE: Okay.
- 5 CROSS-EXAMINATION
- 6 MR. MILLER: Thank you.
- 7 I think we were trying to prioritize some of our
- 8 questions here, so I want to skip to the chase here.
- 9 I believe it's Ms. Moran did the SeriesSEE
- 10 analysis?
- MS. MORAN: I did not do the SeriesSEE analysis.
- 12 I did a Theis equation checking the SeriesSEE analysis.
- BY MR. MILLER:
- 14 Q. Okay. Well, in relation to the SeriesSEE
- analysis by the Fish and Wildlife Service?
- 16 A. Yes. That's correct.
- 17 Q. Okay. Would you agree or are you aware that the
- 18 data interpreted using SeriesSEE Curve-fitting by DOI in 2013
- 19 like monthly pumping at major wells within the -- within the
- 20 study area, groundwater level data collected and reported in
- 21 that study area is available on the Nevada Division of Water
- 22 Resources' online and publicly accessible website?
- 23 A. Yes. I'm aware of that.
- 24 Q. Would you also agree that the -- the USGS

Page 126

Page 128

- 1 first participant for asking questions of the panel for
- 2 cross-examination purposes is the United States Fish and
- 3 Wildlife Service.
- 4 And so if they have any questions, I'm going to
- 5 go ahead and give you guys 14 minutes to go ahead and make
- 6 that presentation.
- 7 And before you start asking questions, if you'll
- 8 just go ahead and state your name and make an appearance for
- 9 the record. And just for the purposes of making appearances
- today, I'm going to ask each of the attorneys to do so when
- 11 they speak.
- We're also going to go ahead and, for purposes of
- identifying all the parties that are here, mark as an exhibit
- 14 the sign-in sheet. So if there's participants who have not
- signed in on the sign-in sheet, please make sure you do so
- 16 before the close of business today.
- Go ahead.
- MR. MILLER: Okay. My name is Luke Miller. I'm
- with the Department of the Interior's Office of the Solicitor
- on behalf of the Fish and Wildlife service.
- 21 SPEAKER FROM THE AUDIENCE: Madam Chair, are you
- 22 going to swear the witness?
- HEARING OFFICER FAIRBANK: I'm sorry?
- SPEAKER FROM THE AUDIENCE: Are you going to

- 1 SeriesSEE Excel add-in code is a public domain that has been
- 2 publicly available from I believe it's 2012 to present on the
- 3 USGS publications warehouse?
- 4 A. That's correct. 2012.
- 5 Q. Okay. And it sounded like you had familiarized
- 6 yourself somewhat with the SeriesSEE instructions, I guess we
- 7 want to call it, from the -- let's see if I found it here.
- 8 USGS Techniques and Methods, Halford, et al?
- 9 A. That's correct. It's available from the website.
- 10 I downloaded it.
- 11 Q. Okay. Well, do you agree with the USGS authors
- of that SeriesSEE regarding their characterization of the
- 13 purpose methodology employed and intended application of
- 14 SeriesSEE?
- 15 A. I -- I guess I'd like you to restate it.
- 16 Q. Yes. How about this.
- 17 A. Okay.
- 18 Q. Would you agree that it's essentially a
- 19 Curve-fitting tool as opposed to a distributed groundwater
- 20 flow model?
- 21 A. That's correct.
- 22 Q. Okay. Would you also agree with the authors of
- 23 SeriesSEE that the parameters of, say, the Theis transforms as
- 24 applied in that SeriesSEE Curve-fitting analysis are neither

Min-U-Script® Capitol Reporters

775-882-5322

(32) Pages 125 - 128

Page 129

- 1 intended to represent or serve as estimates of aquifer
- 2 parameters like such as transmissivity and storage
- 3 coefficients?
- 4 A. Well, I guess I'm not aware. Could you explain
- 5 what your statement means.
- 6 Q. Well, let's see here. Probably not, but give me
- 7 a second.
- 8 A. It seems a little twisted. If you state it
- 9 again, maybe I can --
- 10 Q. Okay.
- 11 A. -- figure it out.
- 12 Q. Well, we're trying to see if you agree with what
- 13 the authors of the SeriesSEE outlined as the use of parameters
- 14 or Theis transforms as applied in SeriesSEE in a Curve-fitting
- 15 analysis.
- Are they neither intended to represent or serve
- as estimates aquifer parameters?
- 18 A. They're not aquifer parameters. It's a
- 19 Curve-fitting. Yeah, it's still a little -- it sort of
- 20 misses.
- 21 Q. Okay. Well, I might just move on from that one.
- 22 A. Okay.
- 23 Q. So it sounds like you are knowledgeable about the
- 24 DOI's 2013 application of SeriesSEE to the analysis of the

- 1 do to solve this other than I didn't agree with the results.
- 2 And I -- it shows the different pumping in the basin and then
- 3 it -- it puts the relative impact to that particular
- 4 observation well from those wells.
- 5 So it's pretty straightforward that way other
- 6 than I didn't know what the assumptions were that went in.
- 7 Because some kind of knob is in there that has to be adjusted
- 8 to weight the different wells, and that -- it got weighted
- 9 such that a well closer that, in my estimation, should have
- 10 had more impact had less.

11

22

- It just sort of raised a red flag that I can't
- resolve without more background data here.
- 13 Q. So did I understand earlier when you were
- 14 testifying that it's not necessarily that the Fish and
- 15 Wildlife Service's SeriesSEE analysis is completely or
- 16 necessarily unreliable but that you're potentially missing
- some data in your perspective and to reproduce it?
- 18 A. That's correct with the caveat that just a simple
- 19 cross-check analytical model should be able to be
- 20 cross-checked. So do numerical models. You want to have a
- 21 cross-check in them so they don't become a black box.
 - And when I did my analysis, though simple, it
- should have ran as a cross-check to it -- relative
- 24 cross-check, not absolute. And, yes, it -- it is a SeriesSEE.

Page 130

Page 132

- 1 Order 1169 pumping tests?
- 2 A. Yes, I am.
- 3 Q. And the DOI's 2013 interpretation of those
- 4 reports?
- 5 A. Yes. They presented a series of graphs. It
- 6 was -- I could follow what they said, yes.
- 7 Q. And would you say that your approach to your
- 8 effort -- I believe you said it was a Theis -- central Theis?
- 9 A. Non-equilibrium well equation.
- 10 Q. And that was an effort to evaluate the SeriesSEE
- 11 analysis?
- 12 A. It was sort of independent. It was independent.
- But it did come from having the 2013 report available and that
- 14 they did use the Theis equation.
- And though I typically do numerical flow models
- that handle a lot more pieces in it and this is more
- analytical, I decided to do something similar but not -- it's
- not identical because it doesn't move those curves. But it
- 19 does solve for what would be a drawdown.
- And it helped while I was reviewing a report to
- see the relative impacts from the different pumping. I
- 22 suppose I should have showed something, but it's in your
- 23 report
- What's nice about these graphs -- I mean, I could

- 1 I have no problem with the program. I just don't have the
- 2 background information. So, yes, maybe background information
- 3 would resolve that, but I don't know.
- 4 Q. Okay.
- 5 MR. MILLER: No further questions.
- 6 HEARING OFFICER FAIRBANK: Okay. Thank you.
- 7 Next will be National Park Service.
- 8 CROSS-EXAMINATION
- 9 MS. GLASGOW: Good morning. I'm Karen Glasgow
- 10 with the Office of the Solicitor, Department of Interior, and
- 11 I represent the National Park Service. Hi. I just have a
- 12 couple of questions. Just sort of making sure I understood
- what you testified to earlier.
- 14 BY MS. GLASGOW:
- 15 Q. So I understood that you testified that you
- 16 believe an appropriate estimate for recharge to the Coyote
- 17 Spring Valley from the Sheep Range was 5,280-acre-feet per
- 18 year?
- 19 ANSWERS BY MR. REICH:
- 20 A. Yes. That's correct.
- 21 Q. Okay. And is it not true, then, at 520-acre-feet
- 22 per year that that's greater than the mean value of
- 23 34,348-acre-feet per year that is contained in Appendix C for
- 24 the recharge to -- why do I want to not say that right? -- to

Page 133

- 1 Coyote Spring Valley from the Sheep Range?
- 2 A. Yeah, I can -- I'll be happy to answer that. I
- 3 think it's a good point that you look at. So what we did --
- 4 and the appendix that you're referring to is the literature
- 5 review that we did for other -- other reports that were out
- 6 there.
- 7 And as Ms. Palmer mentioned, there were more than
- 8 12 different reports that we looked at to come up with that --
- 9 with that average, and there is different techniques used for
- 10 each one of those.
- What we did was we provided that information, so
- 12 I think people can ask a great question like that. But we --
- 13 we developed an independent analysis, and so our analysis was
- 14 independent. And while it might be greater, I don't know. I
- am -- I guess they are responsive to yes, it's greater than
- the average, yes.
- 17 Q. Thank you.
- You talked about barriers from both natural
- 19 faults that were mapped by CSANT and structural blocks that
- 20 were mapped by CSANT that coincide with geological mapping
- 21 from I think you quoted Rowley.
- 22 A. Yes.
- 23 Q. Okay. How permeable is this structural block?
- 24 A. Oh, so how -- we -- we assume that the

- 1 Do you agree with that, I guess, is a better
- 2 question? Do you agree that the Kane Springs contributes any
- 3 acre feet of whatever amount to the local recharge?
- 4 A. You know, so I think -- could you rephrase the
- 5 sentence -- or question because I think there's two questions
- 6 there. I'm not sure which --
- 7 Q. Well, my question was: The report says that Kane
- 8 Springs contributes 4,200 -- I'm rounding up, as you did --
- 9 acre feet of water to the tributaries to the Lower Water --
- 10 Lower White River Flow System and contributes to the local
- 11 recharge; correct?
- 12 A. That's correct.
- 13 Q. Okay. But now -- and so -- and so my question, I
- 14 guess, is do you agree with that statement, that the Kane
- 15 Springs contributes acre feet to this -- to the Lower White
- 16 River Flow System and to recharge?
- 17 A. Yes, I agree that the Kane Springs Valley
- 18 contributes regional recharge to the Lower White River Flow
- 19 System similar to the other tributary basins that I discussed
- 20 in my testimony.
- 21 Q. Okay. And so then I guess my question is:
- 22 How -- you indicated on page 55 of your July 3rd report that
- you did not believe that the Kane Springs should be included
- 24 in the Lower White River Flow System because of geologic

Page 134

Page 136

- 1 structural block is not permeable.
- 2 Q. Is it true that MX-5 actually is within the
- 3 structural block?
- 4 A. It's drilled right on the edge of the -- in the
- 5 structural block, which I would consider to be in the damage
- 6 zone of that structural block.
- 7 Q. Lastly, so you talked about the SNWA 2000 -- I
- 8 think --7 report?
- 9 A. Correct.
- 10 Q. Okay. And in that report, SNWA states that
- 11 there's 4,190-acre-feet in a tributary that contributes to the
- 12 Lower White River Flow System and to the local recharge;
- 13 correct?
- 14 A. I would have to look to review which tributary is
- 15 that.
- 16 Q. Kane Springs.
- 17 A. Kane Springs. Yeah, I can look. It will take me
- 18 two seconds --
- 19 Q. Okay.
- 20 A. -- and I can confirm that.
- Yes. We've summarized that in Table 9 as
- 4,200-acre-feet per year from Kane Springs based on the 2007
- 23 report
- 24 Q. But -- okay. So -- so yes, the report does.

- 1 characteristics.
- 2 A. Correct.
- 3 Q. Okay. So tell me -- explain how those two go
- 4 together. How is it if it's contributing to this recharge
- 5 that we're talking about, why is it not -- why is it, in your
- 6 opinion, not to be included?
- 7 A. Right. And the best way to describe that is if
- 8 we go back to my budget and I show that, you know, there is
- 9 inflow from Pahranagat Wash and there's inflow from Delamar
- and there's inflow from Kane and there's inflow from Lower
- White River Flow System, you know, we've stated before and Istated during our direct testimony that we agree with the
- stated during our direct testimony that we agree with the State Engineer's boundary for 1303, but we also state that
- these other resources need to be accounted for.
- So -- so we can -- we can isolate and manage the
- 16 Lower White River Flow System as per Order 1303, but in order
- 17 to understand how those resources occur and move through that
- 18 system, then it's important to understand what that regional
- 19 flow into the aquifer is.
- So -- so I treat Kane Springs the same way I
- 21 treat Delamar and Pahranagat and the other basins, and that is
- 22 as a source of regional groundwater inflow into -- into the
- 23 basin.
- 24 Q. But ones that should not be included as part of

Min-U-Script®

Page 137

- the flow system that we're talking about here?
- A. It -- the answer --2
- O. For management. 3
- MS. GLASGOW: Okay. Thank you very much. 4
- THE WITNESS: Thank you. 5
- HEARING OFFICER FAIRBANK: All right. It is 6
- noon, so we will go ahead and take a break for lunch. 7
 - And then we get back, next up for
- cross-examination will be the Moapa Band of Paiute Tribe, and 9
- we'll continue on down the list. 10

11 Thank you very much, and we will be back and start promptly at 1:00 p.m. 12

(Lunch recess at 11:59 a.m.)

13

know, for the purposes and substitute that for the reports in 16

17

scheduling order. 18

With that being said, we'll go ahead and move on 19

20 21

Band of Paiute Indians, and with me is Debbie Leonard, local 22

counsel. I just have a few questions. 23

24

1 CROSS-EXAMINATION

- 2 BY MS. BALDWIN:
- 3 Q. Mr. Carlson, you testified that fault zones can
- be narrow and may not correspond to surface features; is that
- correct?
- A. Yes, that's true.
- 7 Q. And, Mr. Reich, is it accurate to say that known
- faults depicted on geologic maps may be located differently
- 9 than assumed?
- ANSWERS BY MR. REICH: 10
- 11 A. Yes, it is. We used geophysics to redirect where
- those faults were going to be located. 12
- 13 Q. And the C -- I'm going to get this wrong. The
- CSAMT survey was only in Coyote Springs Valley; correct?
- 15 A. Yes, it was only in Coyote and -- yes, Coyote
- Springs Valley. I'd have to overlay it. They're -- yes, it
- was. I was concerned -- the reason I hesitated was because it
- might have been in the northern part of Muddy River Springs
- area, but no, it was all in Coyote Springs Valley.
- 20 Q. Would -- could undetected or mislocated faults
- exist elsewhere in the Lower White River Flow System?
- 22 A. Yes.
- 23 Q. And would you agree that accurate description of
- groundwater flow depends upon knowing fault locations?

Page 140

CARSON CITY, NEVADA, MONDAY, SEPTEMBER 23, 2019, P.M. SESSION

-o0o-

HEARING OFFICER FAIRBANK: And I -- just as a

- regards to the introduction of the PowerPoints or the use of
- the PowerPoints, just to go ahead and clarify to make sure 8
- 9 that the record and the parties are abundantly clear that the
- PowerPoints will be maintained in the hearing -- in the hearing record as demonstrative exhibits. But they are not 11
- the substitute for the reports or the exhibits submitted by 12
 - So just as -- they'll be maintained in the
 - hearing file, but they are not going to be relied upon or, you
 - evidence that was submitted by the parties pursuant to the

 - and next up will be the Moapa Band of Paiute Indians. MS. BALDWIN: I am Beth Baldwin for the Moapa

- 1 A. Yes.
- 2 Q. And just to confirm, the panel concluded that the
- carbonate aquifer is heterogenous throughout its entire
- 4
- 5 A. We identified the heterogenotes in Coyote Spring
- Valley Muddy River Spring area based on the work that we 6
- presented today. My -- we did not present evidence today 7
- about heterogenotes outside of that area, but based on review 8
- 9 of Rowley's map and my review of reports by others, there are
- 10 both thrust faults and normal faults that exist throughout the
- rest of the Lower White River Flow System. 11
- 12 MS. BALDWIN: Thank you. That's all.
- HEARING OFFICER FAIRBANK: Thank you. Next will 13
- be Southern Nevada Water Authority and Las Vegas Valley Water 14
- District. 15
- MR. TAGGART: Is it possible to have the 16
- PowerPoint up on the screen? I'm going to have a few 17
- questions for him. 18
- MR. HERREMA: Which PowerPoint? 19
- MR. TAGGART: Both. Starting though with the --20
- HEARING OFFICER FAIRBANK: Mr. Taggart, will you 21
- make sure your mic is on? 22
- MR. TAGGART: Yes. If it's possible, I may have 23
- some questions about each one of the PowerPoints. 24

Page 141

- HEARING OFFICER FAIRBANK: Okay. Looks like it's 1 2 up.
- MR. TAGGART: Thank you. I want to make sure we 3
- have a clock going. 4
- HEARING OFFICER FAIRBANK: I have one, too, so 5
- don't worry about that. 6
- MR. TAGGART: All right. 7
- **CROSS-EXAMINATION** 8
- BY MR. TAGGART: 9
- Q. Good afternoon, panel. My name is Paul Taggart. 10
- I represent the Southern Nevada Water Authority and the 11
- Las Vegas Valley Water District, and I have a few questions 12
- 13 for you.
- First, to Mr. Reich, from your testimony, do you 14
- 15 agree that alluvial pumping in the Muddy River Springs area
- affects the Muddy River? 16
- ANSWERS BY MR. REICH: 17
- A. Yes. 18
- Q. Okay. And I think in your report, you indicated 19
- immediately it affects the Muddy River; right? 20
- A. I'd have to get the exact wording, but my intent
- would be that immediately, yes.
- Q. Okay. Would it be fair to characterize that as a
- one-to-one effect from pumping versus capture of river flow at

alluvial pumping in the Muddy River Springs area?

- to the geologic map from Rowley and that are reflected on 1
- this? And let me -- what I'll ask you first is, there's a 2
- dotted line that runs along the highway. I'm going to refer 3
- to that as the Highway Fault. Do you see the one I'm talking
- A. Are you suggesting there's CSM-5? CSM-5 -- or
- no, CSI-4?
- Q. Well, there's a Highway 93. Do you see that?
- A. Oh, no, I'm just saying there's two parallel
- dotted lines along Highway 93. There's one on the left and
- one on the right. 11
- 12 Q. Okay. So you see the Highway 93 there?
- 13 A. Yes.
- 14 Q. And you see where CSI-4 is located right on the
- 15 highway?
- 16 A. Yep.
- 17 Q. And just to the right of that is a dashed line
- that runs parallel to the highway. Do you see that?
- 19 A. Correct.
- 20 Q. And I'm going to be referring to that as the
- Highway Fault. And is that new in your analysis to any prior
- geologic understanding of the area? 22
- 23 A. That is a fault that Mr. Carlson's identified
- earlier in his testimony that we would use Rowley's fault and

Page 142

- Page 144
- 2 A. I'm sorry. Could you repeat that because -- is
- it the -- just one section at a time. I'm sorry.
- Q. That's fine. I'll move on.
- 5 A. And also -- no, I --
- Q. I have very short time, so I'll just move on. 6
- Do you also agree that carbonate pumping in the 7
- Muddy River Springs area affects the Muddy River Springs? 8
- 9 A. Yes, I do.
- Q. Okay. And you also agree that pumping in the 10
- Coyote Spring Valley at MX-5 does impact the Muddy River 11
- Springs; is that correct? 12
- 13 A. Yes, I do.
- Q. Okay. Now, I have a couple questions for you
- from Figure 10 in your report. And maybe I'll just use your
- PowerPoint, but I didn't see this one. 16
- 17 A. Oh, my report. I'm sorry.
- Q. Yes, Figure 10 is on page 26 of your report?
- 19 A. Yes, I'm looking at it now.
- 20 Q. Great. So is it fair to say that this figure
- represents your modification of the Rowley geologic 21
- understanding from 2017? 22
- A. Yes, it's a close proximity.
- 24 Q. So let's go through. What changes did you make

- move that to the west.
- 2 Q. Okay. So is that fault located in any other
- geologic literature prior to your report?
- 4 A. Yeah, I believe that's -- it's located and I have
- a -- located in Rowley, that we would take that and move it to
- the west.
- 7 Q. Okay. Now, what other modifications have you
- made to the Rowley map?
- A. The boundary fault that's running through CSI-3
- and just to the right of CSI-1, that was the fault that would
- be on the west side of the structural block.
- Q. Okay. Now, I have a question for Mr. Carlson.
- So, Mr. Carlson, you see the -- good afternoon, 13
- 14 sir.
- ANSWERS BY MR. CARLSON: 15
- 16 A. Yes, hello.
- 17 Q. Do you see the figure that we're talking about?
- 18 A. Yes.
- 19 Q. Okay. And do you see where the A-A prime
- cross-section is located on that map?
- 21 A. Right.
- Q. Okay. Now, I want to ask you about that
- cross-section. And in your PowerPoint at slide number 17, 23
- could we put that up, please?

Min-U-Script® (36) Pages 141 - 144 Capitol Reporters 775-882-5322

Page 148

Page 145

- Okay. Now, you see we're on Figure 10 from the 1
- CSI number one, the expert report from Mr. Reich and others, 2
- do you see where the A-A prime cross-section crosses this 3
- Highway Fault we've been talking about? 4
- A. Right.
- Q. Do you see that?
- A. (Nodded head.)
- Q. Okay. Now, I want to read from your report,
- which is an appendix to CSI number two. Are you familiar with
- that document? 10
- 11 A. Yes.
- 12 Q. All right. And on page 7 of that document, it
- says -- it describes some man-made culture, some noise in that 13
- area on the west end of that cross-section. And when I'm 14
- 15 looking up at the screen, I'm asking you specifically about
- the area between site 1500 and site 3300. Do you see that? 16
- 17 A. Yes.
- Q. And is that -- that's the area Mr. Reich is 18
- relying upon for the location of the Highway Fault; correct? 19
- A. No. The Highway Fault is just to the west of
- that. That -- the label on there, that's the zone of cultural 21
- effects I mentioned, man-made conductive features. 22
- They were doing some construction of some sort 23
- there, but there's man-made conductive features, pipelines, a 24

- reasonable?
- 2 A. No, west of 2,000. The data in between the
- cultural noisy things that were causing us problems and to the
- west end of the line, that was good data.
- Q. Okay.
- A. From approximately 2,000 to 3,000 roughly is
- noisy data that we consider invalid.
- Q. All right. Now, Mr. Carlson, are you confident
- that 5,000-acre-feet of water can be pumped to the west side
- of the Highway Fault based on your resistivity data alone 10
- without causing impacts to the Muddy River or the Muddy River 11
- 12 Springs?
- 13 A. I'm not a hydrologist, so I cannot answer that.
- I can answer questions about the data, the resistivity, and 14
- 15 the measurements made. But I'm not a hydrologist, so I don't
- know what can be pumped. 16
- 17 Q. But in -- given your expertise, do you consider
- the resistivity data, itself, and alone to be sufficient to
- make a conclusion I just asked you? 19
- A. No, I can't draw that conclusion myself, A,
- because I'm not a hydrologist, and B, because we have two 21
- lines of data that show a fault. But, hydrologically, what's 22
- happening from one side to the other is for the geologists and 23
- the hydrogeologists to work out. 24

Page 146

- lot of electrical noise. So that area there, I can't quite 1 Q. Okay. Now, Mr. Reich, back to Exhibit 10 -- I'm
- see the label, but that area you just named is the cultural sorry, Figure 10 from your report, so the Highway Fault I
 - asked about, that was moved and modified from where Rowley had
 - it; is that correct?
 - ANSWERS BY MR. REICH: 5
 - A. That's correct.
 - 7 Q. Any other changes based upon your analysis to
 - what Rowley found in 2011?
 - A. Can I pull Rowley out real quick and I'll tell
 - 10
 - 11 O. Well, I don't really have time for that. So --
 - 12 A. Yeah, that was the major change, yes.
 - Q. Okay. I want to ask you about the water budget
 - analysis that you did. Do you know how much water the State
 - Engineer indicated in ruling 6255? 15
 - And first of all, are you familiar with ruling 16
 - 6255 that established the joint hydrologic area for 17
 - considering pending applications for groundwater rights? 18
 - A. Yes, I'm familiar with it. 19
 - 20 Q. And are you -- do you know how much water the
 - State Engineer indicated was available as perennial yield in 21
 - the Lower White River Flow System in that order? 22
 - A. Available for perennial yield? I'd have to --
 - I'd have to go back and review the order. My understanding

- effects. 3
- Q. Okay. So in your report, you state "the very
- unusual resistivity data near the west end of the line, line
- A, and the upper thousand feet of this section centered at 6
- station 2100 is likely the result of noise and is not likely a 7
- valid geologic structure," right? 8
- 9
- Q. And east of approximately station 3300, the data 10
- appear reasonable, right? 11
- 12 A. Right.
- Q. So isn't it -- is it fair to say that the
- resistivity data west of the 3300 section should not be
- considered because of the noise or the data?
- 16 A. No. I say that the infrastructure that's being
- built and causing the noise is in the vicinity of stations 17
- 2,000 to 3,000, approximately 2,000, depending on exactly 18
- where the -- where you land on the GPS. West of approximately 19
- 20 station 2,000 appears to be valid data.
- Q. Okay. Even though, in your report, it says east 21
- of approximately 3300, the data appear reasonable? 22
- A. Right.
- 24 Q. Now you're saying the data east of 2,000 appear

Page 152

Page 149

- was that the order was looking at additional water rights 1
- applications for appropriation and that the order decided that 2
- there was none available. 3
- Q. All right. Let me ask you to assume for the
- purpose of my question that he indicated that 50,000-acre-feet
- is the perennial yield available in the Lower White River Flow
- System. Do you know how much of that perennial yield is
- allocated to the Muddy River itself? 8
- How many acre feet of perennial yield to the 9
- Lower White River Flow System should be reserved for the flow 10
- of the Muddy River? 11
- 12 A. Based on what was stated in 6255?
- 13 Q. Yes.
- 14 A. No, I do not know with 6255. I would have to go
- 15 back and review that document.
- Q. Okay. Would you disagree that 37,000-acre-feet 16
- 17 was the predevelopment flow of the Muddy River on average?
- A. No, I would not disagree with that. 18
- O. So if those numbers are correct and the State 19
- Engineer indicated that 50,000-acre-feet was the perennial 20
- yield and 37,000-acre-feet needed to be reserved for the 21
- river, that only would leave 13,000-acre-feet of perennial
- yield for the Lower White River Flow System, right?
- 24 A. Yes.

- recharge that you calculated in Coyote Spring Valley?
- 2 A. Yes.
- 3 O. Okay. So for that recharge, you used the PRISM
- data set for precipitation and you used the Maxi Eakin
- coefficients to generate a recharge value; is that correct?
- A. Ms. Palmer can respond to that question.
- 7 Q. Go ahead.
- ANSWERS BY MS. PALMER:
- A. No, we looked at four different empirical
- recharge models. We did do the analysis with the Maxi Eakin 10
- method, but those have been shown to not be valid for use with 11
- the more modern precipitation data sets. They are married to 12
- the Hardman precipitation map, which is based on older data. 13
 - So our analysis is based on two citations, which
- 15 are in our July 3rd report that come from one from the USGS
- and one from -- sorry, the other reference is XD -- we have 16
- 17 those citations.

14

- Q. Well, then do you have an independent calculation
- of recharge in this analysis?
- 20 A. Yeah, it's --
- MR. REICH: Recharge from the sheep range. 21
- 22 Q. Yes, recharge in the sheep range. Do you have an
- 23 independent calculation of that value in this report?
- 24 A. Yes.

Page 150

- 1 Q. And what precipitation data did you use?
 - 2 A. The PRISM precipitation data, which is based on
 - 1981 to 2010 data.
 - 4 Q. And what coefficients did you use?
 - A. I'd have to look in the report to tell you that.
 - HEARING OFFICER FAIRBANK: Mr. Taggart, your time 6
 - 7 is up. If there's time remaining at the end, we can go ahead
 - and open it back up for further questions. 8
 - 9 MR. TAGGART: Thank you.
 - HEARING OFFICER FAIRBANK: Next up is Moapa 10
 - Valley Water District. 11
 - **CROSS-EXAMINATION** 12
 - MR. MORRISON: Good afternoon. I'm Greg Morrison 13
 - and I represent Moapa Valley Water District. Let me get my
 - timer going. 15
 - Okay. Just a few questions here for you, a 16
 - 17 couple of things that I thought might be inconsistencies or
 - maybe I didn't understand in the report. 18
 - First, I know we've talked about Kane Springs 19
 - 20 already. I don't think too much needs to be asked about that.
 - But I just wanted to ask, are you aware if there were any 21
 - 22 measurements taken in Kane Springs Valley pursuant to the 1169
 - pump testing? 23
 - ANSWERS BY MR. REICH:

- 30,000-acre-feet of perennial yield in the Lower White River
- Flow System, right?
- A. Yes.
- Q. Okay. And that calculation is based, in part, on
- your calculation of recharge; right?

1 Q. Okay. And your opinion is there's

- 7 A. Yes.
- Q. You have a water budget that uses recharge as one
- part of the equation to balance for the water budget, right?
- 10 A. Yes.
- 11 Q. And you calculate recharge using precipitation
- data from PRISM and the Maxi Eakin coefficients; is that
- correct? 13
- A. No, let's clarify this because what we -- we used
- estimates from SNWA on the entire Lower White River Flow 15
- System for the available water that's available from 16
- sustainable yield in the Lower White River Flow System. 17
- When we changed our methodology to look to see 18
- what was available in Coyote Springs Valley, we then performed 19
- 20 our own recharge analysis. So only in Coyote Springs Valley
- did we identify the 5280 of local recharge from sheep ranch. 21
- 22 In our analysis --
- Q. I understand, sir. So -- and I'm sorry if I 23
- asked the question inaccurately. I just want to ask about the

Min-U-Script® (38) Pages 149 - 152 **Capitol Reporters** 775-882-5322

24

Page 153

- 1 A. Are you specific about groundwater levels, or --
- Q. Yeah, I'm sorry. I think it's the KSV-1, 2
- alternately known as --3
- 4 A. Yeah, actually I saw the water level. We didn't
- review those as part of our July 3rd report. We saw those
- water levels. We didn't address it. But I'm saying we
- reviewed it, we didn't address it in our July 3rd report.
- Q. Levels were monitored, though, pursuant to the
- 1169 pump testing?
- 10 A. Yeah, there was -- yes.
- 11 Q. Okay. Quick question about the Theis analysis, I
- believe it was Ms. Moran, you completed that? 12
- ANSWERS BY MS. MORAN: 13
- A. That's correct. 14
- 15 Q. Okay. Now, you stated, I believe, that faults
- affect and/or disturb groundwater flows within a basin? 16
- 17 A. They can.
- Q. Or have the capacity to? 18
- 19 A. They have the capacity to, yes.
- Q. All right. And those faults and/or features,
- those aren't represented in any Theis analysis; is that
- accurate?
- 23 A. Not in the one I did. You have to use image
- wells to account for them.

- 1 Q. I have it in the report.
- 2 A. I have 49 as a figure.
- 3 Q. All right. Let me see. I could have left a typo
- in there.
- HEARING OFFICER FAIRBANK: Mr. Morrison, is it
- 6 page 48?

11

- 7 MR. MORRISON: Could be. It is, it's page 48 and
- it is the first full paragraph, first sentence on that CSVM-4,
- does not show a response to pumping, Muddy River Springs area 9
- or eastern Coyote Springs Valley. 10
 - So I'm looking at -- the data that supports that
- on page 5 of appendix E. And I'm looking at your hydrograph 12
- 13 of CSVM-4, and it looks to me like it reflects about a half a
- foot of drawdown at CSVM-4 during the 1169 pump testing. Is 14
- 15 that accurate?
- ANSWERS BY MR. REICH: 16
- 17 A. Yeah, I just want to make sure that we're looking
- at the same graph. It's CSVM-4, page 5 of the appendix;
- 19
- 20 Q. Yep.
- 21 A. Okay. Yeah, and we addressed this issue before
- and I think that what our -- what we see here is a response to
- the hydrologic and climatic conditions. 23
- 24 Q. Yeah, I understand that your conclusions were

Page 154

Page 156

- 1 Q. So this Theis analysis, it's a pretty simple tool
- when you're evaluating complex fragmented groundwater system?
- 3 A. It -- could you rephrase that? It's -- I think
- what I said was that it has some very simplifying assumptions
- to it and it doesn't represent what's happening here. And if you're saying that this is a very fragmented system, and 6
- 7
- therefore, it shouldn't be applied -- I don't understand your
- question. 8
- 9 Q. I guess what I'm saying is, I believe your expert
- reports, collectively viewed does say that this system is a 10
- very fragmented and complex system. With that being the case, 11
- is a Theis analysis not a somewhat limited utility? 12
- A. That's correct. 13
- Q. Okay. Let's see here. A couple things I wasn't
- real sure on within your reports. I think this is all for 15
- Mr. Reich. I want to ask about the effects on a couple of the 16
- wells or at least one of the wells from the 1169 pump testing. 17
- Page 49 of your initial report, I think you 18
- stated that CSVM-4 did not show response to Coyote Springs 19
- 20 Valley carbonate pumping. So that being the case -- and I'm
- looking at this -- this statement sites Appendix E, but the 21
- 22 statement's on page 49.
- A. So are you referring to the rebuttal report or 23
- the --24

- different. I just want to make sure that you do agree that
- there was a half a foot of drawdown show in that hydrograph 2
- from the course of the 1169 pump testing?
- 4 A. Okay. Let's see. So basically from 1874.5 to --
- yeah, a half a foot, maybe even more, but a half a foot.
- 6 Q. Okay. And there's a steady downward trend
- throughout the 1169 pump testing?
- 8 A. There is a trend consistent with -- yes.
- Q. All right. Now, Coyote Springs pumping began in
- 2005, I believe. And looking at this same hydrograph, I see 10
- about a foot of drawdown since CSI began its pumping. Does 11
- that look right to you?
- A. A foot of drawdown since -- so what I -- I'm not
- quite sure of the time frame that you're referencing. I see
- that --15
- 16 Q. '05 to the present.
- 17 A. From '05 to the present? Oh, so over the
- entire --18
- 19 Q. Since Coyote Springs began.
- 20 A. So over the entire period of record, yeah, I
- would agree with you that there would be, yeah, a -- what was 21
- the number you stated? 22
- 23 Q. About a foot?
- 24 A. About a foot.

Page 157

- 1 O. Give or take?
- 2 A. I would agree with a foot.
- Q. Okay. Thank you. I want to ask real quickly
- about page 32 of your rebuttal report. And while you're
- looking that up, at page 32, you state that from 2006
- through 2009, carbonate pumping throughout the Lower White
- River Flow System averaged about 7,000-acre-feet annually.
- From 2010 through 2013, carbonate pumping averaged about 8
- 9,000-acre-feet annually. 9
- So that 2,000-acre foot increase, you refer to 10
- it, page 32 of your rebuttal report, it does refer to those 11
- time frames in that 2,000-acre foot increase? 12
- A. 2006 to 2009, range from 6500, averaging 7,000. 13
- By 2010 to 2013, range 7500, averaging nine. So you -- what's 14
- 15 your question? I'm sorry.
- Q. Well, I haven't asked a question yet. I was 16
- 17 making sure we were on the same page.
- A. Oh, okay. I'm just getting caught up with you. 18
- O. All right. Great. So I want to talk about
- Pederson Springs and Pederson East. 20
- A. Okay.
- Q. Your footnote 58 and 59, I believe, is on that 22
- same page. You talk about the spring measurements at Pederson
- Springs and Pederson East. And October 2006, which is the

- in spring flows measurable?
- 2 A. Yes.
- 3 Q. Okay. That's all I have for you. Thanks a lot
- for your time.
- MR. REICH: Thank you.
- HEARING OFFICER FAIRBANK: Next will be Lincoln 6
- 7 County and Vidler Water Company.
- **CROSS-EXAMINATION** 8
- BY MS. PETERSON: 9
- Q. Hello, panel. Karen Peterson from Allison 10
- MacKenzie law firm, representing the County water district and 11
- Vidler Water Company. So I did have a copy follow-up 12
- questions. Slide 15 on your rebuttal presentation, I don't 13
- know if you can bring that up. 14
- 15 Mr. Reich, one of the items I think you discussed
- was questions regarding, including Kane Springs Valley into 16
- 17 the Lower White River Flow System boundaries, and you
- indicated in your rebuttal comments that Kane Springs Valley 18
- 19 should not be included. Do you see that?
- ANSWERS BY MR. REICH: 20
- 21 A. Yes, I do.
- Q. And did you have an opportunity, during the
- course of all these proceedings, to review all the CSAMT 23
- information performed by Zonge? 24

Page 158

Page 160

- start of the time frame we're discussing here, Pederson East
- flows were about .23 CFS? 2
- 3 A. Pederson East.
- Q. This is in footnote 58.
- A. Right. Yes.
- O. And the Pederson was .24 CFS? 6
- 7 A. Correct.
- Q. All right. So at the end of that time frame, 8
- which would be starting in 2006 and ending in 2013,
- October 2013, Pederson East was flowing at .1 CFS. Is that 10
- what your footnote 59 says or it might still be in 58? 11
- A. No, you're good. No, you're on the 59. Pederson 12
- Springs East spring flow was .1 in October 2013. 13
- Q. All right. And Pederson Springs was 0.7 CFS that
- same time?
- 16 A. Correct.
- Q. All right. So you agree, then, that from 2006 to 17
- 2013, Pederson Springs East flowed -- flows reduced from 0.23 18
- CFS to .01 CFS? 19
- 20 A. Yes, I do.
- Q. And the same time frame, Pederson Springs
- declined from 0.24 to 0.07; is that correct?
- A. Yes.
- 24 Q. All right. And would you consider those declines

- 1 A. Yes, I did.
- 2 Q. And what data supports your rebuttal conclusion
- on this slide regarding, including Kane Springs Valley and the
- boundaries?

10

- A. My understanding -- or my review of the data
- indicates that there's a series of en echelon faults that help 6
- to create a -- some type of a hydraulic barrier or a barrier 7
- to groundwater flow in this area that isolates the Kane
- 9 Springs Valley area from the -- from the Coyote Spring Valley.
 - And a lot of the data I looked at was also based
- on water level data that shows that there is a very large, a 11
- very steep hydraulic gradient between the two valleys. 12
- Q. And is the CSAMT information new data for the 13
- State Engineer to consider since the 1169 pump test?
- A. Yes. My understanding is that the data was 15
- performed or the survey was performed in March of this year. 16
- 17 Q. And to your knowledge, have you seen any other
- data provided by Southern Nevada Water Authority, the Moapa 18
- band of Paiute Indians, the U.S. Fish and Wildlife Service, or 19
- 20 the National Park Service? Any new information regarding
- locations of faults or geologic structures in this whole area? 21 A. I believe the Moapa band presented a conductive
- model -- or effective model, excuse me, a heat transfer using 23
- finite difference in the Colorado -- in this lower region. 24

Min-U-Script® (40) Pages 157 - 160 Capitol Reporters 775-882-5322

22

Page 164

Page 161

- So I believe that to be -- I first heard about 1
- that at a hydrologic review team meeting that we had at SNWA 2
- three or four months ago, and then looked at the presentation 3
- or the reports submitted by them. 4
- But besides that and the geophysical data, you
- know, without going back and reviewing all the reports, that's 6
- my only understanding of the new data. 7
- Q. And you were just asked some questions by
- Mr. Morrison regarding the hydrograph in Appendix -- I believe
- it's Appendix E for CSVM-4? 10
- 11 A. Yes.
- Q. Do you recall those questions? 12
- 13 A. Yes, I do.
- 14 Q. And what's -- do you have the hydrograph in front
- 15 of you?

HEARING OFFICER FAIRBANK: Next will be the City

- 1 A. I can look it up. I have it stated in my report.
- But, no, not off the top of my head.
- 3 O. That's fine. The well of MX-5 elevation is 1813.
- 4 A. Oh, the groundwater level.
- 5 Q. Yes, I'm sorry.
- A. Oh, I'm sorry. I thought you were asking about
- the surface level, so that's why I was -- no, yeah, 1813 is
- appropriate for that.
- Q. And does a groundwater elevation of 1811 at
- Pederson Springs sound about right to you? 10
- 11 A. Yeah. Yes.
- 12 Q. So because groundwater elevations are so similar,
- 13 how would one draw down the water table to capture ET without
- also impacting spring discharge? Are we . . . 14
- 15 A. Well, there's a question that I think we have to
- talk about, and that is one of the themes that we've really 16
- 17 promoted today is the idea that location of pumping has a
- great deal to do with how much pumping can be -- occur in the 18
- Lower White River Flow System. 19
- So when we talk about that and we talk about the 20
- structural control, so again, it's that normal faulting. It's 21
- the structural control that -- where we see flow paths that 22
- come through Coyote Springs down into Hidden Valley and Garnet 23
- and California wash or flow paths that go through Coyote 24

Page 162

- Spring Valley into Muddy River Springs area, California wash.
- I -- and we have to look at that as a whole. It's important 2
- that we see the whole picture. 3
- So why there are wells, and I've stated in my 4
- earlier testimony, that pumping on the east side of Coyote 5
- Spring Valley would absolutely impact groundwater levels and 6
- result in spring flow. There's also other locations where you 7
- can pump that necessarily do not go directly through Muddy
- River Springs area.
- Q. Thank you. Are you aware of what environmental 10
- impacts might results from capturing of evapotranspiration and 11
- 12 the die off of phreatophytic vegetation?
- A. I am -- I'm not a biologist, so I'm not going to 13
- opine on the impact of that. But I am aware that the 14
- groundwater level has a direct relationship on the health or 15
- the habitat that it supports. 16
- Q. Thank you. You state that there is 17
- 30,000-acre-feet of water available for pumping in the Lower 18
- White River Flow System per year; is that correct? 19
- 20 A. Yes.
- Q. How would -- sorry, are you aware of the 21
- significance of 3.2 cubic feet per second of discharge at the 22
- Warm Springs west? 23
- 24 A. Yes, I am.

A. Yes, it is. 23 24 Q. Are you aware of the elevation of well MX-5?

Page 165

- 1 Q. Would removing 30,000-acre-feet of water per year
- 2 from the ground in the Lower White River Flow System maintain
- 3 levels at the spring above 3.2 CFS?
- 4 A. It's a multi faceted response, and so I'm trying
- 5 to figure out the best way to respond to give you the answer,
- 6 because again, I just talked earlier about the location of
- 7 pumping and the importance that the location of pumping has on
- 8 the resources.
- And so when we talk about, you know, what is
- 10 sustainable and -- or what kind of pumping can occur, we
- 11 really have to focus in on what is actually causing that and
- controlling that -- those water levels.
- So if we're talking about pumping in, say, Garnet
- 14 Valley or pumping in certain parts of California wash, how
- does that affect Warm Springs west flow? How does that
- affect, you know, sub flow that might be captured as
- evapotranspiration in the bottom part of the Moapa Valley?
- So it's really -- the answer I want to provide to
- 19 you is that, yes, we can pump up to 30,000-acre-feet based on
- 20 how we distribute that pumping and how we use our conceptual
- 21 model to do that.
- 22 Q. Thank you. You stated that -- in your report
- 23 that your model is at least partially based on the Maxi Eakin
- 24 model; correct?

- 1 be slicing up a basin and evaluating pieces of it in that
- **2** fashion that you did?
- 3 A. I would say that, generally, the method is
- 4 applied to regional areas, but I think that there are some
- 5 applications that have been done for the scope of the size of
- 6 the sheep range is within the bounds of what's been done.
- 7 Q. Taking a broader look at the overall conceptual
- 8 model for the basin, do you assert that discharge equals
- 9 recharge?
- 10 ANSWERS BY MR. REICH:
- 11 A. In predevelopment conditions or --
- 12 Q. Yes, yes. Thank you.
- 13 A. Well, our budget shows that there's a difference
- of approximately 1200-acre-feet. I'd have to do the exact
- 15 math. But there's an imbalance in our budget of some -- I
- don't know, 1 or 2 percent or something.
- 17 Q. Do you have ideas as to where that 1 or 2 percent
- 18 comes from?
- 19 A. Oh, yeah. You know, the values could easily
- be -- you know, could be connected to evapotranspiration
- 21 because we got to remember, we're using different methods to
- 22 establish different fluxes in this budget.
- So while we might be using, you know, mass
- balance, deterrent mass balance to look at recharge rates and

Page 166

- 1 A. I'm going to let Ms. Palmer respond to the --
- 2 you're talking about local recharge from the sheep range.
- 3 Q. Thank you.
- 4 ANSWERS BY MS. PALMER:
- 5 A. Yeah, that's what you mean when you say "model"?
- 6 O. Yes?
- 7 A. No, it's -- the numbers that we presented are not
- 8 based on the Maxi Eakin coefficients.
- 9 Q. Without using the coefficients, was the
- 10 methodology based on the framework of Maxi Eakin, different
- 11 coefficients granted?
- 12 A. It's based on the same type of empirical model.
- 13 Q. Yes.
- 14 A. That relates precipitation to recharge. But it
- 15 is not the coefficients that were established by Maxi Eakin,
- but by papers and literature that established other methods
- 17 and other coefficients.
- **18** Q. Given that it's a different set of coefficients
- 19 with the same framework, was that framework designed to be
- 20 evaluating entire basins or -- I'll leave the question at
- 21 that.
- 22 A. Can you clarify what you mean by --
- 23 Q. The question is: Was the framework designed to
- evaluate recharge on an entire basin scale or is it meant to

- Page 168 fluxes of groundwater coming in, you know, we might be looking
- 2 at historical photographs or different precip or other records
- 3 to measure ET.
- 4 So there can be variations in those estimates,
- 5 which would explain why the budgets don't necessarily equal
- 6 out. You know, the goal of our budget was really to provide
- 7 the State Engineer what we felt was the best available data
- 8 for describing the 1303 administrative units. So we chose
- 9 consistency among data sets to provide that.
- 10 Q. Is the water being discharged generally from
- 11 recent origin and provenance or is water discharged from past
- epics, for instance, Pleistocene?
- 13 A. Yeah. So there's a -- you know, this is a great
- 14 question because I really enjoy this part of the geology and
- 15 hydrogeology because, you know, we got to remember, you know,
- 16 what has happened over the last 12,000 years compared to what
- might have happened over the last 40,000 years or
- 18 50,000 years.
- So, you know, as we've had the last ice age melt
- 20 off and, you know, you have this vision of this basin and
- 21 range area with these lakes and very, you know, paleo areas.
- And then what has happened to that -- you know, what I want to say recent water, you know, that's kind of
- recent water, that last, you know, 12 to 15,000 years,

Min-U-Script® Capitol Reporters (42) Pages 165 - 168 775-882-5322

Page 172

Page 169

- 1 whatever you want to call that last ice age, then compared to,
- 2 you know, some of the dating that we've seen in the recharge
- 3 estimates that we use. So I guess that's a very long way of
- 4 saying that there is older water in the system.
- 5 Q. Granted that, isn't it entirely possible that
- 6 there is more waters -- appreciably more water discharging
- 7 from the system than is coming in in new recharge, given that
- 8 the -- given that the knowledge of interbasin flow and
- 9 recharge is entirely speculative?
- 10 A. Sure.
- 11 Q. Isn't it entirely possible that this is fossil
- water discharging that will not be replaced?
- 13 A. Yeah. So there's two components to the
- 14 discharge. There's local recharge that we've identified, and
- so every year, there's a local amount of recharge that's being
- mixed in. And then there's the old -- you know, the
- groundwater flow system that we suggest starts as high up as
- in the Ely range where that flow has been drained through.
- So you -- if you -- if I understand your question
- 20 correctly, is -- are you asking me if discharge is greater
- 21 than recharge?
- 22 Q. Potentially. Isn't that possible?
- 23 A. Well, two things are going on. So I look at it
- as a -- the potential metric head, right? So let's say

- 1 Q. Well, let me clarify. Is there any reason to
- 2 believe that a predevelopment state in the Lower White River
- 3 Flow System was a steady state? Why do we assume that it was
- 4 a steady state?
- 5 ANSWERS BY MS. MORAN:
- 6 A. Right, because even our budget shows that it's
- 7 slightly not steady state with there being a difference in
- 8 what's an inflow and an outflow. It was the best numbers that
- 9 we have at the time. So we're going to start with the best
- 10 numbers that we have. I don't think we know to the nearest
- 11 foot, notice we round them at least somewhat.
- 12 Q. Right. Sure.
- 13 A. But yes.
- 14 Q. One final line of questioning to build on the
- 15 Moapa Valley Water District. We had talked about Kane Springs
- 16 Valley. Isn't it true that well KSV-1 declined slightly
- 17 during the pump test?
- 18 ANSWERS BY MR. REICH:
- 19 A. Could you -- I didn't present any information on
- 20 it. Could you provide me a view of an exhibit?
- 21 Q. I cannot. So I will withdraw that. I will
- withdraw that question. I cannot provide an exhibit.
- 23 A. We never presented in our reports, so --
- 24 Q. Okay. No more questions. Thank you.

Page 170

1

16

Capitol Reporters

- further upstream as the head drops, you know, the rate of flow
- 2 is going to decrease, right? So everything has to be in
- 3 balance.
- 4 And so something has to be -- something has to
- 5 give, like one of the -- when we look at that -- when that
- 6 budget, if recharge is going to go down, then discharge is
- 7 going to go down also, right, because that -- those budgets
- 8 have to balance out.
- 9 So maybe not only does discharge go down, but
- 10 also ET would go down and spring flow would go down. It would
- be a combination of all those different factors if you were
- 12 to -- if you were to suggest that recharge was going down
- 13 also.
- MS. MORAN: I'd like to look at it just a little
- bit differently, and that is if your question is if recharge
- is changing over time, it can be out of balance with discharge
- until the new steady state is reached.
- And that occurs all the time because if a change
- 19 in pumping occurs, there has to be a new steady state and that
- 20 can take 50 years or it could take ten years or it could take
- 21 100 years.

Min-U-Script®

- But if what you're asking is if recharge is
- 23 changed over historical -- not even historical, you're asking
- 24 for something prehistorical.

- HEARING OFFICER FAIRBANK: Next will be Georgia
- 2 Pacific Republic Industries Dry Lake.
- 3 MS. HARRISON: Good afternoon, panel. Sylvia
- 4 Harrison from McDonald Carano appearing for Georgia Pacific
- 5 and Republic Environmental Technologies.
- 6 Also appearing with me for Georgia Pacific is
- 7 Paulina Williams from Baker Botts in Austin, Texas, and Sarah
- 8 Ferguson from McDonald Carano for Georgia Pacific Republic?
- 9 Just to clarify the record, Broadbent prepared
- 10 its report for three entities, including Dry Lakes Water, LLC.
- Dry Lakes is not participating in these hearings
- 12 and we do not represent them. So with all of that being said,
- 12 and we do not represent them. So with an of that being said
- we have no questions for these witnesses.
- 14 HEARING OFFICER FAIRBANK: Thank you,
- 15 Ms. Harrison. Next is Nevada Cogen Associates 1 and 2.
 - CROSS-EXAMINATION
- 17 BY MR. FLANGAS:
- 18 Q. Hello, my name is Alex Flangas. I'll present
- 19 this to the panel. I'm not really sure if it would be best.
- 20 Referring to your CSI Exhibit 1, your initial
- 21 report, you show in Table 8, a predevelopment water budget for
- 22 the LWRFS based on SNWA's 2007 report. This is on page 41.
- ANSWERS BY MR. REICH:
- 24 A. Yes, I'm looking at it.

(43) Pages 169 - 172

Page 176

Page 173

- 1 Q. You essentially accepted that table and said that
- 2 table was essentially a valid water budget; isn't that
- 3 accurate?
- 4 A. Where do I state that? I'm just curious.
- 5 Q. Page 43. This third -- beginning of the third
- 6 full paragraph, the water budget provided in Table 8 and shown
- 7 in Figure 16 presents an initial budget that may be used for
- 8 groundwater sustainability in the LWRFS?
- 9 A. Yes, that's an accurate statement.
- 10 Q. And so essentially the water table you're showing
- 11 for inflows and outflows in Table 8, that's something you
- accepted as valid; correct?
- 13 A. We accepted the Table 8 as an initial budget for
- 14 the State Engineer to start his planning process. So I -- you
- know, we presented this budget because no other party, up to
- 16 this point, had put together a comprehensive budget that we
- were able to review.
- So we went and used the best data available to
- 19 provide an initial budget and we fully believe that initial
- 20 budget will be improved upon over the years as more
- 21 information is learned.
- 22 Q. But the budget you used drew from these various
- valleys that you have contained in the inflow; correct?
- 24 A. Yes.

- So I don't want to get confused with you on what
- 2 you're calling lateral or axes or whatever. But there -- I
- 3 think a great example, and we see this just southeast of MX-5
- 4 are these subparallel faults that are connecting -- that are
- 5 connecting the Coyote Springs Valley with the Muddy River
- 6 Springs area.
- So, no, there's other -- you know, not all faults
- 8 run northwest/southeast. There are a series of subparallel
- 9 faults that have been developed over different geologic
- 10 episodes.
- 11 Q. I'm not worried about all faults, sir. I'm
- 12 focused on the ones running from Kane Springs Valley into
- 13 Coyote Springs Valley. What does your -- what does your
- 14 mapping show?
- 15 A. Which map are you referring to?
- 16 Q. I'm looking at Figure 9.
- 17 A. It reflects the Rowley map. So this figure was
- 18 based on Rowley and others from 2017. So the purpose of this
- was to show the general geology.
- 20 Q. And what does it show, sir?
- 21 A. It shows a -- kind of a north -- so after -- I'll
- 22 go back to Mr. Taggart's Highway Fault. If you start down
- 23 towards the Highway Fault and work your way directly north,
- 24 there is a fault that's running approximately north, northeast

Page 174

- 1 Q. And Kane Springs Valley, you show 4200-acre-feet
- 2 coming in; correct?
- 3 A. That's correct.
- 4 Q. And then in Figure 16, which is on page 42 of
- 5 that report, you actually show the 4200-acre-feet coming in
- 6 from Kane Springs Valley; right?
- 7 A. That's correct.
- 8 Q. Didn't you just testify a little while ago about
- 9 a boundary condition, a fault that would prevent or a block
- that would prevent that water from coming in from Kane
- 11 Springs?
- 12 A. No, I did not.
- 13 Q. I thought that's what you just said a little
- 14 while ago, that there was not water coming in from Kane
- 15 Springs, that it was blocked?
- 16 A. No, I did not. I never said that.
- 17 Q. Okay. Isn't it consistent with your report on
- page 9 -- just so that I'm clear then, is it consistent with
- your Figure 9 -- not page 9, I'm sorry, Figure 9 that the
- 20 faults in that area run lateral to Kane Springs Valley?
- 21 A. No, we identify in our write-up, and are we on --
- we're on the July 3rd report. Yeah, there's a series of these
- 23 northwest/southeast trending faults and subparallel faults to
- 24 those.

- direction that runs along the northern part of Kane Springs
- 2 Valley. It also shows a fault system that runs along the
- 3 southern side of Kane Springs Valley.
- 4 Q. And the faulting system on the southern side of
- 5 Kane Springs Valley runs what direction towards Coyote Spring?
- 6 A. It runs in a northeast/southwest direction.
- 7 Q. Toward -- essentially, when I say "laterally,"
- 8 I'm talking this way, not crossways as a block towards Coyote
- 9 Spring; correct?
- 10 A. Laterally would be along the long axis of the
- 11 Kane Springs Valley.
- 12 Q. Along -- okay. Thank you, sir. So is it your
- contention, then, that the tables shown in Table 8 that shows
- the 4200-acre-feet flowing in is accurate?
- 15 A. Not -- it's a best available data that was --
- that we could use in order to provide the State Engineer. I
- think another example might be to look at some of the
- 18 literature review that we did for that.
- So there's a literature review, I believe
- 20 appendix C, that might be -- that might be helpful to look at.
- 21 But again --
- 22 Q. To answer that question, sir, do I need to go to
- 23 Appendix 3 to answer a question as to whether you find the
- 24 4200-acre-feet shown on Table 8 flowing into Kane Springs

Min-U-Script® Capitol Reporters (44) Pages 173 - 176 775-882-5322

Page 177

- 1 accurate or inaccurate? Do we need to look at Appendix 3?
- 2 A. No. I find it -- no, I find it's based on the
- 3 2007 SNWA report, we think it's a valid estimate for an
- 4 initial budget for the Lower White River Flow System.
- 5 Q. Thank you.
- 6 MR. FLANGAS: That's all the questions I have.
- 7 Thank you.
- 8 HEARING OFFICER FAIRBANK: Next would be Muddy
- 9 Valley Irrigation Company.
- THE STATE ENGINEER: Good afternoon, Steve King
- 11 from Muddy Valley Irrigation Company and we have no questions
- 12 for this panel.
- HEARING OFFICER FAIRBANK: And just so -- for
- 14 those individuals watching on the internet, that was Mr. Steve
- 15 King making his appearance and not having any questions.
- Next would be Bedroc.
- MS. SCHROEDER: Laura Schroeder, representing
- 18 Bedroc. I just have a couple of questions. Thank you.
- 19 CROSS-EXAMINATION
- 20 BY MS. SCHROEDER:
- 21 Q. You -- CSI estimated that there was about
- 5,280-acre-feet of recharge in the Coyote Spring Valley that
- originated in the sheep range.
- 24 My question is whether -- where CSI suggests that

- 1 A. Oh. So the mechanisms for recharge, I think, are
- 2 very -- it's very common what we see throughout eastern
- 3 Nevada. So there's a rainfall that occurs and, you know,
- 4 there's direct precipitation in the carbonate rock and there's
- 5 runoff that comes down. And that runoff also contributes to
- 6 and supports recharge directly into the carbonate and there's
- 7 also runoff into the basin fill.
- 8 So one of the things that we looked at also was,
- 9 you know, what happens to that basin fill water in that area
- 10 and what are the water level differences. So we were -- we
- 11 went through and we looked at some of the alluvial water
- 12 levels and saw that they were higher actually than that of the
- 13 carbonate aquifer.

14

- So our conceptual model, if we were to continue
- to describe it, would indicates that areas along the west
- 16 contribute -- the basin fill contributes into the carbonate
- 17 rock in that area.
- 18 Q. So is the flow on the west side of the Coyote
- 19 Spring Valley, is it at all hydrologically isolated from the
- 20 Muddy River Springs aquifer?
- 21 A. Is it all isolated?
- 22 Q. Is it isolated by a fault or other structural
- 23 impediment?
- 24 A. Yes. So I think now we're talking specific

Page 178

Page 180

- 1 that flow -- where is that flow going?
- 2 ANSWERS BY MR. REICH:
- 3 A. So the recharge that falls on the eastern side of
- 4 the sheep range, it contributes to multiple different
- 5 drainages along the base of the sheep range itself, or I
- 6 believe is it Steptoe, the Steptoe Range. The water comes
- down and then drains into the -- what we would call the
 western side of the Coyote Spring Valley. So that local
- 9 recharge is contributing with regional groundwater flow that
- 10 comes in from the north.
- 11 Q. Okay. And is that local flow, that flow on the
- western side then, is that something that can be pumped in
- that alluvial fill without impacting the carbonate aquifer?
- 14 A. So I'm also hearing two questions. I want to
- make sure I answer accurately.
- 16 Q. Um-hum?
- 17 A. So is your question whether the recharge
- 18 occurs -- what is your question because I hear a couple
- 19 different questions.
- 20 Q. All right. So we -- you've testified that we
- 21 have this flow from the sheep range that goes into the west
- 22 side. And my question is whether that is contained by -- in
- that area such that it's not contributing to the carbonate
- 24 flow?

- 1 elevations, right?
- 2 Q. Right.
- 3 A. So you -- you're -- and I don't mean to read into
- 4 your question, but you're asking, is there a mechanism or
- 5 there is a mechanism for water to flow from the west to the
- 6 east, is that what you --
- 7 Q. Yes. Is there or isn't there, yes?
- 8 A. No, it's a great question, and I think that's why
- 9 if we were to look at the very northern portion of Coyote
- 10 Spring up towards bedrock, for instance.
- 11 O. Um-hum?
- 12 A. Or even closer up towards -- I believe it's
- 13 CSM-3, you know, we've shown through our geology and
- 14 geophysics that that's a northern part of the Arrow Canyon
- 15 Range that's coming through and diving down.
- And so as that dives down, it's plunging, going
- 17 for northward. And so recharge that occurs in the very
- 18 northern end of the sheep range, does it have an opportunity
- 19 to mix with basin fill material and end up contributing to the
- 20 west side is kind of --
- 21 Q. Um-hum?
- 22 A. Is kind of a good, you know, way to look at this
- 23 conceptual model, and my answer would be, yes, there could be.
- 24 Q. Okay.

Page 181

- MS. SCHROEDER: I think that's it. Thank you 1
- very much. 2
- HEARING OFFICER FAIRBANK: Next will be NV 3
- Energy. 4
- MS. CAVIGLIA: Hi, my name is Justina Caviglia 5
- and I represent NV Energy and I just have a couple of 6
- questions for you. 7
- **CROSS-EXAMINATION** 8
- BY MS. CAVIGLIA: 9
- Q. So, Mr. Reich, you stated towards the end of your 10
- testimony this morning that you interpret the structural 11
- blocks to be impermeable; is that correct? 12
- 13 A. Yes, it is.
- Q. What evidence do you have that they are 14
- impermeable? 15
- 16 A. Groundwater level data.
- Q. Okay. Can you please change the slide to 17
- rebuttal testimony on page 14. 18
- So in your reports, CSI -- I want to understand, 19
- CSI-1 is on the west side of the fault zone; is that correct? 20
- A. That's correct. 21
- Q. Can you focus your attention on the -- during the
- pumping inventory testing? When you look at, I would say
- quarter three in 2011, and you look at CSI-1, is there an

- 1 A. Yes, small bump up.
- 2 Q. Right in here?
- 3 A. Yes.
- 4 Q. Now, that CSI-1 is on the west side of defaults;
- is that correct?
- 6 A. That's correct.
- 7 Q. So let's go down to, say, MX-4, and that is on
- the east side of the faults; is that correct?
- 9 A. That's correct.
- 10 Q. So around the same time in 2011, is there also a
- slight bump up?
- 12 A. Yes, there is.
- 13 Q. And then you go to 2012, is there also a slight
- bump up?
- 15 A. Yes, there is.
- 16 Q. So would those lines be somewhat consistent
- during or around the same time period?
- 18 A. They seem to look a little bit different. The
- 2012 appears to occur later in CSI-1. But, yeah, that -- I'd
- have to take a look at that. And I think, again, you know,
- this is where we go back and talk about the impact of 21
- hydrologic events and rainfall events. So seeing something 22
- 23 similar like that, yeah.
- 24 Q. And then I have another question for you. Can we

Page 182

- Page 184
- increase in water level at that time?
- 2 A. No, there's not.
- 3 Q. There's no increase right there?
- 4 A. I'm --
- MS. MORAN: I'm looking at the same thing. 5
- MR. REICH: Yeah, what are we looking at? 6
- BY MS. CAVIGLIA: 7
- O. CSI-1? 8
- 9
- 10 Q. During the pumpage time, so probably the third
- quarter of 2011?
- 12 A. Yes.
- Q. Is there an increase in the groundwater?
- 14 A. Third quarter of 2011, no.
- 15 Q. Is it the second quarter? It's hard to tell
- exactly. Does there look like there's a small increase in 16
- 2000 ---17
- 18 A. Oh, a small -- oh, you mean -- you're talking
- about that very slight little bump up? 19
- 20 Q. Correct.
- 21 A. Yeah, it appears that there's a small bump up in
- 22
- Q. Okay. And can we go to 2012 for the same one? 23
- Is there also a small bump up?

- go to slide 25? 1
- So when you go up to the rebuttal comments, you 2
- state there is no hydrologic -- or hydraulic connection
- between north Coyote Springs Valley and south Coyote Spring
- Valley; is that correct? Is that what that states?
- A. Northern Coyote Spring Valley and southern Kane
- Spring Valley.
- 8 O. Yes, with MX-5?
- A. Yeah.
- 10 Q. So MX-5 is in southern Coyote Spring Valley?
- 11 A. MX-5 is -- there's -- well, okay, MX-5 is -- I
- would consider it to be kind of central or south central
- Coyote Spring. 13
- 14 Q. Okay.
- 15 A. And so I chose that as the pumping well to
- describe that.
- 17 Q. So is that saying that for the northern Kane
- Springs, Coyote Springs Valley and southern Coyote Springs
- Valley, there's no connection? Is that what you're stating 19
- 20
- 21 A. I just -- I'm going to help you. The northern
- Coyote Spring Valley. 22
- 23 Q. Yes.
- 24 A. Southern Kane Spring Valley.

Min-U-Script® (46) Pages 181 - 184 Capitol Reporters 775-882-5322

Page 185

- 1 Q. Yes, and southern Coyote Springs Valley?
- 2 A. Right. So is there a hydraulic -- is there a
- 3 connection there? My review of the data showed that there was
- 4 no response from pumping MX-5 in the CSVM-4 well.
- 5 Q. Okay. So does that mean that your testimony
- 6 today is that you can pump as much water as you want from that
- 7 northern area without affecting the Muddy River Springs?
- 8 A. Pump as much area as you want? So what areas
- 9 specifically? Let's -- if we're going to go down this, let's
- make sure that we're going to identify the right area.
- 11 Q. Okay. So what I read when I read your comment is
- that there is a line basically in the middle of the Coyote
- 13 Springs; is that correct?
- That there is no connection between northern
- 15 Coyote Springs, southern Kane Springs Valley and where MX-5 is
- in southern Coyote Springs. Is that what you're stating right
- 17 there?
- **18** A. No, I'm saying there's a hydraulic barrier. So
- that's a -- yeah, there's a hydraulic -- there's a hydraulic
- 20 barrier in the sense that from -- there's no hydraulic
- 21 connection from MX-5 pumping in Kane Spring Valley, yet there
- 22 still is flow out of the Kane Springs Valley are into the
- 23 Coyote Spring Valley area.
- 24 Q. Okay.

- 1 microphone?
- MR. REICH: Yeah, I apologize. That exhibit, I
- 3 believe, has MX-6 in the wrong location. So slide 21.
- 4 MS. MORAN: 23.
- 5 MR. REICH: Oh, slide 23, sorry.
- 6 BY MS. COOPER:
- 7 Q. Your report is the correct location then?
- 8 A. Yes.
- 9 Q. Thank you. I have a few more questions, please.
- Ms. Moran, you did the Theis analysis?
- 11 ANSWERS BY MS. MORAN:
- 12 A. That's correct.
- 13 Q. Could you explain what the reason for using
- 14 solely MX-5 pumping and not total Coyote Spring Valley
- 15 carbonate pumpage was?
- 16 A. The way the Theis equation works, I wanted
- 17 pumping in a center versus in multiple locations. And I was
- 18 only looking at four being an example, the pumping that occurs
- 19 at two places.
- And given MX-6 was the largest pumping volume, I
- 21 took that average pumping of the pumping test to look at what
- 22 its effect would be at the spring, just using the simple Theis
- 23 equation.
- 24 Q. MX-5?

Page 186

Page 188

- 1 A. So there's a downward vertical gradient into the
- 2 Coyote Spring Valley area. So as I've showed in the water
- 3 budget, there would absolutely be an impact if there was
- 4 unlimited pumping upstream.
- 5 MS. CAVIGLIA: I think that's all the questions I
- 6 have.
- 7 HEARING OFFICER FAIRBANK: Thank you. Now we'll
- 8 go ahead and open it up to staff. Do we have any questions?
- 9 MS. COOPER: Hi, thank you.
- 10 HEARING OFFICER FAIRBANK: Please state your
- 11 name
- MS. COOPER: Christi Cooper, DWR. I'll start
- with -- I think anyone on the panel could ask -- answer this
- 14 question.
- 15 EXAMINATION
- BY MS. COOPER:
- 17 Q. I'm looking in your initial submittal report,
- 18 Figure 10, specifically at the location of MX-6 and slide 23
- of your presentation today, your very first presentation.
- 20 Could you verify which location of MX-6 is
- 21 correct?
- 22 ANSWERS BY MR. REICH:
- 23 A. Yeah, that's -- I believe that's --
- 24 HEARING OFFICER FAIRBANK: Can you turn on your

- 1 A. MX-5, right. That was the greatest pumping in
- 2 those two years, representative two years.
- 3 Q. But you used both Arrow Canyon wells and the
- 4 Muddy River Springs area?
- 5 A. Right. They're fairly close together as a
- 6 pumping center.
- 7 Q. Okay. Do you think that if you would have
- 8 used -- combined Coyote Spring Valley pumpage, that would have
- 9 made any difference in your analysis?
- 10 A. I would have to do it to know if it would.
- 11 Q. Okay.
- 12 A. Thanks.
- 13 Q. Thank you. Can I have one more question? I can
- go to slide 14 in your initial presentation. Oh, maybe the
- 15 rebuttal, I'm sorry.
- Mr. Reich, do you believe that CSI differs
- 17 from -- number two differs from wells 1, 3 and 4? And in what
- 18 ways again, please?
- 19 ANSWERS BY MR. REICH:
- 20 A. Sorry. I was reading the previous slides you had
- for well. Does well -- does well one?
- 22 Q. Two, did you say previously two differed from 1,
- 23 3 and 45
- 24 A. Yes, I did. So there's a couple -- there's a

Min-U-Script® Capitol Reporters (47) Pages 185 - 188 775-882-5322

Page 189

- 1 couple of characteristics I would like to point out here. The
- 2 CSI-3, the -- you see the large decline during the Order 1169
- 3 aquifer test. And, you know, we have to then go and compare
- 4 that to the pumping that was going on on the west side.
- 5 So if you look at CSI-3, the data, you know,
- 6 shows the red bars at the bottom. But we also have to
- 7 remember that the transmissivity of that well tested out at
- 8 about 13,000 feet squared per day.
- And so, you know, when you think of a lower
- 10 transmissivity as compared to CSI-4, which had 130,000 feet
- 11 per day, then we start to think about how these different
- wells will react to different stresses.
- So, for instance, I believe we're all in
- agreement that CSI-2 mimics MX-4 or CSVM-6, UMVM-1 water
- 15 levels. But CSI -- and so CSI-2, so when you look at CSI-3
- and the CSI-4, and we look at the pumping that's occurring on
- 17 the west side at the same time, I see that as an explanation
- 18 of -- that explains why those are behaving during that time.
- 19 When I look previously, or afterwards, I also see
- 20 a change in the recovery. If you look at -- if you look at
- 21 kind of the long slope from 2014 to the present of CSI-3,
- 22 that -- it's kind of generally trending, I don't know about
- 23 upwards, but it has a different type of trend during those
- last 5 or 6 years than it does before.

- 1 Service?
- 2 MS. GLASGOW: No questions. Thank you.
- 3 HEARING OFFICER FAIRBANK: Okay. So I've gotten
- 4 declined from Fish and Wildlife Service and Park Service.
- 5 The Moapa Tribe, do they have any follow-up
- 6 questions at this time? Seeing none.
- 7 Mr. Taggart, does Southern Nevada Water Authority
- 8 and Las Vegas Valley Water District have some follow-up
- 9 questions?
- MR. TAGGART: We do.
 - HEARING OFFICER FAIRBANK: And given the fact
- 12 that the prior parties have not asked any follow-up questions,
- 13 I'll go ahead and extend that time to -- I'll give you seven
- 14 minutes.
- MR. TAGGART: Okay. Thank you.
- 16 BY MR. TAGGART:
- 17 Q. Okay.
- 18 HEARING OFFICER FAIRBANK: Make sure you use the
- 19 mic. Thank you.
- MR. TAGGART: Thank you. For the record, Paul
- 21 Taggart for the Southern Nevada Water Authority and Las Vegas
- 22 Valley Water District.
- 23

11

24

2

Page 190

Page 192

- So when I look at this together and I look at
- 2 those different periods, I really feel strongly that there's
- 3 different geologic kind of environments that control the water
- 4 levels that we're looking at in each of these different
- 5 periods.
- 6 Q. So would you say, to follow up that pre-1169
- 7 tests and post tests, that all four CSI wells do have a
- 8 decline in water levels?
- 9 A. Oh, yes, they all have a decline in water levels.
- 10 If -- starting from the beginning of their period of record to
- 11 today, yes, they all have a decline.
- MS. COOPER: Thank you.
- HEARING OFFICER FAIRBANK: So given that we have
- 14 some additional time, I guess I'll say thank you to everyone
- 15 for being concise and honoring the spirit of what the purpose
- 16 of a hearing is. We're going to go ahead and open it back up
- 17 for questions, and so I'm going to just kind of go back down
- 18 in the order.
- Does United States Fish and Wildlife Service have any additional questions that they'd like to ask? And I'm
- 21 going to limit the parties to approximately three minutes for
- 22 any follow-up questions.
- MR. MILLER: No further questions.
- 24 HEARING OFFICER FAIRBANK: And then National Park

- 1 FURTHER CROSS-EXAMINATION
 - BY MR. TAGGART:
- 3 Q. Mr. Reich, I'm going to ask you, if you could, to
- 4 use the demonstrative that you guys prepared. And I have a
- 5 couple questions that I'm going -- I'd like to walk over there
- 6 and ask you, but I'll be off the mic temporarily. Is that
- 7 okay? Folks in the internet won't hear me?
- 8 HEARING OFFICER FAIRBANK: Mr. Taggart, we can
- 9 probably share one of our mics with you.
- MR. TAGGART: Okay. Great.
- 11 BY MR. TAGGART:
- 12 Q. Okay. We'll see how this works. All right. So
- where on this map can this pumping happen, this 5288 feet of
- 14 pumping happen on the west side of Coyote Spring Valley
- 15 without impacting the Muddy River or the Muddy River Springs?
- 16 Can you show me?
- 17 HEARING OFFICER FAIRBANK: And, Mr. Taggart, will
- 18 you put the demonstrative on the easel so that those that are
- 19 watching from afar can see.
- BY MR. TAGGART:
- 21 Q. And I don't want to offend my colleagues, but do
- 22 you mind if he writes -- if he draws this on there so we can
- 23 see where it is, Mr. --
- 24 A. See, which one is it? It's the direct --

Min-U-Script® Capitol Reporters (48) Pages 189 - 192 775-882-5322

Page 193

- 1 HEARING OFFICER FAIRBANK: And, Mr. Reich, when
- 2 you go -- and if you'll also provide a verbal description of
- 3 where you're putting that so that it's clear on the record,
- 4 and you can use the mic that Mr. Taggart is using to do that.
- 5 MR. REICH: Great.
- 6 BY MR. TAGGART:
- 7 Q. And I can help you along there a little bit
- 8 because -- so you see where CSVM-6 is?
- 9 A. Yeah.
- 10 Q. So you've acknowledged that that is impacted by
- 11 the MX-4 pumping; is that right?
- 12 A. That's correct.
- 13 Q. So that would be on the right side of the
- 14 structure you talked about?
- 15 A. So let me --
- 16 Q. But CSI-1 is not impacted, right? So that would
- be on the other side --
- 18 HEARING OFFICER FAIRBANK: Mr. Taggart, if you'll
- 19 let him just make his answer so that we can have a clear
- 20 record as well.
- MR. TAGGART: Okay.
- HEARING OFFICER FAIRBANK: And so that it can be
- 23 heard both here and on the internet and in our southern Nevada
- 24 location.

- 1 A. That's west of the structural block.
- 2 Q. Okay. So a well west of the structural block
- 3 pumped will not impact the river. Is that your testimony?
- 4 A. That is my testimony, correct.
- 5 Q. Okay. And you've dashed that or you've hashed
- 6 that structural block, right?
- 7 A. So, yes, and I want to be clear that when we talk
- 8 about, you know -- so now we're going to look at a cross
- 9 section.

11

- And when we look at a cross section and we have
 - some type of horse structure and we have a series of faults
- 12 that move these boundaries up and down, and then we have --
- this area has Rowley described the different structural
- 14 components of whether it's a damage zone or a core zone that's
- creating some type of barrier in this direction --
- 16 Q. Okay. That's not really my question, but --
- 17 A. No, wait --
- 18 Q. -- so what's the southern boundary of the
- 19 quadrant that you've identified where pumping can occur
- 20 without impacting the river? What's the southern boundary of
- 21 that area?
- 22 A. Well, so now -- what's the southern boundary of
- 23 this quadrant? Is that what you're asking?
- 24 Q. Is there a southern boundary running from east to

Page 194

Page 196

- 1 MR. REICH: So which question? I just want to
- 2 make sure I answer the question correct.
- 3 BY MR. TAGGART:
- 4 Q. I'll ask you a specific question. Where does the
- 5 line of no impacts run north/south between CSVM-6 and CSI-1?
- 6 A. CSI. Okay. So as we've seen with Rowley and,
- 7 you know, we have this -- I'm going to not do dashes and dots
- 8 and other things that we would normally do with geologists.
- 9 But it's -- what we've done is we've used the CSAMT in order
- to map what the boundary of this fault is.
- So we got -- sorry. It goes something like this
- 12 and something like this. We already had all this up here and
- then we talked about the fault running through A and B here.So we have these series of down-drop blocks.
- 15 This is the horse that we've talked about, the structural
- block that's in the center.
- 17 BY MR. TAGGART:
- 18 Q. Okay. Can I just stop you there? So is it west
- 19 of the structural --
- 20 HEARING OFFICER FAIRBANK: Mr. Taggart, if you'll
- 21 please use the microphone.
- BY MR. TAGGART:
- 23 Q. Is it west of that structural block or is it
- within the structural block that --

- 1 west of the quadrant you believe can be developed without
- 2 impacting the river?
- 3 A. It's the -- so what we've talked about before and
- 4 what we've presented is where the flow goes through the Coyote
- 5 Springs Valley, and we have flow on the western side, I've
- 6 shown in my budget and in my conceptual model that there's
- 7 another either 11 or 17,000-acre-feet of flow that comes down
- 8 into this area. And as we come down into this area, now the
- 9 question is, where does the water go.
- 10 Q. Okay. So where is the southern -- okay. Let me
- 11 just -- I don't have a lot of time.
- 12 A. No, I --
- 13 Q. So your testimony is the State Engineer can
- 14 authorize 5280-acre-feet of pumping in Coyote Spring Valley,
- west of this fault structure.
- And I'm asking you: Is there a southern boundary
- 17 to that area where this water can be developed? Is it the
- 18 Coyote Spring Valley hydrographic basin boundary?
- 19 A. No, it's beyond that.
- 20 Q. Okay.
- 21 A. I'm sorry. Is there 5280 -- you're asking if the
- 22 5280 is within Coyote Spring Valley or if we're pumping 5280
- 23 within this area, are you saying -- are you asking, is there a
- 24 southern boundary to that?

Min-U-Script® Capitol Reporters 775-882-5322

(49) Pages 193 - 196

Page 197

- 1 Q. No, you saying there's an area that can be pumped
- 2 5280-acre-feet without impact. I want to know where it is.
- 3 So what's the northern -- I mean, is there a box that you can
- 4 put around it?
- 5 A. So let's talk about -- let's talk about the
- 6 recharge because where did the 5280 come from?
- 7 Q. Well, sir, either there's a box or there's not.
- 8 Can you tell me what the box is from which this 5280-acre-feet
- 9 could be pumped without impacting the river?
- 10 A. The 5280 comes from the amount of water --
- 11 O. I know where it comes from. Is there a box?
- 12 A. -- so as that -- so the question is always where
- 13 is the water going.
- MR. TAGGART: I withdraw the question.
- MR. REICH: No, no --
- 16 BY MR. TAGGART:
- 17 Q. If you can't show the State Engineer where it is,
- 18 how is it --
- 19 A. -- it is going out into the California -- into
- 20 the Hidden Valley, Garnet, Black Mountain and the Black
- 21 Mountain area. And it's going to be -- like I said before,
- 22 the pumping is going to impact subsurface, outflow, ET. Those
- 23 kind of issues.
- 24 Q. Okay.

- 1 HEARING OFFICER FAIRBANK: Well, let's see if
- 2 there's addition people that have questions.
- 3 MR. TAGGART: All right.
- 4 HEARING OFFICER FAIRBANK: And then if there's
- 5 still time, we'll allow you a little bit more time.
- 6 Moapa Valley Water District, do you have any
- 7 further questions?
- 8 MR. MORRISON: Just one.
- 9 HEARING OFFICER FAIRBANK: Okay.
- 10 FURTHER CROSS-EXAMINATION
- MR. MORRISON: All right. Once again, Greg
- 12 Morrison, Moapa Valley Water District. I just -- I really
- 13 want to nail down what your position is on the Kane Springs
- 14 Valley.
- After me, Ms. Peterson, on behalf of Lincoln
- 16 County Vidler, asked you about Kane Springs and its exclusion.
- 17 And you stated that your exclusion of Kane Springs Valley from
- 18 the management unit was supported by en echelon faults that
- 19 isolate Kane Springs Valley from Coyote Springs Valley.
- And then shortly thereafter, Mr. Flangas asked
- 21 you about Kane Springs and faulting, and you stated that you
- 22 didn't testify about impediments to flow from Kane Springs
- 23 Valley.
- So I guess I really want to nail down CSI's

Page 198

Page 200

- 1 A. So I'm not the only one --
- 2 Q. So there's no southern boundary?
- 3 A. Southern boundary of -- so -- and that's why --
- 4 Q. Just as --
- 5 A. I just want to tell you why I'm confused.
- 6 MR. TAGGART: I withdraw the question.
- 7 MR. REICH: You're asking --
- 8 HEARING OFFICER FAIRBANK: -- Mr. --
- 9 MR. TAGGART: -- can I -- 5280 --
- 10 HEARING OFFICER FAIRBANK: Mr. Taggart, if -- you
- can intervene just to have -- so that we can have a clear
- 12 record, because the court reporter cannot record multiple
- people, excuse me, multiple people at the same time.
- MR. TAGGART: And I think I can just clarify it.
- BY MR. TAGGART:
- 16 Q. Is it a fair statement that your testimony is as
- long as you stay to the west of that structure, that the 5280
- 18 can be developed?
- 19 A. Yes, in the Coyote Springs Valley.
- 20 Q. All right.
- 21 HEARING OFFICER FAIRBANK: Okay. I'm --
- 22 Mr. Taggart, do you have any additional questions?
- MR. TAGGART: I do, but I don't want to get in
- 24 trouble.

- position on: Are there strict impediments to flow from Kane
- 2 Springs Valley into Coyote Springs Valley or is there a
- 3 substantial amount or say 4200-acre-feet of interbasin flow
- 4 from Kane Springs into Coyote Springs Valley?
- 5 ANSWERS BY MR. REICH:
- 6 A. So question one would be -- and I don't mean
- 7 to -- or I will summarize is, is there impediments between --
- 8 maybe you can just state -- if you can just give me one
- 9 question at a time, I really would look forward to answering
- **10** this.
- 11 Q. Do en echelon faults justify the exclusion of
- 12 Kane Springs Valley from the management area?
- 13 A. Yes, they do.
- 14 Q. Are there interbasin flows between Kane Springs
- 15 Valley and Coyote Springs Valley?
- 16 A. Yes, in a similar manner that there is -- and
- 17 that there is flows and faulting between Delamar and Coyote
- 18 Springs Valley and Pahranagat and Kane Spring Valley -- Coyote
- 19 Spring Valley.
- 20 Q. Okay. And the 4200-acre-feet that you have in
- your report, is that a fair estimate of that flow, do you
- 22 believe?
- 23 A. It is an initial estimate that I -- as the best
- 24 information I can provide today to the Nevada State Engineer.

Min-U-Script®

Capitol Reporters 775-882-5322

(50) Pages 197 - 200

Page 204

Page 201

- 1 Q. That's the best estimate of interbasin flow that
- 2 you're aware of?
- 3 A. That I am aware of.
- 4 Q. Thank you.
- 5 HEARING OFFICER FAIRBANK: Okay. So next would
- 6 be Vidler Lincoln County, no additional questions? Okay.
- 7 Thank you, Ms. Peterson? City of North Las Vegas?
- 8 MS. SCHROEDER: No.
- 9 HEARING OFFICER FAIRBANK: No? Okay. Mr.
- 10 Donnelly for Centers for Biological Diversity?
- MR. DONNELLY: It's actually singular, Center.
- 12 FURTHER CROSS-EXAMINATION
- BY MR. DONNELLY:
- 14 Q. Thank you. Patrick Donnelly from the Center for
- 15 Biological Diversity. I want to follow up on a couple things
- I hit on in my first round that I wasn't able to follow
- |17 through on.

A. Yes, I do.

pump test?

rephrase.

of diversion?

A. Yes.

6

10

11

12

13

16

17

18

19

20

21

22

- I'd like to refer you to page 54 of SNWA's
- 19 July 3rd report. So that is page 54 of the PDF file of SNWA's
- 20 July 3rd report, Figure 5-6 is what I'm referencing. I'll
- 21 give you a minute to find it?
- 22 A. 5-6, yes, we're looking at it.

3 Q. Approximately how much?

4 A. On this scale, half a foot.

groundwater levels.

- 23 Q. Yes. So there is a figure for well KMW-1, the
- 24 monitoring well in Kane Springs Valley. Do you see any

Q. And is there further decline subsequent to the

7 A. There appears to be a decline in 2014 at which

Q. In a generic hypothetical groundwater model,

Q. Is there a lag -- is there a lag time between a

A. Yes, there is. I testified to that this morning

levels and Coyote Spring Valley.

other wells and Coyote Spring Valley?

point the -- there's fairly average conditions or level

would decline signals take longer to spread through a system

the further away from the point of diversion you are? I can

pumping and the signal being picked up far away from the point

when I was talking about our observations of groundwater

declining in -- declined during that period in parallel to

Q. Do you observe here that the Kane Springs well is

declines of that well -- monitoring well during the pump test?

- 1 hydrologic response as other wells, yes.
- 2 Q. And are you aware of the elevation --
- 3 A. I'm sorry.
- 4 Q. Sorry.
- 5 A. Earlier I testified about the seasonality of
- 6 that, and that is something that I do not see in this well, is
- 7 the annual type of variability. But I do see the other
- 8 characteristics, which are observed of in the wells.
- 9 Q. Understood, yes. Thank you. Are you aware of
- 10 elevation difference -- groundwater elevation difference
- 11 between Kane Springs Valley and northern Coyote Springs?
- 12 A. Yes, I am.
- 13 Q. And how much is that difference?
- 14 A. Well, I know in the groundwater elevations, we're
- 15 looking at approximately 40 -- I believe if we look at CSVM-4,
- which is right down -- it's what, 40 feet.
- And then if we go down all the way to -- into the
- main part, CSM-4 -- so it appears to be about a seven-foot
- 19 decline to CSVM-4.
- 20 Q. A seven-foot difference in groundwater elevation?
- 21 A. Yeah, and then from CSVM-4 down towards CSVM-6,
- there's approximately another 40 or 50 feet of decline.
- 23 Q. Okay. Thank you. To shift gears completely to
- 24 evapotranspiration, you say the location of pumping makes a

Page 202

- 1 difference as far as -- well, you assert that the location of
- 2 pumping makes all the difference.
- 3 Is there a location in Coyote Springs Valley
- 4 where they can -- where one could pump the 5,280-acre-feet of
- 5 water while also capturing ET?
- 6 A. ET and --
- 7 Q. Yeah, okay. I'm sorry. Do you -- are you aware
- 8 as to which side of that north/south fault the ET is occurring
- 9 on in Coyote Springs Valley?
- 10 A. Oh. Right now, there -- our initial budget says
- 11 there's only 1,000-acre-feet of ET in Coyote Spring Valley and
- 12 I would guess that that's even overestimated today.
- So under predevelopment conditions, there might
- 14 have been 1,000-acre-feet. I think today there's probably
- much less, if any, phreatophytic ET that's occurring.
- 16 Q. And which side of the fault would that have
- 17 occurred on or be occurring on? Where is that locus of ET?
- 18 A. As I stated today, I don't believe it exists in
- 19 Coyote Spring Valley, so --
- 20 Q. Okay. So the thousand-acre-feet is
- 21 predevelopment only?
- 22 A. Yes.
- 23 Q. And there's none now?
- 24 A. Yes.

1 age 202

24 A. The Coyote -- Kane Spring well has a similar

Min-U-Script®

Capitol Reporters 775-882-5322

(51) Pages 201 - 204

Page 205

- 1 Q. Okay. I guess my question is: Is there a place
- 2 one could place a well to pump such that ET within the LWRFS
- 3 is captured that doesn't affect the springs? Where is that
- 4 pumping location?
- 5 A. That would be located on the western side of the
- 6 fault.
- 7 Q. That accounts for 5,200-acre-feet. What about
- 8 the other 25,000-acre-feet? Where can that be pumped where it
- 9 affects ET, but not spring discharge?
- 10 A. So let's go back to identify a little bit more
- about -- I think where you're headed on this because I want to
- read my exact statement if that's okay.
- So total -- so my documents states that after
- accounting for 32000-acre-feet of surface flow of the Muddy
- 15 River, total evapotranspiration and groundwater outflow from
- 16 the Lower White River Flow System would be 30000. So that's
- why I'm asking you exactly what your question is.
- 18 Q. Okay. My question is: You've stated
- 19 30,000-acre-feet can come out of the ground sustainably in the
- 20 Lower White River Flow System and that 5280-acre-feet of that
- would be on the west side of the fault in Coyote Springs
- 22 Valley.
- So my question is: Where can the other
- 24 25,000-acre-feet be pumped such that it is capturing ET, but

- 1 HEARING OFFICER FAIRBANK: And that will be your
- 2 last question.
- 3 BY MR. TAGGART:
- 4 Q. Yeah, yeah. It's been one question.
- 5 A. Well, no, it's important that I answer. I want
- 6 to provide information to you and to the State Engineer on how
- 7 that can be managed, and I think that's where we have to go
- 8 and look to see where that evapotranspiration is. How much
- 9 is -- how much does the State want to capture, you know? How
- much is there willing to put up?
 - I mean, I've always said there is a trade-off for
- 12 the imbalance of groundwater pumping and what is it going to
- capture? Is it going to capture ET? Is it going to capture
- 14 groundwater outflow? Let's map those areas and go find out
- where those areas are.
- MR. TAGGART: Thank you.
 - HEARING OFFICER FAIRBANK: Mr. Reich, and I guess
- 18 I -- the question, though, and -- was: Have you identified
- 19 where?

11

17

- MR. REICH: Oh.
- 21 HEARING OFFICER FAIRBANK: I think that was the
- 22 question that was being asked of you. And so I guess that's
- 23 the answer that we're waiting for is: Have you identified
- 24 where that pumping could occur?

Page 206

Page 208

- 1 it is not affecting spring discharge?
- 2 A. So my response, sir, is I didn't -- I think that
- 3 they're the -- the important response here is that it's total
- 4 evapotranspiration and subsurface outflow.
- 5 So when we -- if we're talking about designing a
- 6 system where we want to capture a certain amount of
- 7 evapotranspiration and a certain amount of groundwater
- 8 outflow, you can't assign all 3,000-acre-feet just to ET.
- 9 You have to determine how much of the outflow are
- 10 you going to capture, because I've stated clearly throughout
- 11 my testimony today that, you know, all the pumping that's
- going to go on, something's going to happen.
- There's no -- you know, something has to --
- 14 something has to be measured. There has to be a reduction in
- 15 ET. There has to be a reduction in outflow. There has to be,
- you know, some type of impact that occurs from that.
- So what I've suggested in my report is that, you
- 18 know, that can be captured from, as I state here, total
- 19 evapotranspiration and groundwater outflow. So I'm not saying
- 20 that there's 30,000-acre-feet of ET. In fact, I'm suggesting
- 21 there's 11,900-acre-feet of ET.
- 22 Q. Well, again, my question would be then: Where
- 23 can you pump such that you can accomplish 11,000-acre-feet of
- ET without affecting any surface discharge of springs?

- 1 MR. REICH: Oh, no, I have not. I -- if it was
- 2 that easy in the beginning, I'm sorry, I would have answered
- 3 that way. But did I miss --
- 4 HEARING OFFICER FAIRBANK: All right. Next,
- 5 Georgia Pacific, do you have any additional questions or
- 6 follow-up questions?
- 7 MS. HARRISON: No further questions.
- 8 HEARING OFFICER FAIRBANK: Seeing none. Nevada
- 9 Cogen, do you have any follow-up questions?
- MR. FLANGAS: I have no further questions.
- 11 HEARING OFFICER FAIRBANK: No additional
- 12 questions. Okay. Thank you, Mr. Flangas.
 - Muddy Valley Irrigation Company?
- MR. KING: No questions. Thank you.
- 15 HEARING OFFICER FAIRBANK: Seeing no other
- 16 questions. Bedroc, any further questions?
- 17 MS. SCHROEDER: Nope.
 - HEARING OFFICER FAIRBANK: Okay. Seeing none.
- 19 And then Nevada Energy, any further questions?
- MS. CAVIGLIA: (Shakes head.)
- 21 HEARING OFFICER FAIRBANK: Okay. Just one
- 22 moment. All right.

23 24

13

Page 212

Page 209

- **EXAMINATION** 1
- MR. BENEDICT: For the record, John Benedict. 2
- My question goes to hydrograph for CSVM-5, and I 3
- know it's one that you said you haven't spent as much time 4
- researching, but it is kind of an interesting area with 5
- respect to the Coyote Springs area and it's on the west side 6
- of the basin. 7
- And so I think this is in your July report, 8
- there's a -- oh, do you have one up there. 9
- ANSWERS BY MR. REICH: 10
- 11 A. Yeah.
- Q. Yeah, okay. You have it up there. So I was 12
- curious about the climate relationship that you've been 13
- talking about and what this hydrograph tells you. I know 14
- 15 there's a bump in 2005, '6, it's relatively small and water
- levels continue to increase. 16
- Would you like to speculate on what you think or 17
- what your opinion is on how the recharge that you're defining 18
- in sheep mountains is impacting that hydrograph? 19
- A. Yeah, no, we'd love to. 20
- We find this is a real challenge to understanding 21
- and developing our conceptual model in the area, and so we've 22
- asked ourselves a couple of different questions. 23
- One of the first questions we've talked about 24

- for that precip station because that's where we want to go
- with this. We want to -- we really want to develop higher 2
- elevation rainfall. We think that's an important factor of 3
- 4 understanding how this recharge system is working.
- So with that recharge and with that rainfall 5
- runoff relationship, we start to try to better understand 6
- 7 that. As we stand here today, you know, right now, we can
- hypothesize on what's causing that. 8
- As I mentioned before, there's either perched 9
- water supply, a barrier. There could be a couple different 10
- fault structures that are going on there that could cause 11
- 12 this. But, no, we're looking forward to actually addressing
- 13 this issue.

14

- Jean, you were with me, too. Do you have
- 15 anything additional?
- MS. MORAN: Given where the well is located way 16
- up on the side of the valley, I -- obviously it's not 17
- connected with what's happening on the valley floor, and 18
- either it is a pocket that is seeing the recharge and the 19 collective recharge coming up. 20
- We haven't seen a spring nearby to say that maybe 21
- it reaches a certain level and then it becomes a spring. You 22
- know, why did it go flat. We haven't fully determined why 23
- this well is behaving this way. But it is in the recharge 24

Page 210

- amongst ourselves is just a different in elevation. You know, 1
- why are we looking at -- now I'm going off of memory, was it 2
- 20. 3
- MS. MORAN: About 60 feet. 4
- MR. REICH: About 60 feet. So we have about a 5
- 60-foot difference in elevation in this well than we do in the 6
- other wells in the main part of Coyote Spring Valley. 7
- So what's causing that? Is it a -- is it a 8
- 9 perched, an area perched water? And we've seen in this other
- mountainous areas. So we could have an area of perched area 10
- water, we could have a boundary, we could have -- you know, we 11
- didn't get into technicalities today. But when we talk about 12
- boundaries, we often talk about leaking boundaries and what 13
- the permeability across those boundaries could be, whether 14
- they be faults. And so this is something special. 15
- We went up and actually visited this well. This 16
- well is -- it really -- it peaked our interest on why this was 17
- going on. 18
- So we drove up the -- it's an old rocky road that 19
- 20 goes up the side of this hill out to where drainage is through
- the Steptoe Range there. And not only is the well there, but 21
- there's also -- Clark County flood control also runs a precip 22
- station at that location. 23
- Unfortunately, the data period is not real long 24

- zone, so it is an area that does receive more precip.
- HEARING OFFICER FAIRBANK: All right. 2
- Mr. Taggart. And we'll go until 3:00, when we'll take a 3
- break, and that's when we're going to go ahead and call it 4
- good for opportunities for cross-examination. 5
- FURTHER CROSS-EXAMINATION 6
- BY MR. TAGGART: 7
- 8 Q. Hello, again, Paul Taggart for the record. I
- have a question about that line that you just talked about. 9
- 10 Is that CSVM-3 we're talking about, up on the -- up north in
- Coyote Spring Valley along the --11
- **12** A. It is CSVM-5.
- Q. Okay. And that's up in the right panel, upper
- right panel? 14
- 15 A. That's correct.
- 16 Q. So it does not reflect an increasing trend in
- water levels in that area? 17
- 18 A. Yes, it does.
- 19 O. And doesn't that reflect the increased
- precipitation regionally? 20
- 21 A. I think as I stated in my direct testimony, this
- is an area that we have not been able to answer as thoroughly 22
- as we have others. This is the one well that doesn't fit the 23
- same characteristics as all the other wells that we've looked

Min-U-Script® **Capitol Reporters** 775-882-5322

(53) Pages 209 - 212

Page 213

- 1 at in the area.
- 2 As we just testified to, there's different
- 3 reasons for it. One of them being it could be a purge supply.
- 4 Another reason being that it could be a pocket of some area
- 5 that is causing that faulting, and then lastly, it just -- it
- 6 could actually be reflecting of some type of regional increase
- 7 in recharge.
- 8 And so, no, you know, we've stated clearly today
- 9 that we intend to continue to investigate this well to be able
- 10 to answer that question.
- 11 Q. You're familiar with the reports that were
- submitted by the Park Service and the Fish and Wildlife
- 13 Service?
- 14 A. Yes, I am.
- 15 Q. And you're familiar with their analysis of
- 16 regional precip in areas surrounding Coyote Spring Valley, are
- 17 you not?
- 18 A. Yes, I am.
- 19 Q. And you're familiar with their conclusions that
- 20 regionally around Coyote Spring Valley to the north, east and
- 21 west, precipitation and climate has actually been trending up?
- 22 A. Yes, I am.
- 23 Q. All right. And so it's possible that this well
- 24 is reflecting that, right?

- 1 conductivity layer, and a different elevation on this side.
- 2 Q. Well, what is it that shows your vertical offset?
- 3 A. Right in this section. The difference between --
- 4 Q. This being located where?
- 5 A. Between 700 and 11,000. If you look at that
- 6 resistivity layer, you can see that there's a difference in
- 7 that resistivity in those layers up there.
- 8 Q. In colors? You see -- do you see -- I mean, this
- 9 is the -- this is the primary basis for your determination of
- the Highway Fault, this evidence, right?
- 11 A. Yeah. Well, do you see -- excuse me, do you see
- 12 the blue?

19

- 13 Q. But am I right about that?
- 14 A. Do you --
- 15 Q. This is the primary evidence you're relying upon
- 16 for the existence of this Highway Fault along this A-A prime,
- 17 right? I object to you guys -- if, Mr. Carlson, you want to
- answer the question, you can answer it.
 - But I mean, it's a bit of a privilege that we do
- 20 this in panels. But I think folks talking among each other
- 21 during the answer isn't proper. If you want to answer the
- question, go ahead and answer it. But if it -- I don't want
- 23 him giving me your answer.
- MR. CARLSON: Okay. Sure, I'll answer.

Page 214

Page 216

- 1 A. Yes.
- 2 Q. And I want to ask you -- I have one other quick
- 3 question about this in your PowerPoint on page 17, and I
- 4 already asked Mr. Carlson a little bit about this.
- 5 This is the resistivity data from cross-section
- 6 A-A paren. And where -- Mr. Reich, where on this do you see a
- 7 fault on the west side? What exact resistivity data do you
- 8 see there that you believe is a fault?
- 9 A. We lost our pointer. So I -- oh, is this one?
- 10 Can I use this? Oh, we need paper. It's not showing up.
- MS. MORAN: It is. There it is --
- MR. REICH: So I -- you see where my arrow is
- there, and I wish I could read those numbers for you, but I
- believe that number is 700. And you see that high resistivity
- blue layer and then you see the low resistivity, red, and then
- you get into this area of cultural noise that Mr. Carlson
- testified to.
- Well, then when you go across that, I mean,
- 19 you're above that 3,000 as we talked about the data that was
- 20 east of 3,000 and you see, again, this lower high conductive
- area. So what I'm looking at here and what I'd like to point
- out about this fault is this vertical offset.
- So you can see kind of this level here where there's this main elevation of the low velocity, low

- 1 BY MR. TAGGART:
- 2 Q. Well, the standing question to Mr. Reich was: Is
- 3 this the primary evidence that you're relying upon for the
- 4 existence of that Highway Fault, Mr. Reich?
- 5 MR. CARLSON: Yes, and line B. And as I said
- 6 earlier, line B, it is better defined on the disk. But, yes,
- 7 this line does show a fault near the western end of the line.
- 8 It also shows the cultural noise that we talked about earlier.
- 9 BY MR. TAGGART:
- 10 Q. Well, because when I look at your Figure 13,
- 11 forgive me, but this line that -- this Highway Fault, I don't
- 12 know if we have that handy.
 - MR. REICH: Which figure is 13? In the report
- 14 or --

13

- MR. TAGGART: Your Exhibit 13, it's page 23 of
- 16 your slideshow. Do you see that? I mean, forgive me, but I
- see that -- I see the fault, the Highway Fault cutting through the 2000 number on A-A prime, not where you just identified it
- 19 at 700.
- MR. CARLSON: 700 to 1,000 is where we put it.
- MR. TAGGART: But it's not -- that's not where
- 22 it's shown on --
- MR. CARLSON: On this -- you're right, it does
- look like it's drawn closer to 2,000. The culture starts at

Min-U-Script® Capitol Reporters
775-882-5322

Page 220

Page 217

- about 1900. We can't put an exact edge on it with a culturesitting there.
- 3 MR. TAGGART: So Exhibit 13, which is shown on
- 4 page 23, that's inaccurate showing you where the fault is? It
- 5 shouldn't be going through that location on line A, right?
- 6 MR. CARLSON: I would say that's approximate, but
- 7 it's not inaccurate, no.
- 8 MR. TAGGART: Now, because -- well, forget that.
- 9 Where is -- so now you have Exhibit -- so I'm
- 10 looking at Figure -- the figure up on the screen, Exhibit 13,
- 11 I think.
- When I look at Figure 10 in your report, and I
- 13 wish I could have them both up on the screen at the same time,
- but Figure 10 in your report, can you get a copy of that in
- 15 front of you?
- ANSWERS BY MR. CARLSON:
- 17 A. Yes, I've got that.
- 18 Q. Okay. And this Highway Fault that I'm calling
- 19 it, it doesn't cross line B at all on this figure, right?
- 20 A. Right. I think that's a typographical error.
- 21 Q. Oh, so this one doesn't -- this one's not
- depicted properly either on this figure?
- MR. REICH: I'd like to clarify. You know,
- 24 because of the -- because of the rush that we went through to

- 1 construction area of unknown cultural effects.
- 2 Q. Right. And I guess my point just is that you
- 3 didn't draw your line through the cross-section of BB prime on
- 4 Figure 10, even though you had the BB prime resistivity data
- 5 because it was also submitted as part of the same report.
- 6 But now you're testifying that the resistivity
- 7 data in BB prime is actually support for your position. But
- 8 you didn't make that support in your report when you filed it;
- 9 is that true?
- 10 A. Is that a question?
- 11 Q. It is.
- 12 A. Oh, we didn't submit it. Why wasn't that --
- 13 Q. Well, maybe I'll make it easier. Strike the
- 14 question.
- Is Figure 10 -- you would draw it differently if
- you could draw it today, right?
- 17 A. Yes, I would.
- 18 Q. Okay. And let's look at BB prime, and where on
- 19 there do you see this evidence of fault? That's at about the
- 20 200 -- I'm sorry, 2,000 site; is that the same?
- MR. CARLSON: Yes, the faults, it's -- when I'm
- 22 looking at them, I'm primarily looking in the deep data down
- 23 there where the shades are dark blue. On the actual printed
- 24 plot, if you have those, you can see some contour lines.

Page 218

- They're roughly horizontal in the middle of the
- 2 line and then they take a sudden downward plunge. That
- 3 happens to be right about station 2500.
- 4 As you move further, you go into lower
- 5 resistivities than that. This suggested to me that the fault
- 6 is someplace in that zone, a different geophysicist could draw
- 7 that at 1500, somebody else might draw it as 2300, and then we
- 8 can also argue about what direction the fault goes. My
- 9 impression is it dips to the west.
- 10 BY MR. TAGGART:
- 11 Q. All right. But aren't you interpreting there to
- be carbonate rocks on top of basin fill rocks?
- 13 A. No.
- 14 Q. Okay. So the dark blue is, in your opinion,
- 15 carbonate; right?
- 16 A. The dark blue in the -- at the bottom of the
- 17 cross-section is carbonates, right, most likely.
- 18 Q. Um-hum.
- 19 A. The dark blue up near the surface is probably
- 20 very dry alluvial cover.
- 21 Q. So just -- Mr. Reich, on the 30,000-acre-feet
- 22 that you were asked by Mr. Donnelly about, I have a similar
- question. Of the 30,000 feet, 30,000-acre-feet, why didn't
 - 4 you do two water budgets, one on each side of the fault?

1 ago 210

1

get Mr. Carlson and his company out there in April, it really

- 2 was a lot to do in a very short period of time.
- 3 So unfortunately, when the July report came out,
- we had not received the final results. That's why, as you see in our August 16th submittal, we had attached Zonge
- 5 in our August 16th submittal, we had attached Zonge
- 6 Engineering, Zonge International's final results.
- So why there might have been, you know, differentchanges in between when we submitted the preliminary results
- 9 from the Zonge Engineering and the final, you know, there are
- 10 going to be discrepancies and changes in our understanding of
- 11 what constitutes that change.
- BY MR. TAGGART:
- 13 Q. But when you completed your report in July, CSI
- 14 number one, you did not basis your conclusion about this
- 15 Highway Fault and its location on the resistivity evidence,
- 16 did you, because you didn't have it yet?
- 17 ANSWERS BY MR. REICH:
- 18 A. If you look at Figure 11, I think a good picture
- 19 would be to look at 11 and that is the April 29th, these are
- the preliminary results.
- So if you're looking at the same report, it's
- 22 literally the next page. You can see, you know, a good
- 23 example would be as Mr. Carlson previously testified to, and
- 24 this is in July, we knew the same thing. There was a

Page 224

Page 221

- 1 A. You have to -- my goal was to respond to the
- 2 State Engineer for the Lower White River Flow System. So, you
- 3 know, I really looked at this as an exercise to be able to
- 4 provide that information.
- 5 So I wasn't focused on just necessarily where the
- 6 individual flowed paths throughout, you know, as they go
- 7 into -- from MX-5 area down to the Muddy River area or the
- 8 flow pass around through Garden and Hidden or into Black
- 9 Mountains area. I think that's all very important stuff, but
- no, I didn't break it down to that level of detail.
- 11 O. How much water does CSI own?
- 12 A. I'm not familiar with their water rights. I
- believe it's over 4,000-acre-feet.
- 14 Q. Okay. And of the 30,000 that you opined as a
- water budget, 5,000 is what you believe can be developed on
- 16 the west side; right?
- 17 A. Um-hum.
- 18 Q. And that's -- that would be enough for CSI's
- 19 water rights; right?
- 20 A. Yes.
- 21 Q. Okay. And what about the other 25,000? I think
- the question to you was: Could it be developed without
- 23 capturing ET or capturing ET without affecting spring
- 24 discharge. I mean, do you have an opinion on whether the

- 1 rights in the Muddy River?
- 2 A. Right. And then I would ask the question, you
- 3 know, do you look at the point of measurement and the point of
- 4 impact at different locations throughout the Muddy River? Are
- 5 you measuring it at one location or are you measuring that at
- 6 multiple locations or what would be your metric? And this is
- 7 a --
- 8 Q. Sir, sir, the metric would be capturing senior
- 9 water rights. That's the metric.
- 10 A. Right.
- 11 Q. Capturing river flow. Can 25,000-acre-feet be
- 12 captured somewhere else outside of the compartment you've
- 13 identified without impacting senior rights, without depleting,
- 14 in any quantity, the Muddy River?
- 15 A. Yes, I believe that, sir.
- 16 Q. Where?
- 17 A. I did not identify where that would occur.
- HEARING OFFICER FAIRBANK: It's 3:00 p.m. We're
- 19 going to go ahead and take a break. We'll go off the record
- 20 for about ten minutes and we'll come back, and then we can go
- ahead and proceed with Coyote Springs rebuttal.
- 22 (Recess.)
- HEARING OFFICER FAIRBANK: All right. Let's go
- ahead and go back on the record.

Page 222

- remaining 25,000-acre-feet in your water budget can be
- 2 developed at all?
- 3 A. Yes, I do.
- 4 Q. Can it be developed without impacting the Muddy
- E River?

18

- 6 A. Yeah, there's going to be impact. I want to
- 7 state this really clearly and I've stated all day today is
- 8 that as water withdrawn and is used and put under production,
- 9 there is going to be an impact. And the goal here that we're
- 10 here today is to be able to identify, you know, how that water
- moves through the system.
- I'm not here to say what are an acceptable
- impact, you know, what was an acceptable reduction in
- 14 groundwater outflow or what is an acceptable reduction in
- evapotranspiration. Rather, we've really taken this as an
- opportunity to provide the information that we see.
- So, no, I have not identified exactly where the
- be the resulting impacts from that 30,000-acre-feet.
- 20 Q. So, hypothetically, if the standard was no
- 21 impacts to senior rights, where could that water be developed?

30,000-acre-feet would occur, nor have I identified what would

- 22 A. So no -- so what senior could -- so maybe you
- 23 could just tell me exactly what those senior rights are.
- 4 Q. Let's say no impact to the senior surface water

- 1 And before we get started, I just have one
- 2 question for counsel. It looks as though there's a missing
- 3 page in your original presentation. The copy that we received
- 4 did not have a slide number 62, so we jumped from page 61 to
- 5 page 62. So I didn't know if that was intentional or an
- 6 accidental omission.
- 7 MR. ROBISON: Intentional.
- 8 HEARING OFFICER FAIRBANK: Okay. Thank you. Go
- 9 ahead and proceed.
- MR. HERREMA: I just have three questions on
- 11 redirect. I hope to be very brief.
- 12 REDIRECT EXAMINATION
- BY MR. HERREMA:
- 14 Q. Mr. Reich or Ms. Moran, could one of you please
- 15 explain for the State Engineer and the staff why you decided
- to do the Theis analysis that's included in your reports?
- 17 ANSWERS BY MS. MORAN:
- 18 A. We decided to do the Theis analysis to look -- to
- use something similar to what the Series C did as a cross
- 20 check of how they approached it and to try to check to see if
- 21 it made sense for the different wells.
- 22 Q. Thank you. Mr. Reich, Mr. Morrison asked you
- some questions regarding page 3 of the rebuttal report
- 24 specifically related to the declines in water levels at the

Min-U-Script® Capitol Reporters

775-882-5322

Page 228

Page 225

- Pederson Springs east and Pederson Springs locations. 1
- Do you recall that exchange? 2
- ANSWERS BY MR. REICH: 3
- A. Yes, I do. 4
- Q. Did you have page 32 of the rebuttal report 5
- before you?
- 7 A. Yes, I'm looking at page 32.
- Q. Okay. The very last paragraph of that page,
- there's a sentence that says "these data support the
- conclusion that the change in spring flow at Pederson Springs 10
- 11 east and Pederson Springs is closely tied to climatic
- conditions and not to carbonate groundwater pumping." 12
- 13 Is that still your opinion that that's the case?
- A. Yes, it is. 14
- Q. Thank you. I'd like to turn your attention to 15
- Exhibit 13, CSI's Exhibit 13, which is also one of the slides. 16
- 17 Give me just a second. It's also slide 23 in the direct
- examination slides. Okay. Thank you. 18
- In response to one of the State Engineer staff 19
- folks, the -- we've identified the locations of MX-6 is -- may 20
- not be correct on this figure. Other than that, is the 21
- interrelationship between the wells and the faults accurately 22
- represented on this figure? 23
- ANSWERS BY MR. CARLSON: 24

changes. 1

2

- For example, if we included the entire map, we'd 2
- see the -- as we go this way across the contours, we're 3
- getting into higher and higher density rock. As we go down
- towards here and we see some negative contours in the lower
- left, that's the very low density rock. And it's just like
- 7 topographic contours. The more contours you see in a given
- area, the steeper the slope basically.

And the USGS in 2000 did a fairly dense gravity survey along these orange lines called S -- gravity profile S1, S3, S2 down here and S4. And apparently their geologists were thinking the same thing as the CSI geologists and us.

This is an important area in Coyote Spring

Valley. So they ended up putting their lines pretty much where we did. So our line A is right up here, our east/west line B is right here, and then C is over here. It runs behind the cross-section.

And all we've done here is align and size our cross-section for line B line, which is right here, lined up so we can look at what they saw versus what we saw.

On their map, they're showing faults that they 21 interpret from the gravity data as these gray ovals. You see 22 two of them up here, one right in here. There's actually two 23 24 or three overlapped right in here, and then two down here that

Page 226

- 1 A. Yes, with the exception of the MX-6, which we
- pointed out the relationship with the faults, the
- orientations, the placement relative to the wells that are 3
- established there is correct, yes. 4
- Q. Okay. Okay. Mr. Carlson, is there -- in
- addition to the work that you did in your survey, is there any 6
- other data that you reviewed that supports that answer? 7
- A. Yes. In the rebuttal slides this morning, we ran 8
- out of time, so we weren't able to present two or three of the
- slides. And one of those slides shows data from the USGS open 10
- file report. I don't remember the name, but it will be on the 11
- slide. 12
- Q. And could we pull up slide 22, please, rebuttal 13
- slide 22?
- A. From the rebuttal. Yes. So this is slide 22 15
- from the rebuttal and copies are -- were passed out this 16
- morning. The base map of this is the southern section of 17
- plate one, which is titled isostatic gravity anomaly, USGS 18
- open final reports, 00420. They -- faults at all. It was 19
- 20 2000 open file report.
- So all these contour lines that you see are --21
- 22 all the contour lines that -- I'm just showing you the general
- location. That's the isostatic anomaly contours and what 23
- that's telling us is where the density of the subsurface rock 24

- 1 we don't cross at all.
 - But if you follow these gray ovals that they
- interpret -- they call gravity faults because there's a big 3
- change in the gravity, which means there's a big change in 4
- density. If you just trace those overlay back -- those back 5
- to our line, that's where we see a big fault on the edge of 6
- that resistive rock. 7

They have a hole here, which is where we see a 8

- 9 big change in color. That's where we see -- where we verified
- the concealed fault from. And out here, they put a gray fault 10
- right -- a very steep fault, you can see that by all the 11 contours in that short area. 12

And if you project that onto our line, that's the 13

- west end of line B, approximately station 1500 to 2000, that 14
- general area. And they draw their faults as big, fat circles 15 because they know that they can't place them exactly down to 16
- the 200-foot interval or anything like that. 17
- But they can tell from all these contour lines in 18 19
- a very short area that there's a fault there, and that lines 20 up virtually perfectly with the fault that we see on line B.
- They don't have any dense gravity stations out 21
- here, so we can't verify the fault on line A, but we do verify 22 the fault on line B very, very nicely. 23
 - Down here is their gravity cross-section. They

Min-U-Script® (57) Pages 225 - 228 **Capitol Reporters**

775-882-5322

24

Page 229

- divide the results up into just two rock types basically. 1
- Cenozoics, which would include basin fill and some of the 2
- volcanics and the deeper Paleozoics. That's the high density 3
- 4 harder rock. And you can see in their cross-section, that
- fault right there where we go from high density Paleozoic rock 5
- to low density Cenozoic fill and volcanics. 6
- So it's -- I honestly wish we had seen the report 7
- before we did the survey because we would have adjusted our 8
- lines a little bit to line up even better. But this is a very
- pleasing result, at least to a geophysicist, because we're 10
- seeing a big change in two different physical properties at 11
- the subsurface at exactly the right points along those lines. 12
- 13 We're seeing a big change in electrical
- resistivity, which is how it conducts electricity, and we're 14
- 15 seeing a big change in density, which is how dense that rock
- is, how tight it is. So a very good result, a very good 16
- correlation. And as I say, it's included in our rebuttal 17
- slide this morning, but we just didn't get to it. 18
- MR. HERREMA: I have no further questions at this 19
- point. I'd like to move to have CSI Exhibits 1 and 2 20
- admitted. 21
- HEARING OFFICER FAIRBANK: The exhibits have been 22
- admitted. Thank you. 23
- (Exhibit 1 admitted into evidence.) 24

- necessary. 1
- HEARING OFFICER FAIRBANK: Well, yes, we'll have 2
- them. And then also I think there's some additional follow-up 3
- 4 questions, if you don't mind, by our staff.
- MR. HERREMA: Certainly. 5
- MR. BENEDICT: John Benedict for the record. 6
- 7 **EXAMINATION**
- BY MR. BENEDICT: 8
- 9 Q. So I'd like to follow up on the structures and
- make sure I understand the importance of these structures. 10
- The first question, and I guess go to page 24 of 11
- 12 this presentation -- no, it's not. It's the one that actually
- 13 shows the structures based on, I guess, the interpretations of
- some aerial photos. Do you have that? 14
 - Yeah. So I wanted to make sure I understood
- which one of these structures represents what would be called 16
- the divide, I guess, or the isolating feature of the barrier 17
- of these, just so I'm clear? 18 ANSWERS BY MR. REICH:
- A. So when we're -- excuse me, this is Steve Reich. 20
- What we're identifying as the carbonated block or the 21
- isolating feature would be if you look at MX-5, it would be 22
- the fault trending north, 30 degrees west, running through the 23
- location. And then the fault parallel to that on the other 24

Page 230

15

19

2

14

Page 232

- (Exhibit 2 admitted into evidence.) 1
- MR. HERREMA: Thank you. And then in terms of 2
- the slide presentations, should -- how should we mark those 3
- for identification in the record? 4
- HEARING OFFICER FAIRBANK: Those will be included 5
- by the State Engineer in the hearing and filed. They're not 6
- being marked as exhibits. 7
- MR. HERREMA: Okay. And these lovely posters 8
- 9 that we brought today, I know one of them has already been
- used for additional purposes. Should we, perhaps, mark them 10
- and see if they're -- they continue to be used during the 11
- 12

13

15

- HEARING OFFICER FAIRBANK: Again, they were
- presented for demonstrative purposes and I think we'll go
- ahead and just like the PowerPoint presentations, they will be maintained, we'll keep them available for the purposes of the 16
- hearing, and -- but I don't see that they're going to be 17
- marked as an Exhibit because the deadline for marking 18
 - exhibits, again, it was a demonstrative document.
- 19
- That was what was it was presented for, so it'll 20
- maintain -- be maintained summarily as the PowerPoint 21
- presentations that were not marked as exhibits in this list. 22
- MR. HERREMA: Okay. I may have been -- or I 23
- meant just to mark them so that we can refer to them if 24

- side, which is also trending, there we go. 1
 - So this fault here, which is a continuation of
- the Arrow Canyon Range, and this fault here, which is the 3
- other side of that structural block. What you've seen today 4
- is the center area here is that dark blue area, which we're 5
- saying is high resistive formation. What we just discussed a 6
- minute ago then was this highway fault. 7
- So the isolation faults there would be not only 8
- the structural block in between, but like we've seen in other 9
- 10 areas, normal faults that can also act as barriers or conduits
- to flow. So there could be, you know -- there could be a 11
- 12 movement or, you know, prevention of movement of water across
- a highway fault, across this fault, across that fault, you 13 know. So those are the main -- those are the main faults that
- I think are germane to this discussion. 15
- 16 Q. So would it be fair to say then there are series
- of structures that represent that barrier or would you say 17
- that that horse block is primarily the feature of importance? 18
- A. So I would say they're both important. The horse 19
- 20 block is important as well as the other normal faults. If --
- Anne, you could go to slide 5 or 6 or 7, which is the 21
- cross-section, maybe the conceptual drawing. 22 You know, the -- so I bring this up not because 23
- - it represents that structural block, but rather it represents

(58) Pages 229 - 232 Min-U-Script® **Capitol Reporters** 775-882-5322

Page 236

Page 233

the importance of faults that are in the Coyote Spring Valley. 1

- So again, as we look at these faults that are 2
- what we considered normal faults or due to extensional. Each 3
- one of these faults can impact the flow of water both in a 4
- lateral direction as well as a cross direction. 5
- So when we look at that conceptual model and then 6
- we go to the -- that gravity survey that we were just showing
- a minute ago, I think it really gives us an understanding 8
- that -- the other slide -- of the importance of these and 9
- where they're located. 10
- 11 So again, looking at those -- looking at that
- last figure, imagining that one of those normal faults is 12
- 13 trending that way. One of those nominal faults is trending
- that way, one of those normal faults might be trending that 14
- 15 direction, a normal fault going up and down there, and also
- coinciding with that structural block. And then as we've 16
- 17 shown before that the fault is located on that side.
- So that's how we tie that conception model into 18
- what we're looking at from the geophysics data and then from 19 the hydrology in terms of groundwater movement. 20
- MR. HERREMA: Mr. Reich, can I just interrupt? 21
- When you're using the pointer for the purposes of the record, 22
- if you could just describe what you're pointing out with your 23
- words as well, that would be great. 24

- And then, of course, that's what allows us to 1
- draw the conclusion that there's a fault. I think when we go 2
- further to the right and we look at that dark red low high 3
- 4 conductivity and low rate resistivity section, that also
- corresponds to the same thing that they saw in the gravity. 5
- It's a thickening wedge to the right. So that fault is 6
- 7 located there.
- And then, again, the high carbonate, high 8
- resistivity carbonate located here and then -- and again I'm 9
- just circling with the pointer on the geophysics on the CSAMT 10
- where, you know, you can see a slide replica in the same shape 11
- 12 that we see.
- 13 So again, it's really combining the amount of
- information that's out there and putting it all together for 14
- 15 us to understand why these faults are important, not just a
- structural block that we talked about, but also the normal 16
- 17 faults that occur in the center of the valley, how they offset
- different sediments and forms.
- O. Okay. So last question. The structure that's 19
- identified that we've talked about quite a bit on the west, is
- there any reason from a geophysical perspective to 21
- characterize those two faults that are, I guess, mapped or 22
- 23 interpreted based on the cross sections as being the same
- structure as you do in the map? I'm just curious. 24

Page 234

- MR. REICH: So I was responding to the question
- 1 by indicating that on the rebuttal Exhibit 22, that there was 2
- a fault located through the gravity confirmed by the CSAMT. 3
- And when I'm using the pointer here, we -- these are high 4
- angle faults. So normal faults would typically be a high 5
- angle fault as compared to a low angle thrust fault. 6
- So typically somewhere in this range, we would 7
- expect to see a high angle fault, and what I'm doing is 8
- 9 drawing a near vertical line through the -- just a Paleozoic
- sediments to represent that high angle fault. 10
- Same thing further in the gravity profile, the 11
- lower figure in rebuttal slide 22, we would expect there to be 12
- some type of fault in this direction. I don't want to venture 13
- too far into geophysics, but as we discussed earlier, there's 14
- both a down-drop side, as we see, and that's the vertical 15
- 16 displacement that we would expect to see.
- And I think that when you look at how this 17
- corresponds, you look at that low resistivity material that's 18
- shown in the geophysics slides and you compare that to the low 19
- 20 density material that's in the gravity.
- That correlation -- and I'm circling the low --21
- the red low gravity, low electrical resistivity material at 22
- the west end of line B, how that corresponds with the thick 23
- sequence of basin fill. 24

- You've got a couple of cross sections and you've 1
- identified a structure on the very west side on both of them, 2
- and then you've defined that as a single structure inferred on
- your plan view map. 4
- Any reason that they need to be the same
- structure?
- 7 A. I'm -- I apologize. I'm not following exactly.
- Is there a figure that we can look at?
- 9 O. Yeah, back to the aerial --
- 10 A. Yeah.
- 11 Q. -- photo image.
- 12 A. And I'm going to let the geophysicist answer
- that. 13
- 14 O. Yeah.
- ANSWERS BY MR. CARLSON: 15
- 16 A. Yeah, yes. I --
- 17 Q. You have the aerial photo? Yeah.
- 18 A. Yeah.
- Q. So the western most, I'm just curious why that's 19
- drawn as a -- connecting the interpreted structures there. Is 20
- there an offset that's similar for both of those in the 21
- profile or some reason that they have --22
- A. No, the appearance of the fault is complicated on 23
 - line A by all that culture. So we can't say that they look

Min-U-Script® (59) Pages 233 - 236 Capitol Reporters 775-882-5322

Page 237 similar enough to be 100 percent sure that it's the same 2 structure. We feel it is based on the fact that we have the 3 4 continuation of this fault. We see it clearly on both lines, this fault clearly on both lines, and this one was at the same 5 orientation as those. 6 7 So, yes, we are interpolating across from line B up to line A. There's no way that we can say geophysically 8 that it's absolutely the same feature, but true. 9 MR. REICH: That's all I have. 10 11 HEARING OFFICER FAIRBANK: All right. Having no other questions from our staff, we can go ahead and conclude 12 today's hearing. And so just to get everyone aware for 13 tomorrow, we'll practice the same procedures again. 14 15 But, again, if people are expedient and efficient with their use of their time, which is much appreciated by the 16 State Engineer and our staff here, we certainly appreciate 17 that. And we will begin tomorrow with the United States Fish 18 and Wildlife Service. So we'll see you tomorrow. Thank you 19 very much. 20 MR. ROBISON: Thank you. 21 (Proceedings concluded at 3:36 p.m.) 22 23 24 Page 238 STATE OF NEVADA) 1 **CARSON CITY** 2 3 I, MICHEL LOOMIS, a Certified Court Reporter, do 4 5 hereby certify; That on the 24th of September, 2019, in Carson 6 City, Nevada, I was present and took stenotype notes of the hearing held before the Nevada Department of Conservation and 8 Natural Resources, Division of Water in the within entitled 9 matter, and thereafter transcribed the same into typewriting 10 11 as herein appears; That the foregoing transcript, consisting of 12 pages 1 through 237 hereof, is a full, true and correct 13 transcription of my stenotype notes of said hearing to the 14 best of my ability. 15 16 Dated at Carson City, Nevada, this 24th day of 17 September, 2019. 18 19 20 21 MICHEL LOOMIS, RPR NV CCR #228 22 23 24

- 1 CARSON CITY, NEVADA, TUESDAY, SEPTEMBER 24, 2019, A.M. SESSION
- **2** -00o-
- 3
- 4 HEARING OFFICER FAIRBANK: Good morning. We'll
- 5 go ahead and go back on the record, and this is the second day
- 6 of the hearing in the administration of Lower White River Flow
- 7 System hearing on Order 1303. We'll go ahead and get started
- 8 this morning with the U.S. Fish and Wildlife Service.
- 9 But just before we get going, again, just to
- 10 reiterate, this is an opportunity for the participants to go
- 11 ahead and present their salient conclusions and point us in
- 12 the direction of the evidence that supports those conclusions,
- 13 and yesterday I thought was a very -- went well.
- And so keep it in that path that we've been
- 15 proceeding. And we appreciate everybody being succinct and
- 16 making, you know, efficient use of their time. So with that,
- 17 we'll go ahead and turn it over.
- 18 MR. MILLER: Hello to everybody, and good
- 19 morning. My name is Luke Miller. I'm with the Department of
- 20 the Interiors, Office of the Solicitor and I'm here on behalf
- 21 of the Fish and Wildlife Service.
- Today is our special day to bring forward our
- 23 authors and experts who took part of drafting the reports on
- 24 behalf of Fish and Wildlife Service that were filed with the

- 1 B-R-A-U-M-I-L-L-E-R, and I authored sections 1.1 through 1.5 2 and 1.7.
- 3 MR. MAYER: Hello, I'm Tim Mayer, that's
- 4 M-A-Y-E-R. I'm a supervisor hydrologist of the water
- 5 resources branch in the regional office of the U.S. Fish and
- 6 Wildlife in Portland, Oregon and I think that's it.
- 7 DR. SCHWEMM: My name is Mike Schwemm,
- 8 S-C-H-W-E-M-M, and I'm the Senior Fish Biologist for the
- 9 Southern Nevada Fish and Wildlife Service office in Las Vegas,
- 10 and I coordinate recovery efforts for the Moapa Dace.
- 11 HEARING OFFICER FAIRBANK: Okay.
- MR. MILLER: Oh, just, we'll --
- 13 HEARING OFFICER FAIRBANK: And so at this point
- 14 in time, we can go ahead and have the witnesses sworn in.
- MR. MILLER: Yeah, that's a great idea. Sorry
- 16 about that.
- 17 (The Panel sworn.)
- 18 DIRECT EXAMINATION
- 19 BY MR. MILLER:
- 20 Q. I would note just for the record that these three
- 21 individuals were qualified in this proceeding as experts in
- 22 their respective fields. And I'll go ahead and ask them now.
- Sue, just starting down there with you -- I'm
- sorry, Ms. Braumiller, can you verify that you're familiar

Page 244

Page 246

- 1 State Engineer in response to Order 1303.
- 2 As you'll note, we have three authors. They each
- 3 took part in drafting a specific section, a distinct section
- 4 of the primary report filed on July 3rd, and we have one
- 5 author who filed the rebuttal or drafted the rebuttal in
- 6 whole.
- 7 They will each be providing today a summarization
- 8 presentation that is distinct and precise to their particular
- 9 section, and so hopefully you'll get it mixed up and see their
- 10 own styles as well.
- 11 The reports, themselves, the Fish Wildlife
- 12 Service believes are very robust, well rounded, rational,
- 13 reasonable presentations of good information. They are solid
- 14 and dense, so they took your recommendation to heart and they
- 15 are trying their hardest to focus on the salient points and
- 16 conclusions, and just trying to put some good useful
- 17 information in front of you folks today so we can have a good
- 18 discussion.
- To that end, I'll just go ahead and have them
- 20 introduce themselves, maybe we can start on the far end, get
- 21 your name and spell your last name for the record and just
- 22 tell them what you do.
- MS. BRAUMILLER: Yeah, Sue Braumiller. I'm a
- 24 groundwater hydrologist. The last name is spelled

- 1 with Fish and Wildlife Service Exhibit 5, the report titled,
- 2 "issues related to conjunctive managements of the Lower White
- 3 River Flow System," filed July 3rd, 2019?
- 4 ANSWERS BY MS. BRAUMILLER:
- 5 A. Yes, um-hum.
- 6 Q. And can you attest that you personally prepared
- 7 any part or parts thereof?
- 8 A. Oh, yes.
- 9 Q. Can you identify those one more time?
- 10 A. Yeah, sections 1.1 through 1.5 and 1.7.
- 11 Q. Okay. Mr. Mayer, same question for you. Are you
- familiar with the Fish and Wildlife Service Exhibit 5, the
- 13 report filed July 3rd?
- 14 ANSWERS BY MR. MAYER:
- 15 A. Yes, I am.
- 16 Q. And can you attest that you personally prepared
- any part or parts thereof?
- 18 A. Yes, I prepared Section 1.6.
- 19 Q. All right. And, Mr. Schwemm, same question to
- 20 you. Are you familiar with Fish and Wildlife Service
- Exhibit 5, the report filed July 3rd?
- 22 ANSWERS BY MR. SCHWEMM:
- 23 A. Yes.
- 24 Q. And can you attest that you personally prepared

SE ROA 53055

Min-U-Script® Capitol Reporters (2) Pages 243 - 246 775-882-5322

Page 247

- any parts or parts thereof? 1
- A. Yes, I prepared the entirety of Section 2. 2
- Q. Okay. And, Mr. Mayer, I'm going to come back to
- you since you are extra authored here. Are you familiar with
- Fish and Wildlife Service Exhibit 7, titled "rebuttal to water
- level decline in the LWRFS managing or sustainable groundwater
- development," and that was filed August 16th, 2019?
- A. Yes. 8
- O. And can you attest that you personally prepared 9
- any part or the whole part of that report? 10
- Yes, I prepared the whole report. 11 A.
- Q. Thank you. I don't know if the format was for me 12
- to wait until the end or -- if not, I'll probably just go 13
- ahead and ask that these be admitted into evidence. 14
- HEARING OFFICER FAIRBANK: They will be admitted. 15
- MR. MILLER: Thank you. 16
- (Exhibit 5 admitted into evidence.) 17
- (Exhibit 7 admitted into evidence.) 18
- MR. MILLER: So for our summarization 19
- presentations today, the Fish and Wildlife Service has opted 20
- to do a very narrative format style presentation for their 21
- direct testimony. And with that, I believe I will just go 22
- ahead and turn it over to Ms. Braumiller will start. 23
- MS. BRAUMILLER: Sure. And there are handouts 24

- earnest literature search in an effort to enumerate the 1
- sources of water in the Muddy River, from the Muddy River 2
- Springs to uppermost floor of Moapa Valley below which the 3
- 4 river is oozing all the way to Overton.

In some cases, I found that sources were 5

hypothesized, but hadn't been definitively demonstrated in the 6 7

past, and I think I have identified definitively some of those

sources. They are -- and most of this, we -- we already know. 8

9 The immediate sources of water in the Muddy River are, of course, Muddy River Springs, the surface discharges, 10 seepage from alluvial aquifers into the river in the Muddy 11 12 River Springs area in California Wash, and of course,

13 intermittent runoff and precipitation in the river.

The Muddy River Springs, in turn, as we all know, are almost entirely derived from regional carbonate aquifer. The sources of water in the alluvium adjacent to the Muddy River Springs area and California Wash are infiltration of the surface discharges and some surface seepage from the springs in the Muddy River Springs area, the carbonate aguifer underlying Muddy River Springs and California Wash.

Alluvial inflows from basins bordering the Muddy River Springs area in California Wash, I found, or concluded that those included Lower Meadow Valley Wash and maybe Coyote

Spring Valley.

20

21

22

HEARING OFFICER FAIRBANK: I think it will get 10 better as it warms up. 11

MS. BRAUMILLER: Oh, okay. That's fine. Well, I 12 will go ahead. My sections of the report are very simply an 13 interpretation of geologic and hydrologic data leading to 14 responses, my responses to the questions posed in Order 1303. 15

So what I'm going to present are my salient findings, hopefully just enough additional explanatory material to provide context and they are as follows:

They're -- I'm going to present them in the order in which I developed them because, in general, they followed one another. So I think that's the most logical way to present them.

I began by doing a literature search, probably by 23 no means a complete literature search. But it was a pretty 24

Page 250

And lastly recharge of local precipitation to 1

alluvium probably to Pahranagat Wash from -- in Muddy River 2

Springs area and Lower Meadow Valley Wash. 3

So most of that we already knew, but some of 4 those sources, I think I was able to confirm -- oh, I'm not 5

clicking in the right place. There we go. 6

In the process of confirming some of those sources of water in the Muddy River, I also demonstrated, I believe, that hydraulic connections exist between the alluvial aquifers of the Muddy River Springs area and California Wash and the underlying regional carbonate rock aguifer.

Oh, I didn't put that in the right place. Oh,

boy. I should have brought my bifocals. Okay. Here we go. And the hydraulic connections also exist between the alluvial aquifers, Lower Meadow Valley Wash and the Muddy River Springs area between Lower Meadow Valley Wash and California Wash and between the Muddy Springs area and California Wash.

Second, I endeavored to clarify the DOI 2013

SeriesSEE Curve-fitting analysis of the Order 1169 pumping 19 20 test and those findings since they are foundational to the identification of six basins and parts of basins under --21 unclaimed by a portion of the regional carbonate rock aquifer 22

possessing exceptionally high field scale transmissivity. 23

Those five plus basins being the Muddy River

Min-U-Script® (3) Pages 247 - 250 **Capitol Reporters** 775-882-5322

11

12

18

19 20

21

22

23

The basis for identifying the five-plus basins and that really occurred what, six years ago, was the development -- really the isolation of a remarkably uniform 1.5 to 1.6 drawdown in the regional carbonate aquifer due to the MX-5 test pumping as of the end of the Order 1169 test.

That drawdown isolated using SeriesSEE analysis. 9

Of course, you know, we didn't analyze all of the water level records for monitor carbonate -- carbonate monitoring wells in the entire study area, but just did that for a select number of wells, far flung across the study area. And it -- I'll show you in a minute where those five wells were located.

At any rate, I'll just skip to this slide. This is really hard to see. So MX-5, if you can see this, is the triangle in the middle. All right. About three miles north of MX-5 is CSVM-6 in Coyote Spring Valley. It's -- it -- I think that was one point -- these are all between 1.5 and 1.6 feet of MX-5 induced drawdown.

21 So three miles north of MX-5 and CSVM-6, we see 22 this 1.5 to 1.6 feet drawdown. Nine miles south of MX-5 in 23 CSVM-2, also in Coyote Spring Valley, again, we isolated 1.5 24

to -- well, it was a starting place for where we're at right 1 now. 2

Third, I concluded that the alluvium aguifers of, 3

at a minimum, those five plus basins and the underlying 4 5 carbonate rock aquifer function for all practical purposes as one groundwater basin as the source of the Muddy River Springs 6

7 and Muddy River.

That conclusion based on my earlier findings, 8

that the five-plus basins are underlined by a portion of 9 regional carbonate aquifer possessing exceptionally high field 10 state of transmissivity, and I mean, you know, the carbonate 11 12 rock province of the Great Basin.

Secondly, the hydraulic connections that I think I've demonstrated exist between the alluvial aquifers of the Muddy River Springs area and California Wash and the underlying regional carbonate aquifer.

And lastly, that the alluvial aquifers of the Muddy River Springs area, California Wash, and Lower Meadow Valley Wash are, themselves, in hydraulic connection.

Okay. So fourth, yeah, I propose that Kane Springs Valley should be considered for incorporation in Lower White River Flow System pending clarification of the completion of the existing carbonate wells in Kane Springs 24 Valley KMW-1 and KPW-1, relative to the Kane Springs Wash

Page 252

13

14

15

16

17

18

19

20

21

22

23

Page 254

to 1.6 feet of MX-5 induced drawdown. 1

27 miles south of MX-5 in Garnet Valley at GB-1, 2 3

we, again, saw 1.5 to 1.6 feet of MX-5 induced drawdown, and 15 miles southeast of MX-5 in California Wash, in M-1, we saw

4 the same thing. And nine miles east of MX-5 at SCSV-2 in 5

Muddy River Springs area, we saw the same thing. 6

So -- oh, yeah, okay. So, I mean, this looks 7

like a very small area on the screen, but it was a really

9 expansive area of near uniform drawdown. 10

Clearly, it's a drawdown cone, it can't be anything else. But it was remarkably uniform, 1.5 to 1.6 feet of MX-5 induced drawdown over a very large area.

So in order to identify the five-plus basins, we 13 then -- or I then interpreted that because it is a drawdown, flat or not. It must extend to -- at least to the nearest 15 likely no flow boundaries and that is how we came up with the 16 17

identification of five-plus basins that we did. Okay. And that area, that portion of the regional carbonate aquifer based on a SeriesSEE analysis of 2013 of the pumping test, that area that possesses exceptionally high field scale transmissivity is something on the order of 1,050 square feet -- miles rather, miles, and as much as 24 miles from west to east and 60 miles from north to south. So I would deem that result, you know, foundational

1 Fault. That is still not clear to me. I'm not sure whether they would be completed on the -- it would be the northwest 2

side or perhaps through the fault. They're very deep wells. 3

And also pending, the acquisition is sufficient 4

hydraulic data to determine whether the hydraulic connection 5 that I believe I've demonstrated to exist between carbonates 6

in southern most Kane Springs Valley and central Coyote 7

Springs Valley is limited to one side or occurs on both sides 8

9 in the Kane Springs Wash Fault as I just said a moment ago. 10

And I'll just mention here that contrary to a 2007 ruling, I think it was 5712 -- yeah, it was 5712, that I 11 12 believe I've demonstrated that although the transmissivity of the carbonates between central Coyote Spring Valley, I'm 13 thinking like CSVM-6, might be the most northern extent and 14 southern most Kane Springs Valley. 15

16 That although the transmissivity of the carbonates is clearly much lower than this chunk of the 18 carbonate aquifer that just possesses exceptionally high field scale transmissivity. 19

It is still transmissive as evidenced by the fact that you can see the same -- at least temporally, you can see the same variations in water level preorder 1169 pumping test at CSVM-6 as you do in CSMV-4.

And, in fact, you can see it in KMW-1, and during

Min-U-Script® (4) Pages 251 - 254 **Capitol Reporters** 775-882-5322

17

20

21

22

23

24

Page 255

1

- the pumping test, you see the same response, not the same 1
- magnitude, but the same timing in the central Coyote Spring 2
- Valley, in CSVM-4 in northern Coyote Spring Valley, and in 3
- 4 KMW-1.
- So there is a hydraulic connection, the 5
- transmissivity is just lower in that chunk of the carbonates 6
- 7 than in this very large area possessing exceptionally high
- transmissivity. 8
- So let's see. So, you know, I think that more 9
- information is needed, but there's plenty of evidence that it 10
- should be investigated and considered. 11
- And, you know, as a consequence, I propose a 3-12
- 13 to 4-month multi-well pumping test in KPW-1, which is needed,
- but not necessarily going to be sufficient to clarify the 14
- 15 effects of carbonate pumping in Kane Springs Valley and Coyote
- Spring -- you know what I'm trying to say, Coyote Spring 16
- 17 Valley, and its effect -- the effect of pumping Kane Springs
- Valley on the remainder of the Lower White River Flow System. 18
- 19 Depending on what the completion of KPW-1 is and KMW-1
- relative to Kane Springs fault, that's really key. We 20
- don't -- we've got to note that. 21
- Five, you know, I conclude that the effects of 22
- carbonate pumping in northern Coyote Spring Valley or 23
- southwestern Kane Springs Valley within a wedge of the 24

- Six, I've concluded that the Kane Springs Wash
- Fault must be permeable over much of central Coyote Spring 2
- Valley. And I can go into this one, if I'm asked about, just 3
- 4 based on water budget and secondarily, geologic
- considerations. 5
- Seven, I think that Lower Meadow Valley Wash 6
- 7 should be considered for incorporation in the Lower White
- River Flow System, given the potential for hydraulic 8
- connection between the portion of the regional carbonate 9 aquifer underlying Lower Valley Meadow Wash, which I 10
- understand is poorly known, but apparently is there somewhere. 11

12 And that underlying northern and central Coyote

- 13 Springs Valley, the Muddy River Springs area, and California Wash based on geologic considerations. The potential is there
- 14 15 and -- but pending hydraulic confirmation following the
- installation of adequate carbonate wells in Lower Meadow 16
- 17 Valley Wash of which I don't think there were any at present,
- and collection of sufficient hydraulic data to confirm a 18
- 19 hydraulic connection between the carbonates being used Lower
- Meadow Valley Wash and these other five-plus basins, et 20
- cetera. 21

24

1

- And that is a correction from our July report --22
- 23 well, it's a clarification really, and we did submit that as
 - this slide as some -- as an additional exhibit. I think we

Page 256

Page 258

- carbonate aquifer that is situated northwest of the Kane 1
- Springs Wash Fault and east of a north striking fault, normal 2
- fault, passing near CSVM-3 are currently unknown. 3
- It's basically that chunk of the -- that chunk of 4
- the carbonates that is north or northwest of Kane Springs Wash
- Fault. You know, I think we just don't know what would happen 6
- 7 if we moved carbonate pumping into the wedge, I would say, of
- the aquifer. 8
- 9 And, you know, I mean, on -- you know, based
- on -- if possible that this wedge of the carbonate aquifer is 10
- also compartmentalized by the Delamar Thrust Fault, then maybe 11
- gouge in the river's fault zone, unknown at this time. 12
 - And as such, because I know that's been
- 13 considered, you know, I propose a 3- to 4-month multi-well
- pumping test in CSVM-3 to clarify the potential effects of 15
- moving carbonate pumping into this wedge, northern wedge of 16
- the carbonate aquifer, northern part of either Coyote Spring 17
- 18 Valley or actually southwestern Kane Springs Valley is also
- part of that area. 19
- 20 What is to determine the effect of pumping within
- that wedge of the carbonates on groundwater levels in central 21
- 22 Coyote Spring Valley and the remainder of the Lower White
- River Flow System, including the springs when they're flowing, 23 of course.

- submitted four of these slides as exhibits just to be sure,
- because it was not stated that way in my original report. 2
- But I would note that, at a minimum, the alluvial 3
- aquifer of Lower Meadow Valley Wash, I believe I demonstrated
- to be a source of water in the alluvium adjacent to the river 5 in California Wash, plus a source of water in the Muddy River. 6
- So for that reason, if for no other reason, I 7
- would advocate that it does impact water, the amount -- it 8
- 9 does impact the Muddy River and California Wash to some
- degree. And for that reason, Lower Valley Wash should be 10
- considered, to some capacity, to be part of the Lower White 11 12 River Flow System.
- Okay. Eight, I identified climate signals and I 13
- did this very simply, just inspection of hydrographs, nothing 14
- statistical. I'm not trying to infer any statistical 15 significance here, et cetera. 16
- 17 But I endeavored to identify climate signals in
- 18 Lower White River Flow System groundwater levels and spring
- and spring flows in response to the 2004, 2005 and somewhat 19
- 20 lesser, but still 2010, 2011 wet conditions for the limited purpose of characterizing the timing of those wet period 21
- 22 responses of ground water levels and spring and stream flow
- relative to changes in the climatic conditions in the Nevada 23
- climate division 4, which includes the Lower White River Flow 24

Min-U-Script® (5) Pages 255 - 258 Capitol Reporters 775-882-5322

Page 259

System basins, the original five-plus basins, plus KaneSprings Valley, and Lower Meadow Valley Wash that I also

3 proposed be considered. Those are all Nevada climate division

4 4 and -- I'm kind of rambling here. Okay. Sorry.

Characterizing the timing of the wet period

6 responses in the groundwater levels and spring stream flows in

the Lower White River Flow System relative to climatic changes

8 and climactic conditions in division 4 and division 3, which

9 are -- includes the basins that are immediate up gradient of

10 the Lower White River Flow System basins and are the primary

11 source of water in the Lower White River Flow System -- Lower

12 White River Flow System.

13

14

20

24

9

10

11

12

13

14

15

16

17 18

19 20

21

And I -- I undertook this because I think that understanding the timing of the responses of groundwater levels and spring and spring flows in the Lower White River Flow System, the timing of those responses relative to the changes in climactic conditions are necessary, but also probably not sufficient to determine how climatic conditions are influencing groundwater levels and springs, spring flows, and the availability of water in the Lower White River Flow

System.
And what I found or I believe I see, just based
on simple inspection of the hydrographs, again, is that

climate signals, really wet period signals in groundwater

1 my earlier findings and using available geologic and

2 hydrologic data, beginning with inflow boundaries. And the

3 first and most prominent one, of course, is Pahranagat Sheer

4 Zone, which is a constant inflow boundary between Pahranagat

5 and northern Coyote Spring Valleys. I believe for the

foreseeable future, two reasons, that is pretty clear this isa constant inflow boundary.

a constant inflow boundary.

8 One, there is a potential for hydraulic

9 resistance across a sheer zone based on geologic
10 considerations, the three, I believe, slip falls that are the
11 Pahranagat shoot zone. So, you know, water basically piles up

in Pahranagat Valley behind the sheer zone.

And secondly, I estimate that a minimum of 1200 -- a minimum of a 1200-foot difference in head exists in the carbonate aquifer across this portion of the sheer zone.

That's a very large head difference, and consequently, I believe that -- I think it's pretty -- it's not -- it's pretty clear it changes on the order of many tens of feet in carbonate water levels in either Pahranagat and/or Coyote Spring Valleys, have no significant effect on the hydraulic gradient or basin groundwater flow across the sheer zone into the Coyote Spring Valley.

So it is -- you know, for all practical purposes, very conservatively you could say, it is basically a constant

Page 260

13

14

15

17

18

19

20

21

22

23

24

1 levels and spring stream, you know, in flows at the Moapa Gage

2 are detectible in carbonate water levels records basically

3 throughout the five-plus basins in the alluvial water levels,

4 in the Muddy River Springs area, in the hydrographs, water

5 level records for Pederson and probably also Plummer springs,

6 and the Muddy River Springs area, and arguably flows in the

7 Muddy River and Moapa Gage all within about one year, which I

8 thought was interesting.

In contrast, I looked at the water level record for both Baldwin Spring and I don't see those wet period responses in that record and I really don't know why.

But what I thought was very interesting and important because of big Muddy Spring is -- let's see, what is it? It's about seven CFS, it's a big spring and it's a significant component of the spring discharge to the river.

The Big Muddy Spring flows gradually increased and then decreased over about 12 years from 1995 to 2007 as that's a pattern not seen in division 4 or 3, Palmer drought of severity index trends since about 1977 to 1989 for 18 years prior, which I thought was very interesting. And I have a theory about that.

Nine, I identified the physical locations and conditions on the boundaries of the five-plus basins, Kane Springs Valley, and Lower Valley Meadow Wash consistent with Page 262

inflow boundary. And it appears to be on the order of about
49,500-acre-feet per year based on the most recent water

49,500-acre-feet per year based on the most recent water
 budget analyses I've looked at was using -- that is -- those

4 were the water budgets developed by SNWA as part of their

5 conceptual model for their CCRP model. Okay. So that was

2009.

6

7 Anyway, the other inflow boundary, I believe, is

a variable inflow boundary between -- this is at the top of

9 the Lower Meadow Valley Wash between Panaca Valley and Lower

10 Meadow Valley Wash, given the potential for hydraulic

11 conductivity through Lake Patterson and Panaca Valleys into

12 Lower Meadow Valley Wash, all within the Meadow Valley Flow

13 System based on geologic considerations. There's a continuity

of carbonates and other permeable units.

And secondly, based on the available water

budgets, again, they were SNWA's water budgets from their CCRPconceptual model, they concluded that there is water flowing

18 from Panaca Valley into Lower Meadow Valley Wash based on

19 those water budget analyses and variable -- a variable inflow

20 boundary, given that, you know, the groundwater level data is

21 pretty sparse in Panaca Valley.

But, you know, I found at least a couple records,

well records, water level records where you could seelong-term variations in groundwater levels up gradient of

Lower Meadow Valley Wash and Panaca Valley. It wasn't
 seasonal, it was longer than that. So I believe that to be a
 variable inflow boundary to the Lower White River Flow System.

variable inflow boundary to the Lower White River Flow System.
 And, again, based on SNWA's water budget analyses
 for their conceptual model for the CCRP model, it appears to
 be, you know, something on the order of 4700-acre-feet per

7 year.

8 Next, I evaluated the potential for no-flow

9 boundaries in the vicinity of the five-plus basins, Kane

Springs Valley, Lower Meadow Valley Wash, you know, using
 geologic and hydrologic data that showed these -- well, okay.

12 I'm babbling here.

The no-flow boundaries -- luckily no-flow boundaries were either coincidence with topographic that is for groundwater divides, coincidence with flow lines inferred from groundwater level data, or the locations where -- based on -- I made extensive use actually of HNL 2006, geologic cross-sections, and also, wherever possible, a 3D

hydrogeologic framework model developed by SNWA to support the develop of CCRP numerical model.

Using those two sources, I attempted to locate places for the full sequence of Paleozoic carbonates are juxtaposed with low permeability rocks. Those being potential. Okay. I've lost my -- yeah, anyway, creating the

e 263 Page 265

Black Mountain areas beyond the five-plus basins is unlikelyto change significantly as a result of water management within

3 the Lower White River Flow System in view of a 250-foot drop

4 in carbonate water levels that is documented from west to east

5 across the Glendale thrust.

That is from Lower Meadow Valley Wash to Lower Moapa Valley and a 100 to 150-foot drop in ground waters that is documented from west to east across the Muddy Mountain thrust, that is from California Wash to Lower Moapa Valley and Black Mountains area.

So, you know, although, you know, it may exist and it's not entirely clear what the rate of outflow is to Lower Moapa Valley or perhaps Black Mountains area, you would have to have -- it seems high unlikely that you would have sufficient change in head within the carbonates of Lower White River Flow System basins, or specifically California Wash, sufficient to change that gradient significantly.

And likewise, it seems unlikely that you get a really -- you know, I guess the 150 to 200-foot difference in head, it seems unlikely that you would get a large enough change in head of the Lower Moapa Valley side of these two thrusts to, again, change that gradient and that rate of outflow significantly.

So although it may exist, I'm not terribly

Page 264

1 potential for no-flow conditions. I lost it again.

Okay. Confirmed by groundwater level data where it's available. It's pretty sparse, but where it was available, and also it -- including the propagation of pumping induced drawdown or lack thereof across some of these geologic discontinuities.

And, you know, in summary, what I see is that the available geologic and hydrologic data support that a large number of no-flow segments can be identified in the vicinity of the five-plus basins, Kane Springs Valley, and Lower Valley Meadow Wash, which largely define the aerial extent of what I propose would be considered at least as the Lower White River Flow System.

Ten, without going into the details until I'm asked about them, in which case we can talk about it. Ten, I wanted to know that whereas some ground outflow may occur across the Glendale and Muddy Mountain thrusts from Lower Meadow Valley Wash and California Wash into lower Moapa Valley and/or the Black Mountain area, that the rate of outflow is poorly known. It's uncertain. To date, it's based on Darcy-flux approximations and/or basin scale water budget

analyses.But more importantly, what I believe that that

outflow to the extent that it occurs to lower Moapa Valley and

1 concerned that management within Lower White River Flow System

2 is going to affect it, outflow to Lower Moapa Valley.

3 11, so in summary -- some summary, you know, I

would propose revisions to the aerial extent of the LowerWhite River Flow System to include the following eight basins

6 and parts of basins: The Muddy River Springs area, most of

7 Coyote Spring Valley, Hidden Valley, Garnet Valley, most of

8 California Wash, the northwest part of Black Mountains area,9 those being the original five-plus basins, plus Kane Springs

10 Valley and Lower Meadow Valley Wash, pending, you know, the

acquisition of the information that I mentioned earlier.

And that's really, really hard to see, but as you can see, that would be a significantly larger area than what has been proposed by others and what we recognize right now. So I'll just give that to you for your consideration.

12, you know, I conclude that knowledge of the relative transmissivities, storativities and hydraulic diffusivities of the carbonate and alluvial aquifers of the Lower White River Flow System are sufficient to address the remaining questions posed in Order 1303.

We don't -- you know, we don't need, you know, sophisticated estimates. We know that the carbonate aquifer had -- possesses high field scale transmissivity. All, of it compared to the alluvium, limited storativity and high, but

The alluvial aquifers of Muddy River Springs area 2 and California Washburns are lower in transmissivity, higher 3 in storativity and possess lower hydraulic diffusivity than 4 the carbonate aquifer. 5

And I believe that's really all we need to know 6 in order to answer the rest of the questions posed in Order 7 1303, such as, what are the effects of moving alluvial pumping 8 into carbonates or carbonate pumping into alluvium. 9

13, based on all those previous findings, I developed a hydrogeologic conceptual model of Lower White River Flow System as a basis for addressing the remaining questions posed in the order.

And just generally, they -- it includes the effects of carbonate pumping. The effects of alluvial pumping within the Lower White River Flow System. The effects of constant inflow at the Pahranagat Sheer Zone. The effects of variable inflow of at the north end of Lower Meadow Valley

19 The causes of climate signals in groundwater 20 levels and spring and spring flows in the Lower White River 21 Flow System. The effects of decreased local recharge, local 22 recharge or inflow to Lower Meadow Valley Wash due to changes 23 24 in climatic conditions. The effects of changes in groundwater

Oops, I lost the place again.

That's assuming that flows in the Muddy River in 2 2015 through 2017 were sufficient to meet senior decreed water 4 rights in the river, which, you know, is a domain in the State Engineer's office. I won't pretend to know that for certain. 5

And as I presented in my report and I -- you 6 7 know, it's not here in detail in my summary presentation, but

8

I do believe this to be conservative, but not overly conservative initial estimate of the sustainable level of 9 total carbonate alluvial pumping in the system, if only 10 because we know that pumping -- I can't bring it on the top of 11 12 my head. It was like 10,000 something acre-feet per year was 13 the total -- average total carbonate alluvial pumping during Order 1169 pumping test. 14 15

And when the test -- you know, when the test pumping ceased, the system was nowhere close to the equilibrium state as evidenced by the fact that the spring flows at Pederson and the Plummer Springs -- let's just say Pederson Springs because they're more accurately monitored, were in an undiminished state of decline and paralleled by changes in water level, in carbonate monitor well EH-4 is the closest monitor well, undiminished state of decline.

So the system was nowhere close to new steady state when the pumping test ended. So we know the 10,000,

Page 268

Page 270

availability up gradient of the Lower White River Flow System basins due to development, time lags and the manifestation of pumping impacts and recovery, and lastly, the source of the Muddy River Spring, I have a hypothesis.

14, you know, I conclude the following about the sustainable levels of pumping in the Lower White River Flow System. Just an initial observation, carbonate and alluvial aquifers in the Lower White River Flow System are generally in good hydraulic connection, therefore, total carbonate and alluvial pumping must be used to establish a sustainable level of pumping. The total pumping, carbonate and alluvium.

Secondly, I observe, at least in my opinion, that there are too many outstanding questions regarding the hydrology and hydrogeology of the system to construct a numerical model at this time that will be useful in predicting the sustainable yield.

So I believe that the average rate of combined carbonate and alluvial pumping in 2015, '16, and '17, that was 9318-acre-feet per year or so, is the best initial estimate of a sustainable yield of Lower White River Flower System available at this time.

That is excluding rates of alluvium pumping that is currently -- that's occurring in Lower Meadow Valley Wash as that has not been inventoried as far as I can tell.

1 whatever it was, acre-feet per year was a total carbonate alluvial pumping during the test average is probably too much. 2

We estimated that the Pederson, one of the 3 4

Pederson Springs would have stopped flowing if it had continued. So that is too much. 5

And I think we know from what we observed in 2015, '16 and '17, that assuming that the amount of water flowing down the river was sufficient to meet the senior decreed rights on a river, that the spring flows were pretty steady, the flow on the river was reasonably steady. It seems like a pretty safe bet and I don't know how we're going to know any better than that right now.

I also have a -- probably suggest an alternative approach. He's not here, so I've included it in my report, and he suggests that it may be possible to create a simple empirical model that can be used to project a level of combined pumping at a sustainable yield that will allow senior decreed water rights on the river to be met. And that would involve, if this can be done -- I'm not clicking again here, okay -- oh, here we go.

Yeah, what that would involve is if you could estimate what the total carbonate alluvial pumping was in the Lower White River Flow System basins, going back, you know, 20 years and just make an X/Y plot, that against -- I don't

24

Capitol Reporters

(8) Pages 267 - 270

Page 271

- know if it would be flow to Moapa Gage, flow in the Glendale 1
- Gage, or maybe you'd have to look at both of them, but you 2
- could create a simple empirical relationship based on data, 3
- 4 okay, that relates the rate of total carbonate and alluvial
- pumping versus what you saw going down the river at the Moapa
- Gage or the Glendale Gage or both of them. You could then 6
- pick off of that graph, okay, the level of total pumping that
- allows enough water to go down the river at the Moapa Gage or 8
- Glendale Gage. 9
- And if you created such an X/Y plot using data 10
- 11 that goes back, say, 20 years, you would also capture the
- 12 effects of changes in climate, at least within that record.
- So it would have that benefit as well. 13
- So I would suggest that be the next step. That, 14
- 15 of course, would have to be updated periodically, but like I
- said, that kind of empirical model -- because I think -- you 16
- 17 know -- it's -- we don't know enough to build a numerical
- model that can predict sustainable yield yet. That's what I 18
- 19
- 20 That kind of empirical model would have the
- advantage of accounting for climatic -- variations in climatic 21
- conditions at least in the past years. And regardless of what 22
- method is used, I do think that sustainable yield is going to 23 have to be updated periodically to reflect changes in the 24

- remainder of water in the river comes from alluvium in the 1
- Muddy River Springs area and California Wash, and that 2
- existing alluvial pumping in the vicinity of the river should 3
- 4 not be moved closer to the river, pretty obvious, because that
- could reduce the time lag in development impacts to the river
- possibly before the impacts can be detected based on periodic 6
- 7 data collection and processing.
- And lastly, I enumerated -- it's probably -- it's 8
- not a complete list, but I enumerated some obvious unresolved 9 technical questions, which I identified through my analysis 10
- regarding the hydrogeology for Lower White River Flow System, 11
- 12 unresolved technical questions that I think are relevant to
- the development of an effective conjunctive water management 13
- program and eventually, you know, hopefully we can address. 14
- 15 And that is it.
- MR. MILLER: All right. Thank you, 16
- 17 Ms. Braumiller. I think we're going to have to swap seats so
- Tim Mayer can put up his presentation. 18
- MR. MAYER: Okay. I'm Tim Mayer, and I'm going 19 to be talking about Section 1.6 of the report that was 20
- submitted in July, we go to the slide view. So the title of 21
- that section is, "groundwater and spring discharge 22
- 23
- relationships in the Muddy River Springs area and their
- 24 importance to the trigger levels in the 2006 MOA."

Page 272

- 1 available of water within the system due to changes in
- climatic conditions or groundwater development up gradient of 2
- the Lower White River Flow System, which at least at the top 3
- of Lower Meadow Valley Wash could affect rates of inflow to 4
- the basins. So I don't see this as being a static number. 5
- 15, I thought about the effects of moving 6
- carbonate and alluvial pumping within the Lower White River 7
- Flow System and this is my conclusion. 8
 - Carbonate pumping, total carbonate pumping should not be increased in exchange for reductions in alluvial
- 10 pumping, even if total pumping is maintained at a sustainably 11
- overall level, since the Muddy River Springs, at least the 12
- Refuge Springs are derived almost entirely from the carbonate 13
- aquifer. 14

9

- And existing carbonate pumping should not be 15
- moved closer to any of the springs or the river, which could 16 reduce the lag time and the development impacts to the springs 17
- or the river, possibly before the impacts can be detected 18
- based on periodic data collection processing, because that 19
- 20 does take time. And with respect to alluvial pumping, I don't 21
- believe that it should be increased in exchange for reductions 22
- in carbonate pumping, even if total pumping is maintained at a 23
- sustainable overall level since, in addition to springs, the 24

- Page 274
- And basically we've all heard how Pederson Spring 1 on the refuge is the highest, most sensitive spring in the 2
- system. And so I'm going to take a couple slides here and
- explain why that is just for those of you who haven't heard 4
- this before. 5
- I think most of the people have seen these slides 6
- and heard this. This is our theoretical understanding of 7
- groundwater and spring discharge in relationship to the Muddy 8
- 9 River Springs area.
- 10 So the springs are derived from the regional
- carbonate aquifer and that aquifer is confined and is under 11
- 12 pressure. And so the potentiometric surface elevation of the
- aquifer rises above the land surface elevation in the Muddy 13 River Springs area and that results in spring flow. 14
- And because of the high transmissivity of the 15
- aguifer in this area, that potentiometric surface elevation is 16
- 17 fairly consistent and uniform throughout the Muddy River
- 18 Springs area. But the elevation of the springs, themselves,
- in the Muddy River Springs area varies quite a bit, by 70 feet 19
- 20 or more.
- So what this means is you have a range of 21
- hydraulic head differential driving the spring flow of the 22
- individual springs in this area. And by hydraulic head 23 24
 - differential, that's simply the difference between the

potentiometric surface elevation and the land surfaceelevation of the spring.

So if I can direct your attention to the higher
elevation spring on the slide here on the left-hand side, and
we have a potentiometric surface elevation at that site of
1,817 feet. We have a spring orifice with an elevation of
1,807 feet. So we have ten feet of difference between the
potentiometric surface elevation and the spring elevation at

So our hydraulic head differential is ten feet.

If you move over to the right-hand side part of the slide and you look at the lower elevation spring, that spring is in elevation of 1,797 feet. All right.

that higher elevation spring.

18

19

Potentiometric surface elevation is uniform throughout this whole area, so it's still at 1,817 feet. So we have a hydraulic head differential at this spring of 20 feet. So the important part here is that we have a range of hydraulic head differentials at individual springs.

Now, why that is important is if you impose a drawdown, if you vary the level of the potentiometric surface elevation, say, through pumping or climate or whatever, so I've imposed a hypothetical five-foot decrease in the potentiometric surface elevation of the regional aquifer. So now that potentiometric surface, it was at

1 the changes in head at several different sites in the Muddy

2 River Springs area. And we did that in the Order 1169 report

3 that the Department of Interior submitted in 2013. So this is

4 an update of that order.

5 This is a map showing the monitoring sites that

6 we looked at, the refuge boundary is shown in purple here.

7 There are five sites that we looked at that are on or close to

8 the refuge. Those are the Apgar Spring -- I mean, the Jones
9 Spring, the Pederson Spring, Pederson East Spring, the Warm

Spring, the Pederson Spring, Pederson East Spring, the WarmSprings West flume and then the Iverson flume.

Now, we didn't look at Baldwin Spring, but we did in 2013, but we didn't do it in this update. There were some funny things in the record there and we didn't look at Big Muddy Spring.

Big Muddy is the lowest elevation spring, it's the least sensitive, and we did not see any relationship when we looked at that in 2013. So we didn't look at that spring in this analysis here.

And then the -- just for reference, the monitoring well that I'm talking about, this is the carbonate monitoring well just south of the refuge, that's CH-4, and that's the well that we're using to represent the potentiometric surface elevation in the aquifer.

So I'm just going to walk you through one figure.

Page 276

1,817 feet, now it's at 1,812 feet. So if you look at the
 hydraulic head differential at the higher elevation spring on
 the left now, that went from an initial value of ten feet to a

4 new value of five feet.

We have a 50 percent reduction in the hydraulic head differential at that spring. If you look at the lower elevation spring on the right, we had an initial hydraulic head differential of 20 feet, now we have a new hydraulic head differential of 15 feet, so we have a 25 percent reduction at that spring.

So we have 50 percent at the highest elevation spring, 25 percent at the lower elevation spring, and we -- because of Darcy's Law, we expect that the reduction in spring flow is going to be proportional to the reduction in hydraulic head differential, a change in hydraulic head.

So that means we would expect a 50 percent reduction in spring flow at the highest spring and only a 25 percent reduction in the spring flow at the lower elevation spring.

So that's why our highest elevation springs are
the most sensitive to changes in water level elevations, at
least that's our theory anyway. So this section is really an
update of an analysis that we did of looking at groundwater
and spring discharge relationships and the changes in flow and

This is the top plot from Figure 19 in our report and this is

2 showing the average monthly flow at Pederson Spring, which is

3 the highest elevation spring versus the average monthly water

elevation at EH-4. And this is for the period from 2004 to2019.

So we've got discharge on the Y axis and the range of water elevations in EH-4 on the X axis. And you can see, we have a really good relationship between spring discharge and groundwater elevation here.

So what happens is the groundwater effects the springs there very clearly. We have an R-squared of about .97, that says that 97 percent of the variability in monthly discharge at the Pederson Spring is described by monthly groundwater elevations and EH-4. So that's really good.

So as I said, this was the most sensitive spring. And if you look at the coefficient or the slope of this line of this relationship, it's .05 CFS. That equates to about 19 percent of the maximum flow per foot of drawdown.

So, in other words, for every foot of drawdown that you get in EH-4, you lose 18 percent of the flow relative to the maximum flow. And that's the highest relative decline that we found in our analysis of the five sites that we looked at. So it makes sense. It's supposed to be the most sensitive spring, it looks like it is the most sensitive

Min-U-Script® Capitol Reporters (10) Pages 275 - 278 775-882-5322

Page 282

Page 279

spring. 1

3

8

10

11

12 13

14 15

And then since we know the potentiometric surface 2 elevation at the maximum water level here and at the minimum groundwater level, and we know the elevation of the spring orifice, we could estimate the reduction in head differential just like I did on the illustration that I just showed you. 6

So we did that and we estimated that the reduction in head should be or was about minus 72 percent. So we had a change -- that much of a change in head differential over this range of water elevations. And we compare that to what we measured in terms of reduction of flow and we see that we have very good agreement, 73 percent reduction in flow.

So that says that this spring is behaving pretty much exactly as we theorized that it should, and that it is the most sensitive spring in the system.

So this is just a table summarizing our results 16 17 from the analysis of the five sites that we looked at, and the five sites are listed here in the first column on the left. 18 Pederson Spring, Pederson East Spring, Warm Springs West, 19 Jones Springs, Iverson Springs -- or Iverson Flume. I should 20 say this is Table 1 in our report. 21

And these springs are ordered from high elevation 22 to low elevation, so from high sensitivity to low sensitivity 23 if they follow our theory. 24

are ordered from, you know, steepest or greatest decline to 1

less decline. So it looks like these springs are behaving as 2

we think they should, according to the theory that we

4 developed. And this says that the Pederson Spring and those

higher elevations springs are the most sensitive, and that if

you protect those, you're going to protect the other springs 6 7

in the system.

8

9

10

11

12

13

14

15

16

17

18

19

20

21

22

23

So, in conclusion, I've shown you that groundwater levels and spring discharge are really closely related, especially at these higher elevation springs. If you limit pumping in the Lower White River Flow System, you're going to maintain groundwater levels and you'll protect the spring flow.

I didn't talk much about this in the presentation here, but there are triggers on the Warm Springs West flume. Those triggers protect or measure the flow from the highest elevation springs, Pederson, the Pederson East, a number of other springs there. So those triggers are established to protect the flows on that use in the refuge, the Pederson -the Pederson that has most sensitive springs.

So if we protect those springs, then we believe that you'll protect all the other springs in the MRSA as well. And that's all I have to say.

24 MR. MILLER: All right. We'll switch seats one

Page 280

And we've got the type of monitoring site here in 1 the next column from the left. Some of these are spring 2

monitoring sites, they're monitoring the outflow from the 3

individual springs. 4

9

10

11

12

13

14

15

16

17

18

19 20

21

22

Some of these are flow monitoring sites and 5 they're monitoring the collective discharge from a lot of 6 different springs. And then we have the elevation here or the 7 range of elevations depending on the site. 8

We have the R-squared value, I said was .97 for Pederson. You can see we get worse R-squares as we go to less sensitive springs. We don't have as much descriptive power in each water level elevations. We don't do as good a job explaining water elevation -- or water discharge changes at these lower elevation sites.

Then we have a slope coefficient, that's the slope of the line with key value associated with that coefficient.

And then over here, we have the changes that observed discharge that we measure over the range of water level elevations. And in the following column, the furthest column on the right, we have what we estimate was the change in head.

So these should agree pretty closely and then 23 there's some variability, but they're fairly close. And they more time and let Mr. Schwemm sit over there. And after

2 Mr. Schwemm's presentation, if you could let me know if the

3 timing is such you'd like to take a break and then we'll have

one more substantive presentation for the rebuttal report. 4

5 DR. SCHWEMM: All right. My name is Michael Schwemm and I'm going to be talking about Section 2 of the 6

report, which deals with sort of the direct implications of 7

the biology and springs for the Moapa Dace. So for this talk,

9 I'm going to briefly go over a few elements that correspond to 10 the sections straight out of the report.

So basically of the report that was divided up 11 12 into these sections and I pulled out a number of salient features, not all of them, but ones that were important that I 13 wanted to highlight here today. 14

It looks like we got the automatic timer on. So basically I'm going to cover elements of background biology of the Moapa Dace and some of the peculiarities that make it a really interesting species, and that led into a number of anthropogenic impacts and conservation actions that we've done on the Moapa Valley Refuge over the years, and that's kind of naturally led into the importance of cone activity and fragmentation and how that might affect the biology of the species.

And then that kind of -- after that is a

22

23

discussion of spring flow and habitat needs, and for this 1 section, I want to highlight one of the papers that I believe 2 provides the best information in terms of this relationship. 3

And then I'll briefly touch on the -- our current and historical abundance of Moapa Dace and then I have a summary slide at the end. So I think it's only about 17 slides after the title slides. That's good news.

So starting off with where it is, I didn't think we had covered it already, but I wanted to just highlight a couple elements of the system that are important. So just starting at the very course of scale, I did have this one image here that isn't found in our report. It's just a map of the southern U.S., but this one here on the left is.

But as I mentioned or discussed in the report 14 15 that the Muddy River Springs is part of a larger river system. Historically, in pluvial times, it was part of the pluvial 16 17 White River, which is basically drainage that runs all the way down from the White River to -- through Pahranagat down into 18 19 what's called the Muddy River and the original arm of Lake Mead. And that area here is shown in this little diagram I 20 made. 21

But basically, at present, the Muddy River 22 Springs provide a substantial water in the system currently. 23 So that's -- makes it a really important sort of legacy of 24

it shares its habitat with a couple other fish, a couple 1 snails and bugs. 2

So -- but overall what this system is 3

characterized why it's unique from a biological standpoint is 4 that Moapa Dace and others were sort of stranded in this 5

little pocket of water that the Muddy River Springs area since 6

7 the end of the Pleistocene. So as Holocene warming began,

these fish were kind of stuck up there. And with the case of 8

Moapa Dace, there's no other fish in genus Moapa.

So what that means is there are no really similar minnows. All of its very close relatives are extinct and it represents a unique component of the biodiversity of the system. So given that it's rare from, you know, a biogeographic standpoint, it also has some really interesting features about this species.

The first one is that it's thermophilic. That means that it likes hot water and for a minnow, this is way on the high end. So this species occurs from 32 to 26 degrees Celsius. That's about 90 or so on the top end. And spawning occurs at the very highest temperatures, 30 to 32. So it really likes hot water.

It's a small fish that's about 120-millimeter fork length with -- when it was sort of described in the '90's and -- oh, crap. That's about -- that's less than five inches

Page 284

water in the system from a biogeographic standpoint, which is

why animals occur where they do. And that's an important --2

I'll cover that in a minute. 3

4

6

7

8

9

10

11

12 13

1

17

18

On the left here is a diagram of the streams. 4

The colored sections just represent areas that we identify as 5 6 recovery units and we can communicate effectively. So the numbers just identify specific segments. 7

But as Tim just talked about previously, here's 8

Pederson right here, here's Plummer Spring. This is Apcar.

This green area here shows the majority of the refuge and 10

these are some -- and then there's this -- kind of another 11 branch here that's made up by the north fork and south fork 12

that comes down, and this is the main stem down here. 13

So the Gage that Tim was talking about is right 14

here on the Pederson stream, right at the refuge boundary, the 15 Warm Springs West Gage. 16

MR. MILLER: Mr. Schwemm, just to remember, try to be specific with your descriptions since it doesn't come through with the pointer.

19 20 DR. SCHWEMM: Okay. So the system that we're talking about, the Muddy River, because as I mentioned that 21 it's part of this historical drainage, there's a number of 22 endemic species that live there. And the one we're the most 23 concerned with is the Moapa Dace because it's endangered. But

and it's left to live about four years or so. 1

But I'll come back to this at the minute -- or in 2

a minute later in the slides that it's actually a little 3

smaller now and probably only living a couple of years now. 4

We have a little different age structure than was what we 5

thought we had in the '90's. 6

A typical -- or typical threats of the species are those that affect most of the desert southwest, which is 9 outright habitat change and then the effects of predatory 10 invasive species, both fish and otherwise, and the availability of in-stream flow. 11

So you can touch -- boil down to rest of desert fishes of those three big ones. We don't have issues -serious issues with pollution and stuff that we have as you move farther east in other systems typically.

So given all of this unique status that we've known about Moapa Dace for a long, it was listed as endangered kind of -- as kind of the first wave of fishes that came after the establishment of the Preservation Act in '66.

So it was right after that and it's one of the earliest fish to receive some protection. And it only occurs in the sort of upper mile or so habitat of the springs because it likes hot water. So as you go downstream, you're not going to find this in the cooler water areas or at least below 26.

So you're limited in that range. 1

But there's -- I'm going to talk a lot about 2

movement within that range in the subsequent slides. But at 3

- present, we have about 1500 animals, which is considerably
- better from the 500 animals that we had in the recent past.
- So we're pretty pleased with that at the moment, but we still 6

7 have quite a ways to go.

21

So given this rarity of the fish, it was

important that a refuge was established for the Moapa Dace and just as an -- it's kind of an aside is that, you know, the wildlife refuge typically established for -- for waterfowl and wetland areas, and this probably was the only refuge established for a minnow. It's that unique in its biology

that it warranted such an entire refuge based on this habitat. 14

15 So it's really unique.

Early efforts on the refuge involved removing palm trees and trying to get stream habitat back to what it was naturally. And basically Plummer and Pederson were characterized by chlorinated swimming pools in which the stream was completely obliterated and similarly Apcar was taken all for municipal water supply.

So these springs had to be almost completely 22 recreated and fish had to be moved around on the refuge and --23 or off the refuge back onto those habitats. So it's really an 24

at juvenile stages, they drift downstream. This was shown by a lot of the early work of others that worked in the -- at the refuge. And then you typically find large fish in faster 4 moving and deeper parts of the water.

And not only do they -- does the habitat vary by life stage, but it's also really interesting that the fish, even within their own lifetime, they vary where they are in the stream by their behavior.

And this is key and the adults are known to only spawn in the highest temperatures at the spring head that's about 30, 32 degrees, and yet they were found and typically feeding gross likely downstream. And this -- this is typical of even larger fish, kind of grow better due to, you know, metabolic concerns as they go downstream.

So the implication of these sort of complex biology is that Dace are continually moving upstream and downstream in the system on -- you know, daily, seasonally quite often because these fish are spawning year round, yet they feed in cooler water, at least historically. So we have a lot of issues with migration to deal with.

And I wanted to bring up one slide here, this is from the Warm Springs stewardship plan. And what I want to highlight here, it's just a nice diagram of the temperature of the spring heads. So you can see how the spring heads are hot

Page 288

effort of extensive habitat recovery. 1

And similarly, when we do these sorts of 2

renovations, we're trying to make habitat that's more amenable

- to Moapa Dace and less so to the invasive aquatic species like 4
- mollies and Mosquitofish and Tilapia that really have posed 5
- 6 significant threats to the species and we've done a lot to
- 7 mitigate these.

And on the refuge, more recently, we've really 8

- been thinking critically about what types of habitat we need
- the most benefit of the Dace, you know, how can we, you know, 10

mitigate the effects of endangered -- of invasive species on 11

the system and protect in-stream flow requirements. And the 12

Fish and Wildlife Service has done this from a couple of 13

previous agreements that I'll talk about. 14

What -- I guess probably what has -- what makes the species most interesting are a number of complex

biological requirements that are really, really unique, but, 17

however, they've also posed significant challenges to the 18

recovery of the Moapa Dace and I want to highlight some of 19

20 those here.

The first one is that the stream habitat where

these fish occur varies with life stage, and specifically 22

young fish feeding on really small stuff in slow moving pools. 23

And as they get larger, they grow a little bit and become --

1 here, indicated by the red and as it goes through the blue,

yellow, green as the streams cool down. 2

So what this means from Moapa Dace is that 3

they're having to swim back and forth between the hottest 4

spring areas of the spring head and downstream all the time 5

6 and really highlight the importance of conductivity.

So what we've done for the conservation in Moapa 7

Dace is kind of -- we've taken this three-part approach. And 9

the first was to restore all types of habitat, because we know

we need up at the spring head and we know we need slightly

downstream.

And we've done this by trying to remove barriers and constructing habitat that's amenable to the species. And simultaneously, though, we've done a ton of work on trying to mitigate the effects of credation and non-native fish like Mosquitofish and Molly and the chemical removal of Tilapia from the entire system. And we think we have a pretty good handle on this now.

Just recently, we've come -- finished the entire system, treated the entire system of the Muddy River for non-native fishes over the course of the last decade or so.

And the last point is maintaining in-stream flow, and as I pointed out, it's -- we need to maintain these habitat -- specific areas of the habitat and the connectivity

Min-U-Script® **Capitol Reporters** (13) Pages 287 - 290 775-882-5322

Page 291

between them. And this has been accomplished through voluntary curtailment of groundwater pumping through a couple of Fish and Wildlife Service agreements.

In 2006, one was the MOA that we mentioned
already that looks at Muddy River Springs area, Coyote Springs
Valley. And the second agreement, which is the amended
stipulation with Lincoln County, Vidler that dealt with Kane
Springs. And so just to highlight some important aspects of
the MOA is that it brought together the main water users in
the area to actively protecting spring flow in the Moapa Dace.

And part of this was to establish a system where we would all meet monthly and discuss the needs and how they are changing so that we could have this sort of adapting management approach that has really been successful.

And then this included explicit financial agreements from all the parties to fund recovery actions of research that have made a difference, as you'll see, in the -- when we get to the current abundance slide.

Also, in there was these mandatory annual discussions of hydrology where we would discuss the pumping data that occurred only last year and how the triggers and the Dace are doing. And, of course, the important main in-stream flow triggers, which is the voluntarily curtailment of surface and groundwater.

these -- which is sort of the shape, whether it's a glide or ariffle or a run type of habitat.

And then the second was to use this information,

these variables that were important to develop a simulation
that showed -- a model that showed when you actually changed
the flow, how is that going to affect the amount of habitat

7 that's available for Moapa Dace.

So starting with the first part, this is the part that developed a model for the number of variables and what variables they were. And there's a lot of text on here and a lot of stuff, and I don't want to get bogged down. I just wanted to cut and paste the direct figures from the exhibit unaltered.

But what I wanted to highlight is these are models here on the left, 1 through 13, and they included a bunch of univariant and multivariant models that -- virtually every one that they could and then they used the AIC, which is a model selection approach to choose the variables that best fit the data.

And typically with AIC modeling, models that have a delta AIC score of less than two is considered to be good models. So that limits us right here at the first two models. So they ranked them in the table convenient for us. So we're only concerned with these top two models. And within these

Page 292

Page 294

And my report dealt only with the biology and not with other elements of these agreements, but I wanted to just highlight the triggers here just to show the -- what they are. And these are several exhibits and so I wanted to highlight that the -- it's 3.29 CFS or below 3.2 CFS, is where the first trigger in the MOA. And in the amended stipulation, it's 3.15. So they're approximately similar in where voluntary curtailment would occur.

So given that, you know, we have this, you know, this species that we know uses different parts of habitat and is likely sensitive to flow based on these habitat needs, I want to highlight one specific paper, in particular, that really shows -- provides the best evidence of how spring flow and Dace habitat, their relationship of those features. And I want to walk through this particular paper.

So what this -- what the authors did is they identified Dace habitat based on typical snorkel surveys and they measured habitat characteristics. And then what they did with this information is they wanted to ask, you know, what are the important variables for Dace, and they did this using logistic regression and model selection approach that used a presence/absence model and the -- and typical stream characteristics that you go out and measure like water depth, velocity, the sub-stream and the stream lithology which is

1 models, the variables that were important were depth,

2 velocity, and the substrate, which is like cobble, sand, rock,

3 so forth. And the other -- and a variable FRD which is that

4 complex stream variable.

So given that these were the top models, the authors chose model 2 among them to carry forward the -- these

7 sorts of important variables, depth, velocity and substrate

to -- into the model simulation for flow.

So specifically what the authors wanted to ask is to address the question, how does habitat change in response to flow. And what they did to answer this question is they simulated 10, 20 and 30 percent increases and decreases of stream flow and they used this software, River 2D, to calculate how the amount of habitat that would be available at those flow rates. And they did this with Apcar, Pederson and Plummer.

So here's a slide showing a cut and paste of the data from the Hatten paper and there's two panels, A and B, and I'll sort of walk through what's on these panels and what they mean. So there's three colors on each panel. Those correspond to Plummer, Pederson and Apcar respectively.

Starting with the top panel, I'm going to point to the Y axis here. This is the amount of habitat per meter.

So you can about this as an assessment of habitat. And then

Min-U-Script® Capitol Reporters (14) Pages 291 - 294 775-882-5322

Page 298

Page 295

across the bottom are the different categories of flow. 1

- So in the middle column here, this is start --2
- this is base flow right here. And then to the left would be 3
- 4 at 10 percent, at 20 percent, at 30 percent increase or
- conversely a 10, 20 percent decrease in flow. 5
 - So as you can see, it's really obvious that
- there's a really nice pattern in the amount of habitat and 7
- then it's going down with decrease in flow. So whether you 8
- increase it, it goes up or decrease it, it goes down. And 9
- it's particularly clear on the descending limb. So as you get 10 11 10, 20 or 30 percent, you can see it's a really nice
- 12 relationship.

6

- 13 Similarly, another way that the authors chose to
- graph this information to explain it a little differently was 14
- 15 how habitat would change from what you had originally. And this is the same data, but it's formatted in a way that shows
- 16 17 you the change in habitat on the Y. So it's either plus
- habitat or minus habitat as you go to the different flow. 18
- 19 And here, you see that same pattern. But I
- wanted to highlight that -- so when you reduce the flow at 10, 20
- 20 or 30 percent, and I'm pointing to those bar graphs, you 21
- can see that, in all cases, in all streams that they looked 22
- at, at all levels, that every time you reduced the habitat, 23
- you see a consequent reduction in the habitat in those 24

- or another because they're all kind of happening concurrently.
- But it's important to note that we have the stable population 2
- of about 1500 most recently and we had a low of about 500 3
- 4 animals in their recent past.
- Historically, it's fluctuated a lot from all the 5
- way up to in the high 3,000's at some point in time. But the 6
- 7 system is dynamic in that stream reaches change and habitat
- changes, the effects of invasive species changes and so forth.
- So it's hard to pin down exactly what response is happening at 9 what time. 10

So here is the same data and obviously these 11

- numbers are really small. I don't want anyone to read any of 12 13 them. I just want to point out that we have the number of
- this stream reach. As I pointed out, there's a number 14
- 15 assigned to each part of the stream along the -- on the
- left-hand side of this table, rather, and I just want to 16
- highlight that the bottom section of the table has all the 17 18

And those sections of the stream correspond --

- the zero sections is that the north fork and south fork and 20
- the main stem river here, that we don't seem to have a lot of 21
- fish in that we used to historically, and that all the fish 22
- 23 that we're counting now, basically are on the southern part of
- the system. 24

19

Page 296

- particular streams. And, in fact, it's really prevalent in 1
- Plummer, which is a pretty small one. 2
- So the conclusions are that flow and habitat are 3
- proportional in this system and that any reduction in flow
- results in the decrease of the amount of habitat available for
- Moapa Dace. And given that's -- given it's endangered 6
- species, habitat is a premium. 7
- So now I want to move on to talk a little bit 8
- about what the -- what we have currently in the system right
- now. This graph here shows abundance on the Y. I'm pointing 10
- to that and time across the bottom. 11
- And this is Moapa Dace over time and you can see 12 that this is about 2005 and '6. This is when that MOA was
- 13 established and you can see the number -- you can see the 14
- increase in Moapa Dace in this diagram. 15
- I didn't particularly identify specific features, 16
- but there's been so much habitat recovery going on since we've 17
- hit this really low, about 500 animals. This was when we had 18
- lots of invasive species. We had lots of Tilapia in the 19
- 20 system. There's been, you know, fires, there's been a lot of
- recovery actions and things that have happened that result --21
- that all play into the amount of Dace that we see. 22
- So it's complicated into attribute different 23
- features to exact to, you know, one particular recovery action

- This is the Warm Springs natural area that's 1
- received a lot of recovery actions and, of course, the refuge 2
- that's received a lot of recovery actions. I'm pointing to 3
- the refuge and the southern portion of the Muddy River Springs 4
- area here. 5
- So, with that, I want to summarize it up and wrap 6
- it up. Basically, we have this really interesting species 7
- that's a unique component of the biological diversity of the 8
- 9 area given that it's a relic species and it's hot and it's a
- 10 minnow and it uses cold temperature or slightly -- or hot
- temperatures, rather, and slightly cooler. And the 11
- 12 implications are this fish is moving around and needing both
- sufficient discharge for deep water, as we noted, but it also 13
- needs all these kind of habitat concurrently. 14
- And the ability for the fish to move back and 15
- forth among them is really paramount here and that's a little 16 bit unique as far as fish go. This is an interesting species 17
- that has some challenges for us. 18
- So recent estimates have shown Moapa Dace size 19
- 20 has fluctuated a lot, but we have some protection in place
- 21 that we've not hit the triggers. And the triggers at this
- point now are 32 and 315 respectively, and I think they have 22
- been useful in -- and particularly MOA in protecting the Dace. 23 24

However, with the caveat that, you know, we only

Page 302

Page 299

- have about 1500 Dace right now and as the Hatten, et al paper
- showed that increasing flow, even just 10, 20, 30 percent 2
- would result in a consequent increase in habitat, which would 3
- 4 be reflected in Dace.
- So it's important to remember that any decrease
- in flow is probably going to result in a decrease in habitat 6
- 7 and could potentially harm the Dace. That's it. Thanks.
- HEARING OFFICER FAIRBANK: So we have about 8
- another half-hour until we would take a break. 9
- MR. MILLER: Okay. 10
- 11 HEARING OFFICER FAIRBANK: If you want to keep
- going. 12
- 13 MR. MILLER: What did we say, 30, 40 minutes?
- MR. MAYER: My presentation is probably 30 --14
- 15 probably 45 minutes maybe, 30 to 45 minutes. So we can start
- it and there is a place where I could break. 16
- HEARING OFFICER FAIRBANK: If that works for you. 17
- MR. MAYER: Yeah, sure. 18
- HEARING OFFICER FAIRBANK: Let's do that. 19
- MR. MAYER: Okay. I'm Tim Mayer again. I was 20
- the primary author of our 1303 rebuttal report. That rebuttal 21
- report really focused on the Moapa Band of Paiutes Order 1303 22
- report, their initial report, and it really focused on the 23
- 24 main argument in that report that there is long-term drought

- steepens around 2011, beginning with the -- corresponding with 1
- the aquifer test. That continues until about 2013, the 2
- aquifer test and then the levels come back up somewhat. They
- don't come back up to the levels prior to 2010, but they seem
- fairly stable for the last few years or so. 5
- So the main question is: How much of this that 6
- 7 we see in this record is attributable to climate and how much
- is attributable to pumping? 8
- So what I did in my report, the first thing I did 9
- was I looked at some of the climate data for this area. And I 10
- was a little surprised not to see climate data in the Moapas 11
- 12 report. But they didn't include any, so I looked at climate
- 13 Division 3 and Division 4.
- We heard about climate division data yesterday 14
- from CSI that's available from the National Atmospheric and --15
- Oceanic and Atmospheric Administration, NOAA, and it's 16
- available all over the country. 17
- I'm focused on Division 4, which is extreme 18
- southern Nevada. It's just the southern tip of Nevada and 19
- overlays the Lower White River Flow System as it's currently 20 defined. 21
- And then I also looked at Division 3, which is 22
- 23 just north of the Lower White River Flow System in what is
- 24 believed to be the area of recharge for the flow system. And

Page 300

- in this region and that this has affected well levels and
- spring flows in the Lower White River Flow System and will 2
- continue to do so in the future. 3
- So I don't mean to unfairly single out the 4
- Moapas. They were not the only one that made this argument.
- There are several other parties that did, too, but they were 6
- the main proponents of this argument. So I'm focused on their 7
- report. 8

1

- 9 So the first thing I did in my report is I
- presented this figure, which is Figure 1, and this is the 10
- monthly water level record for the carbonate monitoring well 11
- EH-4 from 1987 to 2019. 12
- This is the well that's just south of the refuge 13
- that I showed you in my previous presentation and it's one of
- the longer records that we have of carbonate monitoring wells 15
- in this area. 16
- And if we look at this figure just real quickly, 17
- it looks like we have about a ten-year period of fairly stable 18
- water level records in the beginning of the record there. 19
- We have a decline that starts somewhere around 20
- 1997 or '98, continues to 2005, then we had widely recognized 21
- wet year response to what was an extraordinarily wet year in 22
- 2005. That response continued for a couple years. 23 Then we continued to decline again. The decline 24

- I looked at both precip data and Palmer Drought Severity Index
- data or PDSI. 2
- Now, these are Figures 2 and Figure 4 from the 3
- rebuttal report. This is monthly precipitation totals in 4
- climate Division 3 on the top plot and Division 4 on the 5
- bottom plot. And this is for period 1990 to 2019. 6
- And what you see when you look at this, there's 7
- the monthly precipitation totals plotted and then there's a 8
- 9 moving average, a 12-month moving average, which just helps to
- identify the pattern of the data. 10
- And what you see is quite a bit of variability, 11
- 12 especially in the first half of the record. You'll see wet
- years, you see dry periods, less of that in the second half of 13 the record. And, in fact, you may see a little bit of an 14
- increase if you look at the moving averages in monthly 15 precipitation in the second half of the record. 16
- What we don't see and what I was specifically 17
- looking for is some kind of long-term drying trend or drought 18
- here. I see dry periods, but they're sandwiched between wet 19
- 20 periods and so forth. I don't see any consistent long-term drying trend in these precipitation data. 21
- Next, I looked at drought indices data for the 22
- Palmer Drought Severity Index. This is, again, Division 3 on 23
 - the top plot, Division 4 on the bottom plot. The same period

16

17

I also looked at Palmer Hydrologic Drought Index 2 for Division 4 and that's plotted on the bottom plot there 3 along with the PDSI. There was very little difference so I 4 really didn't do much with that except plot it. 5

But, again, here, what we see if we look -- step back and look at this, first of all, let me explain what the Palmer Drought Severity Index is in terms of units. It's a standardized index. And so what that means is zero, a value of zero on the index represents average conditions. It's neither dry, it's neither wet. And the units of the drought index can be thought of as standard deviations.

So if you have a value of one, that means that you are one standard deviation wetter than the average conditions. All right. And a value of negative one, you're one standard deviation drier than average conditions.

And so Palmer defined negative 3 or 3 standard deviations drier than average as severe drought, okay? And correspondingly, he defined positive 3 or a 3 standard deviations wetter than average as severe wet conditions. So that gives you some idea of the relative value of what you're looking at here in these plots.

So we see -- we go from severe drought to severe 23 wet, back to severe drought, severe wet. Bounce around a lot, 24

River Flow System. There's no reason to believe that there's

different climate down in the Lower White River Flow System 2

from these basins. And these basins have little or no 3

pumping, as I say, so the well hydrographs in these basins

should represent the climate response. 5

So this is the -- this is four monitoring wells 6 7 monitored by SNWA and Dry Lake Valley for the period 2008 or 2010 to 2019. And if you look at these levels, the top plot, let's see, on the left there, is stable. 9

The top right plot shows a slight decline and then the bottom two plots here show slight increases. So certainly no consistent decline in these water levels in this basin.

Next, I dropped down to Delamar basin, which is, as I said, adjacent to Coyote Spring Valley, just north of it. And here we see two water levels, the top left plot and the bottom plot are stable, and then the top right plot shows a decline, but that really doesn't start until about 2015 or so. So it doesn't look like a strong drought signal in these water levels either.

Next, I looked at 13 monitoring wells in Tule Desert. Now, in the report, I only graphed these four, but I did discuss all 13 and I included them as exhibits, which I'll get to when I get to the next slide. But these four were

Page 304

more so in the first half of the record, but then the second half of the record. But, again, we don't see any kind of

long-term drying trend or drought in these data. 3

And even in the second half of the record, which 4 looks a little bit drier, you still have some wet periods in 5 there, some average or wet periods, especially one around 6 7

the -- in the aquifer test, the time of the aquifer test.

And then I will note that both divisions showed that it's become severely wet in the last year or so. So things have gotten wet. We don't see that kind of similar recovery or that similar trend in the water level data or the spring flow data.

So next, I looked at well hydrographs for basins that were close to or adjacent to the Lower White River Flow System, but basins where there's little or no pumping. This includes Dry Lake Valley and Delamar Valley.

Delamar Valley is tributary to Coyote Spring 18 Valley and the Lower White River Flow System and Dry Lake Valley is just north of Delamar Valley and tributary to 19 20 Delamar Valley. And then I also looked at Tule Desert, and this basin is just east of the Lower Meadow Valley Wash and 21 22 the Kane Springs area.

So presumably all these basins are responding to 23 the same climate signal as what's happening in the Lower White 1 graphed in the report and you can see here that three of the

wells show increases in water levels and one is stable. 2

And there's some funny things that happen in the 3 first part of the record in all these wells, I think maybe 4

there was adjustment in the elevations or measuring points or 5

something. But if you look beyond that, basically three of 6

the four wells are increasing over this period from 2007 to 7 2019. 8

9 Next, this is six more of the 13 wells in Tule Desert for the same period and all six of these wells show 10 increases in water levels. And then finally these are the --11 12 and I'm sorry, if I back up there, if you're looking for these graphs, these are exhibits down here in the lower left-hand 13 corner. 14

These were not in the report, these six monitoring wells and neither were these last three on the left part of the slide. And those are exhibits, again, listed down in the lower left-hand corner presentation. But, again, these are three -- the last three of the 13 monitoring wells that I looked at, and you see increases in water levels in all these wells in addition. So certainly no drought signal in this basin either.

22 And then finally I looked at -- in the report, 23

Figure 9, looked at the water levels in CSVM-5, which is the

well we were discussing yesterday with Coyote Spring 1 investment. They had a graph of this too and showed same 2 figure, same period of record from 2003 to 2019. Basically 3 that well has increased over time and may be stabilized in the last few years there. So no drought signal in that well either. And that's in a part of Coyote Spring basin that is 6 believed to be unaffected by pumping, so that should be 7 reflecting climate as well.

16

17

So my point with this is that there's no evidence that long-term drought or drying in the region exists or has affected water levels in this area. So I want to go back to the slide that I just showed you before, the hydrograph for CSVM-5, and I want to focus on this right here.

This is the wet year response to what I said was an extraordinarily wet year in 2005. We see that CSVM-5, we see that in almost all the carbonate monitoring wells in the Lower White River Flow System and even outside of the -- that system, we see it in other wells.

We certainly see it in EH-4 and this is a graph that was presented in our DOI 1169 report in 2013. This shows EH-4 water levels in red here and then the water year precipitation in Division 4. And I'm just singling this out to look at the wet year and dry year response in this figure here, which I discussed in the report.

Page 309

One other thing I want to point out about this 1 record, just kind of a side note is that, you know, why are we 2 looking at climate and water levels? I would have looked at 3 this first ten years of record here because that's a period 4 where we had very little carbonate pumping, and yet we had a 5 lot of variability of water, increased precipitation there. 6

And so if you wanted to try to illustrate the relationship between water levels and precipitation, that's a great record, a great opportunity to do it, and I'm -- I say I'm a little disappointed that no one did that.

So getting back to my previous point, we saw a response to the wet years. We didn't see a response in dry years. So should a water level response to extremely wet years imply a proportionate response or sensitivity to extremely dry years. And I would say, and we discussed this in our paper in 2008, listed as an exhibit there in the lower left-hand corner, that the answer to that is no.

The relationship between precipitation and recharge is nonlinear, especially in arid systems, which means that the system is much more sensitive to wet years than to dry years. And the reason for that is that a much greater fraction of precipitation becomes recharge in wet years compared to dry years.

So if you think about rain or snow hitting the

Page 308

1 So if we look at the wet years, particularly 2

2005, in 1992 and '93, we had back-to-back wet years in '92

and '93 and we see a little bit of a response there in the 3

water levels. In 2005, a really wet year, the wettest one on 4

record, and we see a really big response in water levels in 5 6 EH-4.

7 So what you don't see is any kind of

corresponding response to dry years. Let me back up here. I

also looked at '95, you may see a little bump up there, and

'98, they were fairly wet years, not quite as wet, and they 10 weren't back-to-back wet years. But you may see some increase 11

there, too. The '98 response may be obscured because of the 12

climate trend started that year. 13

So what you don't see is the corresponding

response to dry years in this record. So if you look back at 1989, that was a really dry year, look at the water levels

there, really no change in the pattern before or after that or

during that dry year. You look at '96, that was even drier, 18

again, really no change in response to that dry year. 19

20 And then 2002, which is exceptionally dry. We 21

had declining water levels through that whole 1998 to 2004

22 period, but we don't see any change in the slope of the decline related to that dry year in 2002. But we seem to have 23

a response to wet years, but not to dry years. 24

1 ground and what happens to that precipitation once it hits the

ground. Well, it can be consumed by evapotranspiration in 2

3 plants and evaporation from the soil. It can go to meet soil

4 moisture demand or it can go to recharge the aquifer. But it usually meets those first two components first. It meets 5

evapotranspiration and it meets soil moisture and it satisfies 6

those requirements first before it gets down to the aquifer. 7 8

So in a dry year, after it satisfies those first

two requirements, there's just not much water left over to recharge the aquifer. But in a wet year, the capacity of plants to transpire and evaporate water and the soil to take up moisture, that's limited. There's only so much they can do

with that. 13

So there's a much greater fraction of the 14 15

precipitation that's available to get down to recharge the aquifer in a wet year. And so that's why aquifers are so much

sensitive -- more sensitive to wet years than dry years. So that's the physical explanation and we see that in the data,

too. So I think that this is a pretty good place to stop if 19 20 you want.

HEARING OFFICER FAIRBANK: That sounds like a 21 good plan. Let's go ahead and take a ten-minute break. 22

23 24

HEARING OFFICER FAIRBANK: All right. Let's go

Min-U-Script® (18) Pages 307 - 310 **Capitol Reporters** 775-882-5322

Page 314

Page 311

ahead and go back on the record, and you can continue on withyour presentation.

MR. MAYER: Okay. Tim Mayer again and I'm finishing up the discussion of the rebuttal report.

So I'm going to switch gears here and I'm going to start to look at a critical review -- more of a critical review of the report that I reviewed of the Moapa's 1303 report.

But let me say again that I'm not singling them out, because a lot of the points that I'm raising with their report, I see in other reports that have been entered into the record here, too. So these are general points, just kind of using Moapa as an example.

This is Figure 3 from Appendix 2 in the Moapas 1303 report. And this figure represents the annual EH-4 water levels as derived by the authors from the annual base flow of the north fork, Virgin River, Utah. And in their own words, they're using the base flow of the north fork Virgin River as a climate proxy, okay? So something to represent climate.

And what they have here, they have water levels on the X axis, time on the Y -- or the X axis, I'm sorry, water levels on the Y axis. And then they have in blue, the water level record from the Gage 4 and those are water level elevations and then they have an orange kind of on top of

discharge in the Gage 4 water levels, I didn't plot the two in
 time to show that they varied together and all that stuff. I
 plotted one against the other, Y versus X and that's an X/Y
 plot. And that's the most effective way to evaluate the

quality of a relationship.

So I would like to encourage everybody, if you're trying to demonstrate a relationship, started using X/Y plots. Do not use time series plots to demonstrate relationships. We looked at a lot of time series plots yesterday in the presentation from CSI. And they were trying to demonstrate a relationship between -- I think it was cumulative departure of the mean and the water levels and stuff. Over time, again, it's just easier to see that if you plot water level versus cumulative departure from the mean. So in an X/Y plot. So

that's a second point I wanted to make about this.

And the third point I would make about this figure, and this is specific to this figure and this report, is that there wasn't a lot of information on how they derived this, I didn't feel. There wasn't enough information and I plotted in the slide, my Figure 1, which is the EH-4 water levels and then I derived monthly base flow for the north fork of the Virgin River from 1970 to 2020. And I lined the X axis up so the times would be -- you know, would correspond.

I look at these graphs -- I didn't look at this

Page 312

1 that.

The training, what they call the training test data set, and I interpret that to meant that they derived that training set from the base flows of the north fork of the Virgin River. And then they -- if I'm interpreting the graph right, they hind cast the water level record back through time using the base flow of the north fork of the Virgin River.

So I want to make a couple points about this figure. First of all, I question why you would use a climate proxy, especially one in a different state when you have climate data as we've seen readily available, locally and regionally. So I question the need for a climate proxy.

The second point I'd like to make on this figure is -- and this is common to so many of the reports that we've seen. This is a time series plot. That means that time is on the X axis, and in this case, they're plotting these two variables parallel in time and trying to establish a relationship between those two variables.

The time series plot is not the best graph to establish a relationship between two variables. If you want to demonstrate a relationship, the best way to do it is to plot one variable versus the other in an X/Y plot. I think the technical people will know what I mean here.

So, for instance, when I showed you Pederson

1 that closely, but I look at the graphs and I just question how

2 you got the relationship we see there in EH-4 graph from the

bottom plot. I don't see any similar kind of decline at anypoint in time like that.

5 So the points I want to make about this are,

6 first of all, I would avoid the use of climate proxies when

7 climate data are readily available. The problem with the

8 climate proxy is there are questions about, was the site

affected by the divergence, was it affected by adjacent
 groundwater pumping, has there been changes in the measurement

groundwater pumping, has there been changes in the measurement
 location or method or something that would flow -- affect the

location or method or something that would flow -- affect the flow record.

12 flow record 13 Again, w

Again, we have climate data available and climate proxies were used -- you know, there were several kind of climate proxies that were used in this report, so I would have avoided those.

The second point is the point I made earlier about time series plots. I think we should avoid the use of time series plots when we're trying to illustrate the relationship between two variables and we should stick with X/Y plots.

So then I want to address some statistical questions and problems in the Moapa's report, and again, I'll emphasize that these were not unique to the Moapa's report. I

20

21

22

23

24

1 see these same issues and some of these same problems in other people's statistics. 2

The first issue is model and variable selection 3 and there was very little information in this report on how variables were selected in -- for regression analysis. And so they had a regression -- they had a number of regression 6 7 analyses and those had multiple variables, as many as 27 in one case that I recall. 8

And so model and variable selection, how you choose the variables in your model that explain your -- the variable that you're trying to explain is very important. It's a very important issue.

9

10 11

12 13

14

2

3

4

5

6

7

8

9

10

11

12

13

14

15

16

17

18

19 20

Now, it's so important there are automated tools to help you do this objectively. There's the AIC, that's the 15 Akaike information criteria. That's one tool to diagnose model selection. There's also step-wise procedures you can 16 17 use that add variables, that take variables out and do that iteratively until you arrive at the optimum model.

18 What you want to do is you don't want to under 19 fit the data, you don't want to over fit the data. You want 20 the most parsimonious model, that is the model with the fewest 21 variables that can describe the data because everything -- if 22 you start adding a lot of variables, then you get into a lot 23 of other issues, some of which I'm going to talk about here. 24

hypothesis testing, this P value is you're testing that. 1

You want to be able to reject the null hypothesis 2

and the way you do that is with a really low P value. And

traditionally we said that P values less than .05 are 4

statistically significant, that indicates statistical 5

significance. All right. 6

And so many of the regression coefficients that I saw in this report and in other reports had P values that were not even close to .05. They were much higher. I should say P values go from a value of zero to one. So .05 is on the lower end of the P value.

So this is just one example. This is output from table that was in the report in the Appendix 2. This is EH-4 water levels versus 16 years of north fork Virgin River base flows. So the regression is trying to establish a relationship between the EH-4 water levels looking at the current year base flow and the previous 15 years of base flow in the north fork of the Virgin River.

And the first column here on the left indicate that in this table, those are the 16 variables. LV-1 through LV-16. The second column on the left is the value of the regression coefficient itself. Okay. And we're testing that, that's the value that we're testing.

We're saying, is that really truly different from

Page 316

You start over fitting the data in the model. 1

So the next issue I saw in this report, and I've seen this in other reports to be fair, is the statistical significance of regression coefficients or I should say the non-significance. That was the issue.

So when you do a regression, you're trying to establish a relationship between explanatory variable, say, pumping or climate and a dependent variable, say water level, and that relationship is quantified through a coefficient in the regression. All right.

So the larger the coefficient in absolute terms, it can be negative or positive, but the larger the coefficient, the more impact that explanatory variable has on the dependent variable.

And every coefficient in the regression -- for every explanatory variable, you have a coefficient and every coefficient has a P value associated with it. And that P value is the probability of getting the value of the coefficient that you've got in regression when the true value is actually zero.

Okay. So the null hypothesis of regression 21 analysis is that the regression coefficient is zero. That 22 means there's no relationship between explanatory and the 23 independent variable. And what you're doing with this 24

zero. And this P value here on the furthest column on the

right, that is telling us what the P value is, how likely is 2

it that that value is truly different from zero. 3

And if we look at the ones I've highlighted 4

there, I've highlighted 12 of the 16 variables and none of 5 those are less than .05, which would indicate that they're 6

statistically significant and statistically different from 7

zero. 8

9

10

11

12

14

17

So -- and the R software here, the asterisks that are behind some of the ones that are statistically significant, the -- our software actually indicates which ones are statistically significant for the user.

So this is a problem. I think 12 of these 13 variables probably should not have been included in the regression. So this is more output. This is from a 15 regression of EH-4 water levels versus 13 weeks of Arrow 16 Canyon well pumping.

So trying to relate the weekly water level, I 18 think it's the weekly water level, and the EH-4 with the 19 20 current pumping for the week at Arrow Canyon well and the 12 weeks prior. 21

And, again, you have like zero through like 12, 22 on the left-hand column, those -- that represents the 12 weeks 23 of pumping -- or 13 weeks of pumping, sorry. And then they

Min-U-Script® **Capitol Reporters** (20) Pages 315 - 318 775-882-5322

13

14

15

16

17

18

19

20

21

22

23

24

have the regression coefficients, the values here in the second from the left column. 2

And then you have the P values in the middle 3 there, and I've highlighted those. And you can see that 12 of the 13 are not statistically significant, so again, they should probably not have been included in this regression. It 6 7 looks to be over fitted.

So this was not an issue I saw addressed in this report and I didn't see it addressed in other people's reports either.

So another issue that I raised -- that raised questions with me is the issue of multicollinearity and what that is, is that's the correlation of explanatory variables with each other.

So in a regression analysis, the assumption is that every explanatory variable in that regression is independent of others. And when you -- when they're not, when they're correlated, then you have multicollinearity and you have problems, you have regression coefficients that are unrealistically large. They can be unstable. So if you make a change in the data, they vary wildly in values.

They -- the statistical significance can be 22 inflated, so you -- it looks like they're statistically 23 significant, but they're not. And then also, finally, the 24

indicates problems with multicollinearity in this regression. 1

And again, they probably had more variables than they should 2

have in this regression.

4 So the final issue that I questioned in the report was autocorrelation. So this is a little different 5

from multicollinearity in that this is correlation of the 6

7 dependent variable, the variable you're trying to explain.

The dependent variable with itself. 8

So sometimes we -- say, for instance, we're looking at water levels in EH-4 on a weekly basis. Chances are that the water level from the previous week probably explains some of the water level that we see in the current week, right?

There's some information in that previous measurement that would explain a lot of the information in the current measurement. So they're correlated. This is called autocorrelation. And the problem with this is you have N observation -- N number of observations, but you don't have N number of independent observations. They're not all independent.

So what this does is it inflates the statistical significance too, and accept that these statistical significance that you see is probably worse than what it appears.

Page 320

1 sign of the regression coefficient cannot make physical sense.

So what I mean by that is the positive and the 2 negative sign. So if you have a regression between a 3

precipitation and water levels, you expect that when 4

precipitation goes up, water levels are going to go up, right?

So that's -- that would be a positive coefficient. That sign 6 7

would be positive.

8

9

10

11

12 13

14

15

16

17

18

19

20

21

8

10

11

12

13

15

16

17

18

19

20

21

22

23

24

If you get a negative for some -- you know, you have a lot of correlating explanatory variables, you're likely to get a negative sign on that coefficient for precipitation just because it's trying to balance something else that's already accounting for the variability.

So when you have a bunch of variables that are correlated, that's a problem. And I think that this was a problem in the authors's report because they made a comment on page 44 in their report, they were discussing their two climate model, and they said, "the significance of over half, 17 of the 27 regression coefficients being negative in the combined models and not understood."

So I'm assuming that they probably expected positive coefficients, and in this case, they were looking at base flows and water levels. So you expect as base flow goes up, water levels should go up. They should be all positive.

The fact that they were negative probably

There are ways to account for autocorrelation,

there are ways to diagnose multicollinearity and account for 2

that, too. So I would have liked to have seen a discussion of 3

these issues in the report, and in all reports that there are 4 5 any kind of regression analysis.

I'd like to see them address these issues and 6

explain better in model and variable selection and address the 7 significance of regression of coefficients and considerable to

9 collinearity and autocorrelation and that kind of thing.

10 So I think that that is, yeah, the end of the 11 slide. So I'm going to go back and I'm going to conclude the 12 whole rebuttal report, okay, kind of wrap up here.

So I believe that there's no credible evidence that drought exists or has affected water levels in the Lower White River Flow System. The only water level response to climate that I observed in the wells in the Lower White River Flow System is response to extremely wet years. I didn't see a response to dry years.

So even if there is a drought, the question is: Does it really affect anything as far as water levels go? And then the analysis presented in the Moapa's 13303 report requires more information on methods and results. The authors either neglected or were not aware of many of the assumptions and proper procedures of a regression model. And that's it.

Min-U-Script® **Capitol Reporters** (21) Pages 319 - 322 775-882-5322

Page 323

- 1 MR. MILLER: So that should conclude the Fish and
- 2 Wildlife Services direct summarization presentation testimony.
- 3 And if it is still allowable, I think we're ahead of schedule
- 4 in the sense of our allotted time. I would still like to
- 5 reserve maybe 30 minutes for redirect.
- 6 HEARING OFFICER FAIRBANK: Certainly. You have
- 7 about 50 minutes left, so you can reserve that time for
- 8 redirect and you can use as much or little as you like.
- 9 So we'll go ahead and get prepared for
- 10 cross-examination. And cross-examination, we had a couple of
- 11 parties that stated that they were not going to be
- 12 participating in cross-examination today.
- So I've adjusted the amount of time allotted to
- 14 the various participants who have indicated or have not
- indicated that they would not be participating in
- 16 cross-examination.
- So based upon that, the parties will be allowed
- 18 16 minutes and then similarly, as yesterday, if there's
- 19 additional time remaining after the State Engineer staff has
- 20 an opportunity to ask questions, then we'll reopen that time
- 21 frame up again on a limited basis to participants to follow up
- 22 with additional questions that they may not have sufficient
- 23 time within that first allotment of time or such.
- So we'll go ahead and start the timer with

- 1 Q. And have you relied on that SeriesSEE analysis
- 2 for your conclusions in your current report?
- 3 A. Some of them. Okay. I think it clearly
- 4 established this area of exceptionally high field scale
- 5 transmissivity in the carbonate aquifer underlying those
- 6 five-plus basins. So I -- it's a -- it is a very important
- 7 conclusion.
- 8 Q. Okay.
- 9 A. One of many.
- 10 Q. Did that SeriesSEE analysis account for
- 11 groundwater recharge?
- 12 A. No, it did not.
- 13 Q. Are faults or boundaries accounted for in that
- 14 SeriesSEE analysis?
- 15 A. No. No, Keith did not. I'm not even sure it's
- 16 possible. We -- a few of us have discussed this. It might be
- 17 possible to use image wells in the SeriesSEE Curve-fitting
- analysis to account for no-flow boundaries, but he did not
- choose to do that and it's not clear to me at this time as even possible using SeriesSEE.
- So -- but the reason he did not choose to do
- 22 that, if this is helpful, is the purpose was to -- you know,
- 23 there was a lot of pumping going on within the study area for
- 24 water supply, right, at the time of the study. And it was

Page 324

Page 326

- 1 16 minutes and we'll begin with Coyote Spring Investments.
- 2 CROSS-EXAMINATION
- 3 MR. HERREMA: Good morning. My name is Brad
- 4 Herrema and I represent Coyote Spring Investment in this
- 5 proceeding and I have just a handful of questions for you.
- 6 I'd like to start with Ms. Braumiller. You
- 7 conducted a SeriesSEE analysis, did you not?
- 8 ANSWERS BY MS. BRAUMILLER:
- 9 A. Actually, I did not conduct the SeriesSEE
- analysis that's in our DOI 2013 report. Keith Halford, who is
- 11 the author of SeriesSEE, conducted that analysis in 2013. It
- was a pretty new code at the time.
- 13 It had only been published in 2012, and frankly,
- 14 I think Keith was the only one that was proficient in it
- 15 enough at that time to analyze all the data. We were working
- on a pretty tight timetable.
- So he graciously volunteered to the other DOI
- agencies to perform that himself. He did it at my desk and
- 19 tutored me in SeriesSEE and we walked through it together for
- 20 about 11 hours. But he actually performed the SeriesSEE
- 21 analysis.
- 22 Q. So you're familiar with the SeriesSEE analysis?
- 23 A. I am. I'm very familiar with it. But I wanted
- to be clear that I did not perform it in 2013.

- 1 pumping at MX-5. That was the test pumping. That was really
- 2 the test.
- 3 So the purpose of that SeriesSEE analysis was to
- 4 try to isolate the MX-5 induced drawdown from all that
- 5 drawdown induced by all the other ongoing water supply
- 6 pumping, and just look at how aerially extensive the drawdown
- 7 create by the MX-5 test pumping was or was not. The
- 8 surprising part was that it was incredibly uniform over a very
- 9 large area. That was unexpected.
- 10 Q. Did the analysis account for varying levels, I
- 11 guess, of transmissivity and storability?
- 12 A. No, that's not how SeriesSEE works. Okay.
- 13 There's no question that this fractured rock aquifer is
- 14 heterogenous, no question about that. Okay. So SeriesSEE is
- a Curve-fitting tool, a Curve-fitting tool, right?
- So, you know, I mean, in the simplest terms, the
- 17 assumption is, is that there's a collection of pumping and
- 18 non-pumping stresses and non-pumping stresses and
- 19 environmental stresses that influence water levels in a well.
- And they're each approximated by analytical
- 21 expression and those analytical expressions, every one of them
- 22 has a coefficient and they are jointly optimized. In the end,
- you have a collection of analytical approximations that
- 24 represent the effect of each of those either pumping or

Page 327

- 1 non-pumping stresses on the water levels that you observed in
- 2 the well, right?
- 3 So what did you just ask me? I'm so sorry.
- 4 Q. I'll move on to the next question.
- 5 A. Yeah, that's fine. Sorry.
- 6 Q. Following the 2013 SeriesSEE analysis, did you
- 7 check your results with available post-test data in
- 8 preparation for -- of the July report that you prepared?
- 9 A. Yeah, did I cross check? I'm sorry. That
- 10 doesn't quite make sense to me.
- 11 Q. Did you use any post-test data to check your --
- the results of that SeriesSEE analysis in preparation of the
- 13 July report?
- 14 A. No, that wouldn't have been relevant. The
- 15 purpose of the SeriesSEE analysis was to look at how extensive
- 16 the drawdown was created by the MX-5 test pumping. And the --
- and it proved to be very extensive and it proved to be
- 18 remarkably uniform.
- The implication being that that chunk of the
- 20 carbonate aquifer possesses exceptional high field skill
- 21 transmissivity. So there wasn't anything in particular that I
- needed to clarify about that result.
- 23 Q. Okay.
- 24 A. Right. So, no, I didn't.

- 1 But you would -- I have no doubt that the results
- 2 were so remarkable, the drawdown was so expansive and it was
- 3 so surprisingly uniform, you know, that I have no doubt you
- 4 would show that same thing there.
- 5 Q. Thank you. Could I change gears to talk about
- 6 the boundary of the Lower White River Flow System?
 - 7 A. Sure.
 - 8 Q. In your conclusions, you identified a number of
 - 9 tasks that you would do to confirm your conclusion about the
- 10 best boundary for the Lower White River Flow System?
- 11 A. Um-hum.
- 12 Q. Is that correct?
- 13 A. Yeah, with respect to considering Kane Springs
- 14 Valley for inclusion in the system.
- 15 Q. And so pump tests as well?
- 16 A. And Lower Meadow Valley Wash both, right.
- 17 Q. Okay. And you also discussed the possible
- 18 construction of I think what you refer to as an empirical
- 19 model that, in my words, might -- you might be able to back
- out the total of pumping that could sustainability occur.
- Do you recall that as well?
- 22 A. Yeah, absolutely. Right.
- 23 Q. Okay. One of the caveats that you had on the
- 9,318-acre-feet per year number in your presentation was that

Page 328

Page 330

- 1 Q. Yeah. Could the same unprocessed data produce a
- 2 different result in that SeriesSEE analysis?
- 3 A. Would a different set? I wouldn't expect it --
- 4 Q. No. Was it the same unprocessed data?
- 5 A. The same -- oh, the original input data to the
- 6 SeriesSEE analysis?
- 7 Q. Yeah.
- 8 A. What, if someone repeated it or if there was a
- 9 whole new data set -- I'm sorry, from the big pumping test
- 10 which -- I'm sorry --
- 11 Q. No, the same unprocessed data, perhaps if the
- amounts were adjusted a little bit, would that produce a
- 13 different result?
- 14 A. Well, it's a Curve-fitting tool and so the
- results of the Curve-fitting are a collection of -- it is
- 16 certainly an approximation and an estimate, but the trend in
- the results were so clear that, yeah, if you repeated
- 18 Curve-fitting to the original Order 1169 pumping test data,

you -- I absolutely believe that you would come up with the

- 20 same result.
- 21 Would you get the exact same estimates of the
- 22 MX-5 drawdown at every single well? It would probably be
- 23 somewhat different because it's a Curve-fitting process,
- 24 right?

19

- 1 that assumed that flows in the Muddy River during that period
- 2 were sufficient to meet senior water rights.
- 3 Do you recall that?
- 4 A. Yes, and --
- 5 Q. Do you have -- I'm sorry.
- 6 A. No, go ahead.
- 7 Q. Do you have an opinion as to what quantity of
- 8 water is necessary to satisfy those?
- 9 A. I -- this is a demand on the State Engineer's
- 10 office and I do remember a table that was assembled and
- 11 distributed in one of our Lower White River Flow System
- working group meetings.
 - You know, I wouldn't pretend to have a handle on
- 14 what the total senior decreed water rights are on a river or
- 15 how they're distributed on a river. So I didn't attempt to
- 16 evaluate that. I said, assuming that what happened in 2015 to
- 17 '17 was enough water, I think that total pumping during that
- 18 period is the right starting place.
- 19 Q. Okay.

13

- 20 A. Yeah.
- 21 Q. Are you familiar with the MOA?
- 22 A. MOA.
- 23 Q. 2006 MOA that was discussed?
- 24 A. Um-hum, yes.

Page 331

- 1 Q. Would the trigger levels that are in that MOA,
- 2 would that be something that might be a mechanism that could
- 3 satisfy the Fish and Wildlife Services concerns about the
- 4 spring flows?
- 5 A. Yeah. So I cannot speak for the whole agency,
- 6 okay? But from my perspective as a groundwater hydrologist, I
- 7 would tell you this: They provide a level of protection that
- 8 we've never had before and we have now and I think that's
- 9 great.
- But at the time that the MOA trigger levels were
- 11 developed, we didn't know as much about how the system works
- as we do now. So I think it is important and obviously it
- exists and it's going to continue to exist, and that's very
- important. But it's not sufficient in and of itself in my
- 15 opinion.
- 16 Q. I'd like to move to Mr. Mayer if that's okay.
- Mr. Mayer, I'm going to ask you the same question
- 18 I asked Ms. Braumiller. Do you have an opinion on what
- quantity of water is necessary to satisfy the Muddy River
- 20 rights?
- ANSWERS BY MR. MAYER:
- 22 A. No, I don't have an opinion on that.
- 23 Q. And your second conclusion on your conclusions
- 24 five was that the trigger levels in the -- for Warm Springs

- 1 A. Because there was no effect.
- 2 Q. Okay. Did you review the location of faults,
- 3 recharge areas or discharge areas when assessing the
- 4 hydrographs that you looked at?
- 5 A. No, I didn't.
- 6 Q. Would you expect that faults or recharge areas,
- 7 other structural barriers might affect the hydrographs?
- 8 A. I would admit that they would probably affect
- 9 some of them. I wouldn't expect them to affect all of them,
- 10 though.
- 11 Q. Okay. Did you review any of the well driller
- 12 logs for the wells that you looked at in terms of total depth
- or perforation zone?
- 14 A. No, I reviewed the aquifers that they were in,
- 15 but that's it.
- 16 Q. Do you think that depth of the well perforation
- zones, those type of things you would see in a driller's log,
- that they might affect the groundwater level response?
- 19 A. Yes
- 20 Q. Is it Dr. Schwemm?
- ANSWERS BY DR. SCHWEMM:
- 22 A. Yes.
- 23 Q. Okay. Dr. Schwemm, a couple questions for you on
- 24 the Dace. What is the greatest threat to the Dace immediately

Page 332

Page 334

- 1 West flows established in the 2006 MOA are still valid and
- 2 important for protecting the Pederson Unit Springs; is that
- 3 correct?
- 4 A. Yes.
- 5 Q. All right. I'd like to shift gears to a couple
- 6 questions on your rebuttal of the Moapa Band of Paiute Tribe
- 7 report?
- 8 A. Okay.
- 9 Q. The data that you showed in your rebuttal
- 10 presentation regarding precipitation records you reviewed,
- what was the period of that record; do you recall?
- 12 A. Well, I showed you two periods. I showed you
- 13 1990 to 2019 and then I also showed, on a later graph, I had
- 14 data from 1987 to 2013.
- 15 Q. Did you consider precipitation data at the NOAA
- division for -- or NOAA division for precipitation data from
- 17 1895 to 1990 when assessing whether or not there are bad
- 18 droughts or current drought condition?
- 19 A. Yes, I looked at the -- I downloaded all those
- 20 data.
- 21 Q. And did those have any effect on your -- or
- 22 impact your analysis?
- 23 A. No.
- 24 Q. And why is that?

- 1 downstream of Pederson Springs?
- 2 A. Immediately downstream? Well, it's a mix of
- 3 immediately downstream of Pederson Springs. Most of the
- 4 habitat that I believe this is from EH-5 on the diagram, and
- 5 if you want, we can pull it up.
- 6 But I think that area that has undergone
- 7 extensive -- at least at the transition point from the refuge
- 8 to the Warm Springs natural area, that's undergone a lot of
- 9 habitat restoration at this point and doesn't have the level
- of non-natives.
- So in that particular stretch flow, I think, is
- 12 probably the most important, maintaining flow. And -- but it
- 13 depends -- it shifts because their shifting relative
- 14 contribution of invasive species and flow and the quality of
- 15 the habitat.
- 16 Q. What about barriers to the passage?
- 17 A. Oh, yes, there is a barrier below, right at the
- 18 refuge boundary to the Warm Springs area. There's a
- relevant -- the old -- the Gage that's installed there is
- 20 relatively old and it has a drop associated. We think it made
- 21 it difficult for Dace to get up and down there very easily.
- And we target that as something on the near
- horizon, to sort of increase the level below the Gage or
- 24 change the Gage to a newer model, that there wouldn't be an --

Min-U-Script®

Capitol Reporters 775-882-5322

(24) Pages 331 - 334

Page 338

Page 335

- as great of a small waterfall sort of barrier there.
- 2 Q. What is keeping that work from going forward?
- 3 A. It's just been an ongoing project because the
- 4 Gage -- there's -- because the Gage is used for the MOA,
- 5 there's just been a lot of discussions and meetings that have
- 6 to take place and have taken place over what it takes to get a
- 7 new Gage that would read accurately.
- 8 And in this case, our goal for moving forward is
- 9 to place another Gage on there and make sure that they read
- 10 the same. And then after that, we could remove the old Gage
- 11 and leave the new Gage in there that would be a more modern
- style that would hopefully have less of an impact to
- 13 migration.
- 14 Q. And do you have a time frame for when that might
- 15 be done?
- 16 A. Not really. We're hoping the next couple of
- 17 years. So I guess I do have a time frame, but exactly when
- 18 that happens and getting the funding in place and getting all
- 19 the asterisks to line up.
- 20 Q. Are there other barriers to fish passage in the
- vicinity of the Warm Springs Gage?
- 22 A. Yeah, there's a number of -- or one that we
- 23 just -- were just addressing in the last few weeks to months,
- 24 and that was one on the -- what we call the refuge stream,

- 1 here, there was a period of stable water levels until about
- 2 1998 and then there was a decline. That decline coincides
- 3 with an increase in Arrow Canyon pumping, approximately a
- 4 four-fold increase, I think we said in our 1169 report. So
- 5 that's -- I believe that to be pumping related.
- 6 MS. GLASGOW: Thank you. No further questions.
- 7 HEARING OFFICER FAIRBANK: Next is the Moapa Band
- 8 of Paiute Indians.

11

- 9 MS. BALDWIN: Thanks. Beth Baldwin for the Moapa
- 10 Band, along with Debbie Leonard, local counsel.
 - CROSS-EXAMINATION
- 12 BY MS. BALDWIN:
- 13 Q. And these questions are for the whole panel
- 14 mostly. Are your opinions the official position of the Fish
- 15 and Wildlife Service?
- 16 ANSWERS BY MS. BRAUMILLER:
- 17 A. Well, I think that has to be the case, right? We
- 18 did submit our report from the U.S. Fish and Wildlife Service,
- 19 so yeah, um-hum.
- 20 Q. Is that true for all of you?
- MR. MAYER: Yes.
- DR. SCHWEMM: Yes.
- BY MS. BALDWIN:
- 24 Q. Did you discuss the opinions expressed in your

Page 336

- which is down -- a little bit downstream of the Plummer and 1 reports with anyone
- 2 Pederson, where they come together.
- But it's a -- so, yes, we have one barrier that
- 4 we fixed and as -- because it's a dynamic system with flows
- 5 changing and, you know, erosion happens.
- 6 So we end up with having parts of habitat that we
- 7 don't think are the very best for Dace. So we target those
- 8 areas first as they appear and work our way to improving all
- 9 the habitat in the system.
- MR. HERREMA: Thank you.
- 11 HEARING OFFICER FAIRBANK: Next will be National
- 12 Park Service.
- 13 CROSS-EXAMINATION
- MS. GLASGOW: Good morning. Hi, I'm Karen
- 15 Glasgow with the Department of Interior Office the Solicitor
- and I represent the National Park Service.
- Good morning. I have one question for you,
- 18 Mr. Mayer. You talked about looking at the levels of EH-4.
- 19 ANSWERS BY MR. MAYER:
- 20 A. (Nodded head.)
- 21 Q. What caused the reduction in EH-4 water levels in
- 22 approximately 1998, I think it was? Was it pumping or was it
- climate in your opinion?
- 24 A. I think it was pumping. You see, on this graph

- 1 reports with anyone else at the Service before submitting your
- 2 reports?
- 3 ANSWERS BY MS. BRAUMILLER:
- 4 A. I did not.
- 5 DR. SCHWEMM: Not officially.
- 6 MR. MAYER: Did we discuss -- is the question,
- 7 did we discuss opinions?
- 8 BY MS. BALDWIN:
- 9 Q. (Nodded head.)
- 10 A. Yes, with other Fish and Wildlife Service staff,
- 11 I did.
- 12 Q. Did anyone from any other agencies like
- 13 Reclamation or BLM provide technical review or comments on
- 14 your reports?
- 15 ANSWERS BY MS. BRAUMILLER:
- 16 A. The National Park Service did provide some
- 17 comments on my sections of the report, but I did not utilize
- 18 them.
- 19 Q. Are you familiar with Fish and Wildlife Service
- 20 policies on information quality and peer review?
- 21 A. Not in detail, no.
- 22 Q. And I saw nods from --
- MR. MAYER: Yes.
- DR. SCHWEMM: Yes.

Min-U-Script® Capitol Reporters (25) Pages 335 - 338 775-882-5322

Page 339

- BY MS. BALDWIN: 1
- Q. Did you adhere to those policies with regards to 2
- your reports? 3
- 4 DR. SCHWEMM: Yes.
- ANSWERS BY MS. BRAUMILLER:
- A. I certainly think so. All the data sources that
- I utilized are thoroughly cited. They're public, they're
- published, et cetera. So I assume so, yes.
- Q. Did you obtain any outside peer review from other
- third parties? 10
- A. Only we had review from the National Park 11
- Service, and as I said, I didn't implement any of those 12
- proposed changes. And other than that, no. 13
- MR. MAYER: I think the Park Service looked at my 14
- 15 report, but they -- I believe they didn't give me any comments
- 16
- BY MS. BALDWIN: 17
- Q. What is the services interest in this proceeding? 18
- Why are you here? 19
- ANSWERS BY MS. BRAUMILLER: 20
- A. I'm very happy to answer that. The State 21
- Engineer's office asked for technical input and I was happy to
- give it, and that is really the truth. 23
- You know, the springs are such a significant 24

- ANSWERS BY MR. MAYER:
- 2 A. What I meant -- if I said that, it's true. I
- don't remember exactly what I said, but I --
- 4 Q. I'm paraphrasing.
- A. Okay. I meant the criticism that I have and the
- comments I have apply more generally to everyone, not just the
- 7 Moapa.
- Q. Okay. Do you recall sending an e-mail to Katie
- Johnson on July 16th, 2019?
- 10 A. I sent him several emails, but I recall that.
- 11 Q. This is the e-mail where you asked to see his
- files relating to his analysis of the climate impacts? 12
- 13 A. I do recall asking him several times for the
- files that he cited in his report. 14
- 15 Q. Okay. And for the record, Mr. Criedter and
- Mr. Sullivan from the State Engineer's office were copied on
- 17 that e-mail. Do you remember what you said in that e-mail,
- other than asking for the files?
- A. No.
- Q. Well, I'm going to read from it, quote, "I have
- to warn you that it's not going to look good and you will have 21
- a lot of explaining to do to the State Engineer if you aren't 22
- willing to share your results. I will make a point of this in 23
- my review, Tim," end quote. Does that sound accurate? 24

Page 340

Page 342

- component of water flowing down the Muddy River that, you
- know, the reality is they'll be protected by default if an 2
- effective conjunctive water management program can be 3
- developed. 4
- Q. So it's part of your role in implementing the
- Endangered Species Act? 6
- A. No, what I'm trying to say is that -- that's 7
- obviously -- it's obviously -- it's obvious it's to the 8
- 9 benefit of the Dace for an effective conjunctive water
- management program to be developed. That's obvious. 10
- But my purpose was the State Engineer's office 11
- asked for technical input and I endeavored to help and that's 12
- it. 13
- Q. That answer applies to all the rest? 14
- DR. SCHWEMM: Absolutely. 15
- MR. MAYER: I'll say that the mission of our 16
- water resources branch in the regional office is to protect 17
- the water resources of the Fish and Wildlife Service and 18
- that's primarily on national wildlife refuges. So we're here 19
- because -- or I'm here because of that. 20
- BY MS. BALDWIN: 21
- Q. Mr. Mayer, you said you're not -- you were not 22
- targeting the Tribe unfairly by submitting a rebuttal 23
- addressing only their report; correct? 24

- 1 A. It does and I think I did say that in my report.
- I said -- in the rebuttal report, I said there was no data
- files, although they were cited in the report, they weren't
- made available to me. So I did make a point of it.
- Q. Thank you.
- A. And so I still believe it doesn't look good. I
- believe we should share data.
- 8 Q. It's okay. It was a yes/no question. So turning
- to the SeriesSEE, did you -- how did you get the values for
- 10 the aguifer parameters that were used in the Theis
- transformation? 11
- 12 ANSWERS BY MS. BRAUMILLER:
- A. A very common misunderstanding. They are fitting 13
- coefficient. 14
- 15 Q. Right.
- 16 A. So they're not intended to be or function as
- estimates of aqua parameters. And -- but the fitting 17
- coefficients are arrived at through -- there's a joint 18
- optimization of the fitting coefficients in whole series of 19
- 20 analytical approximations, describing all the stresses that
- the SeriesSEE analysts believes are having a significant effect on the water level record that you're trying to 22
- interpret. And it's -- you want to know how they're 23
- optimized? 24

21

Page 343

- 1 Q. Well, I'm just curious. So in order to do the
- Theis transform that you described, you have to assign some 2
- value to, T, transmissivity, and S, storativity?
- A. Yeah, that's a good question. We don't --
- they're not assigned.
- O. Okay. 6
- A. They're joint -- they're not really optimized.
- We don't know what they are and, first of all, they're not
- aquifer parameters or it's not an attempt to estimate aqua
- parameters. 10
- 11 They're just fitting coefficients and they are
- jointly optimized, all the coefficients for each of these 12
- numerous analytical approximations for pumping and all these 13
- different pumping centers -- yeah, okay. 14
- 15 Q. But where do the numbers come from?
- A. Well, they're -- they start out -- you have to 16
- 17 give it some initial values like any parameter estimation
- process or any other thing. Give us some initial value. 18
- And then the code includes routines for trying to 19
- optimize all the coefficients simultaneously to get the best 20
- fit of all your water level records. And it's a couple 21
- utilities that are -- were written by John Dougherty for PEST, 22
- it's -- let me find it. 23
- 24 Q. I don't need all the details because I can read

- So I have not endeavored to -- it's really not a -- it's not 1
- the kind of thing that groundwater hydrologists usually do. 2
- So I have not critiqued Tim's analyses. That's something he's
- quite good at. 4
- Q. Is it correct that when the Service did the 5
- original SeriesSEE analysis in 2013, it never tried to remove
- 7 climate-based fluctuations from the hydrographs because there
- was no reference wells to use?
- A. No, that's not the case. I mean, I would say
- I -- it's difficult to come up with a reference well. Okay? 10
- 11 Q. Well, I'm looking at Page 9 of Nevada State
- 12 Engineer Exhibit Number 256, your 2015 report?
- 13 A. Yeah, yeah.
- Q. And that's what it says? 14
- 15 A. Yeah, happy to explain why things like barometric
- pressure fluctuations, bird ties, none of those things were 16
- 17 incorporated in this Curve-fitting because the purpose was --
- because the most significant drivers of changes in groundwater 18
- 19 levels were pumping, okay? And the goal of the analysis was
- 20 to see how aerially expansive the drawdown due to the MX-5
- test pumping was. 21

22

9

10

- So the goal -- the purpose of the SeriesSEE
- analysis was to separate out the drawdown create by the MX-5 23
- test pumping from that induced by all the other ongoing water 24

Page 344 Page 346

- the paper.
- A. Okay. Yeah.
- Q. I'm just -- you know, when you come up with
- these -- these --
- A. Yeah.
- Q. You're -- are you -- you're inferring some high 6
- level of transmissivity from the model in some way. We're
- just curious where the numbers are coming from?
- A. Well, yeah, the exceptionally high field scale
- transmissivity is inferred, not from the optimized values in 10
- the fitting coefficients in the SeriesSEE Curve-fitting 11
- process, but by the result, the result being that there was a 12
- really remarkable uniformity of drawdown of a very large area 13
- of the carbonate aquifer. 14
- And that can only have happened, that could only 15
- happen if you have exceptionally high field scale 16
- transmissivity. It can't happen any other way. 17
- Q. Okay. If we have more time later, we can talk 18
- about it. 19
- 20 A. Okay.
- Q. So do you agree with Mr. Mayer's conclusions 21
- about a lack of a long-term drought in the region? 22
- A. Well, we have very different backgrounds and I 23
- don't have Tim's background in multiple regression analyses.

- 1 supply pumping and study area of which there was a lot, all
- right? That was the goal. 2
- And the assumption is, and I think it's a good 3
- one, that the effects of certainly barometric pressure
- fluctuations, bird ties were very small compared to the 5
- effects of pumping by changes in water levels. And at even 6
- 7 groundwater recharge, you know, over two years is still going
- to impact water levels in wells, no question, okay. 8
 - But that's still relatively small impact on water
- levels in the wells compared to the pumping. So, you know, it was a simplest SeriesSEE analysis possible to answer the
- 11 questions that the SeriesSEE analysis was done. 12
- Q. Okay. Looking at your initial report for this 13
- proceeding, you said you did a simple analysis hydrographs to 14
- try and come up with some relationship between climate effects 15
- and what you were seeing in the wells? 16
- A. Well, not a relationship. I --17
- Q. You were just looking to see if you could see 18
- anything that would be a climate --19
- 20 A. Well, no, I was after something specific.
- 21 Q. Okay.
- 22 A. Okay.
- Q. And you identified in your -- your best guess is 23
- that there appears to be a one-year lag between wet years and

SE ROA 53080

Page 350

Page 347

- 1 when?
- 2 A. All those --
- 3 Q. Where the water level increased?
- 4 A. Within one year.
- 5 Q. Okay.
- 6 A. You can see the effects of those -- the 2004,
- 7 2005 and 2010 to 2011, in some cases. You can see the effects
- 8 of those particularly wet periods in groundwater levels in the
- 9 carbonate aquifer over pretty much the entire five-plus basin
- 10 area. You know, if -- CSVM-5 is an interesting exception, but
- 11 I think I know why. But it's not fair. Okay.
- 12 Q. Okay.
- 13 A. But at any rate, my purpose, I wasn't trying to
- come up with a relationship. I just believe that if we're
- 15 going to get a handle on how climate is affecting groundwater
- 16 levels from the spring flows, the first thing you have to do
- is get a handle on what is -- you know, what's the time lag
- 18 between the change in climate, wet seasons and showing up in
- 19 the groundwater levels in the spring flows.
- And that will give you somewhere to start when
- 21 you're trying to figure out how is it an affecting groundwater
- and springs and springs flows, right? And so with that and
- 23 only that purpose, okay, I just use simple visual inspection
- 24 of the hydrographs, the Palmer Drought Severity Index versus

- 1 those all the wells in those basins or did you just pick
- 2 certain ones?
- 3 A. I just picked what were designated as monitoring
- 4 wells by SNWA or by Vidler, so --
- 5 Q. Thank you.
- HEARING OFFICER FAIRBANK: Next is SNWA, Las
- 7 Vegas Valley Water District.
- 8 CROSS-EXAMINATION
- 9 MR. TAGGART: Good morning. My name is Paul
- 10 Taggart. I represent the Southern Nevada Water Authority and
- 11 the Las Vegas Valley Water District, and I want to start with
- a few questions for Mr. Mayer.
- How many years have you been analyzing issues
- 14 regarding hydrogeology in the Lower White River Flow System?
- 15 ANSWERS BY MR. MAYER:
- 16 A. Well, I've been working down here since about
- 17 1997.
- 18 Q. Okay. And I have a few questions about -- just
- 19 some quick historic questions about the role of the Fish and
- 20 Wildlife Service.
- Initially, the Fish and Wildlife Service, did it
- 22 file protests against the water right applications in the
- 23 Coyote Spring Valley?
- 24 A. Yes.

Page 348

- noticed 1 Q. Okay. And were you present during the hearings
 - 2 in 2001 on the CSI applications?
 - 3 A. Yes, I was.
 - 4 Q. Okay. At that time in 2001, did you have a
 - 5 similar opinion than you have today regarding the impact of
 - 6 pumping in Coyote Spring Valley on the Muddy River Springs?
 - 7 A. Yes, I did. Yeah, I believe so.
 - 8 Q. And were you involved in recommending that a pump
 - 9 test occur?
 - 10 A. It's possible. It was a long time ago, but I
 - 11 could have been.
 - 12 Q. Okay. And I'm wondering, did the pump test --
 - 13 I'm sorry, the pumping test that was ordered by Order 1169,
 - 14 did that pumping test validate your understanding of the
 - 15 system in 2001?
 - 16 A. I think it did, yeah.
 - 17 Q. And did you review the State Engineer's rulings
 - 18 that came out after the pump test and after the reports were
 - submitted by all the parties? And I want to say this was
 - 20 2013, 2012, somewhere in that range.
 - 21 A. Yes, I reviewed those reports.
 - 22 Q. Okay. And do you agree with the findings of the
 - 23 State Engineer made in those rulings regarding the effect of
 - 24 Coyote Spring carbonate pumping on the Muddy River Springs?

•

groundwater level spring flows and stream flows, and noticed

- 2 that it's not one year, but it's within one year.
- 3 O. That'll be it.
- 4 A. Yeah, that was it. Yeah.
- 5 Q. Okay. Mr. Mayer, when you looked at the
- 6 hydrographs in Dry Lake, Delamar and Tule Desert, did you
- 7 consider whether water levels are responding to any delayed
- 8 climate signal?
- 9 ANSWERS BY MR. MAYER:
- 10 A. No, I didn't.
- 11 Q. Is that something that you have done previously
- 12 in your work?
- 13 A. Yes, I've looked at climate responses before.
- 14 Q. And did you reach any conclusions?
- 15 A. It -- well, it was a different study. I mean,
- 16 yeah, I -- yes.
- 17 Q. So you have identified climate lag?
- 18 A. I have identified lags in climate responses, yes.
- MS. BALDWIN: I don't have any more at this time.
- 20 But if there is additional time later. Hold on a second. One
- 21 question.
- BY MS. BALDWIN:
- 23 Q. Mr. Mayer, you looked at 20 hydrographs in those
- adjacent basins, Tule Desert and Dry Lake and Delamar. Were

Min-U-Script® Capitol Reporters (28) Pages 347 - 350 775-882-5322

Page 351

- 1 A. Yes.
- 2 Q. You mentioned in some previous answers that the
- 3 Fish and Wildlife Service owns a water right in the Muddy
- 4 River Springs area. Could you describe that water right?
- 5 A. Yeah, we have a water right. It's measured at
- 6 Warm Springs West and it's essentially -- it's for wildlife.
- 7 It's essentially an in-stream flow right. So it's on the
- 8 refuge.
- 9 Q. And --
- 10 A. That's the Pederson reach of the springs.
- 11 Q. Okay. And did you say -- did you say what the
- 12 flow rate is in your opinion of that water right?
- 13 A. Well, that water right is 3.5, but I believe it
- has a priority date of 1991. So it's fairly junior.
- 15 Q. Okay. Now, was the MOA that's been described --
- and you understand what I mean when I talk about the MOA?
- 17 A. Um-hum, yes.
- 18 Q. Was the MOA executed, in part, to address
- 19 potential impacts to that water right or do you know?
- 20 A. It was designed, established to protect that
- 21 reach of stream. The trigger levels are actually below the
- 22 water rights. So in a way it doesn't protect the full water
- 23 right, but it still protects the stream.
- 24 Q. Okay. And do you have an understanding whether

- 1 about this Kane Springs wedge, fault or whatever we're calling
- 2 it?
- 3 A. Yes.
- 4 Q. Does that somehow make it possible for, in your
- 5 opinion, CSI to pump water from the west side of that highway
- 6 fault without impacting the Muddy River Springs?
- 7 A. I can't say because it was never clear yesterday
- 8 what -- which of the faults were discussed or the Kane Springs
- 9 wash fault. So I'm not sure if the highway fault is the Kane
- 10 Springs wash fault. I was never clear about that yesterday.
- 11 Q. Okay. And do you have your PowerPoint?
- 12 A. I do.
- 13 Q. Available?
- 14 A. Got to switch.
- 15 Q. Okay. There was a -- yeah, there was a figure
- 16 with boundary for the proposed --
- 17 A. Um-hum.
- 18 Q. Your recommendation regarding the boundary for
- 19 the Lower White River Flow System?
- 20 A. Yes.
- 21 Q. Could you find that?
- 22 A. Yes.
- 23 Q. It was probably maybe 25 slides in. So where on
- that figure is this area that you're talking about? And

Page 352

Page 354

- 1 the MOA was completed in order to allow the 1169 pump test,
- 2 itself, to occur?
- 3 A. Yes, it was.
- 4 Q. Um-hum. I have a couple questions for
- 5 Ms. Braumiller, and they have to do with a couple points you
- 6 made in your presentation.
- 7 And you identified a -- what I wrote down as a
- 8 Kane Spring or maybe a Kane Spring wedge?
- 9 ANSWERS BY MS. BRAUMILLER:
- 10 A. Fault.
- 11 Q. And I was wondering where that's located in the
- 12 Kane Springs area. I wasn't exactly sure.
- 13 A. Yeah, yeah, I didn't -- I didn't refer to as a
- 14 Kane Springs wedge. But it's a portion of the carbonates.
- 15 Some of it lies in southwestern Kane Springs Valley, some of
- 16 it in northern Coyote Springs Valley. But it's between the
- 17 Kane Springs wash fault and a normal fault that -- normal
- trend and normal fault, the passages just by CSVM-3.
- 19 Q. Were you present during yesterday's testimony?
- 20 A. Yes.
- 21 Q. And were you present when there was discussion,
- something we referred to as the highway fault?
- 23 A. Yes
- 24 Q. And my simple question is: Does your opinion

- 1 again, I don't want to misstate what you said. I just recall
- 2 you testifying about an area where it's unknown what occurred
- 3 there or something like that.
- 4 Maybe you want to restate your view on -- or I
- 5 don't want to misstate what your testimony was about. But I'm
- 6 just trying to clarify where it's located. That's all I'm
- 7 trying to do.
- 8 A. Oh, the wedge?
- 9 Q. Yes
- 10 A. Oh, good. Okay. So -- oh, gosh, this is a
- 11 little hard to see. Let me look at it on my screen a little
- 12 bit there.
- Okay. Okay. So that's the north trending normal
- 14 fault that passes right by CSVM-3. So I mean from there to
- 15 the Kane Springs wash fault, which is right there. So at --
- 16 there's also, you know, the Caldera Complex there. That's
- 17 just virtually impermeable for all practical purposes.
 - So south and southwest of the Caldera Complex,
- 19 west or northwest of the Kane Springs wash fault, and east of
- 20 this north trending normal fault that passes right by CSVM-3.
- 21 And I think CSVM-3 is completed within that kind of isolated
- 22 wedge of carbonate.
- 23 Q. Okay.
- 24 A. Yeah, um-hum. So there's never been any

Min-U-Script® Capitol Reporters (29) Pages 351 - 354 775-882-5322

18

Page 355

- 1 carbonate pumping in there and I don't know what the effect of
- 2 pumping in that wedge of the carbonates would be. I don't
- 3 think we have any data that we can use to anticipate that at
- 4 this point.
- 5 Q. Okay. Back to Mr. Mayer.
- 6 So yesterday there was some testimony about water
- 7 budgets being developed by Mr. Reich, and his view was that no
- 8 one else in the hearing room had developed water budgets and
- 9 that was something that he indicated as being significant in
- 10 his opinion.
- My question to you is: Just having been involved
- in this for decades, are we past the point of using water
- budgets as a method of analysis and could you describe, in
- 14 your opinion, what you should -- you know, what you view the
- 15 role of water budgets when you have empirical data from a pump
- 16 test?
- 17 ANSWERS BY MR. MAYER:
- 18 A. Yeah, I think we are past the point where we need
- a water budget because we show that there's water available.
- You could define a perennial yield, but you could start to
- 21 pump that water as we've done here in this basin and this flow
- system, and see the effects and impact springs and other
- 23 resources and rights. So I would agree that I'm not sure how
- 24 helpful the water budget is.

- 1 may have even alluded to it a little bit, is to ask you to
- 2 partition that 9318, if you will, between carbonate and
- 3 ground -- and alluvial. But do you see table -- are you
- 4 familiar with SNWA's report that's been marked as SNWA
- 5 Number 5, I believe?
- 6 A. No, I actually did not read the report.
- 7 Q. Okay. Well, then let me ask you -- or, no, let
- 8 me ask Mr. Mayer.
- 9 Are you familiar with the SNWA hydrology report?
- MR. MAYER: Well, I read it, but just briefly. I
- 11 mean, I'm not sure I'm qualified --
- MR. TAGGART: Okay.
- 13 MR. MAYER: -- I don't --
- 14 BY MR. TAGGART:
- 15 Q. Do you have Tables C-3 there in front of you?
- 16 ANSWERS BY MS. BRAUMILLER:
- 17 A. Yeah.
- 18 Q. Okay. And you're not familiar with this table?
- 19 A. No, I did not read your report.
- 20 Q. Okay.
- 21 A. I'm sorry.
- 22 Q. Well, let me just ask you this then. The table
- 23 says that it's showing Lower White River Flow System or LWRFS
- 24 carbonate aquifer annual groundwater production?

Page 356

Page 358

- 1 Q. And given -- and in your opinion, do we have
- 2 empirical data from the pumping test that pumping in the Lower
- 3 White River Flow System impacts the Muddy River and the Muddy
- 4 River Springs?
- 5 A. Certainly, yes.
- 6 Q. And so would it be dangerous to make decisions
- 7 about groundwater availability based on water budgets when we
- 8 have that empirical data?
- 9 A. I think so.
- 10 Q. There was -- and I guess this is to you,
- 11 Ms. Braumiller.
- So one of your conclusions or recommendations to
- 13 the State Engineer is the -- involves the 9318-acre-feet of
- 14 pumping that's existing, I think, in the basin's lower or
- closest to the basins. Do you recall that opinion?
- 16 ANSWERS BY MS. BRAUMILLER:
- 17 A. Yep, um-hum.
- **18** Q. Okay. And is it accurate that that is a number
- 19 that's associated with actual pumping in 2015, 2016 and 2017?
- 20 A. Yes, actual total carbonate and alluvial pumping.
- 21 Q. Okay. And I want to ask you a question about
- 22 that and it's -- you see the binder over there on the -- I'll
- get it for you, just a second.
- So I'm going to just ask you and I think you just

- 1 A. Okay.
- 2 Q. And over on the right-hand column, there's -- it
- says "total"?
- 4 A. Um-hum.
- 5 Q. Do you see that?
- 6 A. Yeah, I see that, um-hum.
- 7 Q. And so in the years 2015, '16 and '17, would you
- 8 agree with me that this table indicates that there's been --
- 9 there was approximately 7500-acre-feet, give or take, there's
- a range of 7144 to 7791-acre-feet of carbonate pumping?
- 11 A. Sure.
- 12 Q. Okay. And so that's the amount of carbonate
- 13 pumping that, in your recommendation, would be allowed as part
- of that 9318 number?
- 15 A. Right.
- 16 Q. As a maximum?
- 17 A. Well, right.
- 18 Q. Okay.
- 19 A. Because I did also, just for simplicity, suggest
- that carbonate alluvial pumping shouldn't be swapped.
- 21 Q. Okay.
- 22 A. That it just leads to too many questions about
- 23 alluvial pumping. If you just swapped out carbonate for are
- now too close to the river, you know, et cetera, right? It's

Min-U-Script®

Capitol Reporters 775-882-5322

(30) Pages 355 - 358

Page 359

- 1 a pretty simplistic recommendation, but I think implemented,
- 2 so yeah.
- 3 Q. Okay. Now, in your report on page 37, I think is
- 4 where you describe this. And so on page 37 of your report on
- 5 the bottom of that page, there's a paragraph that begins
- 6 consequently assuming a flow rate of 30,550-acre-feet to the
- 7 Moapa Gage is sufficient to meet senior decreed rights.
- 8 So that -- and then you go on to say "the initial
- 50 that -- and then you go on to say the initial
- 9 threshold of combined carbonate and alluvial of 9318"?
- 10 A. Um-hum.
- 11 Q. And that -- this is the base of your
- 12 recommendation; right?
- 13 A. Yeah, I -- you know, I'm going from memory here
- 14 now. But I think 30,550-acre-feet per year was the average of
- what was flowing through the Moapa Gage in 2015, '16, and '17.
- And 9318-acre-feet per year is apparently what the total of
- 17 carbonate and alluvial pumping average in 2015, '16 and '17.
- 18 Q. So from a hydrologic standpoint?
- 19 A. Um-hum.
- 20 Q. If more than 30,550-acre-feet is required to meet
- senior rights in the Muddy River?
- 22 A. Um-hum.
- 23 Q. Would you agree that the amount of pumping that
- 24 should be allowed from the carbonate system would have to be

- 1 the five-plus basins that you said indicated this clear
- 2 connectivity, and then you kind of expanded outward, looking
- 3 for low flow or even no-flow boundaries to help you define the
- 4 extent.
- 5 ANSWERS BY MS. BRAUMILLER:
- 6 A. Yeah. Yeah, so the drawdown in the five wells
- 7 that admittedly you couldn't hardly see on that plot, go
- 8 figure, but the drawdown cone was extremely flat in the area
- 9 of delineated by those five particular wells. Okay.
- But it is a drawdown cone, flat or not, and
- 11 drawdown generally -- I mean, this is a homogeneous or
- 12 isotropic, sorry, aquifer decreases logarithmically with
- 13 distance.

14

- So you can't go from 1.5 or 1.6 feet of drawdown
- 15 reduced by MX-5 to, you know, zero over distance. So, you
- 16 know, as a practical matter, I had, you know, other -- it made
- 17 sense to me to extend the area affected by MX-5 pumping to the
- 18 numerous likely no-flow boundaries.
- 19 O. Great.
- 20 A. And that's how I defined the five-plus basins.
- 21 Q. So this -- and I'm glad this slide is still up
- 22 there. So you're showing your proposed extent there of the
- 23 Lower White River Flow System. Is it safe to assume, looking
- at that, that you did not find any low flow boundary at the

Page 360

Page 362

- 1 less than the 7500 number we just talked about?
- 2 A. Well, I think that might be a step too far, but I
- 3 would say that the total carbonate and alluvial pumping would
- 4 have to be somewhat less.
- 5 Q. That's correct. Just so the 9318 number?
- 6 A. Yeah.
- 7 Q. Would have to come down in relationship to how
- 8 much additional water would be needed to meet rights in the
- 9 river?
- 10 A. Correct.
- 11 Q. Okay.
- MR. TAGGART: Is that me?
- HEARING OFFICER FAIRBANK: That's you.
- MR. TAGGART: Okay.
- 15 HEARING OFFICER FAIRBANK: Next will be the Moapa
- 16 Valley Water District.
- 17 CROSS-EXAMINATION
- MR. MORRISON: Good morning, I'm Greg Morrison
- and I represent Moapa Valley Water District. I just have a
- 20 couple of quick questions.
- First, for Ms. Braumiller, now, you -- I'm going
- 22 to paraphrase here, so please let me know if I butcher this.
- But I think what you said your analysis, you attempted to
- 24 define the scope of the management area by -- you started with

- 1 northern end of Coyote Springs Valley or the southern end of
- 2 Kane Springs Valley that would preclude you from including
- 3 them in your analysis in your area?
- 4 A. Yeah. You know, I'll go back to the 2007 ruling,
- 5 I think it was 5712. There was conclusion that there is a
- 6 very -- there's like a 50-, 75-foot difference in head between
- 7 CSVM-4 in northern Coyote Springs Valley.
- 8 And in a ruling, it was -- the exact location
- 9 where head -- or the carbonate aquifer was 50 to 75 feet less
- 10 than it is at CSVM-4, was not clearly defined. But the first
- 11 location at which I found those kinds of carbonate water
- levels was in central Coyote Spring Valley in the area of
- 13 MX-5, CSVM-6, et cetera.
- So it's very clear because there's a much larger
- 15 head difference between, say, CSVM-6 in Coyote Spring Valley
- and CSVM-4 at the north end, just south Kane Springs Valley,
- that the transmissivity of the carbonates is a whole lot less
- than it is in this other area that is just exceptionally
- 19 high --
- 20 O. Okay.
- 21 A. -- in field transmissivity. But --
- 22 Q. If I can just interrupt you for a second.
- 23 A. Yeah.
- 24 Q. You didn't find a low flow barrier that would

Min-U-Script® Capitol Reporters (31) Pages 359 - 362 775-882-5322

Page 363

- 1 exclude Kane Springs from this management area as you have it
- 2 included in your map up there?
- 3 A. Well, you could always hypothesize any number of
- 4 such things. But what I noted is that water level
- 5 fluctuations in CSVM-6 or MX-5, there's 4 or 5 wells in
- 6 central monitor -- carbonate wells in central Coyote Springs
- 7 Valley.
- 8 In any of those, you saw the same water level
- 9 fluctuations as CSVM-4. They were of different magnitude, but
- 10 there's clearly a hydraulic -- this is where -- don't touch
- 11 that thing.
- This is where it does make a sense to look at
- time series, right, as a hydrologist or hydrogeologist, okay?
- 14 So there's a clear hydraulic connection. It's just the
- transmissivity is much less between central Coyote Spring
- Valley and southern Kane Springs Valley, but it is still
- 17 transmissive.
- 18 Q. All right.
- 19 A. Right.
- 20 Q. Thanks.
- 21 A. Yeah.
- 22 Q. All right. And this generally is directed to
- 23 Mr. Mayer, but I think any or all of you might be qualified to
- answer it. So if anyone feels more comfortable, please.

- 1 A. I think you're right.
- 2 MR. MAYER: Yeah, it was. Yeah --
- 3 ANSWERS BY MS. BRAUMILLER:
- 4 A. And that team was never formed and never met,
- 5 um-hum.
- 6 Q. That was my question. Great. Thank you.
- 7 When did it last meet is another. Has the
- 8 stipulation, to your knowledge, has it ever been modified or
- 9 cancelled according to its terms over the years?
- 10 ANSWERS BY MR. MAYER:
- 11 A. Well, it was -- there was a provision that
- 12 required a monitoring well in the northern part of Coyote
- 13 Spring Valley, two actually. One on Kane, one in Coyote
- 14 Spring, one --
- 15 ANSWERS BY MS. BRAUMILLER:
- 16 A. One on --
- MR. MAYER: I can't remember. Yeah, anyway, so
- 18 that was modified. There was an agreement by the Fish and
- 19 Wildlife Service to allow -- was it CSVM-4 to still be
- 20 substituted?
- MS. BRAUMILLER: I don't remember.
- MR. MAYER: There was another well that was
- 23 drilled that was substituted by SNWA that was substituted for
- 24 the well that was required in the stipulation. But that was

Page 364

Page 366

- You concluded that the triggers from the 2006
- 2 Memorandum of Understanding based on Warm Springs West flows,
- 3 those are valid and important for protecting the springs in
- 4 the Pederson Unit or the Pederson Unit?
- 5 ANSWERS BY MR. MAYER:
- 6 A. Yes, I concluded that.
- 7 Q. Okay. And you're familiar with the amended
- 8 stipulation between the Fish and Wildlife Service and Lincoln
- 9 County, Vidler? It's on the record as Fish and Wildlife
- 10 Service Exhibit 57.
- 11 A. Yes, I'm familiar with that.
- 12 Q. Does that agreement also have some trigger levels
- based on Warm Springs West flows?
- 14 A. Yes, it does.
- 15 Q. Would you say that those trigger levels -- those
- trigger levels are also valid and important to protect
- 17 Pederson Unit Springs?
- 18 A. Yes, I would agree, they are.
- 19 Q. All right. I want to dig a little deeper into
- 20 that stipulation with Lincoln Vidler. So that stipulation
- 21 requires the formation of a technical review team, TRT; is
- 22 that correct?
- 23 A. Yes. Is this more you, Sue or --
- ANSWERS BY MS. BRAUMILLER:

- 1 just the one well. There was never anything addressed as far
- 2 as the other wells as far as I know.
- 3 Q. So your knowledge then was one well was
- 4 substituted and the second one was never drilled?
- 5 A. As far as I know, yes.
- 6 Q. All right. Was there ever -- so there was never
- 7 any agreement obviously from the TRT that those monitoring
- 8 wells wouldn't be required because the TRT didn't meet?
- 9 ANSWERS BY MS. BRAUMILLER:
- 10 A. Never met.
- MR. MORRISON: All right. That's all I have.
- 12 Thank you.
- HEARING OFFICER FAIRBANK: And next up is Lincoln
- 14 County with Vidler Water Company.
- 15 CROSS-EXAMINATION
- MS. PETERSON: Good morning, panel, Karen
- 17 Pederson representing Lincoln County Water District and Vidler
- 18 Water Company. And I just had a question for Dr. Schwemm.
- Are you familiar with the biological opinion U.S.
- 20 Fish and Wildlife Exhibit 59?
- ANSWERS BY MR. SCHWEMM:
- 22 A. Not really. I didn't really address the -- this
- 23 is Mike Schwemm. Not really. I didn't address the biological
- opinion in my report. I just spoke of what the triggers

Min-U-Script®

Capitol Reporters 775-882-5322

(32) Pages 363 - 366

Page 367

- 1 themselves and the values that were in that amended
- 2 stipulation in relation to the Dace themselves. But I'm not
- 3 overly familiar with the biological opinion.
- 4 MS. PETERSON: May I approach the witness?
- 5 HEARING OFFICER FAIRBANK: Yes.
- 6 MS. PETERSON: Thank you.
- 7 I am going to hand you and your counsel a copy of
- 8 your Fish and Wildlife Exhibit 59, which is a biological
- 9 opinion, and if you could turn to page 37.
- 10 ANSWERS BY MR. SCHWEMM:
- 11 A. Okay.
- 12 Q. I hate to waste my time on this. I mean, I need
- you to read it, not out loud, to yourself. But if you could
- read quickly, that would be great.
- 15 A. Which section?
- 16 Q. I'm sorry, number three.
- 17 A. (Complies.) Okay.
- 18 Q. All right. And do you agree that in this
- document, it's the Service's biological opinion that the
- 20 action, as proposed and analyzed -- and again, this is related
- 21 to the Kane Springs Valley groundwater development project in
- 22 Lincoln County; do you agree with that?
- 23 A. Well, I haven't reviewed this document. So it's
- new to me in -- so I don't really know the entire -- the

- 1 geologist, as an expert in the area of geology; is that
- 2 correct?
- 3 A. Yep. Right. Yes.
- 4 HEARING OFFICER FAIRBANK: Please turn your mic
- 5 on
- 6 MS. BRAUMILLER: Oh, it's on actually. Okay.
- 7 Yes, no.
- 8 BY MS. PETERSON:
- 9 Q. And you were also not qualified as an expert in
- the area of hydrogeology; is that correct?
- 11 A. No, I didn't ask to be qualified as a
- 12 hydrogeologist.
- 13 Q. Would you agree that you provided a lot of
- opinions in your presentation that would be in the areas of
- 15 geology and hydrogeology?
- 16 A. Yes, and I asked to be qualified as a groundwater
- 17 hydrologist because I am a groundwater hydrologist by formal
- 18 training and work experience. And I have become a
- 19 hydrogeologist of a result of over 24 years of work. But I do
- 20 not have a geology degree and so I was very conservative about
- 21 that.
- MS. PETERSON: And I just asked the State
- 23 Engineer and panel to take the appropriate -- take into
- 24 consideration that in offering the opinions today, that

Page 368

Page 370

- 1 entirety of what's referred to in the document.
- 2 Q. Do you agree that paragraph 3 there on this page,
- 3 page 37 of what I'll represent to you is Fish and Wildlife
- 4 Service Exhibit 59, indicates that it's the Service's
- 5 biological opinion that the action, as proposed and analyzed,
- 6 is not likely to jeopardize the continued existence of the
- 7 endangered Moapa Dace?
- 8 A. Yeah, I can read that, but I don't really know
- 9 what was stated in the biological opinion because I did not
- analyze that in my report.
- 11 Q. Do you think it was important to analyze the
- biological opinion before you drafted your report?
- 13 A. It could have been and it was -- would have been
- 14 good background. But specifically what I wanted to address
- was if there was a -- the change in flow and how that might
- affect the species itself.
- So I was just interested in the biological effect
- 18 of how flow changes would affect the species and not the
- 19 compliance issues because I did not address those in my
- 20 report.
- 21 Q. My next questions are directed to Ms. Braumiller.
- ANSWERS BY MS. BRAUMILLER:
- 23 A. Um-hum.
- 24 Q. You were not qualified in this proceeding as a

- 1 Ms. Braumiller is not qualified as an expert in geology or
- 2 hydrogeology.
- 3 HEARING OFFICER FAIRBANK: Thank you. We'll note
- 4 that.
- 5 BY MS. PETERSON:
- 6 Q. Do you agree, Ms. Braumiller, that the boundary
- 7 issue with regard to the Lower White River Flow System is a
- 8 structural geology issue?
- 9 A. We're trying to define the boundaries of a flow
- 10 system. So, in part, it's a geology issue; and in part, large
- 11 part, it is not.
- 12 Q. Would you agree, then, that structural geology of
- 13 the region controls the groundwater flow of this region?
- 14 A. It is. It's one factor influencing groundwater
- 15 flow in this region, one of several.
- 16 Q. Do you agree, as a hydrologist, that you're
- 17 making conclusions about where groundwater flows in this
- 18 region. But if you're structural geology is wrong, your
- 19 opinions could be wrong?
- 20 A. Well, but as I said, I have 24 years of work
- 21 experience doing groundwater hydrology that cannot be done
- 22 without also doing hydrogeology. So although I did not ask to
- 23 be officially qualified as a hydrogeologist out of, you know,
- a sense of respect for the fact that I do not have a geology

Min-U-Script®

Capitol Reporters 775-882-5322

(33) Pages 367 - 370

Page 374

Page 371

- 1 degree, I have been doing hydrogeology for 24 years.
- 2 Q. Would you agree, though, if your assumptions
- 3 about structural geology were wrong or if you had no
- 4 assumptions about geology in your flow analysis, that your
- 5 opinions could be wrong?
- 6 A. No, I don't, and here's the reason. Everywhere
- 7 where I cited the likely existence of geologic
- 8 discontinuities, I said subject to hydraulic confirmation.
- 9 And there is not everywhere, hydraulic confirmation for those
- 10 no-flow boundaries, if that's what you're specifically
- referring to. But at many locations, there are.
- And so my approach is to first look at geology,
- 13 look for geologic discontinuities that are very significant,
- and then look for hydraulic confirmation. I don't believe you
- can infer hydraulic connections or a lack thereof just based
- 16 on geology.
- 17 Q. Directing your attention to pages 15 and 16 of
- your report, which is the Fish and Wildlife Exhibit 5?
- 19 A. Okay.
- 20 Q. You make some conclusions about 12 wells on those
- 21 pages, that they're in the carbonate; do you recall that?
- 22 A. Let's see. Wait a minute. Oh, there were
- several -- there were 14, yeah, several of the carbonate wells
- 24 that were the water level records for some of the carbonate

- 1 transforms. Do you see that? It's in the third paragraph
- 2 down.
- 3 A. Um-hum.
- 4 Q. You're familiar with that sentence?
- 5 A. Which sentence are you talking about?
- 6 Q. It starts with "the parameters of the Theis
- 7 transforms as applied in SeriesSEE analysis"?
- 8 A. Yeah, okay.
- 9 Q. Do you see that?
- 10 A. Right, right.
- 11 Q. That they're not intended or -- to represent or
- serve as estimates of aquifer parameters?
- 13 A. Correct, um-hum.
- 14 Q. Are you saying that the SeriesSEE analysis allows
- you to ignore structural geology and well construction?
- 16 A. It doesn't take those things into account because
- 17 it's a Curve-fitting tool, Curve-fitting tool. You're fitting
- 18 analytical approximations of various stresses that account for
- 19 changes in water level in the well to document water level
- 20 records for wells. That's the nature of it.
- 21 Q. And would you agree -- and this might have been
- asked already, so I apologize if it's a repeat. Would you
- agree that the SeriesSEE analysis does not incorporate
- 24 recharge due to weather events, such as high precipitation in

Page 372

- wells that were analyzed using SeriesSEE in 2013 are not part
- 2 of the regional aquifer. So maybe you have to clarify your
- 3 question a little bit.
- 4 Q. Well, directing your attention to the 12 wells
- 5 that you have on pages 15 and 16; do you see those?
- 6 A. I see there are -- there's 1, 2 -- yeah. Okay,
- 7 yeah, I see them.
- 8 Q. All right. You used a geologic map to determine
- 9 which geologic units the wells represent; is that correct?
- 10 A. Not only geologic maps, but also the well logs.
- 11 Q. You did look at the well logs?
- 12 A. Absolutely.
- 13 Q. Did you note that in your report?
- 14 A. I don't know. If you want me to read the text,
- 15 I'll do it right now. But I can tell you I looked at the well
- logs and the geologic mapping, of course.
- 17 Q. For all the wells listed on pages 15 and 16?
- 18 A. Correct, um-hum. Right, um-hum.
- 19 Q. And then directing your attention to page 14 of
- 20 your report?
- 21 A. Um-hum.
- 22 Q. Exhibit 5?
- 23 A. Uh-huh, right.
- 24 Q. You talk about the parameters of the Theis

- 1 2005 or 2010?
- 2 A. It could be made to do that, but that is not the
- 3 way it was applied to interpret the Order 1169 pumping test,
- 4 because our purpose was to characterize the aerial extent of
- 5 the drawdown created by the test pumping.
- 6 And then secondarily, we were surprised to see
- 7 how uniform it was over such a large area. It was not the
- 8 purpose. This was pure application of SeriesSEE.
- 9 Q. Did the SeriesSEE analysis drawdown impacts
- 10 extend from the Order 1169 pumping to Kane Springs Valley,
- which is about over 15 miles away?
- 12 A. You know, I don't believe KMW-1 was officially
- .3 one of the water monitoring wells for the Order 1169 study,
- 14 although there was monitoring. I found the hydrographs, of
- 15 course, in the State Engineer's data basis. And it was not
- officially -- oh, I'm sorry, I'm getting to my point here.
- 17 It was not -- in fact, there was an explicit
- decision in 2007 not to include it in the Order 1169 pumping
- 19 test. I know it was -- there was a decision not to include it
- 20 in the pumping test. I think it was based on the 2007 ruling
- 21 5217. But there is groundwater level data for KMW-1 through
- 22 the pumping tests and I think the monitoring started in about
- 23 2007 perhaps, something like that. So it's there, um-hum.
- 24 Q. Right. But I think I was asking you about -- and

Min-U-Script® Capitol Reporters 775-882-5322 (34) Pages 371 - 374

Page 378

Page 375

- I believe you've stated that your SeriesSEE analysis, there 1
- were no drawdown impacts that extended from the Order 1169 2
- pumping to Kane Springs Valley; is that correct? 3
- A. No. What I'm saying is that the SeriesSEE
- analysis was only -- we only -- Keith Halford, okay, only
- analyzed a select number of carbonate wells throughout the 6
- Order 1169 study area because there were many, many monitor
- carbonate wells. 8
- So he selected carbonate wells from far flung 9
- locations throughout the Order 1169 pumping test that were 10
- 11 also based on other considerations, water level records,
- geologic mapping, well logs, et cetera, also believed to be 12
- 13 completed in the regional carbonate aquifer, some carbonate
- wells that are apparently complete outside the carbonate 14
- 15 aquifer and some other geologic units.
- But at any rate, he didn't happen to choose KMW-1 16
- 17 as one of the records that was analyzed. So it just wasn't
- analyzed, um-hum. 18
- O. How come Mr. Halford is not here, testifying 19
- today about the work he did? 20
- A. Well, we refer to the 2013 DOI report, okay? We 21
- refer to that. We cited it. I re-explained, verified the
- SeriesSEE analysis in my report because it's so foundational 23
- to the identification of the basins that it should be 24

- and Wildlife asked the State Engineer not to include Kane
- Springs in Order 1169? 2
- 3 A. I'm not terribly familiar with the original
- stipulation or with any amendment to it.
- 5 Q. And then directing your attention to page 22 of
- Exhibit 5?

12

- 7 A. Okay, um-hum. Sure.
- Q. Where you want to --
- 9 MS. PETERSON: I'll be back.
- HEARING OFFICER FAIRBANK: Actually if you want 10
- to finish that one question and then we'll break after that. 11
 - BY MS. PETERSON:
- Q. You're asking about the geophysical surveys for 13
- the Kane Springs wells? 14
- 15 A. Well, I'm not asking about it. I'm just noting
- that I reviewed a URS well completion report that included a 16
- 17 description of down hole surveys, including geophysical
- surveys that were conducted in both KMW-1 AKVW-1, and that in 18
- 19 the interpretive material in that report, I saw no conclusions
- 20 about which or perhaps maybe both sides -- these are both very
- deep wells completed over a large interval -- whether they 21
- 22 are -- the completion intervals span the Kane Springs Wash
- 23 Fault Zone or they're entirely limited to the northwest side
- of the Kane Springs Wash Fault Zone. 24

Page 376

- 2
- that's critical because when you look at hydraulic data from 3
- either or both of those wells, we don't know what it means. 4
- So I do think that that question needs to be cleared up. 5
- MS. PETERSON: I will be back. 6
- 7
- HEARING OFFICER FAIRBANK: All right. So we'll 8
- 9 go ahead and break for a lunch break. We will go ahead and
- 10
- 12

considered the Lower White River Flow System. 1

- But we're not relitigating, as far as I know, 2
- Keith Halford's Curve-fitting in 2013. The results, the 3
- analysis that was done is described in the DOI 2013 report as 4
- one of our exhibits. I cited it. The results and our 5
- interpretation are also described and cited in our DOI 2013 6 7 report.
- There is no need for Dr. Halford to be here, 8
- 9 although I think it would have been helpful. I would have
- loved to heard him explain since he's the author of SeriesSEE, 10
- what it is and is not because there does seem to be a lot of 11
- confusion about that. 12
- Q. Did you or Dr. Halford do any analysis of Kane 13
- Springs pumping impacts on the Muddy River?
- A. No. No, not --15
- Q. And are you aware of the amended stipulation? 16
- You were answering questions about it. It's Fish and Wildlife 17
- Exhibit 57, I believe, the amended stipulation in Kane Springs 18
- with U.S. Fish and Wildlife and Lincoln County Water District 19
- 20 and Vidler?
- A. I think that Tim Mayer responded to those 21
- questions. And I do not have a lot of knowledge of amendments 22
- to the original stipulation agreement. 23
- 24 Q. And are you aware, in that stipulation, that Fish

- 1 I saw no indication in your report that that was
- interpreted from the geophysical surveys. And I just think

- MS. BRAUMILLER: Okay. Thank you.
- get back on record and return to our proceedings at 1:15. So
- promptly at 1:15. 11
- (Proceedings concluded at 12:09 p.m.)

- 1 SEPTEMBER 24, 2019; 1:15 P.M.; CARSON CITY, NEVADA.
- 2 3 -o0o-
- 4 HEARING OFFICER FAIRBANK: Okay. We'll go
- 5 ahead and go back on record.
- 6 So, next we'll take questions from the City of
- 7 North Las Vegas.
- 8 And I should have said this yesterday, but just
- 9 as reminder, all the witnesses are still under oath.
- 10 MS. SCHROEDER: Thank you. I'm
- 11 Laura Schroeder, and I represent the City of North Las
- 12 Vegas.
- MS. SCHROEDER: Do I need to hit my button?
- 14 Okay. Now can you hear me?
- 15 HEARING OFFICER FAIRBANK: Yes.
- MS. SCHROEDER: I'm Laura Schroeder, and I
- 17 represent the City of North Las Vegas. I just have a
- 18 couple of questions for Mr. Mayer.
- 20 SUE BRAUMILLER, MICHAEL SCHWEMM, TIM MAYER,
- 21 called as a witnesses herein by U.S. Fish and Wildlife
- 22 Service, having been previously duly sworn, were
- 23 examined and testified as follows:
- 24

19

- 1 average. It looks back at the preceding 12 months.
- 2 So, that's the reason I didn't put a moving average in
- 3 here, because it is a moving average.
- 4 It looks back at conditions of the past
- 5 12 months, and just a running look back, so to -- so to
- 6 speak.
- 7 Q. Right. So, looking visually at this, I drew a
- 8 line on the zero axis through your graph.
- 9 A. Uh-hum.
- 10 Q. And drawing -- just using a visual on that, and
- 11 drawing the line through the zero, and then looking at
- the year 2000 -- I think that you have January, 2002,
- 13 but just ahead of that line. So, I have line at zero
- and a line that divides us between two -- before 2000
- and after 2000. What I see is a lot more area below
- 16 the zero line after 2000 than before 2000. Would you
- 17 agree with me, Mr. Mayer?
- 18 A. Yeah, I would agree with you.
- 19 Q. Is there a Palmer drought severity index value
- 20 that was published for the years before 1990?
- 21 A. I think this record goes back to 1885.
- 22 Q. And I think you testified earlier to that.
- But, I don't think that person who asked you -- the
- 24 attorney that asked you, asked you why you didn't

Page 385

Page 387

- 1 CROSS-EXAMINATION
- 2 BY MS. SCHROEDER:
- 3 Q. And I would like, if possible, for you to pull
- 4 up your PowerPoint. And this is -- we're looking at
- 5 U.S. FWS Exhibit 7. I think we're looking at probably
- 6 about slide number six.
- 7 A. Is this the rebuttal report?
- 8 Q. Yes, please. And this would be the one that
- 9 includes figures 3 and 5.
- 10 A. Yeah, okay, this is it.
- 11 Q. All right. Thank you.
- And this -- these two figures I believe, at
- 13 least it appears to me, that they were in your rebuttal
- report at pages 5 and 6. And I'm going to focus just
- on the upper graph, which is the division three graph,
- which appears to be figure five from page 6 of your
- 17 report -- your rebuttal report.
- So, looking at that report and looking at that
- 19 graph, can you give us an average drought severity
- 20 index before and after 2000?
- 21 A. An average drought severity index? I would
- 22 just have to guess. So, no, I really can't do that. I
- 23 can't give you a visual average. But let me say that
- this drought index is an average. It's a moving

- 1 include earlier years. And so, I'd like to ask you
- 2 that question, Mr. Mayer.
- 3 A. Well, this is a 30-year record, and I -- this
- 4 is the record that we have for the water levels.
- 5 Basically, this is a time of interest, so, that's why I
- 6 focused on this.
- 7 Q. That period of time?
- 8 A. Right.
- 9 Q. Okay. Now, the rest of the slides in your
- 10 rebuttal report focus on illustrating water levels and
- 11 basins that were without pumping. And I would like to
- ask you as to those if you have any opinion as to why
- 13 some of those basins have declined and some have
- 14 increasing water levels?
- 15 A. Some of them have decline, some have stable
- 16 water levels, and some have increasing water levels. I
- 17 would say the majority are increasing. That was my
- 18 point. They're not declining. I have an opinion,
- 19 yeah. It is that the climate is wetter.
- 20 Q. All right. At least in those basins, it's your
- 21 opinion that those -- that it's wetter in those areas?
- 22 A. It's responding to the wetter climates, yes.
- Q. And even though that your figures here show that there is more areas below the zero line than above

Min-U-Script® Capitol Reporters (2) Pages 384 - 387

Page 388

- 1 them?
- 2 A. Yes, this is just one data point. One metric.
- 3 Q. All right.
- 4 A. Yeah.
- 5 Q. But it's an average of those 12 -- rolling
- 6 average of those 12 months, correct?
- 7 A. Yes.
- 8 MS. SCHROEDER: All right. No further
- 9 questions.
- 10 HEARING OFFICER FAIRBANK: Next will be the
- 11 Center For Biological Diversity.
- MR. DONNELLY: Thank you. Patrick Donnelly
- with the Center For Biological Diversity. I have a lot
- 14 of questions, so I'll be moving quickly, and probably
- 15 taking some more time. Appreciate your testimony, and
- obviously, appreciate the work Fish and Wildlife does
- 17 to protect the Moapa dace.
- 18
- 19 CROSS-EXAMINATION
- 20 BY MR. DONNELLY:
- 21 Q. These first questions I will direct toward
- 22 Ms. Braumiller, but they could be for anybody there
- 23 drawing on your experience as Fish and Wildlife Service
- 24 employees and not on your legal opinions.

- 1 Q. All right. And perhaps I'll direct this to
 - 2 Dr. Schwemm. Might individuals or agencies taking
 - 3 action which result in the unauthorized take of species
 - 4 be violating Section Nine?
 - 5 ANSWERS BY DR. SCHWEMM:
 - 6 A. That's true.
 - 7 Q. That you're aware of, are citizens able to file
 - 8 lawsuits to enforce the Endangered Species Act,
 - 9 including Section Nine, suits against entities
 - 10 responsible for unauthorized take?
 - 11 A. Yes.
 - 12 HEARING OFFICER FAIRBANK: If you'll make sure
 - 13 that your mic is on and that you're speaking in your
 - 14 microphone. Thank you.
 - MR. MILLER: I object, too. I don't know if
 - 16 it's a relevant line of questioning for the issue that
 - 17 we've been proffered here for.
 - 18 HEARING OFFICER FAIRBANK: And I would ask
 - 19 if -- how this is relevant to the issue -- the four
 - 20 issues with respect to the geographic boundaries, the
 - 21 quantity of water that can be developed and the
 - 22 movement of pumping?
 - MR. DONNELLY: Understood. I will end that
 - 24 line of questioning.

Page 389

Page 391

- So, the Fish and Wildlife Service's mission is
- 2 to conserve -- in part is to conserve, protect, and
- 3 enhance fish, wildlife, and plants in their habitat; is
- 4 that correct?
- 5 ANSWERS BY MS. BRAUMILLER:
- 6 A. That's my understanding.
- 7 Q. And that includes the implementation of the
- 8 Endangered Species Act?
- 9 A. Definitely.
- 10 Q. The definition of "take" in section three of
- 11 the Endangered Species Act is "to harass, harm, pursue,
- 12 hunt, shoot, wound, kill, trap, capture, or collect, or
- 13 to attempt to engage in any such conduct."
- Does that sound right to you?
- 15 A. That sounds familiar. The focus of my work is
- 16 not regulatory.
- 17 Q. To the best of your awareness, does section
- 18 nine of the Act prohibit take of endangered species?
- 19 A. I think it does because there are take permits,
- 20 but I don't know the details of the basis on which
- 21 those are provided.
- 22 Q. Okay. I'm seeing nods from your co-witnesses
- 23 there
- 24 A. They probably know better than I do.

- 1 HEARING OFFICER FAIRBANK: Thank you.
- 2 MR. DONNELLY: Thank you.
- 3 BY MR. DONNELLY:
- 4 Q. Dr. Schwemm, you state that flow and habitat
- 5 are proportional to the Muddy River Spring area; is
- 6 that correct?
- 7 A. Yes.
- 8 Q. And that any reduction in flow will decrease
- 9 the amount of habitat available?
- 10 A. Yes.
- 11 O. Would a reduction in habitat reduce the number
- 12 of individual dace present?
- 13 A. Yes.
- 14 Q. In a general sense then -- I'll pass on that
- 15 question.
- Ms. Braumiller's presentation stated that
- 17 carbonate pumping reduces spring flow; is that correct?
- 18 A. Oh, that's me?
- 19 Q. Either of you.
- 20 A. All right.
- 21 ANSWERS BY MS. BRAUMILLER
- 22 A. Yes.
- 23 Q. Thank you. Since that is true, doesn't this
- 24 imply that carbonate pumping would result in a

Min-U-Script®

Capitol Reporters 775-882-5322

(3) Pages 388 - 391

- 1 reduction in the amount of individuals Moapa dace?
- 2 A. I guess that's a combo question.
- 3 I would say that's highly likely.
- 4 Q. It's highly likely. Thank you.
- 5 Given that maintaining stream flows is the
- 6 stated goal of the MOA and other proceedings related to
- 7 the Moapa dace, doesn't that imply there should be zero
- 8 carbonate pumping in the Lower White River Flow System?
- 9 A. Oh, no, I don't think so.
- 10 Q. Is it the goal to maintain spring flows?
- 11 A. Yes.
- 12 Q. Does carbonate pumping reduce spring flows?
- 13 A. Yes.
- 14 O. Doesn't it then follow that we need to cease
- 15 carbonate pumping in order to maintain spring flows?
- 16 A. No, it doesn't.
- 17 Q. Why is that?
- 18 A. Okay. Yeah, because you do have inflows to the
- 19 Lower White River Flow System's basins and local
- 20 recharge. And some amount can be captured, right,
- without reducing spring flows below an unacceptable
- 22 level?
- 23 Q. You stated -- and this is for you continuing,
- 24 Ms. Braumiller.

- 1 CSVM1, CSVM2, CSVM4, CSVM6, UNVM1, GV1, Warm Springs
- 2 West and Iverson Flume.
- 3 Are you aware of a trend common to those since
- 4 2015?
- 5 A. Since 2015?
- 6 Q. Yes, in the 2015 to 2017?
- 7 A. I don't specifically remember what the
- 8 hydrographs looked like from 2015 to 2018, not off the
- 9 top of my head. I'd have to look.
- 10 Q. Are your other witnesses able to pull up those
- 11 charts from your report? It's figure 7 to 8, and 13.
- 12 A. Go ahead.
- 13 Q. Yeah, it would be the CSVN wells, Warm Springs
- 14 West, and Iverson Flume that I'm referring to.
- 15 A. You did say figure seven?
- 16 Q. It would be 7 to 8A, and then 13.
- 17 A. All right. I'm looking at that.
- 18 Q. Yeah. Thank you.
- 19 I'm just wondering if you observed a trend
- 20 common to those monitoring points from 2015 to 2017?
- 21 A. Well, I'm looking at the hydrographs for the
- 22 CSVN wells, and 2015 through '18, some of them
- 23 generally appear to decline. All right.
- The data measurements of KMW1 from 2015 to

Page 393

Page 395

- Now, you stated that there are too many
- 2 questions to come up with a sustainable yield number?
- 3 A. No, I did not.
- 4 Q. Okay.
- 5 A. Well, I -- what I did say -- let me clarify, if
- 6 I could. That I think there are too many outstanding
- 7 questions right now to construct a numerical flow model
- 8 that could be used to predict the sustained level of
- 9 total pumping.
- 10 Q. Okay. Thank you.
- 11 A. You're welcome.
- 12 Q. You stated then that 9318 acre-feet per annum
- is a good starting estimate?
- 14 A. I did.
- 15 Q. For sustainable yield?
- 16 A. Right.
- 17 Q. You justified this by citing the steady
- 18 discharge and monitoring well management measurements
- 19 since the pump test, correct?
- 20 A. Right. Groundwater levels, spring flows, and
- 21 flows in the Muddy River, 2015, '16, '17.
- 22 Q. So, I'm going to ask you about a trend, and I'm
- referring to figures 7 to 8, and 13 from your report.
- Basically, these are charts depicting flow levels in

- 1 2018, are pretty sparse, so I wouldn't conclude
- 2 anything.
- 3 Q. Yeah, I think the other ones of interest to me
- 4 would be Warm Springs West and Iverson Flume which are
- 5 in figure 13.
- 6 A. Okay. I'm getting there.
- 7 Q. Yeah. Thank you for working with me here.
- 8 A. Iverson Flume and what else?
- 9 Q. Warm Springs West.
- 10 A. Warm Springs West. Well, you know, Warm
- 11 Springs West, I -- just looking at the hydrograph, it
- 12 might be declining somewhat. Right.
- And Iverson Flume, I'm not all that confident
- in these measurements, but it certainly looks like it's
- 15 declining.
- 16 Q. So, we can observe declines in numerous
- 17 monitoring wells across Coyote Springs and Upper Muddy
- 18 River Springs area?
- 19 A. Some decline.
- 20 Q. Some decline.
- 21 A. Not like pumping --
- 22 Q. Not like the pumps --
- 23 A. Not like the initiation of pumping, et cetera.
- 24 Q. So, if that's the case, if we have a decrease

Page 396

- 1 in trend, and the 9300 number was arrived at due to
- 2 some idea that there is sustainable yield right now,
- 3 don't those -- don't those two things conflict with one
- 4 another? That 9300 is meant to be maintaining spring
- 5 flows, and yet we can observe spring flows declining at
- 6 that pumping level?
- 7 A. Well, it's not to say that you couldn't have
- 8 declines in groundwater levels in spring and stream
- 9 flows at that level of total pumping. But the question
- 10 is, does it leave enough water in the river to satisfy
- 11 senior decreed water rights on the river?
- 12 Q. Well, so, I'd like to question that because in
- 13 your presentation you said that was the justification,
- 14 was maintaining spring -- maintaining senior water
- rights on the river. But isn't the Fish and Wildlife's
- mission to conserve, protect, and enhance wildlife
- 17 populations? So, shouldn't your basis be whether or
- 18 not spring flows that the Moapa dace requires are
- 19 maintained?
- 20 A. No, and -- I'm sorry, I think I probably lost
- 21 track of what you just said. Would you repeat that,
- 22 Patrick?
- 23 Q. Yes.
- 24 A. Because the first part I don't think I agree

- 1 Q. You stated there should be no increase in
- 2 either carbonate or alluvial pumping?
- 3 A. Oh, yeah. And above the 9318 --
- 4 Q. Yes.
- 5 A. -- as an initial starting point for sustainable
- 6 yield, yeah. And we don't know precisely how much
- 7 higher it might be possible to go than 9318 and still
- 8 meet senior decreed water rights on the river. But I
- 9 do believe that we have evidence that pumping at the
- 10 average rate that we pumped during the Order 1169
- 11 pumping test is too high -- okay -- for the springs.
- 12 As I said before, in an undiminished state of decline
- and at the end of the pumping test, meaning the system
- 14 was nowhere close to being in a new steady state.
- 15 Q. But is it not in steady state now as we observe
- 16 continued declines?
- 17 A. No groundwater system is ever in a steady
- 18 state
- 19 Q. Okay. Granted. Thank you.
- Yeah. I'd like to change track for a moment
- and ask a few questions of Dr. Schwemm?
- Does it sound correct to you that section two
- of the Endangered Species Act says that it is declared
- 24 to be a policy of Congress that agencies shall conserve

Page 397

Page 399

- 1 with.
- 2 Q. The justification for the 9300 number put
- 3 forward in your slideshow was that it maintained senior
- 4 water rights on the river?
- 5 A. I actually -- yeah, that's right. Stop right
- 6 there?
- 7 Q. Yes.
- 8 A. I actually did not say that. What I said is
- 9 that from 2015 to 2017, spring flows, groundwater
- 10 levels and flow through the Moapa dace, for instance,
- 11 was relatively constant. I didn't say it was constant.
- 12 Relatively constant. And assuming that 9318 is
- 13 sufficient to be senior decreed water rights on the
- 14 river, that that is a best initial estimate of --
- 15 Q. Understanding that --
- 16 A. Yes.
- 17 Q. -- spring flows are declining at that pumping
- 18 level?
- 19 A. Yeah, they're declining somewhat --
- 20 Q. Sure.
- 21 A. -- right?
- 22 Q. Sorry.
- 23 A. There's multiple factors that contribute to
- 24 that, of course.

- 1 endangered species and shall utilize their authorities
- 2 in furtherance of the Act?
- 3 ANSWERS BY DR. SCHWEMM:
- 4 A. I'd rather speak to elements of the report.
- 5 Q. Absolutely. 1983 recovery plan for the Moapa
- 6 dace details criteria for down and delisting. Are you
- 7 aware if any of those criteria are currently being met?
- 8 A. No, the -- I believe downlisting is 4500
- 9 animals and 6000 for delisting. In the '90s, we've
- approached some pretty high numbers in the high 3000s
 - .1 and -- but then it really was a -- I think the effects
- -- the combined effects of tilapia in the system that
- 13 really knocked it down to 500 animals, and then since
- 14 then we've increased the -- we've taken care of the
- 15 invasive species problem to a vast degree, and that's
- why we've gone up to 1500. But we're not -- you know,
- we're not too close to -- very close to the 4500 for
- 18 downlisting.
- 19 Q. And additional delisting criteria is 75 percent
- 20 of historical habitat unless we provide spawning,
- 21 nursery, cover, or forging habitat; is that correct?
- 22 A. That is.
- 23 Q. Do you have a rough ballpark estimate of what
- percent of historic habitat is providing these

Min-U-Script® Capitol Reporters (5) Pages 396 - 399 775-882-5322

Page 400

- essential functions right now?
- A. Not offhand. I'd have to calculate --2
- calculate that.
- Q. Order of magnitude, 7.5 percent, 75 percent?
- A. I wouldn't be comfortable with numbers, but I
- could estimate, you know, where that is on that figure.
- So, I -- when I showed that slide that had the data
- where the dace are, you can see that the majority of
- that is coming from Apcar, Pederson, and Plummer
- Streams. And where they intersect and then the main 10
- stem of Muddy River with the north and south fork is 11
- where there's very little dace that we find in any size 12
- range, whether it's a, you know, spawning, a juvenile, 13
- or whatever. There's few dace. 14
- Q. So, based on the data you provided, it appears 15
- the Fish and Wildlife is successfully avoiding the 16
- 17 extinction of the Moapa dace; is that correct?
- A. Yeah, I think that we're stable at that 1500 18
- animals, and we have been for a few years. Typically, 19
- they'll be some disturbance event or major recovery 20
- actions or -- such as removal of tilapia -- and you'll 21
- see an effect in that, and then you'll tend to see, you
- know, the system stabilize until the next event,
- whether positive or negative.

- know that 3.2 is at least enough to maintain 1500
- animals. And whether -- how that, you know, might
- fluctuate around that is difficult to say. But, wait.
- Let me refresh on this. We do definitely want to
- provide the caveat that, you know, based on the
- evidence that we have from the Hatten et al Paper is
- that increasing flow 10, 20, 30 percent is going to
- resolve increased habitat, and I believe that will be
- useful for the dace. So, I think that, you know, while
- it may be maintaining it, that 1500 may or may not be. 10
- But, certainly more habitat is going to get us closer 11
- 12 to recovery.
- 13 Q. So, that means that if recovery is the primary
- goal, Fish and Wildlife should be recommending
- 15 pull-over (sic) amount of pumping to increase spring
- 16
- A. That could be what -- it's difficult to make --17
- I really -- it's difficult to have a relationship
- directly between pumping and the actual number of the
- dace. But, I do believe that increasing the dace will
- increase the habitat because that's the best data we 21
- have. 22
- MR. DONNELLY: Thank you. 23
- HEARING OFFICER FAIRBANK: Georgia Pacific and 24

Page 401

Page 403

- 1 Q. So, understanding that extinct -- preventing
- extinction is being accomplished, do you feel you're
- making any headway toward the recovery goals?
- A. We are. I consider, you know, recovery
- goals -- or recovering species, if you think about what
- it was in 2006 and '07, you had about 500 animals. So,
- I consider that having three times as many is great.
- But for a very small fish, and particularly one that
- has a complex life history but more importantly a very
- short lifespan, that's certainly not secure, and we 10
- have a long way to go. 11
- Q. So, given that we're not rapidly advancing
- toward recovery, is the currently recommended pumping
- level of 9318-acre-feet per year going to contribute to
- the recovery of the species, given also that pumping at
- that level was causing spring flow declines? 16
- A. That's a tough question. So, just to repeat 17
- and make sure I got the question right, is that at 18
- 3.2 -- well, you -- you're asking me at 3.2 would that 19
- be limiting the population of the dace at this 20
- particular point? Yes. And that's a -- that's a 21
- complex question because of all of the recovery 22
- 23
- It's difficult to say, but I would say that we 24

1 Republic.

6

- MS. HARRISON: Good afternoon. Sylvia Harrison 2
- for Georgia Pacific and Republic Environmental
- Services. And with me today also representing George
- Pacific is Paulina Williams. 5
- CROSS-EXAMINATION 7
- BY MS. HARRISON:
- 9 Q. My questions today are more for Ms. Braumiller,
- and I would like you to refer to page 8 in Fish and
- Wildlife Service Exhibit 5. That's the initial report.
- 12 ANSWERS BY MS. BRAUMILLER:
- 13 A. Sure.
- Q. And if I recall correctly, Ms. Braumiller, you
- you testified that you prepared this portion of the
- report; is that correct? 16
- 17 A. Yes.
- Q. I just wanted to discuss with you the evolution 18
- of thinking that's described on page 8 about the 19
- recharge, or lack thereof, from the carbonate 20
- aquifer to the alluvial aquifer. And as you describe 21
- on this page, you note that back in the '60s it was 22
- believed that the Muddy Creek Formation could act as a 23
- barrier preventing the recharge in the carbonate

Page 404

- aguifer into the alluvial aguifer and discussed that
- was because of the low permeability; is that correct?
- A. No. Maxey et al 1966, mapped a lot on Muddy
- Creek Formations that went throughout the Wind River
- Springs area, and that's the difference.
- Q. And that was also substantiated with the
- results at the time by the difference in the water
- quality between that alluvial aquifer water which is
- the better quality than the Muddy Creek Formation?
- A. No, actually that --10
- 11 Q. Low tow ray row(phonetic)?
- A. Yeah, the -- yeah, the better water quality
- from the alluvial aquifer of the Muddy River Springs 13
- area -- yeah, the quality of water in the Muddy Creek 14
- 15 Formation's poor. And so the fact that water quality
- was good in alluvial aquifer in Muddy River Springs 16
- 17 Area suggests that water's getting in there from
- somewhere, and it's not coming through the Muddy Creek 18
- Formation in all likelihood. 19
- Q. That's what I thought I said, but I guess I 20
- didn't. 21
- Okay. But then you described how at the 22
- present time beginning in about the mid-1990s, it was 23
- later hypothesized that there was a significant leakage

- 1 believe I can demonstrate that, and I did.
- 2 Q. Are there water quality data that would help
- substantiate that connection?
- 4 A. There may be, but I relied on hydraulic data.
- 5 Q. Okay.
- A. Yeah.
- 7 Q. All right. I would like you now to turn to
- page 36 of that same report. Is it five? And again,
- I verify that you prepared this portion of the report?
- 10 A. I did, yeah.
- 11 Q. This morning when you were giving your direct
- testimony, you didn't really have a chance to get to
- your hypothesis of the source of the Big Muddy Springs,
- and I'd be interested to have you just give us a 14
- summary of that, those proposed sources for us? 15
- A. And it is important because it is about 7 CFS. 16
- 17 And it is just a hypothesis. But, Maxey et al 1966,
- during the 1966 report mapped Muddy Creek Formation in 18
- the Muddy River Springs area, including -- including 19
- high chromiability, massive limestone pebble
- fanglomerates, which were described as high 21
- permeability units within Muddy Creek Formation. And, 22
- you know, I noted that the Big Muddy Springs, it was 23
- approximately located within area of the Maxey, et al, 24

Page 405

Page 407

- upward through -- into the alluvial aquifers from a
- carbonate aquifer to the point where the State Engineer
- has completed as you quote, "There's a significant
- connection between the carbonate aquifers and the
- alluvial", and essentially, the State Engineer has
- concluded the alluvial aquifers surrounding the Muddy 6
- River ultimately drives virtually all of its water 7
- supply from the carbonate. 8
- 9 Do you have an explanation for the different --
- the basis for the different interpretations over time? 10
- A. Well, I think what Dettinger at L95 says is 11
- that generally they observed, that they hypothesized 12
- that there was leakage from the carbonate aquifer into 13
- alluvial aquifer generally.
- As for the basis, the State Engineer's basis, 15
- in the 2014 rulings for that same conclusion, I can't 16
- speak to that. It actually wasn't terribly clear in 17
- the rulings to me. But, I have -- which is why I took 18
- a really hard look at groundwater level data with 19
- 20 carbonate aquifer and alluvial aquifers in the Muddy
- River Springs area and California Wash to see if I 21
- could demonstrate that indeed there is leakage from the 22
- carbonate aquifer into the alluvial aquifer into Muddy 23
- River Springs area and in California Wash, and I

- '66 mapped as massive limestone pebble fanglomerates.
- And that could explain how there could be significant 2
- spring discharge through Muddy Creek Formation. It
- happens to be -- I submit it's probably not a
- coincidence. And there are -- you know, additionally,
- it's a warm spring, right? So, that means that the 6
- water is coming from depth. You know, I mean, and you 7
- can't say how deep. That's a whole another deal. But
- from depth. And also, if you look at the hydrograph
- for flows from the Big Muddy stream -- stream --Spring, sorry, the -- the changes in spring fills are 11
- 12 very attenuated compared to the rest of the springs.
 - And between the warm temperature, the fact that
- the location of the spring corresponds roughly to the 14
- location of these mapped limestone pebble fanglomerates 15
- by Maxey et al, it makes me wonder if what we're not 16
- looking at is water that's flowing at depth through 17
- Moapa Valley, either through the carbonates or maybe 18
- really deep basin fill, greatly attenuating water level 19
- 20 changes. I'm sorry, the discharge from the spring.
- And yet deep, so warm. 21
- And also, it was completely unresponsive as far 22
- as I think any of us could tell to the Order 1169 23
- pumping. Which might be explained by the fact that

Min-U-Script® (7) Pages 404 - 407 Capitol Reporters 775-882-5322

10

13

Page 411

Page 408

- this chunk of massive limestone pebble fanglomerate is
- sort encased in Muddy Creek Formation. So, I think it 2
- could fit.
- Q. So, is the -- just in short, it's clearly a
- different source from the carbonate aquifer so-called
- we've been discussing as the major source of many of
- the wells that have been discussed today?
- A. Right. Well, it could be carbonate beneath
- Lower Meadow Valley Wash, but it does not seem to be
- portion -- the portion of the carbonate aquifer that we 10
- identified with the SeriesSEE analysis. 11
- Q. At least not in direct hydraulic connectivity?
- A. Yeah. The two may be in hydraulic connection, 13
- but it's not -- it's -- the source does not seem to be
- 15 this highly -- exceptionally high transmissive portion
- of carbonate aquifer. 16
- Q. And you mentioned that the flow of that spring 17
- was, what, 7 CFS?
- 19 A. Yes.
- Q. And what percentage of that is -- does that
- make up of the river flow?
- A. Yeah, so, I just ballparked that, because it
- depends on what years we're talking about. But it's
- about three percent of the Muddy River Spring

- 1 is discharging into a tributary that flows in the main
- stem. So, it's not necessarily -- in fact, it probably
- is not -- yeah, water is going the opposite way. It's
- going through the alluvial aquifer into the stream in
- the Muddy River Springs area not the other direction.
- Q. Okay. Thank you.
- In any event, would you agree that it would be
- a very important thing to know about the source of that
- spring as we're trying to determine sustainable yields
- within this proposed unit? 10
- 11 A. The source did you say?
- 12 Q. Yeah. Know more about it?
- 13 A. Well, yeah, it would be one of those
- outstanding, hydrogeology questions, right? Because
- it's clearly a large contribution to the river. And
- so, in order to, you know, to prevent unduly impacting
- the spring flow, we're going to have to understand
- more --
- O. About the sources?
- 20 A. Yeah.
- Q. Thank you. 21
- You mentioned that the Muddy Creek Formation 22
- has been mapped extensively. Is it generally true that 23
- that acts as an aquifer, at least in part?

Page 409

- discharge, and about 15 percent of the Muddy River
- Moapa gage, at least in 2001 -- actually, when Beck and
- Wilson 2006 did their seepage study on the Muddy River.
- Q. That's a lot.
- So, is it reasonable to say that that discharge
- could be a significant source of recharge to the
- alluvial aquifers along the Muddy River?
- A. I don't know about that. Because the spring
- discharges to a spring branch, flows into the main stem
- of the Muddy River, and on down the river, so. 10
- O. You don't whether the stream is gaining or 11
- losing at that point? 12

19

- A. Yeah. And actually it's gaining through almost
- all the Muddy River Springs area. There is a losing
- reach. I can't remember. Maybe two or three miles,
- Moapa Valley gage. But most of it is gaining, apart 16 from the actual spring flow. You know, the surface 17
- discharges in the springs in the river. If you take 18 that out of what Beck and Wilson found in their 2001
- seepage run, you could track out the documented spring 20
- surface flows into the river, you still end up with 21
- gains through most of the Muddy River Springs area. 22
- So it's clearly gaining from the local alluvial 23
- aquifer, right? But the mud -- Big Muddy Spring itself

- 1 A. Yeah. And first I would say I don't know I
- 2 would say it was mapped extensively. It was a
- hand-drawn map by Maxey 1966, right? But, it is a
- relatively low permeability formation.
- Q. So, with respect to trying to understand the
- recharge of the carbonates into the alluvial, again, is
- the extent of the Muddy Creek Formation something we
- need to know more about?
- A. Do you mean the hydra -- what is the nature of
- the hydraulic connection between carbonate and alluvial
- aquifer --11
- 12 Q. Yeah.
- 13 A. -- and the Muddy River --
- 14 Q. It's part of -- it's part of the question that
- we need to answer.
- 16 A. Yeah. I think I -- I think I demonstrated that
- there is a hydraulic connection, and I tried quite a 17
- while to see if I could figure out exactly where. 18
- Okay? And concluded that I can't tell. There is --19
- 20 there is Bird Springs Formation carbonates. You know,
- in the surface geologic map there -- you know, there's 21
- contact between the Bird Spring Formation carbonates 22
- and the alluvial in the Muddy River Springs area, but
- I'm not convinced that the water table is lower than

Min-U-Script® (8) Pages 408 - 411 Capitol Reporters 775-882-5322

Page 412

- 1 that contact. Can't tell.
- 2 You know, and then over -- according to
- 3 Maxey's, et al, hand-drawn geologic map, there's a lot
- 4 of Muddy Creek Formation, you know, throughout the
- 5 Muddy River Springs area. And also, Page et al 2005's
- 6 geologic map, he maps a lot of Muddy Creek Formation
- 7 throughout the Muddy River Springs area. And others
- 8 map somewhat less.
- 9 But, what I concluded is that one way or the
- 10 other, I know there's a hydraulic connection, but due
- 11 to the carbonate aquifer and alluvial aquifer in the
- 12 Muddy River Spring area? Because I see -- I see the --
- 13 the effect of carbonate pumping on groundwater level
- 14 variations in carbonate monitoring wells. And I see
- those same signals in the water level levels for
- 16 alluvial wells in the Muddy River Spring. I there's a
- 17 connection. I just don't know exactly how. But I
- 18 don't think that matters. I just know that there is
- 19 one.
- And additionally, the carbonate aquifer in
- 21 Muddy River Springs area is higher, up to like a
- 22 hundred feet higher than in the alluvial aquifers. So,
- 23 there is a connection. I don't know exactly how. And
- 24 there is an upward gradient from the carbonate aquifer

- 1 than the regional carbonate aquifer in the California
- 2 Wash than in the basin.
- 3 Q. I had the impression in the report maybe --
- 4 HEARING OFFICER FAIRBANK: That was the time.
- 5 We'll get back. We'll have -- we'll probably
- 6 have time to do another round.
- 7 Next will be the Muddy Valley Irrigation
- 8 Company.

9

- 10 CROSS-EXAMINATION
- 11 BY MR. KING:
- 12 Q. Okay. Good afternoon. My name's Steve King.
- 13 I'm counsel for Muddy Valley Irrigation Company. I
- 14 think my questions will be to directed to
- 15 Ms. Braumiller.
- And first question, I know you've got the last
- 17 set of questions. Would you agree that the carbonate
- 18 and the alluvial aquifers are sources of supply of
- 19 water for the Muddy River Springs and Muddy River?
- 20 ANSWERED BY MS. BRAUMILLER:
- 21 A. I would agree -- I would agree that a carbonate
- aquifer and the alluvial aquifer in the Muddy River
- 23 Springs area is a source of water in Muddy River and
- 24 also in California Wash.

Page 413

- Page 415
- 1 into the alluvial aquifer. So, it's happening, but I
- 2 don't know how.
- 3 Q. And would you be confident that there's a
- 4 similar connection with the -- in other areas of the
- 5 proposed management unit?
- 6 A. Yeah, in California Wash I think I demonstrated
- 7 the same thing, only through somewhat different logic.
- 8 But, there the first thing I did was I noticed that
- 9 water levels and basin fill wells, and this was -- I
- 10 mostly rely here on groundwater level measurements
- 11 provided to Fish and Wildlife Service and SNWA to
- 12 prepare the photokinetic biological opinion for the
- 13 groundwater project they had.
- 14 Anyway, long story short, there is apparently
- south to north flow through the basin fill in
- 16 California Wash from, you know, higher water levels to
- 17 lower, and yet there's no -- you know, according to
- water budget analysis, also prepared by SNWA 2000, it's
- 19 part of their conceptual model -- or their numerical
- 20 model. No local recharge. So, how is that occurring?
- 21 Okay. Where is the water that's coming from south
- 22 California Wash to north? Where is it coming from?
- And I think it's coming from the regional
- 24 carbonate aquifer. And again, head is a lot higher

- 1 Q. Right.
- Now, in today's PowerPoint and I think in your
- 3 salient finding number three, that's -- I believe it's
- 4 for all practical purposes one groundwater basin is the
- 5 source of the Muddy River Springs and Muddy River.
- 6 Would be -- would that be accurate?
- 7 A. I'm sorry. I was looking at this when you said
- 8 that.
- 9 Q. I just read what your PowerPoint said, and I
- 10 just wanted to confirm that was your testimony. That
- 11 for all practical purposes, it was one groundwater
- basin that is the source of Muddy River Springs and
- 13 Muddy River?
- 14 A. Yeah, I think the combination portions of the
- 15 source of water for Muddy River and Muddy River
- 16 Springs.
- 17 Q. And is that the general conclusion in your --
- in your mind of the results of the 1169 test?
- 19 A. Only part of that is based on the results of
- 20 the DOI 2013. The only part of that conclusion he's
- asking about is based on the results of the DOI 2013SeriesEEE interpretation of the Order 1169 pumping
- 23 test, and that is the observation that -- or the
- 24 conclusion that a large portion of the regional

Min-U-Script® Capitol Reporters (9) Pages 412 - 415 775-882-5322

Page 416

- 1 carbonate aquifer is up to exceptionally high field to
- 2 scale transmissivity.
- 3 HEARING OFFICER FAIRBANK: Ms. Braumiller, I'm
- 4 just going to ask if you don't mind speaking into the
- 5 microphone as best as possible. Because when you turn
- 6 away, it fades out and it might be hard for people that
- 7 are remote to hear.
- 8 THE WITNESS: I'm sure you're right. Okay.
- 9 BY MR. KING:
- 10 Q. Then if we could just turn pages that question
- 11 the purpose of this hearing and other purposes of
- 12 course. And Order 1303, I just -- several --
- 13 paraphrase several of the points there. It references
- 14 the results of the 1169 aquifer test that caused
- 15 significant decline in Pederson and Pederson East
- 16 Springs. Would you agree with that?
- 17 A. I do, yeah.
- 18 Q. The order 1303, which I've read at this
- 19 hearing, also noted that there were declines in Baldwin
- 20 and Jones Spring. Do you recall that?
- 21 A. You're referring to the DOI 2013?
- 22 Q. The order itself on page 6.
- 23 A. Oh.
- 24 Q. The reason we're here for these hearings --

- 1 are, but I don't know.
- 2 Q. So, under State Engineer Exhibit 333, that is
- 3 the Muddy River decree?
- 4 A. Okay.
- 5 Q. It's a 1920 Nevada district court decree that
- 6 was -- that incorporated the State Engineer's order of
- 7 determination at that time, and it's all new surface
- 8 water. So, I don't think anyone else so far during the
- 9 hearing has asked the imbedded foundational protection
- 10 that's discussed in Order 1303, senior decreed rights.
- 11 That's why I'm trying to bring this into the record and
- 12 your understanding what that means.
- So, let's go back to page -- if we can, to I
- 14 think it's Fish and Wildlife Exhibit 5. Your -- that's
- in fact has been referenced several times today. Page
- 16 37 I believe.
- 17 A. Okay.
- 18 Q. And there the very last paragraph. And this is
- 19 your contribution to the report; is that -- is that
- 20 correct?
- 21 A. Yes.
- 22 Q. And so, there is language that talks about
- assuming a flow rate of 30,550 acre-feet per year
- 24 through Muddy -- through Moapa gage is sufficient to

Page 417

Page 419

- 1 A. Right.
- 2 Q. -- 1303. I made that statement. I just want
- 3 to ask if you agree with that?
- 4 A. Yeah, I can't recall off top of my head what
- 5 the hydrographs for Baldwin and Jones Springs looked
- 6 like. I cannot speak to that right now.
- 7 Q. Then further in the order, the State Engineer
- 8 concludes there's a direct interrelationship with Muddy
- 9 River -- excuse me -- Muddy -- Muddy River Spring flows
- and fully appropriated Muddy River senior decreed
- 11 rights. Do you recall that, or similar language?
- 12 A. Perhaps.
- 13 Q. Do you know what Muddy River senior decree
- 14 rights are?
- 15 A. I don't know the total of those.
- 16 Q. But do you know what --
- 17 A. What it is, yes, I do.
- 18 Q. Maybe you can give us a brief explanation of
- 19 your understanding?
- 20 A. Okay. I should say I have a sense of what that
- 21 means. Okay? I understand senior in priority, right?
- 22 And by decreed, there was let's see an adjudication.
- 23 Q. So, surface water rights?
- 24 A. I think most of them, if maybe not all of them

- 1 meet senior decreed water rights on and along the Muddy
- 2 River. (The domain of the State Engineer's Office.)
- 3 So, do you see that part?
- 4 A. Yes.
- 5 Q. And so, that was -- I was asking the foundation
- 6 of a question of what the senior decreed water rights
- 7 meant to you.
- 8 So where did that number 30,550-acre-feet come
- 9 from?
- 10 A. That -- you know, I think I mentioned this
- 11 earlier. I'm going from memory here. But I thought
- 12 30,550 acre-feet per year, according to my calculations
- was the average flow through Moapa gage in 2015, '16,
- 14 and '17 calendar years.
- 15 Q. And that's -- this discussion is placed in your
- 16 report under section 1.4 sustainable levels of pumping
- 17 of lower -- of the LWRS. So, by sustainable, what does
- 18 that mean?
- 19 A. Well, I --
- 20 Q. Spring flows, would that be --
- 21 A. Yeah. Sustainable in the sense that the spring
- 22 flows part from the Muddy -- Big Muddy Springs, which
- 23 they're operating from a different place. The Refuge
- 24 Springs flow through the Moapa gage and carbonate

Min-U-Script®

Capitol Reporters 775-882-5322

(10) Pages 416 - 419

Page 420

- 1 groundwater levels throughout at least the five plus
- 2 basins were all relatively constant -- not constant,
- 3 and that there was sufficient water discharge springs
- 4 to maintain the dace.
- 5 Q. Okay.
- 6 A. Yeah. And when I said assuming that this flow
- 7 is sufficient to the senior decreed water rights on the
- 8 river, I'm not assuming anything. I'm -- leave that to
- 9 the State Engineer's Office. I'm saying assuming it is
- 10 sufficient to meet them.
- 11 Q. So could you call that a placeholder number for
- 12 just sustainable?
- 13 A. I'm sorry.
- 14 Q. Can we use the term as a "placeholder number"
- 15 that you -- that you chose to use?
- 16 A. I think it is the best available initial
- 17 estimate of sustainable level of pumping.
- 18 Q. And then you have again, same sentence turning
- 19 to (the domain of State Engineer's Office.).
- 20 A. Right.
- 21 Q. Okay. So, and I understand you haven't read
- the decree, that's the State Engineer Exhibit 333. But
- 23 that was a Nevada district court case in which bench/
- 24 State Engineer in 1920 issued an order and

- 1 stating is under this hypothetical senior decreed water
- 2 rights are fully met and now there's no water in the
- 3 river. Because it lies down stream from the Muddy
- 4 River Springs, it's still possible that, you know,
- 5 conditions -- there's still spring flow. It's just
- 6 that downstream down the river is consumed by rights.
- 7 Q. Well, that --
- 8 A. Right? So --
- 9 Q. -- the answer I suppose. My question though
- 10 wasn't -- isn't a very good question. This is a little
- 11 different.
- Really assuming that the decree determined that
- 13 all the water was exhausted and that there was no other
- 14 development allowed that would deplete the flows, would
- 15 your number change as far as that 9138 acre-feet?
- 16 A. Well, you know, maybe it depends on the
- 17 priority of groundwater rights of various other
- 18 locations in the Lower White River Flow System. So, I
- 19 can't exactly answer that.
- 20 Q. Okay. So, let me just ask one -- just a
- 21 question.
- So, I want you to assume that the senior
- 23 decreed right holders in the Muddy River are entitled
- 24 to the water that is depleted from the stream by

Page 421

Page 423

- 1 determination. So, that took place then.
- 2 A. Okay.
- 3 Q. And that -- to be consistent it seems to me,
- 4 but would that be -- strike that question, please. Put
- 5 that in the record.
- 6 That's the State Engineer's Exhibit. It speaks
- 7 for itself.
- 8 Let me ask you another question, if I may.
- 9 Let's consider the following. If the decree, State
- 10 Engineer Exhibit 533, which protects senior decreed
- 11 rights, which is the subject of this -- one of the
- subjects of this hearing, and you can jump to
- management question with grandfather rights, if that
- 14 decree provides that all of the stream system has been
- 15 fully consumed by appropriation, would -- and that the
- 16 river is -- excuse me. It says fully consumed by
- 17 appropriation, would that change your opinion as to
- 18 that 9,138 feet as far as a placeholder number?
- 19 A. Well, let me see if I understand your question.
- 20 So, you're saying if the river is fully consumed
- 21 meeting senior decreed water rights on the river, would
- 22 that change my estimate?
- 23 Q. That's a fair -- yes.
- 24 A. Yeah. Well, assuming -- I guess what you're

- 1 pumping, would that change your 9138 acre-foot -- feet
- 2 number -- foot number for a placeholder number to
- 3 satisfy senior decreed water rights?
- 4 A. Okay. So, let me see if I have your question
- 5 right. So if pumping did not allow enough water to go
- 6 down the river to meet senior decreed water rights on
- 7 the -- on the river, would I consider that level of
- 8 pumping to be sustainable? I would say no, by
- 9 definition.
- 10 Q. Thank you. Okay.
- I'll try to ask a similar question, a little
- 12 different. If water is being captured by wells from
- 13 pumping that was decreed water that was under the
- 14 decree itself, was -- senior decreed water rights were
- 15 entitled to all that water, would that change the 9138
- 16 acre number?
- 17 A. Somehow I got loss in the middle of that
- 18 question. Could you give it to me again?
- 19 Q. Strike the question. I think your answers -- I
- 20 know you're not an attorney, you're not familiar with
- the decree. But I was simply trying to wrap -- come around to the -- one of the conjunctive management
- 23 questions here that's central that hasn't been asked
- 24 yet.

Page 427

Page 424

- 1 Are there any groundwater rights that are
- 2 available to be pumped under the 1920 decree which is
- 3 already determined by the federal district court
- 4 through the incorporation of State Engineer's
- 5 determination, are there any groundwater rights that is
- 6 able to be pumped without affecting senior decreed
- 7 rights?
- 8 A. I think it depends on the uteral (phonetic) and
- 9 the conditions.
- 10 Q. Thank you very much.
- MR. KING: I have no further questions.
- 12 HEARING OFFICER FAIRBANK: Okay. Next will be
- 13 Nevada Energy.
- MS. CAVIGLIA: Justina Caviglia on behalf of
- 15 Nevada Energy. I should be pretty quick. I have one
- 16 question for Ms. Braumiller.
- 17
- 18 CROSS-EXAMINATION
- 19 BY MS. CAVIGLIA:
- 20 Q. So you state that you recommend that the State
- 21 Engineer should not allow water rights to be moved from
- 22 alluvial to carbonate, from the carbonate to alluvial;

1 A. Yeah, and I did -- it was intentionally, maybe

3 Q. Okay. As part of this recommendation, did you

Did you consider whether water rights were

Q. What did you base your opinion on? Like,

current alluvial water rights for carbonate water

rights, you are going to impact the discharge of Muddy

River Springs, and as a consequence, slow down the

Muddy River. You're going to do that. If it's within

transmissivity, it's pretty much not going to matter

carbonate water rights, you're going to impact Muddy

where in that area. If you turn alluvial rights into

Would you do it, you know, somewhat lower

basically, the hydrology and that was it?

A. Yes. It was based on this. If you swap

that zone of exceptionally high field scale

consider water rights or the priority of water rights?

somewhat oversimplified recommendation.

23 is that correct?

O. Correct.

11 A. I did not.

O. You did not.

permitted, certificated?

7 A. No.

23

24

ANSWERS BY MS. BRAUMILLER:

A. The priority of water rights?

- 1 transmissivity portion of the Lower White River Flow
- 2 System, you're still going to impact it. It might be
- 3 somewhat less. If you turn carbonate rights into a
- 4 alluvial rights and they're close to the river, that's
- 5 a bad thing. I think it's going to be a challenge to
- 6 come up with rules that allow swapping alluvial rights
- 7 for carbonate rights. That probably -- probably a bad
- 8 bet altogether within that zone of exceptionally high
- 9 transmissivity to carbonate. It's going to be hard to
- 10 come up with rules that allow you to turn carbonate
- 11 rights into alluvial rights without getting into a lot
- of debate like in Amargosa Valley -- or Desert rather,
- about has it moved closer, is it, you know, increased
- 14 negative impact on water levels in the alluvial
- 15 aquifers, Muddy River Springs area, and California
- 16 Wash.
- That gets complicated. That's why I just, you
- 18 know, recommended something simple. Don't swap
- 19 alluvial rights out for carbonate. Don't swap
- 20 carbonate out to alluvial. Particularly with a concern
- 21 that if you were to change carbonate water rights into
- 22 alluvial rights and they happen to be close -- pretty
- 23 close to the river, you may not have time to -- the
- 24 impacts may occur before you can detect them and

Page 425

- 1 process the data and go Oh, I think we're impacting
- 2 flow in the river because we moved alluvial pumping,
- 3 changed it from carbonate into alluvial, and we've
- 4 gotten it close to the river. You may not be able to
- 5 detect it in time. Right? Maybe not horrible, but,
- 6 you know, you're going to find out about it after the
- 7 horse is out of the barn, right? So, it was -- it was
- 8 very, maybe oversimplified recommendation, but I think
- 9 it's implementable. So, that's why I suggested it the
- 10 way I did.
- 11 Q. And to follow up with that, because I know
- 12 Mr. King asked you a similar question.
- So you're -- are you familiar at all with
- 14 Nevada water law when it comes to senior priorities or
- 15 anything like --
- 16 A. Probably --
- 17 Q. -- when it comes to groundwater?
- 18 A. The basics, yes.
- 19 Q. So, based on this model, would you ask the
- 20 State Engineer to completely ignore that?
- 21 A. The primary?
- 22 Q. The water priority system?
- 23 A. Oh, I don't think they can. Based on my
- understanding of water law I don't think that can be

Min-U-Script®

River Springs.

Capitol Reporters 775-882-5322

(12) Pages 424 - 427

Page 428

- 1 done.
- 2 Q. So, even though there's a conflict between the
- 3 idea of you can't move water rights, but you can't --
- 4 so, if you have -- for example, if you had a senior
- 5 alluvial water right, they couldn't move to a
- 6 carbonate?
- 7 A. Well, we're talking about change applications,
- 8 right?
- 9 Q. Not necessarily under your recommendation. So,
- 10 I'm just -- I'll leave it at that because you don't
- 11 understand.
- 12 A. Yeah, I may not understand enough about that.
- 13 Q. Okay. It's just based -- your recommendation
- 14 is based on the hydrology, and that's basically what
- 15 where --
- 16 A. Yeah. And --
- 17 Q. -- it's coming from?
- 18 A. And handing an ability to protect impacts in a
- 19 timely -- all right?
- So, but for sure, if you turn alluvial rights
- 21 into carbonate rights, and it happens to be within this
- very large area, you know, like a thousand square miles
- of exceptionally high transmissivity carbonate, you
- 24 will impact the springs, which then impacts the river.

- 1 Would you say that that response that you see
- 2 that in most cases I think you've also said it happens
- 3 within a year of precipitation. Do you see any
- 4 evidence that that response to what I guess I'd call a
- 5 yearly spike in precipitation looks like a spike in
- 6 water levels, or does it look like something else? Or
- 7 can you tell me what that response looks like with
- 8 respect to the water levels? Obviously, there's a
- 9 rise. Is that the response that you're talking about?
- 10 Is there any other dynamics there?
- 11 ANSWERS BY MS. BRAUMMILLER:
- 12 A. Yeah, I was just referring to a rise in
- 13 groundwater level or spring flows?
- 14 Q. Water level, let's talk -- let's just talk
- 15 groundwater level.
- 16 A. Yeah. A rise in the groundwater level, the
- 17 water level.
- **18** Q. And that's the -- that's the response? So that
- 19 one-year period of time is the climate response to --
- 20 A. Yeah. And it varied depending on whether I was
- 21 looking at alluvial -- you know, water level records
- 22 for alluvial wells, a number of spring areas or for
- 23 carbonate wells, you know, almost throughout, but it
- 24 was within a year. It's just -- you know, it was very

Page 429

Page 431

- 1 So, in general that -- you know, there might be some
- 2 ways or some situations where you could do it. But, in
- 3 general, I think it's probably negative that you would
- 4 accept --
- 5 MS. CAVIGLIA: No other questions.
- 6 HEARING OFFICER FAIRBANK: Okay. So, at this
- 7 time we'll go ahead and open it up to State Engineer
- 8 staff for questions.
- 9 MR. BENEDICT: I'll start. John Benedict for
- 10 the record.
- 11
- 12 EXAMINATION
- BY MR. BENEDICT:
- 14 Q. I have a question about climate signature
- 15 discussions, so to speak, maybe for Mr. Mayer. I'm
- 16 kind of interested in your opinion after reviewing some
- 17 hydrographs, getting a little bit more insight on what
- 18 climate signature that you described. And I think Sue
- 19 Braumiller also described this. So, this may be
- something that could be answered by either or both.
- But in a review of those hydrographs, you've
- 22 described that there's a response during wet years, in
- particular I think 2005, and perhaps 2010 as well,
- perhaps others in smaller response.

- 1 rough observation.
- 2 ANSWERS BY MR. MAYER:
- 3 A. Again, this is Tim Mayer. I think in 2005, the
- 4 effect probably lasted for a couple of years it looks
- 5 like when I looked at the hydrograph. The recharge
- 6 response may have occurred right within a year, but
- 7 lasted for a couple.
- 8 ANSWERS BY MS. BRAUMILLER:
- 9 A. Yeah. To clarify, I'm not talking about the
- 10 length of the response. What I was looking for was how
- 11 long did it take for change to manifest in the
- 12 groundwater levels. Because what I -- what I was
- 13 looking for was, you know, just something to start with
- 14 to try to start figuring out by what means climate, wet
- 15 season --
- 16 A. (MR. MAYER) Wet periods.
- 17 A. -- are influencing groundwater levels.
- 18 Q. (MR. MAYER) And also spring and stream flows.
- 19 A. Like that's the first clue to the mechanisms by
- 20 which the climate, wet seasons, wet periods are
- 21 influencing water resources in the Lower White River
- 22 Flow. That was my purpose. It's only -- it seems to
- be possibly 18 years at Big Muddy Springs. That's
- 24 wild. Okay? But, everywhere else it seems to be

Min-U-Script®

Capitol Reporters 775-882-5322

(13) Pages 428 - 431

Page 432

- 1 within a year. That's pretty short really. So, I
- 2 wasn't referring to how long the affects it takes for a
- 3 recharge pause to travel through the system. That's
- 4 not in evidence.
- 5 Q. Okay. So, your characterization really has
- 6 more to do with the initial signature --
- 7 A. Yes.
- 8 Q. -- I guess actually seeing that in the water
- 9 levels?
- 10 A. Yeah.
- 11 Q. Okay. Thank you. Next question. If I could,
- 12 I'd like to go back to the CSVN5 hydrograph, and I
- think this is for Ms. Braumiller.
- You've alluded to an understanding or a
- 15 conceptual model for that hydrograph, but I don't think
- 16 you've described, and I'm just curious. Because it
- does have a relatively unique response, and I just
- 18 thought I'd see if I could hear your side on that.
- 19 A. Well, I'll say this much. I noticed that it's
- 20 a pretty deep well. I can't remember how deep, maybe
- 21 900 feet or something like that. But, it's a completed
- 22 up-rigging of a series of overturned anticlines. And
- 23 in my past experience, and I cite northern territory of
- 24 Australia, you know, the fractures, it's conductivity

- 1 that water levels -- in your opinion, at least the
- 2 water levels that the response is relatively rapid and
- 3 widespread. And the springs also respond rapidly to
- 4 that change. So, it seems as though in some sense time
- 5 becomes a little bit less important with respect to
- c impacts and yet in addition it's discussed that
- 6 impacts, and yet, in addition it's discussed that
- 7 equilibrium's not reached very rapidly. I just
- 8 wondered -- see if I could get your thoughts about that
- 9 concept and when you think something like equilibrium
- 10 would be reached in a system like this?
- 11 A. Yeah. I don't think those two observations are
- 12 inconsistent. Because equilibrium is reached when the
- 13 cone of depression expands to the point where it's
- 14 capturing, you know, sources of water out there at the
- same rate that you're pumping, right? So, although the
- 16 cone of depression was very expansive through the
- 17 official two years of the test, it hadn't come anywhere
- 18 close to tapping into sources of water that it could
- 19 capture. It wasn't anywhere close. So, does that make
- 20 sense?
- I mean, the transmissivity of that the
- 22 carbonate aquifer is exceptionally high, but it still
- 23 has to get out there far enough that it captures
- 24 sources of water. Where would they be? Well, the

Page 433

Page 435

- 1 through fractures, right?
- 2 So, if you have a over -- an anticline, much
- 3 less overturn anticline, you could get disconnects
- 4 across the anticline through the fractures. And so, I
- 5 think when CSI said -- Steve said yesterday that
- 6 perhaps it's kind of perched up there, I think it may
- 7 be. And it's also at the bottom of a small drainage,
- 8 right? So, you have recharge downhill, you know, and
- 9 then you've got the well completed behind, you know, an
- 10 overturned anticline. It could be -- could be, you
- 11 know, relatively low permeability structure. I mean,
- 12 you know, I'm sure it leaks, but I've seen that before
- where the fractures, there's just a disruption in the
- 14 connectivity of the fractures around the anticline.
- 15 So, I think somehow it's probably related to that.
- But, it's just an observation.
- 17 Q. I have one other question, and it goes to
- 18 equilibrium, and I think this is for Ms. Braumiller,
- 19 again. Because you had indicated that based on the
- 20 responses that we're seeing during the 1169 aquifer
- 21 test, both to water levels and discharge, that the
- 22 system wasn't in equilibrium and end of aquifer
- 23 testing. I'm just wondering has there been any thought
- to length of time to reach equilibrium? It's apparent

- 1 Muddy River. You know? The language phrase. But it
- 2 hadn't gotten there. It wasn't anywhere close. And if
- 3 that's clear, because carbonate water levels were still
- 4 declining at, you know, undiminished rate when the MX5
- 5 pump was turned off at the end of 2013. And so were
- 6 spring flows to Refuge Springs. So, I don't think that
- 7 those two things are inconsistent at all. I mean,
- 8 that's a basically, capture problem, right?
- 9 Things keep declining until you capture enough
- 10 ET, screens, springs, et cetera. And it hadn't gotten
- 11 there. I don't think they contradict each other.
- 12 Q. Okay. Thank you.
- 13
- 14 EXAMINATION
- 15 BY MS. COOPER:
- 16 Q. Christi Cooper. Looking at your map of the
- 17 Lower White River Flow System, page 60 in your report,
- 18 figure one of your presentation, could you elaborate a
- 19 little bit more as to what your opinion is on the areas
- 20 of high transmissivity and lower transmissivity in the
- 21 Lower White River River Flow?
- 22 A. Yeah. You know, in 2013, DOI used SeriesEEE to
- 23 isolate MX-5 induced drawdown in select wells. If we
- 24 had the time we could have done that with virtually all

Min-U-Script®

Capitol Reporters 775-882-5322

(14) Pages 432 - 435

Page 436

- 1 of them. But, based on the analysis we did do, see
- 2 that extends at least the CSVM-6, the Coyote Springs
- 3 down, which I described as a simple Coyote Springs
- 4 well. It extends as a far south as GV1 in Garnet
- 5 Valley for sure. I have to look at a picture. Let's
- 6 see. I'm just going from memory here.
- As far east as CSV2 in Muddy River Springs area
- 8 for sure. I think EH4 was only isolated 1.2 feet of
- 9 drawdown rather than 1.5 to 1.6. You know, five other
- 10 target wells.
- But I think that the SeriesEEE curve fitting
- 12 may have underestimated the MX5 induced drawdown in H4
- because there's, you know, a low permeability structure
- 14 that creates the layer of spring flow that was not
- accounted for in SeriesEEE as a MX5 reduced drawdown.
- 16 And it extends into California Wash to I think it was
- -- I think it -- which one is the more northern, M1 or
- 18 M2? I can't remember off the top.
- 19 O. M1.
- 20 A. M1. I keep getting them mixed up. You know,
- 21 so, you know, CSBM6 in Coyote Spring Valley. GD1 in
- 22 Garnet Valley over to M1 in California Wash, CSV2 in
- 23 Muddy River Springs area, that was all 1.5 and 1.6 feet
- 24 of drawdown to MX5 pumping. That's what we estimated.

- 1 Well in that it flowed Warm Springs West less than
- 2 three CFS that pumping Arrow Canyon Well would have to
- 3 cease.
- 4 And in reviewing the exhibit, it seems that
- 5 that is only for the duration of the Mumford test. I'm
- 6 curious if you recall what the rule would be or what
 - 7 the Agreement is if that threshold were met now?
 - 8 A. I can attempt to answer that. And I honestly
- 9 don't recall all, but I do remember having the same
- 10 question, Adam, when I -- when I saw that agreement way
- 11 back in 2006. I think I may have even asked about it,
- 12 but I honestly don't remember. I'd just have a look at
- 13 that agreement.
- 14 O. I don't remember that.
- 15 ANSWERS BY MS. BRAUMILLER:
- 16 A. I remember that. I remember the MOA reading
- 17 just like you said, Adam. That restriction on Arrow
- 18 Canyon pumping was during the pumping test. Which
- 19 didn't make sense for me.
- 20 ANSWERS BY MR. MAYER:
- 21 A. I think that's the way it was.
- 22 Q. Okay. Thank you.
- And one more question about the MOA.
- Is there a -- is there a provision in the MOA

Page 437

Page 439

- 1 So, at minimum it includes the area delineated
- 2 by those wells. And, again, because drawdowns due to
- 3 pumping generally decreases what rhythmically the
- 4 distance. You know, that can't be the end of it. It
- 5 extends further than that. And with no better option,
- 6 I extended -- I extended my delineation of a portion of
- 7 the aquifer that's exceptionally high in transmissivity
- 8 to the nearest likely known full boundaries. And
- 9 that's -- that was the basis for the five plus basin,
- 10 roughly a thousand five hundred square miles.
- 11 O. Thank you.
- MS. COOPER: Okay.
- MR. SULLIVAN: Adam Sullivan.
- 14
- 15 CROSS-EXAMINATION
- 16 BY MR. SULLIVAN:
- 17 Q. Mr. Mayer, I have a clarifying question about
- 18 the 2006 memorandum of agreement.
- 19 ANSWERS BY MR. MAYER:
- 20 A. I'll do my best.
- 21 Q. This is actually an exhibit that Mr. Schwemm
- 22 had done, but it demonstrates the consequences of the
- 23 discharge at Warm Springs West reaching certain flow
- 24 level. One of the columns is regarding Arrow Canyon

- 1 that defines what the -- what the cause of spring flow
- 2 decline would be? I mean, the consequences of the
- 3 pumping would be reduced, but say a portion of the
- 4 decline was determined to be pumping from a variety of
- 5 different wells or climate. Does it matter?
- 6 ANSWERS BY MR. MAYER:
- 7 A. Yeah, according to the terms of the MOA, from
- 8 our understanding, it doesn't matter. We went low
- 9 enough that we felt we were below any climate
- 10 variability impacts. So, it would clearly be
- 11 responding to pumping impacts and not the climate
- variability. So, that was the idea. But, I don't
- think there's any means in the MOA of saying no.
- 14 Unless maybe pad together and renegotiate it or
- 15 something, I don't know, but if we said yeah, all of --
- 16 all of us agree this is climate, you don't have to --
- 17 even if it's climate, then, you know, you still --
- 18 pumping is going to make it worse. So, it would still
- 19 seem like it has to be ratcheted back or cut off.
- 20 Q. Thank you.
- 21 EXAMINATION

22

HEARING OFFICER FAIRBANK: Ms. Braumiller, I

24 actual have a question. Would you mind describing or

Page 440

- 1 differentiating the difference between a groundwater
- 2 hydrologist and a hydrogeologist for me as you
- 3 understand it.
- 4 ANSWERS BY MS. BRAUMILLER:
- 5 A. Thanks for asking that. I don't think -- a
- 6 groundwater hydrologist is schooled in groundwater flow
- 7 dynamics and transport, the physics of groundwater flow
- 8 and transport. And hydrogeology is that and also all
- 9 the geologic considerations you have to make in order
- 10 to analyze groundwater systems. So, they are
- 11 inseparable. My education happens to be as a
- 12 groundwater hydrologist, flow dynamics and transport.
- But, actually, beginning before I started
- working, which was 24 years ago or so, even my master's
- 15 thesis was a hydrogeologic -- hydrogeologic site
- 16 characterization for a research site in northern
- 17 territory of Australia. So, that was literally my
- 18 introduction to hydrogeology, not being an
- 19 undergraduate geologist. They're inseparable. You
- 20 can't do groundwater analysis without, you know, giving
- 21 not minor but constant consideration to geologic
- 22 information.
- And yet, I don't believe that geology alone,
- clearly, is not enough to analyze groundwater problems,

- 1 the witnesses' participation. Just bear with us for a
- 2 few minutes.
- 3 Mr. Mayer, we left off talking about your
- 4 rebuttal report, specifically the hydrograph in Dry
- 5 Lake Valley, Delamar Valley, Tule Desert.
- 6 You said you looked at 20 wells total, correct?
- 7 ANSWERS BY MR. MAYER:
- 8 A. I think you add them up.
- 9 Q. Okay.
- 10 A. I will accept that.
- 11 O. Okay.
- 12 A. That's about what it was, yes.
- 13 Q. Were there more wells available that you did
- 14 not include in your analysis?
- 15 A. Well, there are more wells in those basins,
- 16 yes.
- 17 Q. So. I'm looking at I believe it's rebuttal
- 18 slide eight. It's the four monitoring wells in Dry
- 19 Lake Valley.
- 20 A. Okay.
- 21 Q. So, I can tell that the top right one is a
- 22 decline, correct?
- 23 A. Uh-hum. Right.
- 24 Q. Which of the other three are increasing?

Page 441

Page 443

- 1 because that -- you know, that's only one factor in
- 2 determining groundwater flow problems, right?
- 3 They're -- they're one in the same. You can't do one
- 4 without the other.
- 5 HEARING OFFICER FAIRBANKS: Okay. So, we have
- 6 some additional time. So, we'll reopen it back up to
- 7 the participants for some additional time for
- 8 questions. At this point, I think we'll go ahead and
- 9 note that there's about an additional seven minutes for
- 10 each of the participants if they have follow-up
- 11 questions, and we'll start with Coyote Springs
- 12 Investments.
- MR. HERREMA: We have no further questions.
- 14 HEARING OFFICER FAIRBANK: Thank you.
- National Park Service?
- MS. GLASGOW: No questions. Thank you.
- 17 HEARING OFFICER FAIRBANK: Okay. Thank you.
- 18 Same no questions from National Park Service.
- The Moapa? Okay.
- 20
- 21 FURTHER RECROSS EXAMINATION
- BY MS. BALDWIN:
- 23 Q. Beth Baldwin for the Moapa Band of Paiute
- 24 Indians. I know it's been a long day, and I appreciate

- 1 A. The bottom two have slight increases and top
- 2 left one is stable. And I apologize, it's probably
- 3 hard to see on this hardcopy with slides. It's clear
- 4 in the report.
- 5 Q. Can you give a rough estimate of the magnitude
- 6 of the increases?
- 7 A. It's hard for me to see the scale on the graph,
- 8 so.
- 9 Q. I can't -- I can't read the numbers at all.
- 10 A. Yeah.
- 11 Q. Have you done any kind of statistical analysis
- 12 to look at whether those increases are significant in
- 13 any way?
- 14 A. I'm not sure how you would determine what was
- 15 your hypothesis test to be if they're significant or
- 16 not. Are you saying, is that noise? Is that random
- 17 noise?
- 18 Q. You're the statistician. I'm asking you.
- 19 A. Looks consistent to me.
- 20 Q. Okay. So, looking now at two slides forward,
- 21 Tule Desert wells, do you know what causes that drop in
- early 2009 that we see in all four wells?
- 23 A. No, I don't know what that is.
- 24 Q. Do you know if water year 2011 was a

Min-U-Script® Capitol Reporters (16) Pages 440 - 443 775-882-5322

Page 444

- 1 particularly wet year or dry year?
- 2 A. Water year 2011 was pretty wet.
- 3 Q. Do you see any reflection of that in these
- 4 hydrographs?
- 5 A. No, I don't.
- 6 Q. In your opinion, are groundwater levels more
- 7 sensitive to wet years than dry years?
- 8 A. Two of the wet years closest.
- 9 Q. I'm sorry?
- 10 A. I need to clarify these wells are not in Lower
- 11 White River Flow System.
- 12 Q. Thank you. Give me one second.
- 13 Is it your opinion that groundwater systems
- 14 react more slowly than surface water systems to short
- 15 terms wet trends?
- 16 A. It would generally be generally true. Not in
- 17 all cases.
- 18 Q. And just to -- I think I asked this before.
- 19 But did you examine whether the water levels in Delamar
- 20 Valley, Dry Lake, or Tule Dessert are responding to any
- 21 delayed climate?
- 22 A. No. I didn't look at these well hydrographs in
- 23 relation to climate. I just looked the well
- 24 hydrographs.

- 1 you expect to see a rising hydrograph as a result, or
- 2 no change at all? Or a decrease? How would you
- 3 expect that?
- 4 A. The hydrograph we're responding to is
- 5 precipitation only, and you are saying there's less
- 6 precipitation or recharge -- implying there's less
- 7 recharge, then I would expect the water level to go
- 8 down. If that's your question.
- 9 Q. So, yeah, maybe -- I don't know. Let me ask it
- 10 again. We can see if we're understanding each other.
- 11 Average water year but more precipitation
- 12 falling as rain as opposed than snow, does that have
- any impact on a hydrograph?
- 14 A. That would be hard to say on a stream. That
- 15 was probably -- that's going to be reflected more, and
- 16 I'm more comfortable looking at the impacts of that
- 17 kind of situation in a stream and what that is going to
- 18 mean is that the runoff signal is going to be advanced
- 19 in time. It's going to occur. It's not necessarily
- 20 you would have less runoff, and so, it just may be
- 21 coming earlier. So, it may be the same way in the
- 22 winter having been groundwater. I shouldn't -- but
- 23 there's a lot of other factors, because you get into
- the rain evaporates, but now it falls earlier. So, I

Page 445

Page 447

- 1 Q. In your opinion, is there any consensus on how
- 2 climate variability is reflected in well hydrographs?
- 3 A. I don't have an opinion on that question.
- 4 That's a hard one to answer.
- 5 Q. As a hydrologist, do you have any opinions
- 6 about the hydrological impacts of climate change?
- 7 A. Yes.
- 8 Q. Would you agree that climate change may bring
- 9 warmer air temperatures?
- 10 A. Certainly. It has.
- 11 Q. Could we expect to see spacial changes in the
- 12 distribution and timing of precipitation?
- A. We already have.
- 14 Q. Could you explain what that means in terms of
- 15 rainfall or snowfall?
- 16 A. Well, we're seeing more warmer temperatures and
- 17 seeing more rain versus snow in the winter in terms of
- 18 winter precipitation. We're seeing earlier snow melt,
- 19 so, earlier runoff. We're also seeing more frequent
- 20 and intense rainstorms, rain events. So, more heavy
- 21 rain events. It was just a little bit.
- 22 Q. So, hypothetically, if we were experiencing an
- 23 average water year -- not dry, not wet, average -- but
- more of that precipitation was falling as rain, would

- 1 don't know. It's sort of complicated.
- 2 Q. Fair enough.
- 3 And Sue, I have one question for you.
- 4 Mr. Donnelly was asking you a question about a
- 5 pumping rate of -- I think he said 9318 acre-feet, and
- 6 whether that carbonate pumping was causing spring
- 7 discharge to decline. And I think, I think you said
- 8 that there were other factors to consider.
- 9 I might have misheard you. So, I'm just trying
- 10 to understand.
- 11 ANSWERS BY MS. BRAUMILLER:
- 12 A. I think what I remember Patrick asking was if
- 13 the average total pumping rate in 2015, '16, and '17
- 14 calendar years was about 9318 acre-feet per year. And
- 15 then he asked me if, you know, there were visible
- 16 declines in groundwater levels and some spring flows
- 17 during that same period. And I said, I mean, just
- 18 visually.
- There were some. But they were -- it was still
- 20 relatively constant groundwater levels and relatively
- 21 constant spring and stream flows during that period.
- 22 And for that reason, 9318 is as good a place as I know
- 23 to start.
- 24 Q. I just wanted to make sure I understand.

Min-U-Script® Capitol Reporters (17) Pages 444 - 447 775-882-5322

Page 448

- 1 A. Okay.
- 2 Q. Thank you.
- 3 HEARING OFFICER FAIRBANK: SNWA.
- 4
- 5 RECROSS-EXAMINATION
- 6 BY MR. TAGGERT:
- 7 Q. Good afternoon. Once again, Paul Taggert
- 8 represent Southern Nevada Water Authority and Las Vegas
- 9 Valley Water District. I think this question may be to
- 10 Dr. Mayer, but, we'll see.
- Do you -- now, it has it do with the MOA. And
- would you agree with me that the MOA is an
- 13 environmental -- there is an Endangered Species Act
- 14 compliance document. Is that a fair statement?
- 15 ANSWERS BY DR. MAYER:
- 16 A. Yes. This might be for Mike, too.
- 17 Q. Okay.
- 18 A. (DR. SCHWEMM) Yeah, I'll chime in as
- 19 necessary. But, yes.
- 20 Q. So, this ESA is based upon biological opinion,
- 21 right? I'm sorry, not the ESA. The MOA is based on
- 22 biological opinion, right?
- 23 A. (DR. MAYER) Right.
- 24 Q. And is it fair to say that the parties to the

- 1 A. That's difficult for me to address because
- 2 that's not really something that I talked about in my
- 3 report. But, the Fish and Wildlife Service would
- 4 always entertain any conversations with anyone that
- 5 thought that they needed compliance.
- 6 Q. Okay. Is it fair to say that if the flow of
- 7 Warm Springs West gage goes below 3.2, it calls into
- 8 question far more issues with the Endangered Species
- 9 Act than if the flow is above 3.2? Do you agree with
- 10 that?
- 11 A. Yes from a biological standpoint. This is
- 12 Michael Schwenn.
- 13 Q. Okay. In your opinion, should the State
- 14 Engineer include the consideration of how to maintain
- 15 the 3.2 CFS flow at Warm Springs West gage as a
- 16 consideration of what the sustainable quantity of
- 17 groundwater is that should be pumped in the Lower White
- 18 River Flow System?
- 19 ANSWERS BY DR. MAYER:
- 20 A. This is Tim. I'll say yes to that. So, yes.
- 21 Q. Anybody else?
- 22 ANSWERS BY MS. BRAUMILER:
- 23 A. I would say no. Because that's not --
- 24 enforcing the MOA is not the jurisdiction of the State

Page 449

Page 451

- 1 MOA have Endanger Species Act Compliance to the extent
- 2 that Warm Springs West goes down to 3.2, for instance?
- 3 Do you understand my question?
- 4 A. I think I'll let Mike answer this.
- 5 ANSWERS BY DR. SCHWEMM:
- 6 A. I don't think I'll be able to answer it
- 7 accurately.
- 8 Q. Okay. Well, does the MOA allow the parties
- 9 who've signed it to pump groundwater and to have
- 10 that -- have the flows at Warm Springs West go down to
- 11 3.2?
- 12 A. Yes, I believe that one, that's what it means.
- 13 Q. Now, are -- I guess Dr. Mayer, this would be
- 14 you. Is -- are there parties -- strike that please.
- Are there entities that are pumping water, in
- 16 your opinion, that are not parties to the MOA but their
- 17 pumping is affecting the Muddy River Springs?
- 18 ANSWERS BY DR. MAYER:
- 19 A. Yes.
- 20 Q. And do any of -- do those nonparties of the
- 21 MOA, do they have Endangered Species Act compliance
- 22 through the MOA?
- 23 A. That would be, again, a question for Mike.
- ANSWERS BY DR. SCHWENN:

- 1 Engineer's Office.
- 2 Q. So, you don't think the State Engineer should
- 3 take into account --
- 4 A. I'm not saying --
- 5 Q. -- the flow that's necessary for the fish?
- 6 A. My understanding is it's not their obligation.
- 7 Q. Okay. But that wasn't my question.
- 8 A. Okay.
- 9 Q. I mean, do you think they should just ignore
- 10 the fact that 3.2 is necessary for the fish when they
- 11 manage groundwater?
- 12 A. Well, I guess I can't answer that.
- 13 Q. You -- I --
- 14 A. I can't answer that. I mean, as a hydrologist.
- 15 I'm not -- neither biologist or a regulator, so.
- 16 Q. Okay. Mr. -- or I'm sorry, Dr. Mayer, the
- 17 precipitation analysis you did looked at standard
- 18 deviations, and you were asked about the time period
- 19 that you selected. Do you recall that question?
- 20 ANSWERS BY DR. MAYER:
- 21 A. Yes.
- 22 Q. And were you present yesterday when there was a
- 23 presentation that was done by I think Ms. Molly Palmer
- that was using cumulative departure from the mean? Do

Min-U-Script®

Capitol Reporters 775-882-5322

(18) Pages 448 - 451

Page 452

- 1 you recall that?
- 2 A. Yes.
- 3 Q. And which is a better approach, and why?
- 4 A. Well, the cumulative departure of the mean --
- 5 this is really getting into the weeds, so I don't want
- 6 to say too much about this except that that behaves
- 7 very, very strangely, and it should not be looked at as
- 8 a moving average, which people tend to read it as a
- 9 moving average. But, it does some very strange things
- 10 when you start playing around with the angles of
- 11 cumulative departure of means. And there's a paper by
- a person who we didn't cite it in the exhibit. There's
- a paper that looks critically at the use of critical
- 14 departure by -- cumulative departure from the mean as a
- a parameter of climate, and it brings out several
- 16 critical points about it.
- I thought that was just -- I know this is just,
- 18 sort of like I said, going into a lot of detail, a lot
- 19 into the weeds, so I didn't bring that up. But, I
- 20 don't really support that as a good measure of
- 21 precipitation. I think something like a moving average
- or a low S smooth or something like is much better.
- 23 So, the parameter I looked at was the Palmer Drought
- 24 Severity Index, the PDSI, and that really is in itself

- 1 Only because -- I say that only because it's on
 - 2 that side of Kane Springs Wash fault, and actually a
 - 3 normal fault trending that whole sequence of Paleozoic
 - 4 carbonates is present. So, you got a large volume of
 - 5 water coming over the Pahranagat shear zone mostly on
 - 6 the west side of Kane Spring Wash fault, and clearly it
 - 7 gets through the fault at some point in Coyote Spring
 - 8 Valley because a large amount of it discharges into
 - 9 Muddy River Springs. Right? So, whatever that barrier
 - 10 was that was hypothesized yesterday, I think it's
 - 11 pretty clear that there's no complete
 - 12 compartmentalization.
 - 13 Q. Okay. Thank you.
 - MR. TAGGERT: I heard my buzzer go off, right?
 - 15 HEARING OFFICER FAIRBANK: Yes. Thank you.
 - Moapa Valley Water District.
 - 18 RECROSS-EXAMINATION
 - 19 BY MR. MORRISON:
 - 20 Q. Hi. Greg Morrison again. Moapa Valley Water
 - 21 District. I'm going try to keep this as brief as
 - 22 possible?

17

- Real quick for, Dr. Mayer. And anybody else,
- 24 feel free to chime in if they feel like they have a

Page 453

Page 455

- 1 a moving average.
- 2 Q. Okay. And my other question to you, Dr. Mayer,
- 3 is, you were present during yesterday's testimony,
- 4 right?
- 5 A. Yes.
- 6 Q. And what is your opinion regarding Mr. Wright's
- 7 conclusion that 5280 acre-feet of water can be pumped
- 8 to the west side of the structures that he identified
- 9 in Coyote Spring Valley without impacting the Muddy
- 10 River Springs?
- 11 A. Oh, I think that's a better question for Sue
- 12 because she's really looked at the groundwater. So, if
- 13 I can defer that to Sue, I'd rather do that.
- 14 ANSWERS BY MS. BRAUMILLER:
- 15 A. Yeah, I think it's clear that -- and again, I
- wasn't -- I wasn't very clear about which of these
- 17 various faults CSI talked about yesterday corresponds
- 18 to Kane Springs Valley fault. But, at any rate, there
- 19 are all basically north trending, and what I think is
- 20 really clear, is that there's about 50,000 acre-feet
- 21 per year that flows into Coyote Spring Valley from
- 22 Pahranagat Valley with the -- creating a share zone.
- 23 And probably largely does that on the west side of the
- 24 Kane Springs Wash fault.

- 1 better answer.
- 2 But when Mr. Sullivan asked you about State
- 3 Engineer's Exhibit 244, which showed trigger levels
- 4 under the MOA and required responses to those trigger
- 5 levels, everyone seemed little confused as to why Arrow
- 6 Canyon pumping curtailment would only apply during the
- 7 1169 pump testing. So, I just want to see if you have
- 8 a little better understanding than I think of that 2006
- 9 MOA.
- Are you aware that Moapa Valley Water District
- 11 operates the Arrow Canyon well -- wells?
- 12 ANSWERS BY DR. MAYER:
- 13 A. Yes.
- 14 Q. Okay. You're also aware that pursuant to that
- 15 2006 MOA Moapa Valley Water District dedicated 1.0 CFS
- 16 against Jones Spring water right for dace protection
- 17 and restoration?
- 18 A. Yes, I do remember that.
- 19 Q. And that was 25 percent of the district's water
- 20 portfolio?
- 21 A. Yes.
- 22 Q. All right. Now, dedication of that 1.0 CFS had
- 23 the effect of augmenting flows at Apcar Springs?
- 24 A. Right. With the Apcar unit, yes, it did.

Min-U-Script® Capitol Reporters (19) Pages 452 - 455 775-882-5322

Page 459

Page 456

- 1 Q. Okay. So, that's it for that line of
- 2 questioning.
- Now, Dr. Schwemm, I want to take it back to the
- 4 Center For Biological Diversities' cross-examination.
- 5 Mr. Donnelly was asking you whether -- I think in a
- 6 nutshell it's safe to say he was asking if any amount
- 7 of pumping in carbonate aquifer would per se result in
- 8 reduction of dace numbers because of reduction of dace
- 9 habitat. Does that sound pretty familiar?
- 10 ANSWERS BY DR. SCHWENN:
- 11 A. This a microphone?
- I don't know about the carbonate aquifer. I
- wouldn't want to attest to that on the hydrology part.
- 14 But, I'm happy to talk about the Hatten et al published
- paper that showed reduction in flow result in reduction
- 16 in habitat.
- 17 Q. Okay.
- 18 A. Carbonate's that's something that would be --
- 19 Q. Maybe his --
- 20 A. -- my colleague.
- 21 Q. If I direct you to your testimony, it was
- 22 slides 16 and 17. You talk about dace abundance and
- 23 dace counts.
- 24 A. Okay. Let me -- let me key it up.

- 1 and I want to get your concurrence on this -- is that
- 2 Lower White River Flow System pumping at some volume
- 3 can coexist with the dace and dace habitat restoration?
- 4 A. Yeah. Especially when the dace population
- 5 is -- it was as low as it was. So, I believe that at
- 6 least for -- at that level, that provided enough
- 7 habitat for the population to increase.
- 8 So, if we may go back? So, during that period,
- 9 that was, you know, just little over 500 or so fish.
- 10 So, that was likely enough water to provide for that
- 11 population size -- that amount of habitat rather.
- 12 Q. Okay. So, just to wrap it up with a bit of a
- bow, accomplishing a goal and restoration of dace
- 14 numbers and dace habitat, that does not require that
- 15 carbonate pumping to cease, does it?
- 16 A. Can you rephrase that? I guess.
- 17 O. Sure.
- **18** A. Can recovery of the base as far as the -- as
- 19 defined, let's say to 4500 for downlisting or 6000.
- 20 So, they're -- I guess I see it as three main threats
- 21 that a affect the dace, and they all have a role to
- 22 play.
- And what exactly is limiting the dace at that
- 24 particular time could be all three of those. And in

Page 457

- 1 Q. Sure. Dace is on there. Is that slide 16?
- 2 A. Go ahead. Yeah. This one slide?
- 3 Q. Slide 16. I'm looking at -- the period of
- 4 order 1169 pump testing, which I think you can place
- 5 from roughly early 2011 to the end of 2012?
- 6 A. Right.
- 7 Q. Can you tell me what that trendline of dace
- 8 abundance is showing during that time frame?
- 9 A. From 2012 to 2013, it's going up.
- 10 Q. Pretty -- would you call it pretty steep spike?
- 11 A. Yes, absolutely.
- 12 Q. Okay. If you to go your next slide.
- 13 A. Just for -- if I might explain it?
- 14 Q. Please.
- 15 A. So, right after -- in this time period we had a
- 16 lot of recovery action taking place, so, we had a lot
- 17 of expansion into other areas and positive dace
- 18 response.
- 19 Q. Great. Thank you.
- Next slide more or less shows the same thing.
- 21 Shows pretty good increase in dace population. I think
- I see a February 2010 count of right around 700?
- 23 A. Yes. It's exactly the same data.
- 24 Q. Okay. So, then I think what this shows us --

- 1 this case, what this graph depicts is their recovery
- 2 that we had based on recovery actions that have gone on
- 3 in that period, and that allowed the dace to expand.
- 4 So, I would say that we have approximately 1500
- 5 animals, and that may be -- may be compatible with the
 - 6 amount of water that was at the time, but certainly a
- 7 long ways from recovery I would say. Because we still
- 8 need to incorporate more habitat to approach, you know,
- 9 3-, 4-, 5000 animals.
- 10 Q. Sure. And I would assure --
- 11 A. Yeah, I understand.
- 12 Q. I'm not trying to get you to pin down a
- 13 number --
- 14 A. Yeah, but --
- 15 Q. -- you fantasized but some pumping can occur
- and of course not all dace habitat restoration and dace
- 17 health.
- 18 A. For very low numbers of dace, yes. Such as
- 19 what's shown here.
- 20 Q. Okay. I'll leave it there. Thanks.
- 21 HEARING OFFICER FAIRBANK: Next will be Lincoln
- 22 County Water District.
- MS. PETERSON: Thank you. And just to note for
- the record, Dylan Frehner, the Lincoln County District

Min-U-Script® Capitol Reporters

(20) Pages 456 - 459

Page 460

1 Attorney, is now here.

2

- 3 RECROSS EXAMINATION
- 4 BY MS. PETERSON:
- 5 Q. Thank you. Good afternoon, Panel, again.
- 6 Karen Peterson representing Lincoln County Water
- 7 District and Vidler Water Company.
- 8 And, Ms. Braumiller, when we left off we were
- 9 talking about the geophysical surveys from the 2006 USR
- 10 study. Do you recall that?
- 11 ANSWERS BY MS. BRAUMILLER:
- 12 A. Yes.
- 13 Q. And you've had a chance to review those
- 14 geophysical studies now?
- 15 A. I reviewed, you know, them briefly a couple
- 16 months ago. I mean, I didn't actually review the
- 17 studies. I skimmed through the report looking for any
- 18 interpretation by the authors of the geophysical
- 19 results concerning whether or not either one or both of
- 20 the wells are completely through the Kane Springs -- or
- 21 you know what I'm trying to say. Kane Springs Wash
- 22 fault. And I didn't see it.
- 23 Q. All right. And the reason you wanted to see
- 24 that is you needed clarification of the completion of

- 1 include Kane Springs into the Lower White River Flow
- 2 System; is that correct?
- 3 A. Well, what I expressed was that if we
- 4 understood which side of the fault, or perhaps both
- 5 sides of the fault, KPW1, that's be KMW1, are completed
- 6 on, then a pump -- a longer pumping test with
- 7 observation wells that include MW1, but also many other
- 8 observation wells that are very close to KPW1. All
- 9 right? You know, it could be informative. But only if
- 10 we know which side or sides of the fault the two wells
- 11 are completed on.
- 12 Q. And leading up to your July 3rd report, the
- 13 U.S. Fish and Wildlife Service had all the data in the
- 14 URS 2006 report at it's -- it was available to them.
- 15 Would you agree with that?
- 16 A. Yeah. I can't remember when it became
- 17 available to me, but it was -- yeah, it was pretty
- 18 close to June.
- 19 O. Okay. Well, it's been on the State Engineer's
- 20 website, and of course, it's been available since the
- 21 Kane 2006 hearing.
- 22 A. Okay. I didn't actually know about it.
- 23 Q. So, the U.S. Fish and Wildlife Service had
- 24 every opportunity to do the pump test that it's

Page 461

Page 463

- 1 the two existing carbonate wells in Kane Spring Valley
- 2 relative to the Kane Springs Wash vault; is that
- 3 correct?
- 4 A. Yes. To facilitate the interpretation of water
- 5 level data that's collected. Either one of them. Or
- 6 if a pumping test is conducted, I know one was
- 7 conducted previously, how to interpret that concerning
- 8 the transmissivity of the carbon on one side or perhaps
- 9 both sides of that fault in Kane Springs Valley.
- 10 Q. And so, you didn't look at figure 3 3, from
- 11 the -- this is the cross-section of the well location?
- 12 A. No, I -- you're right. I did look at the text,
- 13 and I didn't see that.
- 14 Q. Okay. And so, you're not familiar with the
- 15 Willow Springs fault?
- 16 A. There's a whole series of faults in Kane
- 17 Springs Valley, and I'm not sure which one that is.
- 18 No, I don't know the details.
- 19 Q. In forming any of your opinions did you look at
- 20 any of the precip data in Kane Springs?
- 21 A. No. No, and I didn't have an opinion. I
- 22 really had a question is what I had.
- 23 Q. All right. And the U.S. Fish and Wildlife
- 24 Services proposing a pump test to determine whether to

- 1 proposing in this case prior to your July 3rd report.
- 2 Would you agree with that?
- 3 A. Do I agree? No, I don't. No, they would not
- 4 be. They're not our wells, and we don't conduct
- 5 pumping tests.
- 6 Q. Did I hear you correctly that you did -- there
- 7 was no approval of superiors for the position taken in
- 8 this report -- in your reports to include Kane Springs?
- 9 A. There was. It was reviewed internally. Not by
- any other groundwater hydrologists or hydrogeologist
- 11 because there are none available to us within the
- 12 agency. But no, it was reviewed by management and a
- 13 number of other -- number of other folks within the
- 14 agency and Solicitor's Office. And yes, it was was
- 15 approved to submit.
- 16 Q. Was a legal opinion specifically requested to
- 17 determine whether your position violated the amended
- 18 stipulation in the Kane Spring's proceeding?
- MR. MILLER: Objection; lack of relevance and
- 20 calls into question attorney/client privileged
- 21 information.
- HEARING OFFICER FAIRBANK: I'll sustain that
- 23 objection.
- BY MS. PETERSON:

Min-U-Script® Capitol Reporters (21) Pages 460 - 463 775-882-5322

Page 467

Page 464

- 1 Q. And do you understand that the position that
- 2 you -- that U.S. Fish and Wildlife is taking in this
- 3 proceeding by wanting to include Kane Springs into the
- 4 Lower White River Flow System would impact Lincoln
- 5 County Water District and their various property
- 6 rights?
- 7 ANSWERS BY MS. BRAUMILLER:
- 8 A. Well, first of all, I have to disagree with the
- 9 premise of your question. I don't want Kane Springs
- 10 Valley to be included. I said I think it should be
- 11 considered for inclusion pending clarification of what
- or which sides of the Kane Springs Wash fault the two
- wells are completed in and the collection of additional
- 14 hydraulic data to characterize the nature of the
- 15 connection between Kane Springs Valley and Coyote
- 16 Spring Valley. I don't -- I think what I was trying to
- 17 clarify -- and I certainly don't want Kane Springs
- 18 Valley to be included in the Lower White River Flow
- 19 System.
- I said that I think it should be considered
- 21 pending clarification of what side or sides of the Kane
- 22 Springs Wash fault the two existing wells are completed
- on and the collection of the additional hydraulic data
- 24 to fully characterize the hydraulic connection between

- 1 A. No.
- 2 Q. Okay. Do you know if the recharge sources are
- 3 the same?
- 4 A. I would assume that the climate's the same.
- 5 MS. PETERSON: Darn it. Thank you. Thank you.
- 6 HEARING OFFICER FAIRBANK: City of North Las
- 7 Vegas.
- 8 MS. SCHROEDER: No questions.
- 9 HEARING OFFICER FAIRBANK: So, no additional
- 10 questions.

13

- 11 Centers for -- Center for Biological Diversity.
- MR. DONNELLY: Okay. Thank you.
- 14 RECROSS EXAMINATION
- 15 BY MR. DONNELLY:
- 16 Q. Patrick Donnelly, Center for Biological
- 17 Diversity. I want to go back to this question of take.
- 18 And so, the -- I'm trying to get at a question that
- 19 involves both Ms. Braumiller and Dr. Schwemm, and so,
- 20 you're going to have to build on each other's answers I
- 21 think.
- So, Ms. Braumiller, as you said earlier, just
- 23 to confirm, carbonate pumping in the Lower White River
- 24 Flow System causes spring flow declines in the Muddy

Page 465

- Kane Springs Valley and Southern Kane Springs Valley 1 River
- 2 and Central Coyote Spring Valley, Consequently the
- 3 remainder of the Lower White River Flow System.
- 4 Q. Mr. Mayer, sorry, I don't mean to be rude. I
- 5 just -- I'm sorry. I thought I heard you say that
- 6 pumping from the Arrow Canyon wells impacts Pederson
- 7 Springs?
- 8 ANSWERS BY MR. MAYER:
- 9 A. Yes, I may have said that. It does.
- 10 Q. Okay. What are the impacts?
- 11 A. It lowers the groundwater level.
- 12 Q. And do you -- do you have a quantification of
- 13 that?
- 14 A. It's the top plot in figure 19 in the report.
- 15 Q. Okay. Thank you.
- And, Mr. Mayer, again, is the hydrologic
- 17 setting for the Tule basin the same as the Lower White
- 18 River Flow System?
- 19 A. The hydrologic setting? Could you define that?
- 20 Q. Like the geologic structure?
- 21 A. I don't know.
- 22 Q. I'm sorry?
- 23 A. I don't know.
- 24 Q. You don't know?

- 1 River Spring area; is that correct?
- 2 ANSWERS BY MS. BRAUMILLER:
- 3 A. Yes, generally.
- 4 Q. Dr. Schwemm, spring declines caused a loss in
- 5 habitat; is that correct?
- 6 ANSWERS BY DR. SCHWEMM:
- 7 A. Correct.
- 8 Q. Loss in habitat causes a loss of individual
- 9 dace; is that correct?
- 10 A. Likely, yes.
- 11 Q. As we confirmed based on your general knowledge
- 12 of the Endangered Species Act earlier, a loss of
- 13 individual dace constitutes take; does it not?
- 14 A. If could, yes.
- 15 Q. Therefore, carbonate pumping causes take?
- 16 A. Yes.
- 17 Q. And thus as we defined section nine of the
- 18 Endangered Species Act earlier, carbonate pumping would
- 19 be a violation of the Endanger Species Act?
- 20 A. Yes.
- 21 Q. To go to the line of questioning that came up
- 22 just earlier regarding the population trends of the
- 23 Moapa -- oh, I'm sorry, were you not done?
- 24 A. Yeah. If it -- if it's below the -- I assume

Min-U-Script® Capitol Reporters (22) Pages 464 - 467 775-882-5322

Page 468

- if it goes below the thresholds.
- Q. So, I'd like to explore that for a moment. 2
- What is the current flow rate at Warm Springs 3
- West? Ballpark.
- A. It's around 3.2. This is Michael Schwemm
- and -- but, I think Tim might know a more recent
- number.
- Q. We can go with -- we can go with around 3.2,
- maybe a little more, maybe a little less. As we -- Ms.
- Braumiller observed earlier, spring flows and 10
- groundwater levels are slightly declining since 2015; 11
- is that right, Ms. Braumiller, as you observed? 12
- ANSWERS BY MS. BRAUMILLER: 13
- A. They appear to. 14
- 15 Q. Thus on some level, Dr. Schwemm, there is
- incrementally less habitat now than there was, say, six 16
- months ago? Incrementally less so? 17
- ANSWERS BY DR. SCHWEMM: 18
- A. On average there could be, yes. 19
- Q. So if we are experiencing declines in spring 20
- flow and thus -- incremental, granted -- declines in 21
- habitat, why would we think that 3.2 CFS is an
- acceptable flow level and a sustainable flow level for
- the dace? 24

- 1 A. Yeah, they've been ongoing since '79.
- 2 Q. So, in some ways, dace populations during the
- pump test were increasing in spite of trends on water
- levels?
- A. Yeah. Because there's multiple forces at work.
- I mean, what could be increasing could be -- is the
- interplay of those three things, and they could all be
- modified to some extent.
- Q. Okay. I just want to clarify a question you
- answered earlier, Ms. Braumiller. You seem to imply
- there are some years in which you can't pump any 11
- groundwater in the Lower White River Flow System
- 13 without impacting senior decreed water rights on the
- 14 river.
- 15 A. Oh, I don't think I said that. Not the way I'm
- interpreting --
- O. Okay. 17
- A. -- what you just said.
- 19 Q. Are there years in which one can -- any amount
- of pumping would result in impacts to senior decreed
- water rights on the river?
- A. You know, again, I don't know the total volume 22
- of senior decreed water rights on the river, so, I 23
- can't answer that question.

Page 469

Page 471

- **1** A. Say that again.
- Q. If we are currently at current pumpage levels
- experiencing -- and at thus flow levels of 3.2, we are
- experiencing declines in habitat, why should we think
- 3.2 is an acceptable level to prevent the decline of
- the dace? 6
- 7 A. I think that if -- maybe I'm not getting the
- whole question. But at 3.2 -- or at our current level,
- I believe the dace population is fairly stable. Given
- the other factors, if those stayed the same and we're 10
- just going off of flow, it looks like the population is 11
- relatively stable, around 1500 animals for that flow. 12
- Q. And thank you. So, that gets to a question 13
- that was raised earlier from the Moapa Valley Water
- District regarding the population trend during the pump 15
- test. 16
- The MOA's set up a number of conservation 17
- actions to be conducted; is that correct? 18
- A. Yes, they did. But, I'm only aware of them
- 20 kind of in a general sense that --
- Q. Sure. 21
- 22 A. -- recovery actions would be taken.
- Q. So, there were a number of ongoing recovery
- actions simultaneous to the pump test?

- 1 Q. Okay. Thank you.
- I'd like to go to the boundaries of the Lower 2
- White River Flow System, in particular the idea of a
- pump test in Kane Springs Valley. You said earlier
- that you don't know what the affects of pumping would
- be there right now; is that correct? 6
- 7 A. I think based on data that we already have that
- predated -- water level data -- groundwater level data
- that predated the Order 1169 pumping test than a
- response KMW1 during the pumping test, wasn't official
- part of it, but there was groundwater level monitoring 11
- in it during that period, and since then, all show that
- there is a hydraulic connection between southern Kane 13
- Springs Valley and Central Coyote Springs Valley and
- the the rest of the Lower White River Flow System. 15
- But, it's -- well, since we don't know -- or I don't 16
- know at least -- which side of the Kane Springs Wash 17
- fault KMW1 is completed on, or perhaps both, I don't 18
- know if the connection only meets carbonate on one the 19
- 20 side of it --
- 21 Q. Sorry --
- 22 A. -- the other side, or both. I don't know.
- 23 Q. And I get why you want to do it. The question
- 24 is, if -- is there a chance that the system is so

Min-U-Script® Capitol Reporters (23) Pages 468 - 471 775-882-5322

Page 472

- 1 interconnected that a pump test would result in
- 2 catastrophic declines at the Muddy River Springs just
- 3 like we saw on the last pump test?
- 4 A. Well, I took a three-month long pump test is
- 5 long enough to pick up signals in the observation wells
- 6 that I specifically posed -- proposed in my analysis.
- 7 But, as in -- at other locations, you could -- you
- 8 could identify stopping criteria for the test.
- 9 Q. If there is the potential for impacts to
- 10 endangered species, does Fish and Wildlife Service need
- 11 to conduct a Section 7 consultation before embarking on
- 12 such an exercise?
- 13 A. Regulatory matters are not something I'm very
- 14 well-versed in, and I can't tell you. But somebody
- 15 would know.
- 16 Q. Perhaps one of your other colleagues?
- 17 ANSWERS BY DR. SCHWEMM:
- 18 A. Repeat the question.
- 19 O. If Fish and Wildlife is to embark on an
- 20 exercise such as a pump test which could cause impacts
- 21 to endangered species, does Section 7 compliance need
- 22 to be done, a consultation.
- 23 A. Yes.
- 24 Q. Thank you.

- 1 71, figure 12, did you describe your opinion of the
- 2 trend of the hydrographs since the conclusion of the
- 3 Order 1169 test?
- 4 A. I can't even read my own X axis, so, that's bad
- 5 news. So, must have ended right there.
- You know, there are always seasonal variations,
- 7 and it was fairly constant for a year, year and a half,
- 8 and then it did seem to start declining. That's what I
- 9 see.
- 10 Q. Okay. So, is it -- do you think that it is
- 11 possibly still declining, or a static steadying off, or
- 12 what may be causing that?
- 13 A. So, are you asking if it's recovered from the
- 14 pumping test, or just in general are water levels --
- 15 Q. In general in this particular well.
- 16 A. Yeah, yeah. Yeah, in general it looks like in
- 17 2017 and '18, that they were continuing to decline
- 18 somewhat. I mean, just based on a visual inspection of
- 19 the hydrograph.
- 20 Q. Okay. Thank you.
- 21 A. Sure.
- MR. SULLIVAN: One question.
- 23 ///
- 24 ///

Page 473

Page 475

- 1 HEARING OFFICER FAIRBANK: Georgia Pacific and
- 2 Republic.
- 3 MS. HARRISON: No, questions.
- 4 HEARING OFFICER FAIRBANK: Muddy Valley
- 5 Irrigation Company.
- 6 MR. KING: No questions.
- 7 HEARING OFFICER FAIRBANK: NV Energy, do you
- 8 have any further questions?
- 9 MS. CAVIGLIA: No questions.
- 10 HEARING OFFICER FAIRBANK: We'll go ahead and
- open it up to State Engineer and finish with Water
- 12 Resources staff for questions.
- MS. COOPER: Christi Cooper.
- 14
- 15 EXAMINATION
- BY CHRISTI COOPER:
- 17 Q. Ms. Braumiller, just in my previous question
- and your answer, you identified GV1 well as one of the
- 19 highly transmissive wells; is that correct?
- 20 ANSWERS BY MS. BRAUMILLER:
- 21 A. Identified it as one of the wells that -- in
- 22 which we isolated MX5 induced drawdown on the order of
- 23 1.5 to 1.6 feet.
- 24 Q. Okay. So, in the hydrograph of 4GV1 on page

- 1 RECROSS EXAMINATION
- 2 BY MR. SULLIVAN:
- 3 Q. Ms. Braumiller, I have a question regarding the
- 4 hypotheses that you described regarding the source of
- 5 water for Big Muddy Spring.
- 6 Do you have an opinion of whether or not the
- 7 water discharging at Big Muddy Spring is part of the
- 8 same water budget that is represented by the
- 9 approximately 50,000 acre-feet involved with the
- 10 Pahranagat shear zone?
- 11 ANSWERS BY MS. BRAUMILLER:
- 12 A. Well, no. Right? Because, I mean, these
- 13 groundwater flow systems boundaries are, you know, a
- 14 simplification, right? But, if you look at the trends
- in groundwater levels, it's mostly basins of water
- 16 levels. Right? Down the Meadow Valley Flow Systems,
- 17 it's clearly north to south from lake to, you know, get
- 18 them down Patterson to Panaca to Lower Meadow Valley
- 19 Wash, and that is a separate flow line. But it's not
- 20 -- it's separate from the flow that's coming down the
- 21 White River Flow System to Pahranagat and to Coyote
- 22 Spring Valley.
- So, that would not be. I don't think that
- 24 would be. If you've got a -- say that one more time.

Min-U-Script® Capitol Reporters
775-882-5322

Page 479

Page 476

- 1 Now, so, the 50,000 acre-feet is previous estimate of
- 2 known flow from Pahranagat, right? That would be
- 3 separate. Although, based on SNWA's water budget
- 4 analysis for their conceptual model, the CCRP model,
- 5 the inflow at the north and to Lower Meadow Valley Wash
- 6 from Upper Ameous(phonetic), is like 4700 acre-feet per
- 7 year. It's a tenth, tenth of what comes across the
- 8 Pahranagat shear zone as far as we know.
- 9 Did that answer your question? I'm not sure
- 10 that it did. I'm sorry.
- 11 Q. It does in part. I'm gathering that there
- isn't enough data to validate that hypothesis; is that
- 13 a fair characterization?
- 14 A. Well, we have the water budget analysis from
- 15 SNWA new conceptual model, and, you know, it's a water
- 16 budget analysis. So, you know, I'm sure it's
- 17 approximate, and not necessarily 100 percent correct,
- 18 but, it is a reasonable, probably the best
- 19 approximation we have right now of what would be coming
- 20 from Panaca into Lower Meadow Valley Wash versus what's
- 21 coming from Pahranagat into Coyote Spring Valley. It's
- 22 the best that we have.
- And so, they're in different flow systems, and,
- 24 you know, they -- the inflow to Lower Meadow Valley

- 1 A. It looks like it to me. I mean, one, we didn't
- 2 see any response to the order to combine pumping in Big
- 3 Muddy Springs, right? And it's a really big spring.
- 4 So, it's discharging from something that is pretty darn
- 5 conductive, right? And that those fanglomerates that
- 6 Maxey et al '66 mapped are -- happen to be in, you
- 7 know, the general vicinity. As far as I can tell,
- 8 they're right about at the location that we currently
- 9 map the Big Muddy Springs, and that could be such a
- 10 conduit. Plus, the water is warm, so it's flowing
- 11 through some kind of pretty significant depths. And
- 12 the water level variations are very attenuated compared
- 13 to the other springs. So, to me that suggests that
- 14 it's flowing for some distance at depth through
- 15 something before discharging through something that's
- 16 quite permeable which could be those same fanglomerates
- 17 that Maxey et al 1966 mapped.
- So, I think it's a reasonable hypothesis. I by
- 19 no means have any proof of that. It's just an
- 20 intriguing problem because it does seem like the
- 21 climate signal is delayed by perhaps 18 years or
- 22 something like that. Which I believe the Moapa Band of
- 23 Paiute suggested in the past. It's just a hypothesis.
- 24 Yeah.

Page 477

- Wash would be separate from what's flowing in from up
- 2 gradient and White River Flow System.
- 3 Q. Okay. Thanks.
- 4 MR. BENEDICT: John Benedict for the record.
- 6 EXAMINATION

5

- 7 BY MR. BENEDICT:
- 8 Q. So, I just want to try and understand that
- 9 because it's maybe not still not clear. So, you're
- 10 suggesting that the flow coming from north to south
- 11 which has a different flow path, but then also enters
- 12 Muddy River Springs Area is more likely to go to Big
- 13 Muddy Springs? I mean, can you really diagnose the 14 flow path once it's gone into the Muddy River Springs
- and say that these particles of water from other basins
- are correlated to Muddy River Springs, and then the
- others go to the other springs? Or is that -- is that
- an interpretation that's based on data?
- 19 A. I didn't quite follow the question, John. So,
- 20 better try that again on me.
- 21 Q. You seem to apply a connection between water
- 22 that's flowing from north to south, but outside of what
- 23 we're calling Lower White River Flow System currently
- as being connected to Big Muddy Springs? Am I wrong?

- up 1 Q. Thank you.
 - 2 HEARING OFFICER FAIRBANK: All right. We'll go
 - 3 ahead and take a ten-minute brick, and then when we
 - 4 return from our break, we'll go ahead and open it back
 - 5 up if there's any redirect on the part of Fish and
 - 6 Wildlife Services.
 - 7 (Recess.)

8

- 9 HEARING OFFICER FAIRBANK: Okay. Let's go
- ahead and go back on the record, and we'll open it back
- 11 up for Fish and Wildlife Services.
- MR. MILLER: Okay. Thank you. This is
- 13 Luke Miller again for the Fish and Wildlife Service. I
- 14 just have a few questions here. I don't think this
- 15 will take too long at all.
- 16 ///
- 17 ///
- 18 REDIRECT EXAMINATION
- 19 BY MR. MILLER:
- 20 Q. Sue, I'll start with you. A couple of
- 21 questions here. Just kind of referencing back hours
- 22 ago now, you were discussing, I think some Kane Springs
- 23 Valley well issues.
- Can you just clarify whether either of the Kane

Min-U-Script® Capitol Reporters (25) Pages 476 - 479 775-882-5322

Page 480

- 1 Spring Valley wells were officially monitored as part
- 2 of the 1169 study?
- 3 ANSWERS BY MS. BRAUMILLER:
- 4 A. Yeah, my recollection is they weren't -- they
- 5 weren't officially part of the Order 1169 study
- 6 monitoring that work, but KMW1 was in fact monitored.
- 7 Groundwater levels were monitored in that well
- 8 throughout the pumping test and prior to it for at
- 9 least a couple years.
- 10 Q. And I think Ms. Fairbank touched on this, but
- 11 just to clarify. In your 24 years of working
- 12 experience, how much have you spent, say, using both
- 13 hydrologic and geologic information to analyze
- 14 groundwater levels?
- 15 A. With the exception of maybe a year or year and
- a half where I did some laboratory testing, read rain
- 17 gages on Yucca Mountain, 22 out 24 years easily. Every
- 18 single groundwater problem that I've worked on, I've
- 19 evaluated the geologic and hydrologic data to do those
- 20 groundwater analyses. There's no other way. So,
- 21 easily 22 years of experience doing that. Plus, you
- 22 know, I hate to harp back to my master's thesis, but it
- was a really tough hydrogeology problem.
- And it had -- just the hydrogeology of that

- 1 Moapa dace, in particular fish passage issues at the I
- 2 think the Pederson gage. Do you recall that?
- 3 ANSWERS BY DR. SCHWEMM:
- 4 A. Yes.
- 5 Q. Okay. How do these impacts maybe relate to
- 6 your -- the fish passage impacts related to your
- 7 presentation about the impacts and overall preservation
- 8 of the dace?
- 9 A. Okay. So, overall -- so there's -- there's --
- 10 the overall picture of Moapa dace I think is generally
- 11 formed by that having available habitat, the right kind
- of habitat, invasive species and adequate flow for fish
- 13 to move around. And while that -- whether they --
- 14 well, I -- the Pederson gage issue, while that does
- 15 limit dace, that's only in one particular spot. And
- when we look at the numbers as a whole, I don't believe
- 17 that that -- that any one particular part of the stream
- 18 is responsible for the overall population size.
- 19 There's enough movement that -- you know, collectively,
- 20 we need to maintain connectivity, but any particular
- 21 issue is -- you know, it's of small importance in the
- 22 bigger picture.
- As the overall threat to Moapa dace right now
- 24 is, you know, potential or going in the future, I think

Page 481

- international test site, you know, Australia had been a
- 2 complete mystery through two international NRC funded
- 3 studies in the '80s and the '90s. So, I was quite
- 4 pleased with that. It was good experience. But,
- 5 that's when I first did hydrogeology, was 19 -- early
- 6 1990s.
- 7 Q. Okay. Thank you. Let me lob one over there to
- 8 Tim for a minute.
- 9 Again, referencing back probably a couple hours
- 10 now, you were asked about using your -- or your use of
- 11 well or driller log information in relation to your
- analysis hydrographs. Do you recall that?
- 13 ANSWERS BY MR. MAYER:
- 14 A. Yes, I recall that.
- 15 Q. Was that really a necessary function or action
- 16 for what you were trying to do?
- 17 A. No. It was -- I was really looking at the
- 18 long-term regional response to climate in those wells,
- 19 and I wasn't trying to look at individual well
- 20 responses. So, I didn't even look at well logs.
- 21 Q. Now, Mr. Schwemm over there. You were also
- 22 asked -- and I think this was actually the first line
- 23 of questioning from the morning. So, you were asked I
- 4 think about the overall and biggest threats to the

- Page 483

 1 is much related to the flow of the water given what we
- 2 know about Hatten et al paper. Because we've done so
- 3 much recovery action to improve much of the habitat and
- 4 we've removed nonnative -- just finished removal of
- 5 nonnative fishes from the system, part -- tilapia
- 6 explicitly. But, we've been working to remove them
- 7 from other parts of the system as well. So, those
- 8 two -- at this point in time, those two threats are
- 9 like I say, are lower level to the flow.
- 10 Q. Okay. Well, in relation to the questions
- 11 related to the ESA, I know you got peppered with a
- 12 couple of different approaches to your thoughts and
- 13 conclusions about ESA and take.
- And I should ask first of all, were any of you
- 15 actually proffered today to give testimony and discuss
- 16 ESA compliance issues?
- 17 A. I'm not. I'm not an expert in ESA compliance.
- 18 I typically work more on the biology and recovery end
- 19 of things.
- 20 O. Tim?
- 21 ANSWERED BY MR. MAYER:
- 22 A. No, I'm not expert in that or qualified to talk
- 23 about that at all.
- ANSWERED BY MS. BRAUMILLER:

Min-U-Script® Capitol Reporters (26) Pages 480 - 483 775-882-5322

Page 484

- 1 A. Nor am I.
- Q. Thank you. 2
- So, is it -- is it -- is it something you can 3
- clarify then whether you have a position that you think
- that -- I think was inferred maybe from the Center for
- Biological Diversity's cross-exam that essentially any
- or all pumping is just inherently take? 7
- ANSWERED BY DR. SCHWEMM: 8
- A. I'll clarify that. This is Michael Schwemm.
- You know, likely not. And it's -- take is a more 10
- nuanced -- it would -- it would take a very 11
- sophisticated explicit analysis to analyze take. 12
- Because of the other features -- or the other 13
- attributes that are at work. It's difficult. 14
- 15 Q. Okay.
- MR. MILLER: That's all I have. 16
- HEARING OFFICER FAIRBANK: Thank you. All 17
- right. Thank you very much. 18
- So just one final clarifying matter. 19
- So, Ms. Braumiller, you were admitted as an 20
- expert in groundwater hydrology. And Dr. Mayer, you've 21
- been previously admitted by our office. And
- Mr. Schwemm, you were admitted for the purposes of this 23
- hearing subject to no objection in the discipline of

- Technichrome that they are not going to present anyone
- with respect to that submission. And so, we're just
- going to go ahead and move -- advance everyone, you
- know, basically by that time.
- So, I just wanted to find out or just provide
- notice to the Moapa -- or excuse me -- the Muddy Valley 6
- 7 Irrigation Company unless it presents some form of a
- scheduling problem, anticipate that we would probably
- start you on October 3rd. And then we're going to move 9
- that additional time that was allotted to Technichrome 10
- for public comment just because we had tried to 11
- maximize the time for all the participants and limited 12
- 13 the time for public comment, and that was certainly
- our -- our desire was to allow for additional time for 14
- 15 public comment as that was an essential component of
- our public process. 16

17

- So, that's just kind of a little bit of
- forecast into next week. And I thank you very much,
- and we'll go ahead conclude today's hearing. 19
- Yes, Ms. Harrison? 20
- MS. HARRISON: Now, if you don't mind, can you 21
- let us know when transcripts might be available? I 22
- 23 mean, how soon they would be available online.
- 24 HEARING OFFICER FAIRBANK: The question was how

Page 485

Page 487

- biology, but that will be limited to the purposes of
- this particular proceeding on the basis of there was no
- objection. And so we appreciate you guys' testimony,
- and providing us the information with respect to your 4
- reports. 5
- Just a couple of other housekeeping matters 6
- since we have a little bit of extra time today. So, 7
- one of the things is, is for purposes of this week,
- we're limiting. Even though we may conclude a little
- bit early, just due to the efficiency by the 10
- participants, we're not starting subsequent 11
- participants early. So, tomorrow we'll proceed with 12
- the National Park Service, and then -- and then again, 13
- on Thursday will be the Moapa Band of Paiute Indians,
- and then commencing Friday will be Southern Nevada 15
- Water Authority. Beginning next week, because we have 16
- multiple parties over multiple days, if we had happen 17
- to conclude a particular participant early, then we'll 18
- go ahead and immediately move into the next 20 participant.

19

- And also, I just wanted to address on 21
- October 3rd we had originally scheduled Technichrome as 22
- a participant based upon their submission of initial 23
- report. We've subsequently been notified by

- soon the transcripts would be available, and I don't
- have a good answer to that right now. But, I can go 2
- ahead and have an answer by tomorrow. 3
- MS. HARRISON: Thank you. 4
- HEARING OFFICER FAIRBANK: All right. Thank 5
- you very much everyone. 6

- 1 CARSON CITY, WEDNESDAY, SEPTEMBER 25, 2019, A.M. SESSION
- 2 ---oOo----
- 3 HEARING OFFICER FAIRBANK: So today is the third
- 4 day of the hearing in the matter of the administration of the
- 5 Lower White River Flow System 1303 proceedings. And, so
- 6 similar as we've done the last couple of days, we're going to
- 7 go ahead and start with the National Park Service.
- 8 And, again, we have a sign-in sheet. And just
- 9 for everyone's reference as well, each of these sign-in
- 10 sheets are going to be marked as State Engineer subsequent
- 11 exhibits. So I think our State Engineer exhibits ended at
- 12 334. So they're going to just be marked next in line. So
- 13 those will be exhibits to these proceedings.
- 14 And, so, Ms. Glasgow.
- MS. GLASGOW: Housekeeping matters to that
- 16 effect. So we're signing in every day?
- 17 HEARING OFFICER FAIRBANK: Yes.
- 18 MS. GLASGOW: Okay. So yesterday's sign-in sheet
- 19 is still available for signing in?
- 20 (The court reporter interrupts)
- MS. GLASGOW: My name is Karen Glasgow,
- 22 G-l-a-s-g-o-w. Hello, good morning. I'm Karen Glasgow with
- 23 the Department of Interior Office of the Solicitor and I'm
- 24 here representing the National Park Service. And today we

- 1 Q. And, again, you work for a company called Tetra
- 2 Tech?
- 3 A. That's correct.
- 4 Q. And what do you do there?
- 5 A. Well, Tetra Tech is an environmental consulting
- 6 company that works in lots of different areas. My
- 7 concentration is in groundwater hydrology. I do a
- 8 combination of different things, contaminant transport,
- 9 computer modeling, water resource investigations, and so
- 10 forth.
- 11 Q. And were you at some point hired by the National
- Park Service to respond to the Interim Order 1303?
- 13 A. Yes, I was.
- 14 Q. And what were you hired specifically to do for
- the National Park Service?
- 16 A. I was hired and my company was hired to perform
- 17 some computer simulations to look at the effects of questions
- 18 before the State Engineer's office, specifically the effects
- 19 of moving the location of pumping from the Muddy River
- 20 Springs area and more specifically alluvial pumping in that
- 21 area and along the Muddy River to different parts of the
- 22 Lower White River Flow System.
- And, in addition, to provide, prepare reports,
- 24 and to prepare for providing testimony such as today.

Page 494

Page 496

- 1 are presenting our expert witness, Dr. Richard Waddell,
- 2 Junior, for your consideration.
- 3 Good morning, Dr. Waddell. Would you please
- 4 introduce yourself and spell your name for the court
- 5 reporter.
- 6 THE WITNESS: My name is Richard Kent Waddell,
- 7 Junior, and my last name is spelled W-a-d-d-e-l-l.
- 8 MR. GLASGOW: Dr. Waddell, by whom are you
- 9 employed?
- THE WITNESS: I am employed by a company called
- 11 Tetra Tech.
- 12 HEARING OFFICER FAIRBANK: And, Ms. Glasgow,
- 13 sorry. Not to interrupt, but can we go ahead and swear in
- 14 the witness before we proceed with questions.
- MS. GLASGOW: Thank you. Yes.(The witness was sworn in)
- 16 17
- 18 RICHARD WADDELL, JUNIOR
- 19 Called as a witness on behalf of
- 20 National Park Service, having been first duly sworn,
- 21 Was examined and testified as follows:
- 22
- 23 DIRECT EXAMINATION
- 24 By Ms. Glasgow:

- 1 Q. And did you provide reports?
- 2 A. Yes, we did.
- 3 Q. I would like you to -- Do you have a copy of what
- 4 has been marked as NPS Exhibit Number 2?
- 5 A. I do.
- 6 Q. Could you read the title of that for us please?
- 7 A. It is titled prediction of the effects of
- 8 changing the special distribution of pumping in the Lower
- 9 White River Flow System dated July 3rd of 2019.
- 10 Q. And is this a report that you prepared or was
- 11 prepared at your behest in furtherance of the contract with
- 12 the park service?
- 13 A. It is. There were some sections specifically
- 14 related to the simulations or the input data sets for pumping
- 15 for the simulations that was written by Gary Carst. He had
- 16 put together I guess the request to which wells and what
- 17 pumping to move and how to do that. And then we took that
- 18 information, modified our modeling data sets, and made the
- 19 simulation. So he prepared the section describing those.
- 20 And he also prepared an introductory section describing the
- 21 resources that the National Park Service has in the Lake Mead
- area and the needs for protecting those resources.
- 23 Q. Is this your signature on the July 3rd, 2019
- 24 document?

Page 500

September 25, 2019

1 A. Yes, it is.

- Q. So is this -- And as you sort of peruse this 2
- document, is this the document that you prepared or had
- prepared for the park service?
- A. Yes. Let me just correct. Some of the sections
- in here specifically related to some of the modeling were
- prepared under my direction dealing with some of the
- simulations being performed. Some of the data tables and
- that sort of stuff they prepared. I did not.
- Q. Okay. And, similarly, do you have a copy of NPS 10
- Exhibit Number 3? 11
- 12 A. I do.
- 13 Q. And could you tell us what this document is?
- A. It's entitled National Park Services response to
- 15 July 2019 Interim Order 1303 reports.
- Q. And did you prepare or have prepared at your 16
- behest this report? 17
- A. I prepared this report in its entirety.
- Q. Is that your signature on the face page?
- 20 A. It is.
- Q. And, as you look through the document briefly,
- does this represent the document that you prepared for the
- National Park Service?
- 24 A. It is.

- present to the east. 1
- I left the USGS in 1985 and went in to 2
- environmental consulting with a company then called Geotrans, 3
- which was shortly thereafter purchased by Tetra Tech. I was
- 5 the manager of our Colorado office until 1991 when Tetra Tech
- had joined with IT Corporation to submit a proposal to the US 6
- 7 Department of Energy to be their environmental resource
- services contractor. And that work was to basically get the 8
- process going on closing contamination sites at the Nevada 9
- Test Site. 10

And part of that project that I was part of was 11

investigation of the underground test sites, all of the 12

13 underground explosion cavities in the vicinity. I was listed

on that proposal as the key hydrogeologist for that contract. 14

15 We won that work.

And I was informed about a year later by the DOE 16

17 project manager that the reason that IT Corporation won that

contract was because of my inclusion on the proposal, my 18 experience, that had been gained at the test site in the 19

Yucca Mountain area as well as in some of the testing areas,

underground testing areas. 21

And so it started about a 12-year project with IT

Corporation and later on became Shaw. Basically serving as 23

24 the key hydrogeologist for the underground testing project

Page 498

22

Page 497

- MS. GLASGOW: At this time I would actually like 1
- to introduce in to evidence NPS Numbers 2 and 3. 2
- HEARING OFFICER FAIRBANK: NPS Exhibits 2 and 3 3
- are so admitted. 4
- MS. GLASGOW: Thank you very much. 5
- Q. (By Ms. Glasgow) So, Dr. Waddell, prior to 6
- preparing the park services reports for the -- for the Order 7
- 1303, had you worked in the same or had you worked in the
- 9 geographic area before?
- A. Yes. 10
- Q. Could you tell us what -- a little bit about your 11
- experience in that area? 12
- A. I would be glad to. When I completed graduate 13
- school in 1977, my first job was with the US Geological
- Survey working on a couple of projects at what was called the 15 Nevada Test Site at that time. Most of the work involved the 16
- Yucca Mountain project. My assignments were to look at 17
- 18 regional geology and hydrology around the test site, prepare
- a computer model of flow in the vicinity of Yucca Mountain 19
- 20 that basically covered the entirety as it was thought of at that time of the Death Valley Regional Flow System. I also 21
- did research on movement of radionuclides and fractured 22
- rocks, specifically tufts around Yucca Mountain and 23 carbonates that underlie Yucca Mountain to the east or 24

- that the contractor was a participant in and worked in
 - conjunction with numerous national laboratories at the time 2
 - as well as Desert Research Institute and US Geological 3
 - Survey. 4
 - 5 That work continued, like I said, for 12 years
 - when the contract was rebid and was a small business set 6
 - aside so our team did not win that work because we were a 7
 - large business. But I still maintained involvement with the 8
 - 9 DOE project as the subcontractor to the company or the
 - company team that won that work. And through the years that 10
 - kind of tapered off. 11
 - But as recently as last year I served on a blue 12
 - ribbon peer review committee for modeling that was done for 13
 - closure of the Ranier Mesa corrective action unit. There 14
 - were four peer reviewers and I was the reviewer selected 15
 - based upon my experience with Southwestern US Hydrogeology 16
 - 17 and specifically Nevada Test Site, now Nevada National
 - Security Site geohydrology. 18
 - Q. Thank you. 19
 - 20 A. So that describes my experience at the test site
 - basically within the Death Valley Regional Flow System. 21
 - In addition, I think, in approximately 2001, 22
 - there was a hearing coming up related to applications in 23
 - Coyote Spring Valley. I was hired by the National Park 24

Page 501

11

24

14

18

- Service at that time to put together a computer model of flow 1
- within Coyote Spring Valley and surrounding areas, which 2
- included the Muddy River Springs area. 3
- And so that went to hearing. And other instances 4
- came up where support was required either by National Park
- Service, Fish and Wildlife Service, or Bureau of Land 6
- Management. One of those was work in the Corn Creek area
- associated with water rights within the Death Valley Flow 8
- System. And then another one -- another hearing related to 9
- proposals for change applications in the Amargosa Desert and 10
- 11 the impact on Devil's Hole.
- Q. Thank you. I understood today that you prepared 12
- 13 a power point presentation to assist you in your testimony;
- is that correct? 14
- 15 That is correct.
- Q. Okay. As you -- Are there any corrections or 16
- 17 changes to your power point presentation that you would like
- to make before you get started? 18
- A. There are. And I've changed the presentation, 19
- 20 but I wanted to notify people that when they're going through
- the copies of the presentation there are some minor changes 21
- that they need to be aware of. 22
- The first of these is on slide eight which is a 23
- map where there's a hydrograph for MX-4 and an inset map that 24

- as an expert here today so that it will aid in your 1
- testimony. We qualified you as a geologist, a 2
- hydrogeologist, and computer modeling; correct?
- A. That is correct.
- Q. Thank you. And with that, if you would like to
- get started on your testimony.
- 7 A. I'll be glad to. So this is an outline of my
- presentation. I'm generally trying to answer the four
- questions that were asked that I have woven in other aspects 9 related to the geohydrology of the area. 10

I wanted to first talk a little bit about water

- balance. I had something earlier that became apparent the 12
- 13 last couple of days I really didn't need to discuss. There's
- a pretty good understanding of the concepts of capture and 14
- 15 depletion in the aquifer, so I removed that. But I still
- have a little bit in there that I might talk about. 16
- 17 I want to talk about recommendations on changes
- to the geographic boundary for the joint administrative unit. 18
- One of them kind of tongue in cheek, but I'll discuss that. 19
- Third bullet is discussion about climatic 20
- effects. And this will be somewhat similar to what Tim Mayer 21
- had talked about previously, but I'll be presenting 22
- additional examples of rising water levels in the area. 23
 - And then there will be a discussion about the

Page 502

Page 504

- shows the location of MX-4. When I was putting this 1
- together, I needed to move the location of the map so that 2
- the page number would not get hidden by the map. And I 3
- forgot to move the location point for MX-4. So, in your 4
- copies, MX-4 is shown as the red cross is in the wrong 5
- location, so that has been corrected. 6
- On page 36 there is a discussion about oxygen and 7
- deuterium isotopes and water. And I have a short discussion 8
- 9 about, as I recall, precipitation. And I make this statement
- in there about something being isotopically lighter on one of 10
- the bullets that should have read isotopically heavier. 11
- There is a second instance on that same page where I made the 12
- same mistake. So in the presentation it now says 13
- isotopically heavier in those two locations. 14
- And then the third is just a slide that is out of 15
- order. I decided not to move it in the presentation so it 16
- wouldn't mess up the page numbering. So that when questions 17
- 18 are -- arise, the page numbers on your copies are the same as
- they are on the presentation. And that was just a summary 19
- 20 slide for discussion about water levels. So that's out of
- location in the printed packet. I did not move it in the 21
- 22 presentation and I'll deal with that during the presentation.
- Q. Thank you. So before we get started, I wanted to 23
- sort of identify the subjects at which you had been qualified

- flow model that we had constructed in 2013 and then its use
- in the report in our Exhibit 2. 2
- And then certain discussion about the concept of 3
- using capture zones to describe where pumping effects will 4
- occur. 5
- And then I'll wrap up with a summary. 6
- So, this first slide, slide three, is just a 7
- short quote out of a paper by Lynn Konikow and Stan Leake of
- 9 the USGS. Discussion and depletion and capture. And the
- 10 bullet -- I'll just read the first part of it. An important
- corollary to Theis' 1940 principles is that the average 11
- pre-development rate of natural recharge itself is largely 12
- irrelevant to storage depletion and capture responses. 13
 - And then it lists some references to John
- Bredehoeft and others discuss this concept. If you're 15
- unaware of who John Bredehoeft is, he's an ex USGS researcher 16 and he testified before the State Engineer's office back in 17
 - the Coyote Spring Valley hearing.
- So the idea here is that when you're looking at 19
- 20 capture, we don't really need to know what the recharge is.
- It does serve as a constraint on modeling and so forth. But 21
- 22 it's less important than understanding what the discharge is.
- 23 You're capturing discharge. You're not capturing recharge.

And if you change the estimates on recharge, then you have to 24

24

1 deal with where that water is going, say, in a computer model or in your conceptual model. But the discharge number is 2 pretty well fixed. And so if you change discharge and, say, 3 overestimate -- I mean, if you change recharge and you overestimate what the recharge rate is, that water has got to be leaving the system somewhere. And if it's not discharge 6 because you have a good idea of what that number is, it's got

to be through the boundaries of the system, which gets to the 8 next slide about the sources of uncertainty and water 9 budgets. 10

11 In my view, the two largest sources of error are in estimates of those boundary fluxes. So in the concept of 12 13 here, how much water is coming across the Pahranagat Valley sheer zone. Their guesses as to what that is, they seem 14 15 reasonable in terms of the water budget for a much larger area, but there's still uncertainty in those numbers. How 16 17 much water is discharging in to Lake Mead, for example? This was an area of discussion a couple of decades ago when 18 19 recharge, some of the recharge estimates, were high and the 20 excess water was being shut off in to the Colorado River in

to Lake Mead. So there are arguments about was there any

evidence for that discharge occurring. So there's

uncertainty about the boundary fluxes. I already talked about the recharge rates. 1 of Arizona with the Navajo Sandstone. This was a model that was put together for water management questions related to 2 the pumping of water by Peabody Western Cold Company from the Navajo. And one of the questions in that modeling is what is 4 5 the recharge rate.

And so we did a, basically a computer experiment using a calibrated model. We calibrated it with a parameter estimation technique called PEST and ran the simulations of what the effects of pumping would be. We then modified what the specified recharge rate was by a substantial amount. I think we increased it by 50 percent or something like that. We were able to successfully recalibrate the model to the pumping -- One of the things about this particular question was Peabody had been pumping water for decades and they were really the only major pumper in the basin. It was, in effect, a pumping test that had gone on for decades.

And what we found was, in our simulations, that changing the assumptions on recharge rates really didn't change the effects on the simulations when we predicted the effects of their pumping on capture from the streams. It really didn't change those results because we had this good data set that we could calibrate against.

So, again, my recommendation is let's concentrate on the discharge and the process involved there.

Page 506

1 Discharge is something that we can measure. We can measure that pretty well. We've been measuring spring flow for 2 years. We know how to do that. And in the last decade or so

techniques have been developed for developing good estimates 4

of evapotranspiration, using field instrumentation and using

satellite imagery to assess the help of plants and so forth. 6

7 And USGS has done this at several sites in the southern 8

Nevada area. They did that some for this particular flow

9 system. 10

22

23

24

One of the first was in the Oasis Valley areas near Beatty and then down in the Amargosa Desert. So that's been applied very, you know, in recent years and it was a pretty reliable technique. And then we can measure the discharge in rivers by synoptic surveys along the river -measuring flow along rivers and measuring how much inflow or outflow there are along different stretches.

So, since recharge can't be measured, we can't measure the boundary fluxes, but discharge is one of the things that we're interested in in terms of effects of pumping. We need to concentrate on the discharge question, not what the over water budget is because there's going to be error in the budgets.

I do want to make one comment about recharge. I 23 was involved with a modeling effort in the northeastern part

One of the questions from the State Engineer was are there any recommendations for changing the boundary of the Lower White River Flow System for this joint administrative. And, to my mind, the critical question there is what is the connectedness of the different areas. And this is where the Order 1169 test provided very valuable information. I'll make a comment on that just real briefly.

There's a lot of seasonal pumping, seasonal ET, going on in the area that generates a water level response signal throughout the area. Back when the 1169 pumping test was being designed, the National Park Service was adamant that the pumping signal related to Order 1169 pumping be different than the seasonal pumping throughout the area so that we could separate out the effects of the pumping. So instead of doing seasonal pumping in the same -- in the phase with the other seasonal pumping which would generate a signal that we couldn't separate, we were insistent that that pumping signal looked differently, it was shaped differently.

I'm not sure that our arguments really had much effect on the State Engineer's office, but it turned out that when that test was run it was run the way that we were recommending. And so that helped in terms of differentiating the effects of other pumping in the area from the MX-5 pumping.

Getting back to the question here, the overriding consideration on which areas should be included in this joint unit is related to connectedness. And so I've got some examples here. And I use the terms well connected or connected or briefly connected or unconnected. And so I'll

go through some of these examples.

24

One of the things that surprised I think everybody on the basis of the results from Order 1169 was how connected large areas were. We also found out that the areas that don't have swift connection.

So what determines this connectedness? The first I've listed here is lithologic continuity. If your aquifer is not well connected through faulting or something like that -- And I'm not talking about the barrier effects that faults may have. But if, say, the carbonate aquifer is much thinner and there was normal faulting which completely offset the carbonate aquifer from itself, we wouldn't have this connectedness to cross that fault.

One of the nice things about the carbonate aquifer is it's very thick. And that provides that geographic continuity throughout the flow system.

The next on the list is faulting and fracturing.

And that's related to the next bullet, the permeability of

24 the rock matrix. The carbonate rock itself, excuse me, with

1 through fractures. And so knowing -- understanding something

2 about the details of the fractures isn't all that important.

3 But recognizing that we are dealing with a fractured medium

4 is important in terms of understanding the system.

There have been discussion about the row of faults in the carbonates and whether or not they provide a

7 barrier. And my answer to that is it depends. There are

8 examples of where we do aquifer tests across the faults and

we don't really see that the fault has much effect onresponses.

But there's a very good example again at the Nevada Test Site of where faults and the data that were collected show that there is a significant barrier effect at times, certainly in this location.

We had installed a well to run a tracer test in the carbonate rock so that we could get some information on running nuclides in to the carbonates. There were two wells that were put in. One was going to be an injection well and the other was a pumping well. And we were pulling tracers, not really nuclides, but the tracers that were injected in the injection well -- I think there are actually two injection wells -- towards this pumping well. And that well pumped for approximately seven months as I recall.

Almost immediately -- Again, the concept was

Page 510

Page 512

1 exceptions doesn't have that high of a matrix permeability.

It's not like a basin fill aquifer developed in a gravel

3 where there's a lot of permeability within the matrix itself.

4 Generally the grains are small. The rocks are well

5 submitted. There's not a whole lot of water that you can

6 push through that. There are exceptions to that. The

7 limestone or dolomites being carbonates are subject to

8 dissolution features.

There is a well that we deepened on the Nevada Test Site and a well that had been constructed in volcanic rock and we were understood in getting information from carbonates, which we would underlie that location at a slightly greater depth. This well was UE-10-J. We deepened that well in to the carbonates. We got a lot of water out of it. Ran a camera down that well and found a zone that was basically a small cave system. There was this interval that was about two or three feet thick that you could see a noted calcite that had been precipitated on the walls like you see in caves and produced a lot of water.

That doesn't happen all -- You know, we don't see that very often. Commonly, we don't send cameras down many wells because of the expense. But there are dissolution features within the carbonates.

So fracturing is important. The water moves

1 let's pump this well, ER-6-1#2, and pull the tracers out.

2 Transducers were placed in a large number of the wells in the

3 vicinity in Yucca Flat. And, fortunately, in addition, there

4 were measurements of water levels being made in other areas,

5 including off the test site.

Almost immediately after the well was turned on, drawdown was seen in a well about seven miles to the north that was located in the same fault block as ER-6-1#2.

At the same time, there were wells that had been instrumented across faults that define that fault block which saw very little response. And that's probably because those faults were providing a barrier. So that's certainly something that I think is a valid argument in trying to understand the system here in this flow system and understanding the role of faults as serving as impediments to flow.

The next bullet is fracture fill and alteration. I bring this up with respect to fracture fill. There was some discussion on Monday about the role of thrust faults versus normal faults and the different stress environments for the faults. The older thrust faults moved rocks over large distances, miles, tens of miles. And commonly the upper thrust sheet, the upper plate of that thrust sheet, was intensively faulted and fractured. You look at maps of

Min-U-Script® Capitol Reporters (6) Pages 509 - 512 775-882-5322

Page 513

certain exposures of the upper sheet and the faulting is just
incredible. And you wonder how somebody, first of all, how
could they map it?

4

13

15

16

17

But when you look at the permeability of those, because those rocks are old, a lot of those fractures and faults have been filled in by precipitation of calcite and other minerals.

There's also, in the upper part of the carbonate aquifer, there is a long hiatus where those rocks were exposed, younger rocks had not been placed on top of those yet, and their dissolution features in those. Very commonly when you drill through the contact, say, between basin fill and carbonates or volcanic rocks and carbonates, you find a lot of red clay that filled the pores. Those dissolution features in the upper part of the aquifer. So this is something that also affects what's going on and something to watch out for.

And I can't remember if it was EH-3 or EH-7, the well went in to carbonate aquifer and this red clay was found, which to me indicates that that was Paleozoic rock and Paleozoic carbonate aquifer.

The other well went in to what was described as a carbonate but it was overlain by cretaceous rocks without any description of this. I think it was actually Muddy Creek on

has a seasonal impact that generates a response, a seasonalresponse, in other areas.

But, then again, the pumping is on top of that.

People like to pump water in the summer for crops and running
 power plants and that kind of stuff. So certainly in the
 Muddy River Springs area and along the Muddy River there's

seasonal pumping that generates a signal. CSI's wells in the

8 Coyote Spring Valley pump seasonally that generates a9 seasonal signal. Wells down in Garnet Valley, some of those

are seasonal pumping and generate seasonal signal.
 So you can see these seasonal changes in the
 record, you need to be mindful of there are multiple sources

of these seasonal stresses.

The next bulletin is the Order 1169 pumping test where water was pumped almost continually for a couple of years that generated a very nice signal, generating water level responses in the area. And we'll talk more about that.

Next is looking for low hydraulic gradient. And basically from the mid part of Coyote Spring Valley southward and down through Garnet Valley and down to the shear zone the hydraulic ratings are very low. The hydraulic gradient is basically determined by two things. One is how much water is moving through the well. And, two, what the permeability or transmissivity of the rock is. And these very low hydraulic

Page 514

16

17

21

22

23

Page 516

top as well. It's unclear to me as to whether that was
 Paleozoic carbonate or some younger carbonate associated with
 Muddy Creek. So this is a different thing that may affect
 connectedness.

The final bullet is just related to the permeability detected in the monitoring well. If you happen to have bad luck and drill a well in a location that doesn't encounter permeability -- Again, this is secondary permeability associated with fracturing -- that low permeability around the well board itself may prevent you from seeing effects of pumping other wells. So just another thing to be aware of.

So one of the signs of connectedness within the flow system. My first bullet here, just because it's been going on for so long, water level responses to seasonal pumping or seasonal evapotranspiration. I think both of those generated signals.

I went back and looked at flow measurements within the Muddy River back in the period of approximately 1910 to 1920 before much pumping would have been going on.
I'm not saying there wasn't any pumping, but before much pumping was going on in the alluvial aquifer. And you see the same seasonal pattern in the flow of the river that you saw -- that you see today. So evapotranspiration certainly

gradients tell us that with the amount of water we think is
 coming through the shear zone that there's a lot of high
 transmissivity in the rocks that generates that low gradient.

There are other areas where the gradients are not as low, certainly. If you get in to the volcanic rock, gradients are much, much higher. It tells us that the transmissivity of those rocks is much, much lower.

And then of interest to these proceedings is the gradient in the northern part of the Coyote Spring Valley where the gradient is higher than it is a little further to the south.

Water chemistry provides this information really on what the sources of water are for discharge areas. And I bring this up because with respect to Rogers and Blue Point Springs, which are important to the park service, we think that the water chemistry gives us information about connectedness to the aquifer.

I also mention temperature on here. I'll show you something later on that Vidler had put together that demonstrates this as well.

And then, finally, the geology. And I put on here whether I think that something is sufficient to demonstrate connectedness or necessary or whatever. So geology I think is necessary. If you don't have geologic

continuity, you can't have connectedness. 1

may be due to just absence of flow.

14 15

18

19

20

The water level responses to seasonal pumping to, 2 say, Order 1169, I think those are sufficient to demonstrate 3 connectedness. 4

The low hydraulic gradient, I said it was 5 supportive but not necessarily sufficient. The reason I did 6 that was some of the older conceptual models of flow in the southern part of the system was that most of the water -- And 8 this depends on what your estimates of the water budget are. 9 But most of the water that is moving down the White River 10 11 Flow System discharged in the Muddy River Springs area. And the flow continuing to the south may not -- certainly is not 12 13 as high as in the northern part. And the low gradient there

Water has a hard time getting across the Las Vegas Valley shear zone. It has a hard time getting across some of the rocks that intervene between the carbonate aquifer and the Colorado River, limiting flow and discharge out of the system. So there might just be not that much flow. The waters there, the gradients flow, but the gradient could be low because there's not much flow.

21 That was the conceptual model until the Order 22 1169 test when we saw that pumping signal propagate down the 23 Garden Valley very quickly. 24

Canyon started pumping at a higher rate at approximately 1

four-fold. And MX-4 -- Again, Arrow Canyon is down in the 2

Muddy River Springs area to the southeast of MX-4. There was 3

a very quick response that was noticed in the hydrograph with 4

5 a pretty significant decrease in water levels showing that

the carbonate aquifer between those two areas was connected. 6 7

And this is the 2004-2005 recharge event. We don't see a lot of other recharge events in most of the record. This is a significant one.

And then, following that, we see a decline in water levels. You still see the seasonal effects going on. But we see a decline in water levels and we can discuss what the cause of that decline is. But you'll notice that the slope of that decline is very similar to the decline that occurred before the recharge event that was due to pumping of Arrow Canyon.

The Order 1169 test began late in 2010, continued for a couple of years. MX-5 pumping continued at a higher rate in to 2013. And so you see a change in slope in this area beginning with initiation of MX-5 pumping. MX-5 is turned off and you see a recovery occurring very quickly in MX-4. Realize that MX-4 is only a short distance from MX-5, the well that was being pumped.

24 And then that recovery kind of levels off and

Page 518

The water chemistry I said is supportive but not 1 sufficient. I just talked about geology. I think it's 2 3 necessary.

So not to beat a dead horse, but I'm going to 4 talk about hydrographs. And this is one of the slides that I 5 mentioned I had to make some changes on. Specifically the 6 location of MX-4 in your handout, it's a little bit further 7 to the south. And that was just an error made in preparation 8 9 of the slide.

But MX-4 is a well that is important in the history of carbonate pumping in the Coyote Spring Valley.

Early time -- And, again, the MX wells were put in by the Air Force to look for water supplies for the MX program. So that's why this well is available for measurements in the early part of the period of record.

So you'll see a combination of manual measurements here that are made either by USGS or SNWA. And then there are also some transducer data shown as a line, which provides a more continuous data set and is nice to have in terms of looking at short term responses and seasonal effects.

21 And so we see a fairly flat hydrograph in the 22 early part with some, I would say, some measurement noise. 23 And then, as Tim Mayer testified yesterday, in 1998 Arrow 24

Page 520 it's kind of looking like flat responses through the period

since then. But, as you'll see in other hydrographs, there 2

might be some hint that we're starting to downward trend 3 again. 4

One other point and it's kind of hard to see in 5

this one, this is CSVM-1, which is located in the same 6 general area. The base map that I'm using here is the map of 7

faults that CSI had put together based upon their CSAMT work. 8

9 And this is -- Well, here's a fault just to the west of the

red cross representing CSVM-1. And then there's an area just 10

to the west, which is a structural block that CSI has 11

12 interpreted to be a barrier to flow. It's bounded on the west and crossed by both the CSAMT lines, AA prime and BB 13

prime. And this showed up very well in the CSAMT record. 14

The CSAMT is, in my opinion, a good technique for 15 trying to pick up these faults where you have carbonate rock 16 that is present at depths within the depth of investigation 17 of the technique. And you saw -- you saw these lines. And 18 this shows that very distinctly. 19

So this well is located, according to this map, 20

just to the east of that structural line. And in this, the 21 period of record is much shorter. We're missing the earlier 22

time data or it doesn't exist. But we see the 2004-2005 23

recharge pulse, a decline in water levels like we saw in

Min-U-Script® (8) Pages 517 - 520 **Capitol Reporters** 775-882-5322

Page 519

9

10

15

16

17

18

19

20

21

22

23

24

MX-4, the initiation of MX-5 testing, which increased the 1 slope of decline. And then shut off of the well, we see 2 recovery. And then it looks like we've got declining water 3

4 levels going on again.

4

6

7

8

9

10

13

15

16

17

18

19

And what I was going to try to show on the other slide was that during the Order 1169 test, pumping stopped 6 for a fairly short period of time, as I understand, to do 7 some work on the arsenic treatment facility. But it resulted 8 in a pretty sharp increase in water levels. And then when 9 the pumping started again there was decline in one of those. 10 11 It shows up nicely in the transducer data. So this is another part of the signature of the MX-5 pumping.

12 13 So in these two examples, you see the seasonal pumping, you see the Order 1169 pumping. MX-4 we saw Arrow 14 15 Canyon pumping. I would turn these wells being well connected with the source of the stresses, those sources 16 17 being Muddy River Springs area and -- Well, let's just say Muddy River Springs area for the seasonal signal and then 18 MX-5 for the Order 1169. So it's well connected to both 19 20 areas.

Same kind of story on CSVM-6, shown again pretty 21 close to MX-5. We see similar types of responses. The 22 seasonal pumping, the decline prior to initiation of MX-5 23 24 pumping, the shutdown of the well about halfway through the

low permeability. 1

So here we see seasonal effects and transducer 2 data indicating connection with the Muddy River Springs area. 3

We see the increase in slope with MX-5 pumping. We see the 4 recovery that takes place after that and then a decline 5

starting to appear in the more recent record. And this well 6 7 is quite a bit to the south.

I'm not going to present hydrographs from 8

California Wash or from Garnet, but they have similar responses to these, showing that those areas are well connected.

CSV-3 -- The other wells that I presented are all on carbonate. And CSV-3 is completed alluvium. And it shows similar but attenuated responses. So, fairly flat hydrograph up until initiation of Arrow Canyon pumping where we start seeing water levels decline. We see the 2004-2005 wet winter creating an increase in water levels, the decline in water levels following that until initiation of MX-5 pumping, at which time the slope of the decline increases. We see the recovery from MX-5 towards the end of this record and then water levels starting to go down.

So what this shows us is that at least at this location the basin fill aquifer is also connected with these areas. When that means is that if you wanted to go in and

Page 522

1 pump from the basin fill in this area, you would obviously

2 get different responses because of the different properties

in the basin fill compared with the carbonates. But the 3

water level changes in the basin fill will be transmitted 4 downward in to the carbonate aquifer. And because of the

5 connectedness both with Muddy River Springs area and MX-5, 6

those effects will be transmitted to those areas. 7

CSVM-4 is one that is of interest with respect to 8 9 the connectedness with Kane Spring Valley. We still see similar responses, although, they are greatly attenuated 10 compared to the others. Now, we see an increase in water 11 12 levels associated with 2004-2005 wet winter recharge event. We see a decline in water levels that kind of matches the 13

slope that we've seen in others. We see an increase in the 14 slope associated with Order 1169 pumping. We see recovery 15

following cessation of MX-5 pumping. And then we see water 16 levels start to go down again. 17

So I would term this, instead of being well 18 connected, I say this is connected. We're not seeing the 19

20 seasonal effect of the pumping in ET in the Muddy River 21

Springs area. But we are seeing all the other

22 characteristics of the hydrographs that we've seen. And, you know, obviously there are reasons for why this is attenuated 23

that CSI has discussed and Vidler has in their reports. And 24

testing, recovery at the end of the test. And now it looks

1 like water levels are starting to decline again after that 2 3 recovery.

Another well, CSV-2, looks similar to what we saw with MX-4. So a fairly stable water levels early on, a lot of noise in the measurements. Measurement protocols were being worked on, developed, to improve those or perhaps getting new equipment that responded better. And transducer data that shows the seasonal effects, shows the 2005 recharge event, the decline in water levels following that event.

Order 1169 pumping recovery and now water levels appearing to 11 12 start downward again.

Okay. This is a well, CSVM-2, which is located quite a bit to the south along the highway. MX-5 is in this general location. CSI testified that that well penetrates the fault on the east side of the structural block and that the reason it's so productive is because of faults or fracturing faulting -- fracturing associated with that faulting.

20 And, according to the model of the permeability associated with faults, that permeability runs parallel to 21 the strike of the fault, the high permeability. And then the 22 low permeability perpendicular to it. And, again, this 23 structural block is one that CSI has interpreted as being a 24

Page 523

Page 524

Page 525

3

8

9

10

11

12

13

15

16

17

18

19

20

21

22

I'll get in to those. Did I skip one? Yeah. 1

So this is CE-VF-2, which is located along the 2

highway on the west side of this structural block. And, 3

4 unfortunately, from this plot it's a little difficult to see

what's going on with the hydrograph. And I guess for the

record I should say that all of these hydrographs that I've 6

been showing are out of Nevada State Engineer Exhibit Number

228, which is the 2018 HRT report. And these are all plots 8

that were produced by SNWA. 9

10 11

12

24

3

4

5

6

7

8

10

11

12

13

14

15 16

So this is the well that had a casing failure during the Order 1169 test. So there's a sharp increase in water levels as water levels in the well try to start to calibrate with the higher water levels in the alluvium overlying the carbonates.

And what we see in it is basically a flat response and basically the noise disappeared for the most part in these measurements up until a certain point. And then we see water levels starting to go down beginning with pumping in Arrow Canyon. We see the 2004-2005 wet water recharge event. There's a period of additional decline. And I think that it's kind of hard to pick out, a decrease in water levels associated with Order 1169. At the bottom of this, I show that the later part of that record expanded just to make it a little bit easier to see. We do see that there

to the west. And this one is pretty anomalous to what 1 2 everybody -- you know, all of the other wells have been looking at. This isn't new to you. You've seen this.

4 There's the recharge pulse. There's rising water levels. There's probably an adjustment of the measurement 5 data at this break in the record and then continuation of 6 7 increasing water levels to the present.

But this one clearly behaves differently than the other wells further to the east. And I'll show you gradient information a little bit later. But this well has a higher water level than those to the east.

Because of this different hydrograph response, I classify this as not connected. It doesn't mean that it's not connected. But based on the data we've got, I classify it as not connected.

So CSI has made claims that the wells that are on the western side of the structural block don't show a response to pumping the signals generated in the springs area or MX-5. I differ in my interpretation from them. I think that CSVM-2 located to the south is well connected. I showed you that hydrograph. It's got the seasonal effects. It's got all the hallmarks that we saw in, for example, MX-4. It's well connected to the sources of those signals.

On the other hand, CSVM-3 is, I classify it as

Page 526

is still this seasonal response. But I don't think it's as 1 well defined as what we had otherwise. 2

Order 1169 started approximately here and then there's a change in slope. But, unfortunately, the record is not as complete in others. And so there's still a question about are we seeing MX-5 pumping. I think we are. But it certainly can be debated. But the overall parts of the

hydrograph looks similar to what I've been showing you. CSVM-3 on, this is slide 16, is located in the northern part of Coyote Spring Valley. It is shown here right along the highway. There's an increase in water level occurring. The record starts about the same time as the recharge event, 2004-2005. This increase in water level seems to continue longer than what we see in other areas. The hydrograph flattens out and then starts going down again. And basically this is not as well connected as the other areas that we've been talking about. It's got some of the

17 characteristics of the other hydrographs, but it's certainly 18 much more difficult to make a definite statement that, oh, 19

20 we're seeing MX-5 pumping in this well. So the degree of

connection -- connectedness is less than what I've been 21 22 showing you.

And then, finally -- And you've seen this 23

hydrograph before. This is CSVM-5, which is located further

poorly connected. 1

CSVM-4, the one just southwest of Kane Spring

Valley, I say is connected. It is on the eastern side of the 3

structural block. 4

CSVM-5 I agree with that's not connected.

And this well, CE-VF-02, which is on the western side of the fault that was -- that defines that structural block has a weak connection.

8

9 Their basic claim is that as you go from east to west the degree of connection with, for example, MX-5 or with 10 11 the spring area decreases. And I would say in a general way 12 I agree with that, that it does decrease. But it doesn't necessarily mean that it's not connected. 13

They have made the claim that the structural block is impermeable, this is carbonate rock that is impermeable. Recognize that the carbonate aquifer is the aquifer that's transmitting all of this water. This block itself is impermeable, according to CSI.

So why would the permeability of the carbonate rock in this horst block, this structurally high block, be low? I agree with them that permeability is perpendicular to the fault is probably lower than parallel to the fault.

23

There is a gouge zone that's developed. There is fracturing on either side of the fault that would enhance permeability

Page 528

parallel to the fault. So we agree on that. 1

21

But, within the fault block itself, I think the permeability is high. And I'll first talk about just in a general sense why within the region we don't -- we don't think that carbonate rock blocks between faults have low permeability or are impermeable.

You can go in to these wells when you're doing aquifer testing and run flow surveys or temperature surveys during pumping and see where water is coming in to the well bore. We did this all the time on the test site. And what you find out is that, one, you can't predict very well where the water is going to come in because you don't know where the permeable fracture zones are. You also find that in instances you know from the core or the cuttings that are collected in the well that you've gone through a fault and you see no water coming in through that fault. Certainly much, much less, I mean, to the point of not being easily

detectible than what you see in other areas. So, the structures, the fracture zones, within the carbonate block that are not the fault in many of these instances turn out to be the permeable part of the rock, not the fault zone itself.

So we know that we have of permeability elsewhere 23 than just the faults. 24

if it's that high. But it's very transmissive. There's 17, 18,000 acre feet of water coming out at Ash Meadows. And all

of that water is traveling through this area to the northeast

4 of that, which has a very low gradient. I don't have

specific information that it's not moving just to the faults, 5 but it makes sense that it's moving through the rock and the 6

7 faults might assist.

The Amargosa Tracer Site, I mentioned a while ago, is a site that the USGS had constructed in the early, mid-seventies, early to mid-seventies to evaluate tracer movement, in fact, radionuclide movement in the carbonate aquifer. They actually injected tritium in to the aquifer and watched its recovery. And I don't recall the details on the wells and their productivity. But I think there were, like, six-inch wells that produced in the vicinity of eight or 900 GPM out at Bonanza King. And certainly a lot of permeability there.

And I mentioned earlier the very low gradient in most of the Lower White River Flow System I think is an indication that the fault, although they certainly have probably more barriers, is that the rock itself is permeable and plays a significant role in the transmission of water.

We mentioned earlier that we had put together a flow model, a three-dimensional flow model of this system as

Page 530

Page 532

I already mentioned this pumping test of 1 ER-6-1#2. I can't get into details, because the report has 2 not been released by the USGS. I talked a little bit about 3 the responses seem to pumping in the near vicinity within a 4 few miles of the pumping well itself. But USGS has done an 5 analysis and has determined that they see responses from that 6 pumping test in a well called Army 1, which was an old 7 carbonate water supply well located just to the south of 8 9 Mercury. And those -- Like I say, I can't get in to details,

because it has not been released yet.

But there is an Amargosa tracer site located a little bit further down, a little bit further meaning in the context here, several miles, further down gradient where those pumping responses were also picked up. So we've got another example of where pumping responses from this pumping went tens of miles. And ER-6-1#2 was in the middle of this fault block. There were faults on either side of it. But we were pumping -- I say we were. I helped design the test, but I left the program by the time the test was run. But the well was in a fault block, not along the edges, not the fault down to the edges.

The carbonate aquifer that is up gradient of Ash 22 Meadows is very transmissive. I don't know if it's the same 23 as what we see between MX-5 and the Muddy River Springs area,

1 well as aquifers to the east. As part of that effort we

compiled transmissivity information from aquifer tests that 2

were performed in these wells. We had I think about 25 or 30 3

analyses that we found. And I went through and just listed 4

the ones with transmissivities greater than 100,000 feet 5 squared per day. MX-5 certainly showed up in this list.

6 MX-4 did. Arrow Canyon did. There's a lot of carbonate 7

wells, including one way down to the south.

Let me correct something real quick. The upper ones came out of our modeling report. Well BM-DL-2, the number I pulled was the one that Moapa Band of Paiutes had put in to their initial report for transmissivity.

And so there was a significant number of wells, significant population out of this, say, 25 wells where we've got data or that I had readily available data that show high permeability. This is maybe a fourth of the wells. So, you know, there's transmissive rock out there.

Moving on to slide 21, I want to discuss in a little bit more detail the structural block as a barrier. I like CSAMT. I think that it does a very good job of picking up changes in electrical resistivity which can provide clues as to not only the geology but the hydrology.

In the profiles that were shown by CSI and in profiles that Vidler has prepared, you can definitely see

1

1 where you've got faulting associated with carbonate blocks.

- Because if the carbonate comes up high enough that it's 2
- within the depth of investigation of the technique. You see 3
- a very definite change in the measured resistivity from the
- lower resistivity of the carbonate block to the higher
- resistivity basin fill. Yeah, I got that backwards. Higher 6
- resistivity of the carbonate rock and the lower resistivity
- basin fill. So it is very good at that. 8
- It does not measure hydraulic properties. 9
- There's nothing in that technique -- It's responding to the 10
- 11 rock matrix. It's not responding to the fractures. It does not provide you information on the hydraulic properties of 12
- 13 the rock. It shows you where there's fault and displacements
- very well if you have good contracts. And, in general, I 14
- 15 think it's a good technique and provides various flow
- information. 16
- 17 I think there is a high degree of connectivity
- that's been demonstrated across this block. MX-5 was said to 18
- be penetrating, getting productivity out of the fault, on the 19
- eastern side of the block. 20
- CSVM-2, the well to the south and on the west 21
- side of the block, is highly connected with both MX-5 and the 22
- Muddy River Spring area. That signal is being transmitted 23
- across the structural block that is reported to be 24

- Page 535
- So Kane Spring Valley I've already discussed. 2
- The hydrograph, this is just another set of those. The 3

Rogers and Blue Point Spring in the context of that.

- presentation provided by Lincoln County, Vidler produced the 4
- diagram on the left. And this is that CSVM-4 and Kane Vidler 5
- 1 in it. And the same information is shown on the right 6
- 7 presented in a slightly different form. It's the same data.
- And one of the things that Lincoln County Vidler 8
- did on theirs was draw a line in here which talks about --9 Let me look at that. I think the long term water level trend 10
- line. And that kind of draws your eye to there's this 11
- 12 declining water level in there, at least it drew my eye to
- 13 that, and drew it away from the fact that we have an increase
- in the slope of the decline associated with the Order 1169 14
- 15 test.
- And so on the right what we had done is to break 16
- 17 the lineup in to different segments, three different segments, and run regressions on those. I know you can't 18
- 19 read the numbers on the slide. But it is in the report as
- well. And what we see in both of these wells is an initial 20
- trend of declining water levels, an increase in the slope of 21
- declining water levels during the period of the Order 1169 22
- testing and then at the cessation of MX-5 pumping either a 23
- trend that is shown as being slightly increasing -- I'm not 24

Page 534

Page 536

- 1 impermeable. I think that indicates it is not impermeable.
- And my comment here is that if there's going to 2
- 3 be a claim that a block or whatever is impermeable, that
- needs to be demonstrated. The CSAMT does not provide you 4
- information on that. You just can't make the assumption 5
- because it has a high resistivity that it has low 6
- 7 permeability. That's an invalid interpretation.
- So how do you get that? You can do aquifer 8
- 9 tests. I mentioned the response that you see across the
- block between MX-5 and CSVM-2. If hydrology is correct, you 10
- can maybe measure hydraulic gradients across the block. But, 11 12
- you know, you can have low gradients across a block that do not show that it's permeable. That may be due to just the 13
- geometry of the flow system. So you have to be careful on how you interpret stuff. And I'll show you an example a 15
- little later, I think, that also provides information this 16 structural block has permeability. 17
- So let's get back to the geographic boundary of 18
- the flow system. I'm going to talk about three different 19 areas: Kane Spring Valley, which is one that others said
- 20 should be included. Las Vegas Valley. I mentioned early in 21
- 22 the presentation that there's one that I recommend kind of
- tongue in cheek. That's Las Vegas Valley. And then the 23
- remainder of the Black Mountains area. And I'll talk about

- going to claim that it is increasing. This may be the data
- set. We see that in Kane W-1. And then in the other well 2
- 3 which is located to the southwest in Coyote Spring Valley
- return to declining water levels. And note that the slope 4
- post Order 1169 record is basically the same as what the 5 6
- slope was prior to that. Lincoln County, Vidler, also performed CSAMT 7
- testing. I think it provides useful information. Again, I
- 9 think it's a good technique that provides you information on
- the structure, especially where you have carbonates shallow 10
 - enough to be picked up by the technique. If they're too
- 11 12 deep, you can't see them.
- I didn't say a while ago, but in these profiles 13
- that were produced, and I think they mentioned this, if you 14 see blue up near the surface, it's indicative of unsaturated
- 15
- sediments. There's not water in the sediments to increase 16 the conductivity or decrease the resistivity of the rocks. 17
- 18 And that shows up as blue. It looks like it might be
- carbonate, but it's not. It's dry sediment. You can see in 19
- 20 the basin fill where the sediments are saturated. They show
- up as red. So you can get some hydrologic information on 21 water content and that kind of stuff as well as the location 22
- of carbonates. 23
 - So Vidler, Lincoln County, ran CSAMT surveys.

One is shown here. The trends from this outcrop area in the 1

southeastern side of Kane Spring Wash across the wash to the 2 northwest. Another line that has a similar trend, just to 3

4 locate it a little bit further to the southwest, and then

across the line. And the two lines that trend from southeast

to northwest have a different response. They show different 6

geology. That was their interpretation. That's my

interpretation.

system.

And on the basis of that difference between those two lines, they say there must be a fault in between those two. And that's the fault that's shown on their diagram as a red dash line and they have named that fault -- Let me make sure I get it right -- the northern LWFSX boundary fault. So in their interpretation, this is the boundary of the flow system. And normally a geologist wouldn't say, you know, give it a name like that. You know, they might say, you know -- I know geologist who has done a lot of work in the area and he likes naming his stuff after women that he knows. So he might call that the Susan fault or something like that. So it could be the Weiser or the Kane Spring Valley

termination fault or something like that. But not, you know,

indicating it's the fault, it's the boundary for the flow

And I don't necessarily disagree that there's a 24

that have been available for years and are very useful. We 1

use data, these data and other data, when we constructed our 2

flow model.

4 Between N-2 and N-1, two of the survey profiles,

there is an area of moderate gradient in the contour lines 5

that extends from southeast toward northwest over to an 6 7 outcrop area in the northwestern corner of the right panel on

this figure that is carbonate outcrop. And this indicates 8

that there is also likely to be some faulting in this area, 9

something that is causing the carbonate to be deeper on the 10 southwestern side of that moderate gradient gravity signature 11

than to the northeast.

And this is in the same general area where Lincoln, Vidler County(sic) has interpreted a fault to be present. So I think that the location might be somewhat uncertain. This third east/west profile that they ran did not really pick up the location of that fault, but it's because the carbonate rock is too deep to be picked up by the

So, you know, there's likely to be faulting in that area. We don't know specifically where it is. And based upon this conceptual model that normal faults, which these would be, produce an impediment to flow -- I like to use the term impediment as opposed to barrier, because

Page 538

fault in this area. I provided in my report -- And this is referred to by CSI -- a gravity interpretation that was

published by Phelps and others for Coyote Spring Valley. And

CSI had discussed these lines further to the south and the 4

results from those. 5

And I want to concentrate a little bit on what's going on further to the north near Kane Spring Valley. And basically what this shows is that on the eastern side of Kane Spring Valley there is a gravity low in this area that indicates that carbonate rocks are deeper than they are further to the west. And there is an area of high gradient on the eastern side of that gravity level. And one of their profiles in two goes across that, not in the middle of it, because they didn't know where the middle of it was at the time they were in the survey. But their interpretation of N-2 is that there's a fault on the eastern end of that profile. And you see closely spaced contour lines in that area leading down in to the basin. The gravity data had

picked up a fault in that location. 19 20 Similarly, further to the south and closer to where CSI was looking, we see another area of high gradient. 21 The contour lines are close together. And here we have 22 gravity profiles that again picked up faulting in that area 23 to that gravity level in that location. And these are data Page 540

1 barrier sounds pretty absolute. Impediment allows flow to go

across it. So I'm going to try to say impediment, but I'm 2

going to forget sometimes and say barrier. I'll try to be 3

clear, when I say barrier, I'm talking about a significant 4

barrier. Here I'll say these faults are likely to be 5

impediments to flow. 6

So we're basically in agreement with CSI that there's faulting in this area and that those faults may impede flow through Kane Spring Valley in to Coyote Spring Valley.

11 I had mentioned gradients earlier and this has 12 been an argument that data set that's been available for quite a long time. And, in fact, in a previous order from 13 the State Engineer's office pertaining to whether or not Kane 14 Spring Valley should be included -- I don't know the 15 terminology at that time, but, you know, their area of 16 17 concern I guess for the carbonate aquifer. They had noted that -- or you had noted -- I don't know if any of you were 18 part of that process -- but that there is water that's moving

19

20 from Kane Spring Valley in to Coyote Spring Valley, that

there's an area of higher gradients in northern Coyote Spring 21

Valley than what we find to the south. So in our figure 22 there are gradients listed in such a small font that they're 23

difficult to read on the printed page. I put those in

22

So, up to the north between Kane W-1 and CSVM-4, we had measured a gradient that is indicated here as five E minus three. That's L-4 tran terminology. It means five

times ten to the minus three. And the units would be feet per foot or meters per meter or whatever. But five times ten 6 7 to the minus three is what that indicates.

A little bit further to the southwest, moving

between CSVM-4 and CVF-2, the gradient is somewhat lower, but recognize that it is calculated over a much larger area and there may be higher gradient areas along that profile. We're looking at the average between those two wells. But that's four times ten to the minus four.

Another area up in the north, again, a long distance between wells, you're looking at a gradient of five times ten to the minus three. These are all reasonable gradient that you see in groundwater systems everywhere. If you saw these numbers for a gradient in, say, a basin study, your response would be that's pretty typical, you know, that's not a high gradient. That's a pretty common gradient.

When they move further to the south -- And I'll 21 skip on down to the gradient calculated between I think that 22 says CSVM-5 but I'm not sure, and EH-4, this well that's 23 24 close to the Muddy River Spring area that Tim Mayer talked

But there's likely a structure on the east side of the elbow 1

range in here which provides the barrier effect. And I use 2

the word barrier here. I didn't say impediment. It doesn't 3

4 mean that it does not flow across it. But it's more

significant than what we see in this area. And I make that 5

statement based upon the different hydrographic response we 6

7 see in CSVM-5 than we see in these two wells at the mouth of

the Kane Spring Valley. 8

Interestingly enough, down here to the south, which I think is CSVM-2 -- I can't read it either. But these data show a gradient -- a gradient for flow back to the north. Water levels are lower in the central part of the Coyote Spring Valley than they are to the south down where there's this little break in the range between Arrow Canyon range and the Elbow range. So water levels are higher here and they decrease to the north. We see a low gradient, you know, approximately ten to the minus four, but a little bit lower than that between those wells.

And just an aside here, the conceptual model generally has been that water is moving to the south through Coyote Spring Valley and continuing further down in to Hidden and Garnet Valley, just kind of as a continuous pathway. I haven't done an in-depth study of what's going on in this well, but that conceptual model may be a little bit of an

Page 542

about, we see gradients considerably lower, three times ten

to the minus five. So we're about two orders of magnitude in 2

this area lower than what we see in the northern part of the 3

Coyote Spring Valley. 4

So the argument that it's less permeable to the north I think is substantiated by the gradients that we see. We have a very good idea of how much water is moving through this area because of the discharge measurements in the Muddy River Spring area. And, you know, we know that this is very transmissive. This area to the north is less transmissive. And I think Sue Braumiller vesterday was using language like

it's much, much lower or something like that.

You know, the transmissivity is potentially a couple of order of magnitude lower than what we see in this area even though you have to take in to consideration that the cross-section, the area across which the flow is occurring is larger than it is in this corridor between Coyote Spring Valley leading to the southeast down to EH-4.

CSVM-5, which I had classified as not connected to either the MX-5 pumping or to the seasonal pumping in the spring area, we see six times ten to the minus three. But, again, that is averaged over this distance.

We don't know what causes this to have a higher 23 head and a separate hydrograph response than the other wells.

Page 544

error, it may be that that groundwater divide in the southern part of Coyote Spring Valley at least in the shallow part of 2

the aquifer, maybe the depth we would have an underflow to 3

the south. You know, we don't know. 4

It doesn't really affect this question of

connectivity. This is a -- If this is a divide, it's a 6

divide based on water levels. It's not a divide based on a 7

barrier between the two basins. 8

9 To the west in the Sheep range, we have a divide in both water levels. You know, when water levels are 10 highest and associated with the springs and the kind of stuff 11 12 we see here and measured levels either to the east or west. And, in addition, we've got low permeability rock that's 13 present in here, what's been termed by Ike Winograd as the 14 lower class to defining unit. That's a permeability barrier 15 as well. We have no evidence of permeability down in this

16 area of CSVM-5. 17

So Vidler's argument is that the lower hydraulic 18 gradients in the northern part of Coyote Spring Valley are 19 20 indicative of lower transmissivities in the northern part of 21 the valley. And I agree with that one on that. Something had resulted in lower permeability and lower transmissivity 22

in the northern part of the Coyote Spring Valley than what we 23

find in the central and southern part.

Just another geologic aside, we've talked some about normal faulting and thrust faulting. And then there are lateral strike slip faults that are also present. And Kane Spring Valley is one of these. The primary strike slip

faults in the region is the Las Vegas Valley shear zone which runs from southeast to northwest. It's a right lateral

7 strike slip fault and it's got kilometers of displacement across it. It's believed to be a significant permeability 8

barrier. 9

There are some other right lateral strike slip faults. And at least some have been mapped. And it shows up on the Reilly and others map of this area between Central and Coyote Spring Valley, the area where MX-5 pumping occurred and the other production wells are and the Muddy River Springs area. If you look on Pete's map and there is right lateral strikes that faulting indicated in this area that may be responsible for the high transmissivity we see in that

To the north of this figure is the Pahranagat shear zone. It's a left lateral strike slip fault and is a permeability barrier. The White River Flow System flows to the south. Water hits that barrier. And because of the high gradient that gets developed across it on the northern side of the barrier, groundwater discharges. There is surface

volcanics in this area. 1

One thing that I wanted to point out to you --2

Oh, before I move on. This is one of the displays of the

4 Pahranagat shear zone. So one of the displays here a little

bit further to the north is another. This is left lateral 5

movement. There's a third. This would be on echelon 6

7 faulting. Basically the movement across the shear zone is

taken up on several distinct faults that have been mapped and 8

outcropped in this area. 9

But what I wanted to point out -- It's kind of hard to see just because of the calibration and that kind of stuff. And I'm outlining something called the Kane Springs Launch Caldera Complex. Most of that caldera complex is on the northwestern side of the Kane Spring Valley. Just to the northeast of the Kane Spring Wash Complex is another caldera complex called Boulder Canyon. And then there's a third one to the north of it, Narrow Canyon Caldera. What these calderas are, are ancient, ancient meaning tertiary, volcanic centers. A caldera is a volcanic feature in which the magma is high silica, high water content. And when they erupt, they tend to erupt explosively. So you get this large volume of ash that comes out of the caldera complex. You then have an instant magma chamber. What used to be a magma chamber is now basically empty. And the overlying rock of the volcano

Page 546

water discharge in that area. There's a lot 1

evapotranspiration that's occurring because of the low

permeability caused by the Pahranagat shear zone. 3 4

There's another left lateral fault that runs up Kane Spring Valley. This is another one of these shear

zones. And the argument has been that the presence of the

shear zone on the southeastern side with that strike slip 7

fault comes and turns to the south and forms a normal fault 8

9 on the east side of Coyote Spring Valley, which is part of

the basin range pull-apart structure. Others have 10 11

interpreted it as extending a little bit further towards the 12 middle of the valley. We don't really know.

So the presence of these right lateral faults is significant to the hydrology and hydraulic properties is significant to the hydrology of the area.

So here is the Reilly and others map of the Kane Spring Valley area. It's kind of hard to pick up. And you have to be careful that you're not -- There's also some thrust faulting that shows up in the Paleozoic rocks in this area. There's some mapping of this left lateral shear zone through here. You can see lots of older non-basin range faulting that runs through -- I take it back. I'm getting confused with the volcanics and the boulder limestones and other. You see basin range associated with faulting in the

Page 548

fall back in to that magma chamber and you end up with a caldera complex.

2

On the test site there's a large series of these 3

that are present up in the Paiute Mesa area. Timber Mountain

is a well known caldera in that area that is a little bit 5

different. It's got a resurgent dome. These do not have 6

resurgent domes. 7

They are important here though is not the fact 8 9 that we've got these complexes with the boundaries as depicted here. It's the fact that we had this large magma 10 chamber sitting in this area that had a lot of heat 11 12 associated with it. You know, we're looking at temperatures

in the magma chamber that are, you know, a thousand to 2,000 13

degrees celsius, so hot rock, a lot of heat. 14

Why is this important to the hydrology? That 15 heat makes a very good tracer for water coming out of Kane 16 Spring Valley. This is a figure that Lincoln Vidler put 17 together showing temperatures measured in wells in the 18 northern part of Coyote Spring Valley as well as down in the 19 20 central part. And what we see here, again, the calderas are 21 in kind of the central part of Kane Spring Valley, kind of where the labeling is. The hottest water temperature

22

measured was 130 -- 136 degrees Farenheit in Kane W-1. A 23 little bit to the southwest of that we had a measurement of

Min-U-Script® (15) Pages 545 - 548 **Capitol Reporters** 775-882-5322

22

23

24

106 degrees. This is warm water. And typically we talk about warm water springs occurring down in the measurement spring area. You know, yeah, there is warm water but it's not of the same temperature.

A short distance to the northwest where we've got water coming down out of Pahranagat Valley across the shear zone, water temperatures are in the upper seventies. So we're looking about, you know, 30 or 40 degrees Farenheit temperature difference between these two sets of wells in the northern part of Coyote Spring Valley.

As we go to the south, temperatures decrease, but they still remain elevated on the eastern side of Coyote Spring Valley. We've reached this complex of wells that we've been talking about and looking at values of 90, a hundred, 106 degrees. Continuing down to the south to CSVM-2 where we have still got a hundred degrees.

And then as we go, this water that's moving toward the spring area, the temperatures decline to about 90 degrees in EH-4. When the Arrow Canyon well was first pumped its temperature was similar. I'm not saying it's changed. But we're looking at similar temperature water in the upper part of the carbonate aquifer of that location.

And then, like I said, up in the northern Coyote 23 24 Spring Valley on the western side, we've got temperatures in

This is hydraulic connection. So that's one interpretation 1 from this that I think is important. 2

The other is related to the structural block that 3

CSI maintains is impermeable. We've got water on the eastern side of that block up to the north -- northern end of up close to the Lincoln County line that flows across that block to CSVM-2, which is on the western side of the block. Something is carrying this heat down to this location. It's not another magma chamber sitting down here. It's transport of heat by water from the area on the eastern side of the structural block to the western side of the structural block.

The structural block itself is permeable enough to allow that flow to occur. The faults on the side of that structural block are permeable enough to allow that flow to occur. So I've got another signal here in the data that tells us that this impermeable structural block is being mischaracterized by Vidler -- I'm sorry -- Lincoln County.

And then final note, we have gradients, and this has been known for quite a while for flow to occur out of Kane Spring Valley. The heads, the springs are about 3200 feet at the head of the valley and at the southwestern down around 1880 feet. So we know we've got flow that's coming out that's contributing flow to the Lower White River Valley flow system.

Page 550

17

Move down to CSVM-5, which is this well that has a different hydrographic response on the west side, it's about the same temperature. And so what Vidler has done is interpreted flow along these paths connecting areas of similar temperature. So the wells in the northwestern part of Coyote Spring Valley with temperatures of 77 is associated with flow in CSVM-5 where the temperature is 76. So here's a western flow path in their interpretation. And I don't disagree with that.

And then they also -- they don't show flow from Kane Spring Valley down to these areas in the eastern part of the Coyote Spring Valley. But they show a flow line from this well. And I can't read what it is. But with a temperature of 99 degrees extending to the south to CSVM-2 with a temperature of a hundred degrees and then some movement. 89 degrees in the central part down to the warm springs on the Muddy River Spring area.

18 What's important about this is -- Well, two 19 20 things that are important. The first is that this demonstrates that we've got water moving out of Kane Spring 21 22 Valley in to the eastern part of Coyote Spring Valley. Kane Spring Valley is contributing flow to Coyote Spring Valley 23 and it's contributing flow to the Muddy River Springs area.

Okay. Las Vegas Valley. I wanted to talk about 1 this in the context of some statements made by the Moapa Band 2

of Paiute Indians. The common interpretation of the Las 3

Vegas Valley shear zone is it's got low permeability. Some 4

of the first indications of that were -- Well, at least they 5

were identified by Ike Winograd in his landmark professional 6

7 paper on the Death Valley System with the springs at Indian

Springs and Corn Creek on the northern and southern side. 8

9 Corn Creek is on the northern side of the shear zone. Indian

Springs is water coming off the Spring Mountains that's on 10 the southern side of the shear zone. So on both sides we 11 12 know that we've got a permeability barrier that causes this

groundwater flow to move to the surface for discharge. 13 14

There may have been other hydrologists that picked that up earlier. Ike's is just, his was the first one that I became aware of.

In SNWA's Exhibit 9 where they were also responding to the Moapa Band of Paiute Indian claims they talked about the low permeability sediments in wells near the Las Vegas Valley near the shear zone. I'm going to say if anybody knows about the geology of Las Vegas Valley, it ought to be SNWA and the Las Vegas Valley Water District. I think this is a very significant finding or comment from them.

Jim Harrill, who is a USGS hydrologist who worked

24

Page 553

- in Nevada for decades and moved the regional hydrology of 1
- Nevada very well was hired by the National Park Service to 2
- develop estimates to help guide us in our modeling effort of
- this area. And he estimated, I can't remember the number.
- We ended up using a value of zero, treating the shear zone as
- a no flow boundary based upon his recommendation. 6
- And then, finally, when you look at water level
- data, you're not seeing a gradient, a nice strong gradient 8
- across the shear zone, which you would expect to see if
- you're getting a lot of water movement across the shear zone. 10 11 On both the north side and the south side of this shear zone
- 12 flow is to the southeast. So there's no indication from the
- 13 data that we've got that the shear zone is a permeable area
- that's allowing water to leave the, you know, the area that 14
- 15 we're concerned about. Senior moment here. So it does not
- appear to be a discharge area for flow from the carbonate 16
- 17 aquifer.
- City of Las Vegas did some modeling. Their 18
- estimate is that there's about 700 acre-feet flowing actually 19
- in to our flow system from Las Vegas Valley. I'm not sure I 20
- believe that. But it's still we're looking at low numbers in 21
- terms of what that flux is. 22
- In contrast, the Moapa Band of Paiute Indians 23
- calculated the flow of about 40,000 acre-feet using darcy 24

- in to the definition of this, the area.
- HEARING OFFICER FAIRBANK: Dr. Waddell, we've 2
- been going for about two hours. Is this a good time to maybe 3
- 4 take a break?

6

9

- THE WITNESS: It's a great place. 5
 - HEARING OFFICER FAIRBANK: Okay. Perfect. Let's
- go ahead and take about a ten-minute break and so we'll go
- back on the record at 10:34. Thank you. 8
 - (Break was taken)
- HEARING OFFICER FAIRBANK: Dr. Waddell, you may 10 continue. 11
- 12 THE WITNESS: So at this point I would like to
- 13 discuss the Rogers and Blue Point Springs and the reason that
- the National Park Service is participating in this process. 14
- Rogers and Blue Point are a couple of springs that are 15
- located in this approximate location near the Overton arm of 16
- 17 Lake Mead. You can't see it all that well. I'll show you a
- geological map in just a minute. But there's an escarpment 18
- along the northern edge here of this block and the Rogers 19
- Spring fault is in this general location. 20
- And looking at it in greater detail in this 21
- Google Earth image, Blue Point Springs is the spring that's 22
- 23 located kind of at the apex of this geomorphic feature
- associated with the Arrowhead fault in this location and the 24

Page 554

Page 556

- calculations of water moving across the shear zone from a
- well in that area that I showed you that has a value greater 2
- than 100,000 feet squared per day. And this is a 3
- considerable amount of water. And I think they're saying 4
- this so that they say that there's excess water that's 5
- available for somebody to pump. 6
- And the reason I'm bringing this in -- Well, 7
- there's another part of this. They made this one calculation 8
- 9 and then did a second calculation using combination flow and
- heat transport modeling that for their Las Vegas center they 10
- used what the current groundwater production is in an assumed 11
- steady state for the flow and it shows all of these flow 12
- lines going in to that pumping center. And I think that 13
- calculated a large area but it's including flow from the 14
- Death Valley system as well as in our system. And it's even 15
- 16 a larger number.

18

23

- So my interpretation is I believe the 17
 - conventional conceptual model, I see no evidence to suggest
- 19
- 20
- 21
- 22 it's going to be Las Vegas Valley, which has water that's
- been beneficial use for years. So don't put Las Vegas Valley
- that it's invalid. But just a tongue in cheek I guess that if Moapa Band of Paiute Indian interpretation is correct and if they get water rights based upon all of this excess water then somebody is going to be impacted by that pumping and

- Rogers Spring fault in this location. 1 2
 - So this is Blue Point. And then a little bit to
- the southwest is another spring, Rogers Spring. And flow 3
- from both of these areas, the discharge flows in to Lake 4
- Mead. And you can see the increase of vegetation in this 5
- area that creates habitat and is one of the few locations in 6
- this area with these type features. 7
- There are other springs that are present along 8
- 9 the Rogers Spring fault that I'm highlighting on the
- 10 northwestern side of the road between Blue Point and Rogers
- Springs. And then some others that are a little more 11
- 12 difficult to see further to the southwest.
- This is the hydrograph for Rogers Spring. A 13
- little over one and a half CFS discharges. It's got a little 14
- bit of noise. When you're measuring discharge from something 15
- like this, you have problems with the flume getting chock 16
- with vegetation and stuff like that. So the record tends to 17
- be a little noisy. But we're looking on average, according 18
- to this calculation, about 1.6 CFS discharge. And I really 19 20 wouldn't want to say I see trends in these data.
- This is the discharge hydrograph for Blue Point 21
- Spring. A little over .5 CFS. When we get out in time, 22
- 2013, something was going on in the record here. The 23
- discharge decreased. There's a gap in the record that was 24

actually associated with new construction of the discharge 1 measuring facility. And since that time kind of a slow 2

increase in flow. I would have expected that you fix the 3

- flume and you see a sudden increase and the thing stabilizes.
- But that's not quite what we're seeing. I don't know the

cause for this. 6

19

1

5

6

7

8

9

10

15

16

18

19

There have been two sources of the water

discharging from the springs that have been proposed. Desert 8

Research Institute, Carl Pullman and others did a geochemical

study of the springs in the area. And based upon the 10

isotopic composition -- We'll talk more about it in a 11

minute -- of the water discharging from Rogers and Blue Point 12

13 Springs and measurements that were made in wells and springs

in other locations in the vicinity, they suggested that the 14

15 Weiser Wash area is a likely source of the water discharging

at Rogers and Blue Point and they base that on samples from 16 17 EH-3 and EH-7.

These waters have similar chemistry to the 18

discharge at Rogers and Blue Point. But, as I will point

out, the geology is unfavorable and as well the hydraulic 20

head in that area is unfavorable, the Weiser Wash area being 21 a source area for this discharge. 22

The other proposed source is California Wash and 23

Garnet Valley, the carbonate aquifer in those areas. The 24

on this. Stable isotopes in water has been used for decades as a tool to understand hydrology as well as other processes.

It's a very commonly and well-accepted technique. 3

And, as I said a while ago, in order to match the 4

isotopic composition of the Rogers and Blue Point discharge, 5

based on water discharging from California Wash and Garnet 6 7 Valley, we need to produce a -- mix it with a water that's

isotopic heavier because the spring discharge is heavier than 8

the carbonate waters that were in California and Garnet 9 Valley. 10

And one of the comments that we received was that the discharge that we see could be described or could be produced by evaporation of the water from the carbonate aquifer, which I disagree with, but it doesn't really matter, because we do have an explanation.

But here's what is termed the global meteoric water line. You plot the oxygen isotopic composition versus the hydrogen isotopic composition shown on the X and Y axes of these plots. And the blue diamonds towards the lower end of the line, say, between deuterium compositions of, say, minus 80 down to minus 100 per mil applaud on the meteoric water line.

The meteoric water line is a line that shows a relationship between the hydrogen and oxygen isotopes in

Page 558

chemistry is different, which is why Pullman and others suggested Weiser Wash would be the source. But the chemistry

2 is easily explained by contact of the carbonate water with 3

younger rocks containing gypsum and the back right deposits. 4

And Randy Bassett, who has also been -- is

qualified by the State Engineer's office as an expert in geochemistry, did some modeling of that area. First sampled a lot of wells and springs in the area and then did some geochemical modeling. And the difference in chemistry is explained very easily by dissolution of gypsum from these

younger rocks as well as other evaporite minerals, one 11 including bromine, bromine-bearing halide, and then mixing of 12 some local recharge to change the isotopic composition. 13

And this source area has favorable geology and

favorable hydraulic head in contrast to the Weiser Wash area. I just already said this. I don't need to repeat it. Slide

35. 17

So I'm going to talk a little bit about isotopic

chemistry or composition of waters, waters, H20. It's got

20 hydrogen and oxygen. There's two hydrogen isotopes. The heavier one is deuterium and the lighter one is just called 21

22 hydrogen or protium. And then oxygen has two isotopes, O18

and O16. And it's very easy to sample and measure for these 23

isotopes in the water. And there's a pretty good data base 24

Page 560

precipitation. And it varies around the world. But this is 1 a fairly standard way to display these data and it allows you 2

to point out differences in composition as well as look at 3

processes such as evaporation. 4

5 When you get to the lighter end, which means more negative values, we're looking at water that has been exposed 6

to cooler temperatures in the atmosphere. In contrast, if 7

it's up towards the upper end, that indicates warmer 8 9

temperatures. And I'll show that again in another slide or figure.

Evaporation can occur during the recharge 11

process. It can occur as precipitation is occurring. It can 12 13 occur after discharge occurs. The commenter had suggested

that evaporation was occurring in the groundwater system, 14

basically waters up close to the water table was evaporating 15

from the water table. At least that was my interpretation of 16 17 his comments. And we do not think that is taking place.

Randy Bassett plotted the composition of Rogers 18

and Blue Point Springs on this in the black circles. And 19 20 just slightly more positive or slightly heavier composition

21 than the waters in California, sampled in California and

22 California Wash and valley. And there are other springs that

23 plot a more positive or heavier compositions from some of the 24

evaporative springs in the area.

23

temperatures in contrast to colder temperatures at the southern end. And in the southern Nevada area, the yellow 18 6

composition of precipitation is in the minus 13, minus 14 range. There is a paper published by a geochemist at Mark

Tibble International Labs where they sample lots of 9 groundwaters and that's what they found. So that's about in 10 11 the same area that the samples that we're looking at.

When evaporation occurs, the composition of both the oxygen, which is the upper curve on this upper panel, and hydrogen change with time. You start off with your original water composition shown to the left end of those curves. And with evaporation the composition changes. And basically what's happening is the lighter isotopes, the hydrogen in contrast to deuterium, in O16 in contrast to O18 evaporate more readily because they're lighter. They evaporate off the water surface. And it changes the composition in the remaining water. And so when you plot these together against each other, you get a progression as shown in the lower panel on the right. So we're looking at low evaporation close to the global meteoric water line. And with increasing

springs are located. 1

But it shows carbonate rock. The carbonate 2 aguifer that is thrust on top of younger sedimentary rocks,

cretaceous and Jurassic rocks that are exposed in the Valley

of Fire. So colored in green are those younger rocks. And Valley of Fire is in this general location that I'm pointing 6

7 at there underneath the word mountains.

And then we see over -- I take back what I had said. The section line that's shown on the map inset is a little incorrect. It's actually further to the south. And it does cross Rogers and Blue Point Spring. They show Blue Point I think right here at the Rogers Spring fault,

13 discharging from carbonate rocks present.

And then there's the original aquifer plate, the lower plate of the thrust, at depth. And in between the two, like I said, are the Jurassic and cretaceous sedimentary rocks that are exposed at Valley of Fire.

Section GG prime runs to the southwest of FF prime. And basically it's showing the same type of thing. The carbonate rocks being thrust on top of the younger Mesozoic, Jurassic, cretaceous rocks with carbonate aquifer present at depth.

The depth of the lower sheet of the thrust is approximately five kilometers. It's pretty deep.

Page 562

evaporation we get a shift off of that line at a lower slope than what we see for the global line. And we do not see evidence of this in the Rogers and Blue Point data.

So here's the geologic map of the area. This is a map produced by Page and others showing Muddy Mountains area. Rogers and Blue Point Springs are located along the Rogers Spring fault towards the eastern end of this block. This block contains carbonate rocks exposed at the surface in this area and then a cover of younger rocks. And underneath this cover of younger rocks are carbonate rocks. So we've got carbonate aguifer rocks present in this area. This is California Wash to the northwest of that area.

So what I'm trying to show here is we've got carbonate rocks present in outcrop as well as under this younger cover that extends over to the Rogers Spring fault and it's terminated by that fault on the southeastern side.

So here's a couple of cross-sections.

Unfortunately they don't go right through the Rogers and Blue Point area. But these, again, were produced by Rick Page. And we're going to -- What I want to show here is that in California Wash and so forth, this is section FF prime, which extends from the west side of the Sheep range across in to the area where there's a bend in the section and then across

to the southeast, north of the Muddy Mountains where the

When we look at a section that runs from the

1 Weiser Wash area, which is on the southern side of the Mormon 2

3 Mountains, runs across and goes across Rogers and Blue Point,

we don't have that upper thrust sheet present. All that is 4

present in the carbonate rocks is the lower sheet. And, 5 again, its depth is fairly deep. It's not as deep as the 6

other, but two or three kilometers in this area. And, again, 7

is to the right end of this section shown in the green colors 8

9 are the Valley of Fire sediment exposures. And then to the right of that is the upper thrust sheet that I was describing 10

before present in the other sections.

12 So why do I think that there's not a pathway for flow from Weiser Wash? Weiser Wash would be in approximately 13 this area. There are carbonates present. That water could 14 move to the south in the carbonate rocks and then come up 15 16 along the Rogers Spring fault from depth.

17 One reason is that permeability data on carbonates as well as lots of other rocks in the area, those 18 data show the permeability decreased with depth and these 19 20 data are collected from aquifer testing, primarily pumping 21 test but also including slug testing, that was put together by Wayne Belcher of the USGS as part of the modeling work 22

that the USGS was doing for the Death Valley system. 23

We had -- When I was working on the project with

Page 564

Min-U-Script® (19) Pages 561 - 564 **Capitol Reporters** 775-882-5322

24

Page 565

IT, we had put together similar figures. And what you see is most easily seen when you look at the higher values is that there's a decrease in the number of higher value measurements as you get to deeper and deeper depths of measurement.

1

22

23

24

15

16

17

18

19 20

I've highlighted on here in blue the measurements made in carbonate rocks. And you see that same trend is not as steep a trend as you get in basin fill where the alluvial sediments, basin fill sediments are more compressible. But you still get this same trend and it's because of the weight of the overlying rocks closing the fractures that are the source of the permeability in the aquifer.

There's a large spread in this when you're looking at words of magnitude difference or change in the data of particular depth. But the trend is definitely there. If you -- One way to approach this would be to calculate a geometric mean of the data by depth and look at that trend. And you would see a trend that runs approximately as I'm showing you here. So depth of 2,000, 3,000 meters, which is the depth of that lower sheet, we're looking at permeabilities that are orders of magnitude lower than what they are in shallower settings.

There had been a comment about our modeling that said that there's a disagreement about this. One was that Wayne Belcher disagreed with it. And, interestingly enough,

the contour lines and we're looking at flow moving directly 1 towards the springs. 2

In contrast, Weiser Wash is located up to the 3 north. There's a yellow triangle in this area. That does 4

not represent why the EH-3 or EH-7 wells, but they're in the 5 same general location. And their heads are around 1540, 1560 6 7 feet. So they're at approximately the same head as the

springs are. 8

9

10

11

12

13

14

15

16

17

18

19

20

21

22

23

24

And in between here is an area of lower heads. And I'll show that on this figure. This is showing the most recent measurement of heads in numerous wells in this area. Rogers and Blue Point Spring are shown here. And, as I said before, the heads in California Wash are conservatively higher, providing the gradient for flow in this direction in to the upper thrust sheet to discharge at the northeastern end of the Muddy Mountains.

And, again, Weiser Wash samples would be approximately at some point above the -- the area on this figure. And they're at the same approximate and are actually a little bit lower than Rogers and Blue Point Springs.

There's a well that USGS had put in that is being monitored to look for water level changes. Nothing has really been seen in that that can be interpreted. We generally see, if we look at the spring locations, a decrease

Page 566

Page 568

- he put this same trend in DV-1 or he was involved with DV-1 and put it in to DV-2. The model that the USGS put together
- for DOE of the Death Valley Flow System is a comment that
- Keith Halford disagreed with it. Interestingly enough, Keith 4
- was doing DV-3, version three of the Death Valley model. And
- instead of putting a relationship like this, he did something 6
- 7 much more drastic. He had, I think, the upper 500 meters of
- the carbonate aquifer as being permeable and below that 8
- 9 impermeable. There was about a six order magnitude
- difference in permeability in his model as you went from the 10
- upper 500 feet of the aguifer to everything below that. So 11
- 12 he recognized that there's a decrease in permeability with
- depth. He just expressed it a different way than I do. 13

So long and short, my opinion is that lower part of the thrust sheet or the lower presence of the carbonate aquifer below the Muddy Mountains is too imperme -- has too low permeability to transmit much water.

I also think that head data suggests that California Wash and Garnet Valley are the source of the spring water. The springs are shown here to the right of the

map. They have elevations of 1,562 feet and 1,576 feet. And 21 22 what this map shows, it heads in California Wash or Garnet

Valley or 1800 feet or higher that there's a gradient for 23 flow to the southeast or east. The flow is perpendicular to

1 in head as we move toward Rogers and Blue Point in these springs. So, basically, flow is coming in in the upper 2 thrust sheet, reaching the Rogers Spring fault and then 3

moving along the fault to discharge at Rogers and Blue Point 4

Springs and the other associated springs. 5

We did some simulations with our three 6 dimensional flow model of the area. The outline of that is 7 shown here. The model area is shown in white. And this is 8 9 the southern end of our model. And basically what we did to 10 this was to backtrack particles from the discharge point at 11 the springs and see where the particles according to the 12 model came from. And we see a path that runs to the west toward the recharge areas in the Sheep mountains, the Sheep

13 range. That's not to say that these areas up in here if we 14 had pumping in these areas we wouldn't affect these. And 15

I'll talk about this in more detail. 16

But in order to affect spring discharge, we're 17 not forced -- we're not having to pump within this source 18 area for the springs. Pumping in other areas will also 19 20 affect the springs. And, again, this is a section cut 21 through our geological frame model showing the pathway near the sheet. If this section had been in a slightly different 22 23 area, you would have seen that upper sheet continue over this

area. That's just a function. We happened to cut this to an 24

Page 571

area where the Mesozoic rocks are exposed at land surface. 1

- So I think there is a hydraulic connection 2
- between the Rogers and Blue Point Springs in the carbonate 3
- aquifer and thus the carbonate aquifer in California Wash and
- Garnet Valley and thus for the aquifer in the up gradient
- areas. I'm going to classify this as a limited connection. 6
- There's a significant gradient, as Sue Braumiller pointed out
- yesterday for flow from those basins to the springs. 8
- One thing of interest is there's a well that the 9
- USGS had put in called the Buffington Pockets well that went 10 11 through the upper sheet carbonates, and the carbonates are
- 12 dry in that well.
- 13 HEARING OFFICER FAIRBANK: Mr. Waddell, I don't mean to interrupt, but --14
- 15 UNIDENTIFIED SPEAKER: Can we move the
- demonstrative -- We're at an angle where we can't see. 16 HEARING OFFICER FAIRBANK: Yes. Thank you. 17
- UNIDENTIFIED SPEAKER: Thank you. 18
- HEARING OFFICER FAIRBANK: Thank you, 19
- 20 Mr. Taggart.
- THE WITNESS: That's just at one point the water 21
- levels in the wash are in California Wash and Garnet Valley 22
- need to be high enough to go over that lip. We think that 23
- that's the case in many areas, but pumping lower levels to 24

benefit? 1

7

Page 569

And what the model showed -- And the model does 2

have limitation. But what the model showed is that it will 3

delay the effects, which is what you would expect. But it 4

does not prevent them. And this is consistent with 5

conclusions that SNWA reached. 6

And, again, the hydraulic connectedness is a

primary factor in determining whether or not there will be

impacts from additional pumping. And that's a real thing 9 that needs to be demonstrated before significant pumping can 10

occur in the areas.

HEARING OFFICER FAIRBANK: Yes, Ms. Baldwin. MS. BALDWIN: We have an objection to Mr. Waddell testifying about the opinions of the geological survey scientist during his power point. It's hearsay. It's --

(The court reporter interrupts) 16

MS. BALDWIN: Should I come up to the mic?

HEARING OFFICER FAIRBANK: If you would, actually, that would be great because then I don't have to repeat what you say for everyone listening on the internet.

MS. BALDWIN: This is Beth Baldwin for the Moapa Band of Paiutes. We're going to object to Mr. Waddell testifying to the opinions of the geological survey scientist contained in the power point referenced by this slide. It's

Page 570

- 1 that lip, it's going to have -- impact some spring discharge.
- We don't know enough about the area to really discuss that 2
- except to say that it's a concern. 3
- So we need additional data on the connection. 4
- And I think that additional water monitoring wells need to be
- put in to the upper plate to see what's going on with water 6
- 7 levels in the upper plate as they may impact the discharge
- from the springs. 8
- 9 Moving on to aquifer recovery. I already went
- through hydrographs showing that prior to Order 1169 we had 10
- declining water levels due to pumping from the carbonates and 11
- that subsequent to cessation of pumping in MX-5 we see 12
- recovery and it looks like we're seeing water levels starting 13
- to decline again. And that's of concern. The recovery of 14
- water levels pretty quickly after pumping in MX-5 stopped. 15
- 16 But we're continuing to see declines.
- The further away we are from the production, the 17 greater the delay. But it's a very small delay. Their 18
- response in the wells of great distance was very quick. And 19
- 20 I'll get in to this in more detail in a minute. But when we
- simulated the effects of longer term pumping and asked the 21
- 22 question if we move pumping from the alluvium along the Muddy
- 23
- 24
- River to the carbonate aquifer, say, in Garnet and -primarily Garnet Valley, is that going to provide much

- hearsay to the extent he's using it to bolster his own
- opinion. Those scientists have not been presented by the 2
- park service as experts. They're not here to testify and be
- cross-examined. So if he has opinions about the data, that's 4
- one thing. But he can't just be a conduit for their opinion, 5
- well, they agree with me, that's hearsay. 6
 - MS. GLASGOW: Yes, it is hearsay. But it goes to
- the weight, not the admissibility. The witness is allowed to 8
- 9 have relied upon other people for his own judgment, which is
- what he's been testifying to is that his judgments are in 10
- alignment with people that he's relied upon. So to our mind 11
- 12 he's adopted these judgments himself and therefore is
- testifying about his opinions as to the work that he did. 13
- HEARING OFFICER FAIRBANK: Thank you, 14 Ms. Baldwin. Your objection is noted and the State Engineer 15
- will take note of that objection and we'll assign the 16
- 17 appropriate weight to those references and reliances on work
- of others that are not here to testify for themselves. Thank 18
- you. 19
- 20 MS. BALDWIN: Thank you.
- THE WITNESS: I am primarily going to be 21
- presenting data from this presentation --22
- HEARING OFFICER FAIRBANK: Mr. Waddell, make sure 23

your mic is on. Thank you.

respect.

And I'll skip ahead just real quick to the next slide. I mentioned earlier that I served on a peer review panel for modeling that the Department of Energy was doing at Ranier Mesa, which is one of the weapons testing areas on the NNSS. And part of that model had to do with how recharge was addressed in the model. And so there was presentation of information related to water levels in the Ranier Mesa area that had been provided to the Department of Energy contractor from the USGS.

17 And so, again, in the context of Ranier Mesa, there are measurements and water levels that show rising 18 water levels in this area, in response, primarily to the 19 2004-2005 winter precip event. The well that had the 20 greatest response was in a granite. Granites have low 21 porosity. There's not a lot of storage for water, so the 22 only way to take that water is by increasing water level. So 23 that's why it's most sensitive in this well. 24

1 through time. We see more attenuated effects of the

2 2004-2005 recharge event. And that's because it's in an area

3 that's not as immediate to recharge as Ranier Mesa. Ranier

4 Mesa is the highest point on the test site. It gets the

5 greatest amount of snow fall. And it is one of the primary

6 recharge areas. But we do see water levels increasing

7 through this period of record shown here.

Moving over to Devil's Hole. Devil's Hole is part of the Death Valley Flow System. Prior to the 2004-2005 recharge event, we had declining water levels that's attributed to pumping in the Amargosa Desert. And then following that wet winter, water levels start rising again. So we're seeing the effect of that recharge at that time. So this is one where we go from a period where water levels are responding to pumping to one where water levels are responding to increase -- an increase in recharge over a short period of time.

There are several hydrographs in northern -- in Yucca Flat shown on slide 49, all with rising water levels over the period of record.

I had mentioned previously the well that had the dissolution feature with one or two foot open interval. And that's UE-10-J. It responded very quickly to that recharge event.

Page 574

But what you see was a rising trend that started prior to this period of record that's shown here in 2004-2005. Subsequent to that, the trend increases in slope and then begins to flatten out and then we would expect that

it would drop off as the tail end of this curve shows.

There's some carbonate wells shown in blue which showed a similar type of response of rising water levels prior to 2004-2005, an increase in slope and then a

flattening out and a recovery starting until the 2011 wet winter where we see a similar pattern but smaller magnitude development. And that's also appearing in two of the wells.

So I was first introduced to this concept as part of that peer review. And I and other peer reviewers deemed that to be an acceptable appropriate model for the recharge processes of what's occurring, that it is sporadic, it occurs in association to wet winters. And, in this particular instance, we see rapid responses and then levels starting to decline again.

So I'll return back to the other slide, slide 48, which shows wells on the west side of the Sheep range and in Indian Springs. The Sheep range is the western -- at the western edge of Coyote Spring Valley, basically is the western boundary. And we see immediately to the west in the Corn Creek Spring area that water levels have been increasing

Page 576

And what we primarily see at this location is response to recharge event of tailing off, response to

3 recharge event and then, again, tailing off. So it's not a

4 nice continuous increase in water level but one where we can

pick out the individual recharge events such as the well in
 the Lower White River Flow System where we see the 2004-5 --

7 2004-2005 recharge event and then response from that.

8 Move a little bit further to the south, again, in

Yucca Flat, and we see rising water levels for the period of record. We look over on the western side, we see rising water levels through this period of record.

So around the NNSS or Nevada Test Site, which is a well documented pattern of rising water levels over the last few decades. In areas where pumping has occurred, and this is in Las Vegas Valley, we see declining water levels, a recharge event, declining water levels, a recharge event, declining water levels. This is an area where pumping is affecting water levels. So you see the effect of the recharge, you see the effect of the pumping being repeated and repeated.

Moving in to different areas, and this is within the area that we modeled. Well EH-6 shows seasonal effects from seasonal pumping and rising water levels. Basin fill well shows a similar pattern. This is down in the southern

Min-U-Script® Capitol Reporters (22) Pages 573 - 576 775-882-5322

Page 580

Page 577

1 part of the flow system, the BM-ONCO-2 well, which is one of the clastic aquifers, not the carbonates. Rising water 2 levels. PW-2 in Basin 221, shorter period of record, but we 3 see the same kinds of things. 4

Dry Lake Valley, rising water levels. Garden Valley, rising water levels. And there's some other stuff going on. I expect the question is going to come up when we did this did we look at all the wells and did we find examples of wells going up and wells going down. I did not go do an exhaustive search for all the wells to see what

6

8

16

17

18

19

20

21

22

1

2

9

9 10 11 their pattern is. But we see many, many instances, at least 12 on the test site, and almost all the instances of rising 13 water levels when we look in these other areas, it's less clear because there aren't as many wells with reducing rising 14 water levels. 15

So what determines when recharge occurs? What Tim Mayer testified to yesterday is that there are three avenues that precipitation can take, I guess, before -- or two avenues before it becomes recharge. One is that you have to satisfy the runoff. If it rains, for example, you get runoff that occurs. And so that water is not available to infiltrate the soils. It's runoff.

The second thing is the water that is available 23 to infiltrate the soils has to overcome a deficit. We're in 24

area five radioactive waste management unit in Frenchman. 1

These were deep borings. He did chloride balance 2

determinations trying to measure what recharge was in those 3

environments, and again found the same kind of thing. If you 4

5 have a deep boring -- I'm talking hundreds of feet -- below a

channel, he saw some evidence of recharge occurring in that 6

7 location because flow was concentrated in the channel, move out of those areas and just slightly higher elevations but in

non-channel environments recharge was not occurring. This 9

was over long periods of time. I have forgotten the time 10 frame for this. But thousands of years. 11

There were also some wells that were put in Fortymile a little bit further down gradient that were close enough to the channel that we could see changes in water levels. There were changes that we saw with the sporadic runoff events at Fortymile Wash. Fortymile Wash is a huge channel. If you're driving up to Yucca Mountain, there is an area that is probably one or two-tenths of a mile across the channel. You drive down in to it, you drive across the channel, and then you drive up the other side. There's some large flows that occur in Fortymile Wash but very sporadically. So the recharge is a sporadic process.

The stable isotopic data indicate that recharge occurs from cold water, occurs from snow melt, not summer

Page 578

1 precip. We're looking at a process of having a sufficient

an arid environment. The soils dry out. The permeability of soils is very low at low water contents. So you can't get snow pack that you can fill up the pore spaces down to a 2

12

13

19

20

21

3 depth that prevents evaporation from removing that water.

And admit that that's not a great depth. But then it has to 4

have enough water to continue downward because as it moves 5

downward it's going to spread out and you'll end up with 6

residual water in the soils and in the fractures that can't 7

move down any further until the next recharge pulse or 8

9 infiltration pulse occurs.

> So the data indicate that as the groundwater chemistry and other data that the recharge that we're seeing is winter precipitation is basically the snow melt.

> MS. GLASGOW: Dr. Waddell, I just wanted to let you know that you have about 35 more minutes.

THE WITNESS: Thank you.

MS. GLASGOW: You're welcome.

THE WITNESS: And so this information on winter precip, importance of winter precip is a concept that I've been aware of for decades or was a fellow researcher at the USGS that was doing recharge specifically looking at summer versus winter recharge and mountain environments, particularly to try to come up with the processes. So I for

22 a long period of time I've been a believer in, at least in 23

Nevada, of sporadic recharge associated with winter precip. 24

very much movement until you get some water in the soils so 3 that infiltration can occur. So that's number two. 4 And then after you overcome that deficit, then 5 water can start entering the soils and move to deeper, 6 greater depths and potentially become recharge. 7 I agree with that general model that he 8

described.

And just some studies that I'm aware of related 10 to this, Dick French, a couple of decades ago, he was a 11 researcher at Desert Research Institute instrumented some 12 shallow borings in stream channel Fortymile Wash coming down 13 off of Paiute Mesa and instrumented some more upland 14 locations just outside the channel and found that recharge 15 did sporadically occur with the sporadic runoff events in 16 Fortymile Canyon in the canyon -- in the wash itself, the 17 18 channel deposits. But when you got up to the upland areas, you did not get recharge occurring. So the precip by itself 19 20 was not sufficient to cause recharge, but the collection of water in to the channels did provide enough water for 21 recharge to occur -- or infiltration. Not instrument. The 22 water table. 23

Scott Tyler did a study in association with the 24

The Halford model is similar. And what this 1 represents is data collected from or obtained from the Noah 2 site. I'm sorry. This is from the Western Regional Time 3 Center. But basically precipitation data and it's looking at 4 precipitation during the winter months, October through March. And you'll notice that the cut-off on this is five 6 inches. What this model -- And this is not mine. This is Halford's -- is that you need five or six inches of winter 8 precipitation in order to get a precip -- or a recharge 9 again. 10

The 2004-2005 precip as shown here, that was a major recharge event. Not just infiltration but recharge. When you see that in hydrographs, essentially many, many, many hydrographs that were looked at, this is the 2011 one that shows up in some but not all hydrographs.

11

12

13

14

18

19

20

21

12

13

14

15

16

17

18

19

But this period, what this shows is that when you look at winter precip over five inches, that in the early part of the century you get relatively few of these higher winter precip episodes. And then starting at approximately 1970 the frequency of those increases and then we get these really whoppers like the 2004-2005.

And, again, this is Keith's interpretation, not 22 mine, just for the record. But he interpreted the period of 23 24 record from the beginning of the century up to approximately

was asked to run a model, our model, to come up with an

1 estimate to do that. I refused to do that because I knew the 2

shortcomings in the model. So I did not provide an answer to 3

4 the State Engineer's office except to say that it was 5 something less than approximately 14,000 acre-feet a year,

which was the pumping during the Order 1169 test. 6 7

I think there are questions about, you know, whenever you pump you're going to have impacts. That's not a debatable issue. Somebody has to set a limit. It sounds like the limit might be set to protecting senior water rights in consideration of ecological constraints of the model base. To me that is reasonable.

One of the questions that ought to be part of the considerations is whether or not your evidence data will be delivered. If the concept is that you can have a natural system, you can pump it, water levels will go down and you'll start capturing water from the discharge areas and boundaries and you'll reach a new state of equilibrium, which is basically a new steady state. And the rates of impact or rates are captured and not continue to increase. It doesn't look like we're at a new steady state yet of equilibrium.

If we don't reach that, what will happen is discharge will continue to go down to hopefully at some point if we do reach an equilibrium, but potentially we won't. It

Page 582

Page 584

1970 as a dry period and the time after that a wet period 1 because there's a higher number of these higher winter precip 2 events. And this is his explanation for why we're seeing 3 rising water levels. It's consistent with research that I've 4 been aware of for a long period of time. And it's consistent with the geochemical data. And I think, you know, there can 6 7 be arguments about what this threshold value should be. But I think it's a -- it's a valid model for when recharge occurs 8 9 and what allows it to occur. It's an increase. It's a high amount of precipitation over the winter months and then, in 10 my opinion, the snow melt process after that. 11

So just revisiting, we see in our flow system declining water levels over, you know, the period of record with a precip or recharge event, the 2004-2005 showing in there, the effects of Order 1169 pumping that can affect the record shows after that with our CSVM-5, for example, showing up as an example of where we have rising water levels during this process and continuing. And you will recall that I classified all of these except for this as connected or highly connected to the spring area. CSVM-5 I classified as not connected. I think it is in a different flow regime than the other wells. By being not connected, it's not connected to pumping from the carbonate aquifer.

20 21 22 23 So moving on to annual quantity of pumping. I 24

1 depends on how much water is being pumped and how much water 2 can be induced to flow across, say, barriers, like the Las Vegas Valley shear zone to replace that water. But we're not 3 at a point yet, in my opinion, of being at equilibrium. 4

We talked about -- I showed many examples where water levels are continuing to go down. There's some wells where it looks like things are flattening out after the end of the test. But it looks like what happens over a longer period of time is that they flatten out and then they're starting to decline again.

We ran our model as part of this exercise out 500 years. And, again, I don't put a lot -- I wouldn't put a lot of stock in this 500 years. But our model predicts that after 500 years we're still not at equilibrium. Take that with, you know -- I recognize that the model has some issues that need to be fixed.

And so, you know, are the current discharge rates acceptable? That's not my decision. That's yours.

I'm going to discuss similar modeling results. As I've indicated, we have received comments about the model, heard statements that the model should not be used. And I agree that there are some things the model should not be used for. But let me discuss the process that's gone on. We early on, 2001, 2002, developed a model that was specifically

23

So, in approximately 2010 or so, National Park Service came up with funding to develop a new model, which we did. And it used a lot of additional information and modeling tools that we did not have a available in 2000, 2001. Our calibration data set was halfway -- went through halfway through the Order 1169 test. So we got the first

part of the test. We didn't get the last part of the test. So I'm going to talk about this a little bit. But we provided the modeling report. We provided the modeling data sets for anybody who wanted to use that model to test the model and evaluate its performance. And we received comments from SNWA. They pointed out in a very generous fashion that our report didn't have as much information as it should have. They pointed out some other things that should be looked at. Very useful set of comments. We received other comments that were kind of like we don't like your model. One was a description of what we did but didn't really go through an evaluation of it. But

the model has been out there for people to take a look at

27 hydrostratigraphic units because of all the

fault, different thrust faults in the area, in order to 2

capture the detail of the geology, we have 18 computational 3

4 layers. So it's an 18-layer model. Layers being thinner at

the top and increasing as we go deeper. 5

So there's the surficial geologic map that constrains the Framework model. In the left panel and the right panel are the locations of the cross-sections and where we had geophysical control to constrain our geological Framework model.

These are just a couple of examples. This is a section put together by Rick Page. And this is the same section, at least part of it, put together in our Framework model. The white area in here are the locate crystalline rocks that we did not map or didn't assimilate as a separate unit. But you can see that it captures the geometries that are depicted in the cross-sections very nicely. So that's one section. Here's another. Here the carbonates in blue. Here the carbonates shown in the cross-section.

The Framework model does a good job of matching the data as interpreted by Rick Page in his cross-section and based on geophysics and well control.

A little bit further down -- We talked about the thrust sheet earlier. Here's the thrust sheet with

Page 586

since approximately 2012. And they can run the model, 1 whatever. In fact, Argonne National Lab has used the model 2 to make some predictions of pumping in the valley. 3

We built the geologic framework for the model 4 based upon surficial mapping, cross-sections, well control, physics. We built in independent discharge so we can look at 6 7 the effects of pumping on stream discharge, stream aquifer interactions. We calibrated using PEST, which is an 8 9 automated calibration tool to come up with unbiased aquifer parameters. 10

I already talked about the decrease in permeability and the depth. One of the things it does not have in it is the decrease in storage, specific storage of depth, which I think is an important thing that is needed.

This is the area that we covered in the model. The flow system we're interested in is at the western edge, this portion in here. But we also include Lower Meadow Valley Wash, Tule, the Virgin Valley.

I'll point out that the calibration data or data for constrained calibration in this area, especially with respect to pumping effects, were much -- many fewer data points than what we had available in this area. So in terms of reliability, this is -- has higher reliability but still has shortcomings.

1 overturned rocks. So, you know, a lot of work went in to developing this Framework model. 2

We've got head dependent discharge that occurs.

These are where we're simulating evapotranspiration. There 4 was a question earlier about where you could pump if you 5

6 wanted to capture water from ET. This shows you where ET is

occurring. There's a little area of ET downstream of Rogers 7 and Blue Point Springs, which I showed you. It's not very 8

9 extensive. Primarily, we're talking about the areas that 10

we're concerned about. If we're pumping over here, here's where you can capture ET and extreme flow.

The right panel shows our extreme routing systems so that we can simulate what the effects of capture are on the stream flow.

Just some of the results. This is water table map pre-development. I mentioned the low gradient through Coyote Spring Valley down in to hidden Garnet. So we see here the gradient increases when we get in to the northern part of Coyote Spring Valley. Once we get up in to the volcanic area, lower permeability, higher recharge, gradients are much higher.

And we also simulated halfway through the 1169 pumping, this is -- I can't read what the limitation is on that color range. But we ran a simulation with and a

simulation without the MX-5 pumping, subtracted the two to 1 show where we were simulating the extent of drawdown at that 2 time. 3

Notice we did not -- This had extended down in to 4 hidden Garnet Valley. We under predicted the amounts of 5 drawdown and the extent at least at that point in time. 6

When we ran pumping in this area for a longer period of time, it extends further down and runs all the way to the Las Vegas Valley shear zone. It has connectivity within the carbonate aquifer all the way down.

So I think the model does have utility. I say here to evaluate the extent of pumping effects. In the short term, I think it will under predict what the extent is going to be based upon the Order 1169. In the long term, I think it does a good job.

We can only develop an approximate estimate of the magnitude. We underestimated drawdown and we underestimated impacts on decreases in the spring discharge. So you have to use the result knowing that that is a shortcoming.

We can evaluate flow paths because I think we do 21 a good job of matching the pre-development flow. I would not 22 use it to develop accurate estimates. How much are we 23 impacting Pederson Spring. I can't do that. Can I come up 24

increase in recharge since approximately 1970 based upon 1

Halford's work. Within the Lower White River Flow System, 2

water levels are primarily declining. And I think that's

4 because of pumping from the carbonate aquifer. I don't

think --

(The court reporter interrupts)

7 THE WITNESS: I don't think we're approaching a

new equilibrium. 8

HEARING OFFICER FAIRBANK: And just as a reminder, make sure you're speaking in to the microphone, because not only does it help the court reporter, but it also helps those that are remotely listening.

THE WITNESS: Okay. So we did some simulations to look at the effects of moving pumping from the Muddy River Springs area and the alluvial pumping along the Muddy River in to different areas. There were three different scenarios that we put together that did that in different fashions in scenario two and three. Scenario one is kind of a baseline. The total amount of pumping was the pumping at the time of Order 1169, not the current level. So be aware of that.

This slide, slide 69, shows changes that were made in the distribution of pumping. The panel on the left has a different area, Coyote Spring Valley shows the decline and the pumping within Coyote Spring Valley as the pumping is

Page 590

with a safe yield number? I can't do that. So that would be 1 a misuse of the model. 2

I think that we can improve it. But there's a 3 lot of work that's gone in to it. It's got a lot of 4

capabilities. There's new data out there. Lincoln County,

Vidler has said we did not incorporate the data that they had 6 developed in to it. That's correct. We got that data too 7

late to include in our model. It's still not in there.

I think, and I've made this recommendation before, that there needs to be a model that can be used by the State Engineer's office to answer some of these

questions. I don't care who develops it. But I think it 12 needs to be put together in a group fashion, transparent. 13

Everybody knows what's going in to the model as it's being 14

put in. Everybody understands shortcomings. Everybody is, 15 16 you know, a participant in that process. How that gets put

together is something the State Engineer can decide. But I 17

18 think it needs to be something that would be very useful that

everybody is involved in. It can be my model. It could be 19 somebody's else model. I'm trying to retire, so I don't 20

care. 21

10

11

This is a slide that's out of place. I forgot to 22

mention it. Surrounding areas -- I covered part of this. 23

Water levels are rising because I think there's been an

1 moved further to the south within the carbonate aquifer.

There's the Muddy River Springs area shown on

there as well. There's a decrease in total pumping as you go 3

from scenario one to scenario three, basically being shifted 4

down in to Garnet Valley and California Wash. The right panel shows the redistribution from the

Muddy River alluvium in to the carbonate aquifer. The 7

alluvial pumping is in the brownish color. Carbonate is in

the yellow. And then the total is in green. And as you go

from simulation one to three, the alluvial pumping drops off 10 and the carbonate pumping is increased and primarily down to 11

12 the south.

This map just shows the locations of the

simulated wells. You have to look at it pretty carefully to 14 kind of see the details of it. But that's provided in our 15

report.

So we simulated the effects. We looked at 17

impacts from simulated discharge in the Muddy River Springs 18 area and along the river. And those are shown here. Be 19

20 aware as you look at this. And it's kind of hard to tell, 21 that not all of these figures run from zero up. On this page

they both do. But we're showing that in the bottom scale 22

it's hard to read those from zero to 500 years. So we're 23

primarily interested in the first part of this. 24

The model predicts that there will be decreases in spring discharge as a result of either pumping under scenario one at 14,000 acre-feet per year and change as well as the other. But as we move from scenario one to scenario three, the results aren't that much different. We get quicker results and quicker impacts at early time with scenario one, more delayed as more and more pumpage is moved

When you look at Rogers and Blue Point, you know, we're predicting that there is, you know, a change, but it's not something that is a drastic change unless we get below that lip that I said may exist.

to the south, but only by a small amount.

This is stream flow. So impacts on water rights. People diverting from the stream. And we see similar kinds of things, similar results from all three simulations with -because we're -- here we're looking at the effects of moving. Pumping adjacent to the springs we see a greater delay than what we see with the springs. But we're primarily seeing a delay, not a total change -- change in the total impact.

So my conclusion is that if pumping is moved there will be temporary benefits but at some time the things are going to catch up with us. I say this, but I want to emphasize that our model under predicted the rate at which discharge spread from Order 1169. So I think we're

your pumping will cause declines in water levels to people up gradient from you or side gradient from you and decrease the discharge or deepens -- increases the pumping expenses.

So, in my view, this evaluation that was done provides no useful information to you. One, it was based on a model that is interesting but not a calibrated model. It doesn't do a good job of returning flow system. But then it uses a concept that is invalid. A lot of people make the same mistake.

And just a simple illustration. This is out of a book by Stan Lowman showing the effects of well interference. In this particular example it's how can we simulate using the Theis equation and impermeable boundary. So no flow across this boundary. Here's a capture zone, here's a capture zone. We can't get flow across it because we have this no-flow boundary. It's a simulated no-flow boundary.

But, if you look at this lower diagram, the pumping at this well goes across that boundary in to the area of the other well and causes drawdown in the other well. Similarly, the reverse is true. So the total drawdown is the sum of these two drawdown curves. If you're looking at a discharge area, it's the same kind of thing. You have to sum the effects of pumping from all the wells. The presence of this boundary in quotes it has no effect.

Page 594

predicting longer delays than will actually occur. 1 2

I think it's important -- This gets back to this connectivity thing, that if there are ideas of moving pumping in to less well-connected areas, there needs to be a demonstration that they are less well connected and that there aren't impacts. I don't think that CSAMT surveys provide you information on that brief connectedness to the extent that we would like.

Capture zones. Moapa Band of Paiutes has stated that pumping in California Wash or at least most of California Wash is not going to impact the Muddy River Springs area because it's in a different capture zone, that California Wash is in the capture zone for Las Vegas Valley pumping, not in the capture zoning for the Muddy River Springs.

A lot of people make this mistake. How can I be affecting somebody that's down gradient from me? I can impact somebody down gradient from me if I pump water because that water is no longer available to flow to them. But if I'm side gradient or I'm down gradient from them and I pump, my pumping isn't going to affect that area, that discharge area. That's a surface water concept. You can take water downstream from another user from a stream and not impact the upstream user. You cannot do that in groundwater because

Page 596

1 And this next slide is from the Theis modeling that CSI did. I'm using just an example of the same kind of 2 thing. Pumping of two different wells. I believe it was 3 MX-5 and Arrow Canyon. And calculating by Theis what the 4 drawdown cones associated with this are. They add them 5 together correctly and we develop a groundwater divide 6 between the two wells. So to the right side of this divide 7 is the capture zone for the canyon. To the left of it is the 8 9 capture zone from MX-5. Different capture zones. But the 10 two wells are affecting each other. The capture zone has nothing to do with the -- how far the extent of pumping 11 12 impacts goes.

So to quickly summarize, I really like the idea of joint administrative unit. I had argued in a hearing related to pumping in the Death Valley Flow System that even though there are different hydrogeologic areas, different basins, those basins will impact each other when pumping occurs. And I urge the State Engineer's office to manage those as a collective groundwater system because that's what it is. So I'm really happy that this is happening. It's going to require continued collection of data. I think that long-term production shouldn't be allowed unless there has been a demonstration that it's not going to impact groundwater discharge in the springs area or along the river.

(27) Pages 593 - 596 Min-U-Script® **Capitol Reporters** 775-882-5322

Page 597 Page 599 And in areas -- And this is getting in to Rogers and Blue 1 1 Point, we know that there's not a strong connection between 2 2 those two, but it's a very important resource. And 3 monitoring will be needed to make sure that resource isn't 4 4 affected. 5 5 Next conclusion is that water levels are 6 6 7 declining in the carbonate aquifer, a large area, while 7 they're rising in other areas in the same climatic regime. I 8 8 think this is because of existing pumping from the carbonate 9 9 aquifer and needs to be recognized in decisions. 10 10 11 I kind of already stated this. Rogers and Blue 11 Point are fed by water from the carbonate aquifer. They're 12 12 connected but not a strong connection to the aquifer in 13 13 California Wash and Garnet Valley. But monitoring is needed 14 14 15 to see if there are changes that might impact those springs. 15 And then, finally, moving pumping from the 16 16 sensitive areas, the Muddy River Springs area and the Muddy 17 17 River, is going to help for a short period of time, but 18 18 eventually the impacts will be the same. Thank you. 19 19 MS. GLASGOW: Thank you. That concludes our 20 20 presentation. 21 21 HEARING OFFICER FAIRBANK: Okay. Thank you. So, 22 22 let's see, we will go ahead and take a lunch break and we 23 23 will reconvene at 1:00 p.m. Thank you. 24 24 Page 598 (Lunch recess was taken) 1 STATE OF NEVADA 2)ss. HEARING OFFICER FAIRBANK: Okay. Let's go ahead and go back on the record. And so, we'll go ahead and start the opportunity for cross-examination

and questions.

And we will commence -- start with Coyote Springs Investments. 10

And again, we've had several parties that have 11 12 indicated that they're not going to be participating in cross-examination today, and so, I've adjusted the time 13 schedule so each of the participants will have

15 16 minutes for their cross-examination. And then,

again, if there's time at the end of today, then we can

go ahead and see about maybe allowing a second round of 17

questions. 18

19

Go ahead and proceed, Mr. Herrema.

20

RICHARD K. WADDELL, JR., 21

called as a witness herein by the National 22

Park Service, having been previously duly

24 sworn, was examined and testified as follows:

transmissivity values. Same answer for inflows. But,

whereas say discharge to a spring, you can, depending

on that, the discharge rate from the spring, use

different techniques. If it's a large capacity spring

that results in spring flow, you can build a flume or

other type of measurement, strike them on the stream

7 and measure the flow with that technique.

If it's a very small stream -- a very small 8

discharging spring, you can estimate it -- I'm sorry --9

measure it through a bucket and stopwatch method, if 10

11 you will, where you capture the discharge from the

spring over a certain period of time, measure that 12

volume, and divide it by the amount of time. 13

So, you know, it depends really on what the 14

15 characteristics of that spring discharge are. If you're interested in discharge into a river, you would 16

do like the USGS did with their synoptic study that 17

they performed on the river where you set up stations

along the river and make measurements at those stations 19

either by measuring water velocity cross-sectional area 20

and integrating that to get a value, or you -- if you 21

have a gauging station with a flume or weir or 22

something like that, you can use those data. But, you 23

do that at different points along the stream so that 24

Page 604

CROSS-EXAMINATION 1 BY MR. HERREMA: 2

O. Good afternoon, Dr. Waddell.

A. Good afternoon.

Q. I'm Brad Herrema. I'm counsel for CSI. I have

with me at the table Emilia Cargill who is a General

Counsel for CSI. And I have handful of questions. I'm

going to try to do as much as I can with my 16 minutes.

So, I'm going to try to move quickly. But, I would

like to get your full answers to each of the questions. 10

First, you stated in your presentation that 11

discharge has the smallest -- excuse me -- has the

smallest amount of uncertainty. 13

What do you use to measure groundwater outflow

from a system? Can --15

A. I want to make sure I understand your question. 16

When you talk about groundwater outflow, are you 17

talking about outflow across a boundary, or you talking 18

about outflow to the surface? 19

Q. How would you measure either? 20

A. Well, the outflow across a boundary really 21

can't be measured. You can estimate it based upon 22

estimates of the transmissivity of the aquifer and

gradient. But, there's a lot of uncertainty in the

you can see changes. And the concept typically is to

measure those several times and average out the years.

3 Q. Okay. Thank you. I'd like to move on to some

questions about your model.

Looking at the 2012 report on development of

your model, there's a table 3-4. It's average annual

evapotranspiration discharge by hydrographic area. Do 7

you recall that?

A. I do not, but I think I've got a copy of it

10

O. Okay. The report states that -- or that table 11

12 states that there's 4000-acre-feet per year of

evapotranspiration in Muddy River Springs area, there's 13

2000-acre-feet per year of evapotranspiration in Black 14

Mountains area, 6000-acre-feet per year of 15

evapotranspiration in California Wash which totals 16

12,000-acre-feet per year. And this references a 2008 17

USGS study. 18

Do you know if these were predevelopment 19

evapotranspiration rates, or they were current in 2008? 20

A. They were current in 2008. 21

Q. Your 2012 report also states that flow in 22

Coyote Spring Valley comes from a combination of 23

recharging in Delamar Mountains and underflow at the

(2) Pages 603 - 606 Min-U-Script® Capitol Reporters 775-882-5322

Page 607

- 1 northern most end of Coyote Spring Valley, and the flow
- 2 continues south through carbonate rocks. Some of the
- 3 groundwater flow discharges into the Muddy River either
- 4 through the Muddy River Springs and some regional
- 5 groundwater flow likely to continue southeast into
- 6 California Wash.
- Are you suggesting that there are two flow
- 8 paths through Coyote Spring Valley, one toward Muddy
- 9 River Springs and the other toward Hidden and Garnet
- 10 Valleys?
- 11 A. I'm suggesting that the flow to the south in
- 12 Coyote Spring Valley, some of that goes towards the
- 13 Muddy River Springs area. I don't -- I would answer
- 14 yeah, there are -- there are at least two flow paths,
- but they're three-dimensional flow tubes, if you will.
- 16 So, you can't necessarily draw a line on a map and say
- 17 to the east of this line that all goes to Muddy River
- 18 Spring and to west of it, it goes further to the south.
- But, in essence I'm saying there are two areas
- 20 that that flow goes to.
- 21 Q. Okay. A review of your 2012 report indicated
- 22 that you did one steady-state and two transient
- 23 calibrations. Could you explain why you performed two
- 24 transient calibrations?

- 1 presented today?
- 2 A. It would change the output that I showed you
- 3 with respect to discharge rates into the river along
- 4 the different stretches of the river. It would not
- 5 really change my conclusion that we would be looking at
- 6 similar effect just delayed with movement of pumping
- 7 from the regular area down into the southern part of
- 8 the flow system.
- 9 Q. For the simulations that you discussed today,
- 10 did you update the calibration of the model with any
- 11 data collected since December 2011?
- 12 A. We did not.
- 13 Q. So, the updated model that you presented today
- 14 and you refer to in your report, does it include any
- 15 form of recalibration using data collected after
- 16 December, 2011?
- 17 A. No, it does not.
- 18 Q. Are you able to provide any estimate of
- 19 accuracy of your model for the recent simulations based
- 20 on that 2012 calibration?
- 21 A. It's going to depend upon the area that you're
- 22 looking at. In terms of the amount of drawdown, my
- 23 recollection is that we were -- the model estimated
- 24 about half of what was measured, but it varied on which

Page 608

Page 610

- 1 A. I -- my recollection -- and I haven't reviewed
- 2 that report in that kind of detail, but let me first
- 3 answer your unasked question about the state of the
- 4 study. We wanted to get a base model base so it would
- 5 be consistent with the estimated fluxes across the
- 6 external boundaries, the estimated recharge rate so
- 7 that it calculates the discharge and the distribution
- 8 of water levels throughout the model. My recollection
- 9 is that for the transient calibrations we did one
- 10 calibration process with longer time steps that didn't
- 11 look at the pumping affects in as much detail. And
- 12 then another one was shorter time steps to get
- 13 additional tempo information. But I -- I -- that was a
- 14 long time ago, and I don't recall that detail.
- 15 Q. Okay.
- 16 A. I can check the report if you'd like.
- 17 Q. Not right now, thank you.
- 18 Review of that model report shows that
- 19 simulated flow at the Muddy River near the Moapa Gauge
- 20 goes up to 15 CFS less than observed. Was that Moapa
- 21 Gauge considered during the model calibration?
- 22 A. It was, yes.
- 23 Q. And could correcting for simulated flow at the
- 24 Moapa Gauge change any of the opinions that you

- 1 well you were looking at. So, in some wells, it would
- 2 match better than it did in others.
- With respect to the flow, I don't recall the
- 4 detail about how much we estimated decline at Pederson
- 5 Springs versus what was measured with something less
- 6 than that. I just don't recall.
- 7 Q. Something less than half?
- 8 A. I didn't -- I said less than that.
- 9 Q. Okay.
- 10 A. Less than what was simulated. I'm not saying
- 11 that correctly. I don't know how to -- I don't have
- 12 the information to say how much that model simulation
- 13 was off in front of me.
- 14 Q. Okay. You have said that continued development
- 15 of the model should include changes in recharge and the
- 16 implementation of structural features. Would either of
- 17 these elements effect the underestimated impact of
- 18 Order 1169 pumping?
- 19 A. By themselves? I think if we added some
- 20 additional structure -- you had mentioned the mismatch
- 21 at one of the gages where water bypassed -- in the
- 22 model bypassed that gage location to discharge further
- 23 downgradient. A structure in there that would keep
- that flow would provide a better match.

Min-U-Script® Capitol Reporters (3) Pages 607 - 610 775-882-5322

Page 611

- So, yeah, increasing structure and that kind of
- 2 stuff would, I think, be an improvement to the model.
- 3 I don't think that's sufficient. The changes in
- 4 recharge that I had in mind was putting in the
- 5 transient recharge data set so that we could simulate
- 6 the increases in water levels from the 2004, 2005
- 7 recharge event. So, we had a process for simulating
- 8 that change that was observed in the data. That
- 9 currently does not exist in the model.
- 10 Q. In regard to the faults that are included in
- 11 the 2000 -- I'll call them the 2012 model. Should we
- call it the updated 2012? You haven't added any faults
- 13 since 2012, correct?
- 14 A. That is correct.
- 15 Q. In regard to the 2012 model, is it correct that
- 16 the only faults that were simulated in that model is
- 17 the Coyote Spring Valley and the Muddy River Springs
- 18 area? Are the Kane Springs Wash faults and the White
- 19 Narrows fault?
- 20 A. That's my recollection, yes.
- 21 Q. And could additional faults be added to the
- 22 model based on the recent geophysics work that CSI and
- 23 Vidler had commissioned?
- 24 A. Additional faults could be added in the Coyote

- 1 how would they -- we'd estimate that. I was using this
- 2 slide to say that in other areas where this type of
- 3 information has been collected, the information
- 4 indicates that the fault blocks are not impermeable.
- 5 Q. So temperature and flow testing or tracer
- testing is not compthing that you could do in t
- 6 testing is not something that you could do in the
- 7 Coyote Spring Valley to analyze the fault block there?
- 8 A. No, it could be. I was just -- I thought you
- 9 had mischaracterized what this slide said. But, yes,
- 10 that type of work could be done.
- 11 Q. Did you do any of that type of analysis in
- 12 Coyote Springs Valley?
- 13 A. No.
- 14 Q. Would you recommend that it be done?
- 15 A. I would recommendation additional work. I
- 16 wouldn't necessarily recommend, for example, tracer
- 17 testing in Coyote Spring Valley.
- 18 Q. There is additional work you would recommend?
- 19 A. I think --
- 20 Q. To characterize that fault system? I'm sorry.
- 21 A. I think additional drilling and hydrologic
- 22 testing looking at the amount of attenuation of the
- 23 drawdown signal across the fault would provide useful
- 24 information.

Page 612

Page 614

- 1 Spring Valley, yes.
- 2 Q. And if you added those faults into the model,
- 3 would the model then need to be recalibrated?
- 4 A. Yes.
- 5 Q. Would the addition of the faults allow you to
- 6 better understand -- I'm sorry -- to better estimate
- 7 the predicted drawdown in water levels that you stated
- 8 were underestimated?
- 9 A. I don't think they testified that we
- 10 underestimated water levels. We underestimated the
- 11 amount of drawdown. And the additional faults will
- 12 change the distribution of the estimated drawdown.
- 13 Q. Okay. So, the addition of faults would allow
- 14 you to better estimate the predicted drawdown in water
- 15 levels which you said were underestimated?
- 16 A. With other changes, yes.
- 17 Q. If I could turn attention to slide 19. Do you
- 18 have your slides in front of you? Could you pull that
- 19 one up? Thank you.
- This slide includes different suggestions about
- 21 how you might evaluate the permeability within a fault
- 22 block. Did you do any of that analysis in the Coyote
- 23 Springs Valley?
- 24 A. This slide does not provide suggestions about

- 1 Q. Do you have an opinion as to whether MX-5 and
- 2 MX-4 wells are completed within the structural block or
- 3 within the damaged area or fractured area associated
- 4 with normal faulting?
- 5 A. I think that whole area has been -- has
- 6 enhanced permeability. Whether or not it's due to the
- 7 normal faulting associated with the lateral extent of
- 8 your canyon range and the subsurface or whether it's
- 9 due to the right lateral movement of a shear zone that
- runs from that area towards the Muddy River Springs
- 11 area, I'm not sure about.
- In CSI's presentation the response to one of
- 13 the questions was that MX-5 penetrated the fault on the
- 14 east side of that block. I did not go back and look at
- 15 the log to see if there was evidence for a fault at
- 16 MX-5.
- 17 Q. Okay.
- 18 A. So, I -- you know, they -- those wells could be
- 19 within the damage zone, but I have not looked at that
- 20 carefully to provide you an answer accurate answer.
- MR. HERREMA: Okay. Thank you. I heard my
- 22 buzzer. Thanks.
- 23 HEARING OFFICER FAIRBANK: Thank you. Next is
- Luke Miller, Fish and Wildlife Service. I see that

Page 615

- they have the no questions. 1
- Moapa Band of Paiute Indians. 2

3

- **CROSS-EXAMINATION** 4
- BY MS. BALDWIN:
- Q. Good afternoon. I'm Beth Baldwin, attorney for 6
- the Moapa Band of Paiute. And with me is Lyna Tanner,
- our local counsel.
- Mr. Waddell, I'm going to try to follow the
- general order of your PowerPoint with my questions. 10
- So, I'm going to refer to the slides when I ask the 11
- questions. We may get out of order, but that's my 12
- general intent. 13
- So, starting with slide number seven. So, 14
- 15 you've listed five I guess factors that you look at
- when examining hydraulic connectedness. Is it fair to 16
- 17 say that geology is the most important?
- A. What I indicated on this slide is that 18
- continuity of the geologic unit, or the active unit, is 19
- so high importance that it's -- you have to have that 20
- continuity. But, just having that continuity does not 21
- indicate that there is connectedness.
- Q. Okay. And then, so, would low hydraulic
- gradient and water chemistry then be the least

- 1 Q. Roughly, yeah.
- 2 A. It looks to me like it's the latter part of
- 2010. There's a declining water level prior to that
- that's part of the seasonal effect.
- Q. Okay. All right. Thank you.
- Moving ahead to slide 23. This is Kane Springs
- Valley. These are the hydrographs for KMW-1 and
- CSVM-4. It looks like there's this dip in 2014. Do
- you know why? Did you have an opinion why?
- 10 A. You asked about a dip?
- 11 Q. Well, it looks like there's a drop in the water
- levels around 2014. Again, I'm having trouble reading
- that exact. So, that might not be the right date.
- A. No. It looks to me like the affects of pumping
- continued past the end of MX-5 pumping, which was early
- 2013. On the hydrograph for CSVM-4 there's a gap in
- data, so, it's -- you can't really say much about it.
- Q. Okay. Thanks.
- A. But it's -- the pumping over, you know, the
- two-year period and then the delay because of the
- result of the attenuation of affects delayed the start
- of recovery. 22
- Q. Okay. Going to slide 28, this is titled Las 23
- Vegas Valley. I'm confused whether you're proposing to

Page 616

Page 618

- important? I'm just trying to understand if there's a
- hierarchy here or not necessarily.
- 3 A. As I explained, you can have high -- I mean
- low hydraulic gradient in rock that is not highly
- permeable. There's just not a lot of water movement
- through it. So, by itself it's not sufficient to 6
- indicate a high connectedness.
- Groundwater chemistry provides information that 8
- you can use to -- I'm looking for the right word -- to
- show some type of connection, but, by itself, not the 10
- quality of that connection. 11
- Q. Okay. Going ahead to slide ten, this is the
- hydrograph for CSVM-6. I'm having trouble reading the
- dates on the X access. Is there an Order 1169 response
- in this hydrograph in your opinion, and if so, when is
- it beginning? 16
- A. There is a response in -- give me just a 17
- minute. Let me see if I can read the date.
- Q. They're very small. My best guess is 2013,
- but, I can't really tell for sure.
- 21 A. Are you asking for a response from initiation
- of the test or --
- 23 Q. Yeah.
- 24 A. -- the ending of the test?

- 1 include Las Vegas Valley in the Lower White River Flow
- System or not?
- 3 A. I am not proposing to include it.
- 4 Q. Okay.
- A. That was my tongue in cheek recommendation.
- Q. So, I believe in -- somewhere in your report
- and you're talking about your modeling results, the
- simulations you did for this proceeding, that you did
- notice drawdown in Las Vegas Valley way out in the
- future. Do you recall if that's?
- 11 A. We did not simulate Las Vegas Valley. The
- model simulated that there would be drawdown affects
- that extended to the boundary of the model but was
- along the Las Vegas Valley shear zone.
- Q. Okay. So, it goes just the boundary?
- 16 A. That's correct.
- Q. And I think -- I believe your opinion was that 17
- not much water flows across that shear zone, the Las
- Vegas Valley shear zone; is that correct? 19
- 20 A. That is correct.
- Q. And I don't want to misstate this, but I
- believe you also said that it's the -- there's a low
- hydraulic gradient?
- 24 A. I didn't find evidence of a high gradient

Min-U-Script® (5) Pages 615 - 618 Capitol Reporters 775-882-5322

Page 619

- across that.
- Q. Okay. 2
- A. I don't believe I testified or wrote that it
- was -- that the low flow was because of the low
- gradient. I think that there is a permeability change
- associated with the shear zone that limits the flow
- across the shear zone.
- There were questions earlier about changes to
- the model that I would make if we were doing additional
- calibration, and one of those changes would be to 10
- change that boundary condition in the model from a no 11
- flow boundary to independent boundary. 12
- Q. And I'm not a scientist, so these questions 13
- might be off base. But, if there's a low hydraulic 14
- 15 gradient, how does that impact the measure of
- transmissivity? Or does it not impact it? 16
- 17 A. It depends on how you're trying to measure
- transmissivity. 18
- O. Okay. 19
- A. There's -- the standard, commonly implemented
- way is to run an acra test. Drill wells, you hopefully 21
- -- or you should drill observation wells, or have
- available observation wells. You pump a well and look
- at the drawdown that occurs in the surrounding wells.

- 1 you're referring to, but --
 - 2 Q. It's when you're talking about the 500 years in
 - the future. It was simulated change. I think you said
 - it drops from 2.25 down to 2.0. But, if the current
 - discharge is 2.15, then it would -- that's a
 - difference? 6
 - 7 A. That is probably the reason.
 - Q. Okay. Okay.
 - A. It was not intentional.
 - 10 Q. Okay. Thank you.
 - 11 So, on slide 34, we're talking about the source
 - 12 of the water that discharges at Rogers and Blue Point
 - 13 Springs. Did you look at heat as a tracer or
 - temperature as a tracer? 14
 - A. I did not. I know that because the
 - temperatures is warm --
 - Q. How warm are we talking?
 - A. My memory is somewhere in the low '90s, but
 - they didn't do an analysis of that. That typically
 - suggests to a hydrologist that the water has gone at
 - some depth, and I didn't do any calculations of depth. 21
 - I know that people have suggested using the internal 22
 - gradient or an average thermal gradient. Gradients 23
 - make that calculation, and I think that's appropriate

Page 620

Page 622

- And you develop a model of that drawdown experiment and
- back calculate transmissivity storage coefficient. So,
- that's one way. 3
- The other way, if you know the discharge
- through that area -- and I will stress again, if you
- know it, then you can measure the gradient and
- calculate the transmissivity.
- O. But we don't -- we don't know flow. I believe
- you testified that that's something we don't actually
- know, but it's presumed to be low? 10
- A. That is correct. We do not know the flow.
- This would not be a good location to use this other 12
- approach. 13
- Q. Okay. So, let's talk a little bit about Rogers
- and Blue Point Springs. Looking at slides 32 and 33,
- which are the hydrographs, I see mean annual discharge 16
- at Rogers is 1.63 CFS, and then at Blue Point it's 17
- .52 CFS. But I have a total of 2.15 CFS; is that 18
- correct? 19
- 20 A. That sounds right.
- Q. I think your report you mentioned 2.25, and I
- realize it's, you know, one-tenth of a difference, but,
- is there a reason why the figures differ?
- 24 A. Not that I know of. I'm not sure which report

- in some areas. I don't think it's appropriate in the
- Muddy River Springs area to do that. But no, I did
- 3 not.
- Q. Would the temperature and the correlation that
- it's coming from depth support Wiser Wash as a
- potential source?
- 7 A. I think it would be a similar situation as flow
- from California Wash.
- Q. So, doesn't tell us one away or the other, in
- your opinion?
- 11 A. I haven't looked at it in that detail, but, I
- don't believe so.
- Q. Okay. Going onto slide 36, the isotope 13
- analysis. Does temperature play a role in isotopic 14
- composition? 15
- A. It -- the temperature of the recharge certainly 16
- does. At the temperatures that we're talking about, 17
- we're not looking at changes in the composition through 18
- mineralogical changes which have been documented to a 19
- 20 period that requires higher temperatures. But, the
- primary influence of temperature here would be in 21
- looking at it and trying to estimate what the 22 temperature at recharge was, that recharge source. 23

Q. Okay. Slide 37, you're showing us the Global

Page 623

- Meteoric Water Line, and it generally goes from the
- lower left to the upper right more or less. 2
- What if we have a situation where as oxygen-18 3
- gets heavier and deuterium is getting lighter, what
- would that tell us about the water?
- A. That may suggest mineralogic changes, but I --
- I'd have to say I don't know.
- Q. Okay. That's fair.
- Going into slide 36, and it's your opinion
- there's a hydraulic connection between Rogers and Blue 10
- Point Springs and the carbonate aquifer beneath 11
- California Wash? 12
- 13 A. That is correct.
- Q. And is that different from the opinion the Park
- Service offered in 2013?
- A. I'm not familiar with what they offered. 16
- Q. Were you a part of the 2013 report that they 17
- prepared in the Order 1169? 18
- 19 A. I was part of that, yes. I don't recall what
- they would have said. 20
- Q. Going ahead. Talking about the water levels, 21
- slide -- starting on slide 48. Actually slide 15.
- At the bottom of the Spring Mountain hydrograph 23
- it looks like there's two wells that are either

- 1 Q. My name is Paul Taggart. I represent the
- Southern Nevada Water District and the Las Vegas Valley
- Water District, and I had some questions for you.
- First, how long have you been involved in
- analyzing the hydrogeology of the Lower White River
- Flow System
- 7 A. I -- my first involvement was in approximately
- 2001.
- Q. And at that time, were you involved in the 9
- hearings involving CSI's applications for new 10
- groundwater applications in Coyote Spring Valley?
- 12 A. Yes.
- 13 Q. And at that time, were you concerned about the
- impact of pumping water in Coyote Spring Valley on
- 15 Rogers and Blue Point Spring and the Muddy River
- 16
- A. I was concerned about the effect of pumping not 17
- on Rogers and Blue Point, but on the springs in the
- Muddy River Springs area and also on the Muddy River.
- Q. And during that hearing did you make those
- concerns known to the state engineer?
- A. I haven't reviewed the transcript, but, I
- believe I did. 23
- 24 Q. Okay. And as a result of the pumping test that

Page 624

Page 626

- declining or holding stable?
- A. Excuse me. Which slide?
- 3 Q. Slide 15. Sorry. So, at the bottom right of
- the hydrograph it looks like there's two wells, and one
- is holding stable. The water levels are stable. And
- another it looks like they're declining? Is that -- is
- that accurate?
- A. Yes. 8
- Q. Do you have an explanation or an opinion why?
- A. I wouldn't want to speculate. The BLM well is 10
- down on the, you know, lower elevation close to where 11
- there may be pumping. So, it may be associated with 12
- that. I didn't want to speculate, but I just did. 13
- Q. That's fair enough.
- MS. BALDWIN: I think that's that my buzzer. 15
- Thank you. 16
- HEARING OFFICER FAIRBANK: Yes, thank you. 17
- Next is Southern Nevada Water Authority, Las 18
- Vegas Valley Water District. 19

20

- **CROSS-EXAMINATION** 21
- BY MR. TAGGART: 22
- Q. Good afternoon, Dr. Waddell. 23
- 24 A. Good afternoon.

- was in result of Order 1169, were some of your concerns
- validated, or how would you describe that?
- 3 A. Yes, I would say they were validated. A lot of
- those concerns had previous develop -- previously
- developed from observing the impact of pumping of Arrow 5
- Canyon wells, wells in Coyote Spring Valley. So, we 6
- knew that there was a hydraulic connection, but, the
- pumping test provided additional information on impacts
- on the springs, as well as water levels in the springs 9
- 10
- O. I have a number of questions for you about the 11
- proposal that Mr. Reich made. Were you here during his
- testimony? 13
- A. Yes, I was.
- Q. And the questions I'm going to ask you now, 15
- are -- I'm going to ask you to, if you can, base the
- answers on your analysis of the geology, the hydrology, 17
- as opposed to the groundwater model. So, I'll -- I'd 18
- like you to just tell me if these conclusions can be 19
- made based upon your analysis of that other 20
- information. And the reason I say that is because I 21
- know -- I have a couple of questions about your model, 22
- too. But, since you've indicated some concerns about
- the calibration of it, I just want to be clear about

Page 627

- whether you're relying on that or not in some of your
- answers. Does that -- does that make sense?
- A. It makes perfect sense. I prefer, you know, if
- there are data to support the conclusion that's a much
- stronger base than relying on a model.
- Q. Okay. And so, this line of questions I want
- you to rely on the data itself. Okay?
- So, you said during your testimony that the
- geologic structures that Mr. Reich identified and
- plotted on his figure ten, that you didn't think that 10
- they were impermeable; is that -- is that accurate? 11
- A. Yes, it is.
- Q. Okay. And it's true that you said that the 13
- resistivity data that you relied upon, while it's
- 15 useful for identifying fractures, it's not useful for
- identifying hydrologic properties; is that fair? 16
- 17 A. No. What I said was that the geophysical data
- are useful for identifying faults, the effect of faults 18
- and displacement of the carbonates. But, it does not 19
- provide information on fractures --20
- Q. Okay.
- A. -- that are present.
- Q. I'm sorry. That was my mistake on faults. 23
- But, do you disagree with Mr. Reich to the

- different assumptions, and I looked not only at
- recharge but some other assumptions. I went through a
- recalibration step with each of those models and
- determined that the predicted affects varied very
- 5
- Q. Okay. And do you think the state engineer 6
- should determine what the long-term quantity of
- groundwater that can be pumped without impacting senior
- rights or the public interest? Did you think that
- water budget should play a significant role, or analyst 10
- data should play a significant role in that? 11
- 12 A. I think -- and again, to avoid confusion, I'm
- 13 going to say analytic data is not chemical data. But,
- I think hydrologic data where pumping is done and 14
- 15 observations are made of discharge -- affects on
- discharge rates, your water levels is much more valid.
- Q. Now, I'd like to ask you about the hydrologic
- information regarding CSI-1, -3, and -4, the three
- wells. And in your testimony you talked about your 19
- analysis of hydrographs of certain monitor wells in
- Coyote Spring Valley, and I want to ask you about how 21
- that analysis informs your view of these three wells. 22
- So, I've put out on the table there, that's 23
- copy of SNWA's Exhibit Number -- can't remember. It's

Page 628

Page 630

- extent you rely upon the resistivity data as a basis
- for there being a hydrologic barrier in that location?
- Was it wrong to use resistivity data for that
- conclusion, if that's how he used it?
- A. I think that you can use the mapping of faults
- to hypothesize that there may be -- I will use my
- term -- impediment to flow across the fault. But, that
- it's necessary to do hydrologic work to establish
- whether that's indeed true.
- Q. Okay. Now, did you also on hear testimony 10
- about new recharge estimates that were made in the
- Sheep Range by Mr. Reich and others on behalf of CSI? 12
- A. I did.
- Q. Okay. And would that recharge estimate fall
- within this category of recharge parameters that you
- tested with the pest product and determined that the 16
- recharge really isn't a significant factor in drawdown 17
- generally, and the changes in recharge values aren't as 18 significant as other factors are in how drawdown
- 20 occurs?

19

- A. Yes, but, let me make clear so that there's not 21
- confusion. That modeling and testing that I did, was 22
- in a different area. But what that testing showed me 23
- was that I could develop different models with

- 1 our rebuttal report. And do you see that?
- 2 A. I see it, yes.
- 3 Q. Okay. And on figure five -- I'm sorry, figure
- 2-5 on page 9, there is a set of hydrographs that
- include CSI-1e, CSI-3, and CSI-4, and at -- and at the
- bottom is also the CSVM-1. Do you see that?
- 7 A. I do.
- Q. Okay. My question for you is, do you believe
- that pumping can occur at CSI-1, -3 or -4 wells,
- without impacting the Muddy River Springs?
- 11 A. No.
- 12 Q. And do you believe that the hydrographs for
- CSI-1, -3 and -4 reflect a signal from the pumping at
- MX-5 during the 1169 pumping test?
- A. I believe that -- excuse me. I believe that
- the hydrographs are complicated by pumping that was 16
- ongoing during that test that had the seasonal 17
- signature to it. But, the declines in wells levels 18
- that occurred during the period of MX-5 pumping 19
- 20 indicate that that pumping from MX-5 affected water
- levels in CS-1, -2, and -3. 21
- Q. Okay. I asked about CS-1, -3, and -4.
- 23 A. I'm sorry. One, three, and four.
- 24 Q. And there's been some questions about CSVM-5.

Min-U-Script® (8) Pages 627 - 630 Capitol Reporters 775-882-5322

Page 631

- 1 Are you familiar with that monitor well?
- 2 A. Yes
- 3 O. Okay. And is it fair to say it's on the fan,
- 4 alluvial fan coming down from the Sheep Range?
- 5 A. Yes.
- 6 Q. And that's on the west side of Coyote Spring
- 7 Valley?
- 8 A. Yes.
- 9 Q. And I believe your testimony was that that
- 10 hydrograph does not show a signal from the pump test --
- 11 pumping test that Order 1169 allowed?
- 12 A. That's correct.
- 13 Q. Do you have an opinion on whether a large
- quantity of water could be developed at that -- at that
- 15 well, or at that block area?
- 16 A. I don't have sufficient information to give an
- 17 opinion.
- 18 Q. Okay. Did you hear the testimony of
- 19 Ms. Braumiller yesterday for the Fish and Wildlife
- 20 Service?
- 21 A. Yes.
- 22 Q. And do you recall her answer and question about
- 23 CSVM-5 and it's hydrologic condition?
- 24 A. I remember her answering a question, but I

- 1 numbers in terms of calculations of drawdown at certain
- 2 locations; is that fair?
- 3 A. That is fair, yes.
- 4 Q. But, would you agree that it can be used to
- 5 test trends or general conceptual models that
- 6 hydrologist and hydrogeologists have about this area?
 - 7 A. Oh, absolutely.
 - 8 Q. Okay. And so my questions are going to be
- 9 along those lines. And specifically, if you turn to
- 10 page 73, I think it is in your slides, and there's
- 11 actually a couple of figures in your report.
- But -- and you may have already said this, but,
- 13 the fact that -- well, let me slow down.
- Slide 73, on the right panel is a projection of
- 15 simulated capture flow near Glendale from the Muddy
- 16 River, correct?
- 17 A. Yes. What it is shown here is our simulated
- 18 flow in the Muddy River at those locations.
- 19 Q. Okay
- 20 A. The decline in flow is what happens.
- 21 Q. Yeah, the figure -- I wanted to ask about the
- 22 figure that's in your report, but I'm running short of
- 23 time, so I'm going to -- I'm just going to ask you a
- 24 couple questions about it.

Page 632 Page 634

- 1 don't remember what her answer was.
- 2 Q. All right. The -- the -- okay.
- 3 Could you turn to slide 45 from your
- 4 PowerPoint, please?
- 5 And my question has to do with the opinion that
- 6 you have regarding a flow path through the Glendale
- 7 Thrust in this area and from which Rogers and Blue
- 8 Point emanate. Okay? And is that a fair summation so
- 9 far of your view, that there is some flow that occurs
- 10 through this location, and that's where the Rogers an
- 11 Blue Point source water is?
- 12 A. Yes.
- 13 Q. Okay. Do you believe that there's significant
- 14 water going through that flow path in addition to the
- 15 water that is daylighting, if you will, at Rogers and
- 16 Blue Point?
- 17 A. No.
- 18 Q. Now, I'd like to ask you couple of questions
- 19 about the model results. Now, slide 65, and that's
- 20 just one I'm particularly excited about, "The Proper
- 21 Uses of Models."
- So, I understand your testimony, I think, so,
- 23 I'll ask you to confirm it. Your model you feel isn't
- appropriate for quantitative assessments or actual

- 1 When we look at the simulations that are shown
- 2 in your report and the impact on specifically Muddy
- 3 River flows at Glendale, would you agree that
- 4 regardless of where the wells are located and the
- 5 pumping's located, portions of carbonate wells versus
- 6 alluvial wells which vary through the three
- 7 simulations, that really doesn't make much difference
- 8 where the well -- wells are located or where the
- 9 pumping's located, generally the same amount of
- 10 drawdown occurs at the Muddy River Springs area?
- 11 A. That's correct.
- 12 Q. And that -- is it fair to conclude from your
- 13 model that groundwater pumping in the Lower White River
- 14 Flow System ultimately captures Muddy River flow?
- 15 A. Yes.
- 16 Q. And also that that would, regardless of whether
- 17 it's carbonate, pumping or alluvial pumping, ultimately
- 18 in your model simulations river flow is captured?
- 19 A. Yes. I want to make sure that there's not a
- 20 misinterpretation that I'm saying that the capture is
- 21 on one, one basis. I don't think I can say that.
- 22 Q. Okay.
- 23 A. For example, along the Muddy River, not only
- 24 would flow be captured but it's evapotranspiration

Page 635

- 1 would decrease because of lower omauda take (phonetic),
- 2 so you capture it from a different source.
- з Q. Okay.
- 4 A. There's also a possibility of increasing inflow
- 5 I think a small amount into the lower -- the flow
- 6 system. I'm sorry. But that that's probably would be
- 7 insignificant.
- 8 Q. You're talking about potentially inducing flow
- 9 through boundaries or that sort of thing?
- 10 A. That's correct.
- 11 Q. And so, that's a relatively minor additional
- 12 capture?
- 13 A. Yes.
- 14 Q. And other than that, is it just river flow that
- 15 can be captured?
- 16 A. River flow and evapotranspiration.
- 17 Q. Now, is it possible to capture ET in the Muddy
- 18 River area without also capturing discharge from the
- 19 Muddy River itself?
- 20 A. Not in my opinion, no.
- 21 Q. Okay. One last question is, were you present
- 22 for the questions yesterday about the Big Muddy Spring
- 23 that Ms. Braumiller was answering?
- 24 A. I was.

- 1 of the water level changes between Kane Spring Valley,
- 2 Coyote Spring Valley, and the other portions of the
- 3 basins covered under Order 1169, that the marked
- 4 difference had supported the probability of a low
- 5 permeability structure or change in lithology between
- 6 Kane Spring Valley and the southern part of Coyote
- 7 Spring Valley? Do you remember that?
- 8 A. I remember reading that section, yes.
- 9 Q. All right. And in that same paragraph the
- 10 National Park Service at that time was wanting Kane
- 11 Spring Valley to be part of the Order 1169 proceedings,
- 12 do you recall that?
- 13 A. Yes.
- 14 Q. All right. And this -- the state engineer
- 15 determined based upon those findings that he made
- 16 regarding the elevation, the different elevations and
- 17 the probability of the low permeability structure
- 18 that -- and the quantity of water granted by the
- 19 applications, that he would not include Kane Spring
- 20 Valley in the Order 1169 proceedings. Do you recall
- 21 that?
- 22 A. Yes.
- 23 Q. And then directing your attention to slide 24.
- You indicated based upon the recent CSAMT work,

Page 636

- 1 Q. Would you agree or disagree with this
- 2 statement? That the general hydrological consensus is
- 3 that the Big Muddy Spring is sourced from the same
- 4 sources as the Muddy River itself?
- 5 A. I don't think I have looked at that enough to
- 6 provide an opinion.
- 7 MR. TAGGERT: All right. Thank you.
- 8 HEARING OFFICER FAIRBANK: Up next, Vidler
- 9 Water Company and Lincoln County?
- 11 CROSS-EXAMINATION
- 12 BY MS. PETERSON:
- 13 Q. Good afternoon, Dr. Waddell. Karen Pederson
- 14 representing Lincoln County Water District and Vidler
- 15 Water Company.
- 16 A. Good afternoon.
- 17 Q. Good afternoon. And in your early testimony
- 18 this morning regarding Kane Springs Valley, I was under
- 19 the impression that you had read State Engineer's
- 20 Ruling 5712, which was the 2007 ruling from Kane
- 21 Springs.

10

- 22 A. I have read a small portion of that, yes.
- 23 Q. All right. And did you read the portion of the
- ruling where the state engineer indicated that because

Page 638

1 that you agreed that the two lines shown represent

- 2 different geology; is that correct?
- 3 A. That is correct.
- 4 Q. And that you didn't necessarily disagree that
- 5 there is a fault there? Do you recall that?
- 6 A. Yes.
- 7 Q. And you indicated that it was an impediment to
- 8 flow?
- 9 A. I indicated that I believed there are
- 10 impediments to flow in northern Coyote Spring Valley.
- 11 I don't think I testified that I thought that that
- fault was an impediment to flow. It might be an
- 13 impediment to flow, but, I don't think the evidence
- 14 says that that particular fault is.
- 15 Q. Do you think that that could be the low
- 16 probability structure or the change in lithology that
- 17 the State Engineer referenced in his ruling 5712?
- 18 A. I don't know what the State Engineer was
- 19 thinking when he said that.
- 20 Q. Is there any evidence that you've provided in
- 21 this proceeding that shows that there is a change
- 22 from -- with regard to Kane Spring Valley within --
- 23 including it in Order 1169, that would change the

findings that the State Engineer made in Ruling 5712?

SE ROA 53222

Page 642

Page 639

- 1 A. I believe there is, yes.
- **2** Q. And what is that?
- A. I think it's the observed water level response
- in those two wells to pumping of MX-5 during the 1169
- testing.
- Q. Okay. And we'll get to that. 6
- I did want to ask you a question about your
- model. The model, did you simulate Kane Spring's
- pumping in your model?
- A. We did. 10
- 11 O. And was it a thousand acre-feet?
- 12 A. I think so. But I would have to check. On the
- order of that, yes. 13
- Q. And there was drawdown at Muddy -- the Muddy 14
- River Springs area from the Kane pumping?
- A. I did not investigate that. 16
- Q. So, your model simulated the Kane pumping, but 17
- you did not investigate whether there was any impact or 18
- drawdown at the Muddy River Springs area from the Kane 19
- Spring's pumping? 20
- A. We did not simulate that. Now, we could have 21
- done that by running simulation with that pumping, and
- then a second simulation absent that pumping, and then
- comparing the two results, but we did not do that.

- 1 like it occurs -- starts to occur before that.
- 2 Q. And when do you have it occurring?
- 3 A. For KW-1, early in 2014. And for the other
- well there's a gap in the data at that location. It
- looks like based on a limited number of data points,
- recovery was occurring later in 2014, but then changed
- into a declining trend.
- Q. Is there any reason why drawdown and recovery
- responses would be different?
- 10 A. Yes.
- 11 Q. And what is that?
- A. When pumping occurs for a period of time, you
- get a response curve that shows faster drawdown and
- slower recovery. It's because of the depletion in 14
- 15 amount of water stored in the aquifer, and the lower
- gradient that exists during the recovery phase. 16
- 17 There was a paper prepared by Stan Leake of the
- USGS in Arizona that evaluated this through a modeling 18
- exercise and showed very significant affects. We saw 19
- those same affects in our model of the aguifer in that 20
- Black Mesa area in Arizona. Because it's a function at 21
- how long the well is pumped in terms of the different 22
- apparent behavior in the draw -- initial drawdown and 23
- the late recovery responses. 24

Page 640

- 1 Q. Did you do any simulations of Kane pumping for
- drawdown at Rogers and Blue Point?
- 3 A. No.
- Q. And then direct your attention to slide 23.
- You just had some questions about what you -- what you
- have showing here in your hydrograph. 6
- The MX-5 test started November 2010, and ended
- in March 2013; is that correct?
- 9 A. I don't recall the exact dates, but that sounds
- correct. 10
- Q. All right. And your yellow dots that you show 11
- in your hydrograph here, they start approximately nine 12
- months after the MX pumping starts?
- A. Correct.
- Q. And what is the explanation for that delay?
- A. There was testimony yesterday by Ms. Braumiller
- and then testimony by me today that we both believe 17
- that there's a decrease in transmissivity as you move 18
- further north in Coyote Spring Valley, and that lower 19
- transmissivity delays the transmission of affects to 20
- the location of these wells. 21
- Q. And then you show water levels don't start
- recovery until the beginning of 2015; is that correct?
- 24 A. I don't believe that's correct, no. It looks

1 Q. Did you do any analysis of the affects of

- 2 pumping the Arrow Canyon wells?
- 3 A. No.
- 4 Q. And in Appendix B of your report you -- well,
- on page 15 of your report you indicate there was
- pumping and you included for Kane, Tule, and Virgin
- River Valley. Do you recall that in your report? 7
- A. I do.
- Q. And in Appendix B, we don't see any rate of
- pumping for Kane, Tule, and Virgin River Valley?
- You're referring to the table that we provided?
- 12 Q. Yes.
- 13 A. That's correct. I believe it's correct. I
- haven't -- reviewed that. But this table was intended
- to provide with the changes in pumping for the three 15
- scenarios. And the pumping in those other valleys was 16
- maintained I believe at the rates that we used for 17
- report on affects of pumping that had seven different 19
- 20 scenarios. But, it was not modified in this report,
- and would not have impacted results from this report. 21
- Q. The Kane -- the Kane, the Tule, and the Virgin 22
- River Valley pumping would not have impacted the 23
- results of your report?

scenario one in our, approximately -- I think 2012 18

Page 643

- 1 A. I'm sorry. The Kane would have, yes.
- 2 Q. Okay. But I thought you said you didn't -- you
- 3 I didn't know -- well, you simulated pumping, you
- 4 didn't know what the results were at the Muddy Springs
- 5 area? Okay.
- 6 A. Correct.
- 7 Q. All right. Is there any where in your report
- 8 where the affects of the Kane pumping are described or
- 9 quantified?
- 10 A. I think all we showed were on some maps of
- 11 drawdowns, that there was drawdown associated with the
- pumping of the Kane Spring wells and that drawdown
- 13 extended into Coyote Spring Valley.
- 14 Q. But, of course, with your model, you wouldn't
- 15 be able to have any kind of precise quantification of
- 16 that that you could rely on; is that fair?
- 17 A. That's fair, yes.
- 18 Q. And if Kane should be included in the Order
- 19 1169 proceedings, shouldn't Dry Lake, Delamar,
- 20 Pahranagat Valley, Cave, Garden, all the way up the
- 21 pipeline to Ely, shouldn't they all be included?
- 22 A. I would say at some point the line has to be
- drawn. We have evidence from the responses in those
- 24 two wells to the MX-5 pumping, as well as the other

- 1 reference there to the water level at the southwest end
- 2 of the valley is for the carbonate monitoring well,
- 3 KMW-1?
- 4 A. It probably is, yes.
- 5 Q. And then one of the statements that you made in
- 6 your report which is Exhibit 2, I believe it was on
- 7 page 22, you indicate the model predicts that the
- 8 carbonate aquifer at the Kane Spring Valley and Coyote
- 9 Spring Valley are connected. Do you recall that
- 10 statement?
- 11 A. I don't remember it specifically, but, it
- sounds like something that we would put in.
- 13 Q. And wouldn't you agree that connections such as
- 14 your indicating -- well, such as between Kane Spring
- 15 Valley and Coyote Spring Valley are built into models
- 16 by their authors?
- 17 A. Would you repeat that question?
- 18 Q. Would you agree that connections such as
- 19 between Kane Spring Valley and Coyote Spring Valley are
- 20 built into models by their authors?
- 21 A. I would agree. I don't know if you would say
- 22 that we were guided in how we built our framework model
- 23 based upon the work of Rick Page and the geologic maps
- 24 I had available for the area.

Page 644

Page 646

- 1 evidence that I presented earlier today, that there's a
- 2 close association of Kane Spring Valley discharge with
- 3 Coyote Spring Valley. And it's my opinion that pumping
- 4 in the carbonate in Kane Spring Valley would effect
- 5 water levels in Coyote Spring Valley.
- 6 I have not investigated whether or not that
- 7 that would be -- if you could test it by pumping only
- 8 Kane Spring Valley and no other wells, then you would
- 9 detect that at the Muddy River Springs. My opinion is
- 10 that you wouldn't, but, that in combination with the
- 11 other pumping, you would see affects.
- 12 Q. And this -- that would be based on your model?
- 13 A. No.
- 14 Q. And if you could look at slide 27. You made
- 15 some statements there based on the water levels you
- 16 have at the bottom of the slide there. One of them you
- said was a 3200-foot spring at the head of the valley.
- 18 Isn't it correct that that's sort of a spring in the
- 19 Delamar Mountain?
- 20 A. My recollection is -- it's for a spring that's
- 21 at the northeastern end of the valley.
- 22 Q. Which spring?
- 23 A. I couldn't tell you.
- 24 Q. And would you agree that the 1880-foot

- 1 MS. PETERSON: This you.
- 2 HEARING OFFICER FAIRBANK: Thank you. Next
- 3 City of North Las Vegas.
- 4
- 5 CROSS-EXAMINATION
- 6 BY MS. SCHROEDER:
- 7 Q. Hello. I'm Laura Schroeder. I represent the
- 8 City of North Las Vegas, and I am just going to ask you
- 9 for some clarifications.
- And in doing that, I'm going to have you look
- 11 at your slide 40 in comparison to 41, because I'm
- 12 wanting to understand better how you explained the --
- 13 how the water -- the source waters get to those
- 14 springs. Because when I look at 41 in my simple lawyer
- 15 way, it looks like it's an easier path than when I'm
- 16 looking at 40 to get the water there.
- 17 That's the one question. Why are we trying the
- 18 more difficult path? And I'll let -- I'll start with
- 19 that one.
- 20 A. Thank you for giving me one at a time. Yeah,
- 21 there's a thrust fault to that area that has permanent
- 22 rocks in the -- up a thrust sheet that extends over a
- 23 large area in the mountains.
- 24 Q. So we're looking at 40?

Min-U-Script® Capitol Reporters 775-882-5322

(12) Pages 643 - 646

Page 647

- 1 A. That is correct.
- 2 Q. The thrust? Okay.
- 3 A. And because of -- there is a cover of other
- 4 rocks on top of that thrust sheet. So, you don't see
- 5 it at the surface, but it's likely present at depth. I
- 6 would say we've got to drill a hole to confirm that.
- 7 It's consistent with the geology that has been mapped.
- 8 The cross-sections that are drawn, you know,
- 9 one of these sections goes through an area that's a
- 10 window in that thrust sheet so you see the underlying
- 11 rocks, the Jurassic and the Crustaceous rocks that are
- colored in green. So, there's a hole there that the
- 13 water would have to flow around. The hole in the
- 14 carbonate thrust sheet, and this section just happens
- 15 to go through that hole. So, it's the opinion of the
- 16 geologist, Rick Page, that that thrust sheet is present
- 17 in other place. There's also mapping by Bill Bohannon
- 18 that indicates the same thing.
- But a thrust sheet is not everywhere
- 20 continuous. So, it looks more complicated as a result
- 21 of that. The deeper pathway in carbonates is depicted
- 22 on the section. Shows it's, you know, more continuous.
- But, the problem is getting flow through that is
- because of its great depth, the permeability's low.

- 1 is beneath California Wash in Garnet Valley, into the
- 2 upper thrust sheet and flowing towards the east. Along
- 3 the way it either is in contact with or mixes with
- 4 water that's been in contact with the younger sediment
- 5 and rocks. It reenters, if you will, or continues in
- 6 the carbonate until it reaches the Rogers Springs fault
- 7 in that area, and then has to go to discharge along
- 8 that fault line.
- 9 Q. Okay. Thank you. I have no other questions.
- 10 Oh, I do have one.
- Another point that I didn't understand. You
- talk about a lip, and I didn't understand where this
- 13 lip was. So, is that the thrust? Or where is this lip
- 14 that is preventing or influencing the flow?
- 15 A. What I had said was that in the Buffington
- 16 Pockets well, which went through carbonate rock, the
- 17 upper thrust of this upper thrust sheet.
- 18 Q. Uh-hum.
- 19 A. Into rocks below that. Carbonate's at that
- 20 location are not saturated. Groundwater is not up this
- 21 high. So, water's not passing from the carbonate
- 22 aquifer to the west into that upper thrust sheet or
- 23 flowing through that upper thrust sheet at that
- 24 location.

Page 648

Page 650

- 1 And therefore, not much water can move through that
- 2 pathway, you know, to the fault, and then up that
- 3 fault. So, I don't believe that the lower carbonates
- 4 are transmitting a significant amount of water. But
- 5 that the younger thrust sheet is.
- 6 Q. And is that different than your report? Did
- 7 your report suggest that it went through the carbonate
- 8 and then this is now your opinion that it goes through
- 9 that sedimentary layer?
- 10 A. Which report are you referring to?
- 11 O. Well, I don't have the page in front me, but
- 12 I -- my understanding was that the source waters for
- those springs was the carbonate, but now I think you're
- 14 telling me it's the sedimentary layer?
- 15 A. No. The -- our geochemical report, which was
- one of the appendices. Talks about water being in
- 17 contact not only with the carbonates, but also the
- 18 these younger sediments. Sedimentary rocks that have
- 19 the gypsum and other type minerals. So, geochemistry
- 20 is tell us that it's in contact with both.
- 21 Q. Okay. So, when -- so, your conclusion then is
- 22 that the source waters for those springs -- what is
- 23 that pathway then? What is that flow pathway?
- 24 A. It's eastward from the carbonate aguifer that

- 1 Q. So, do we know any elevations for what that lip
- 2 would be at?
- 3 A. We would know at that location what the
- 4 elevation of the base of the carbonate thrust sheet is.
- 5 I don't know that offhand.
- 6 Q. Okay. And so would this be then a logical
- 7 monitoring place for us to look at in terms of further
- 8 testing?
- 9 A. No.
- 10 Q. No? I guess I would like to know -- because
- 11 you did talk about helping us with going into the
- 12 future or different monitoring places that would be
- 13 most helpful. What is your opinion about some places
- 14 that you would suggest the State Engineer look at or
- 15 that would be helpful?
- 16 A. I haven't looked at that. In order to come up
- 17 with a recommendation like that it'd be necessary to
- 18 take a much more detailed look at the geologic mapping
- in that area and look at the elevations of the -- that
- 20 contact where it's exposed to try to get an idea --
- 21 better idea of the geometry of that thrust sheet and
- 22 come up with locations for it.
- MS. SCHROEDER: Thank you, sir.
- 24 HEARING OFFICER FAIRBANK: Next is Center for

- 3 we have?
- 4 HEARING OFFICER FAIRBANK: 16 minutes.
- 5 MR. DONNELLY: Thank you.
- 6
- 7 CROSS-EXAMINATION
- 8 BY MR. DONNELLY:
- Q. Patrick Donnelly, Center for Biological
- 10 Diversity. Few questions about pumping.
- Do you observe that carbonate levels are going
- 12 up -- carbonate water levels are going up in areas
- 13 distant from active pumping; is that accurate?
- 14 A. It is not only carbonate, but, water levels and
- 15 other lithologies as well of.
- 16 Q. Okay. And you have observed a downward trend
- 17 on carbonate levels within the the Lower White River
- 18 Flow System?
- 19 A. In almost all areas, yes.
- 20 Q. Does this imply that existing pumping is
- 21 causing declining carbonate aquifer levels in more of
- 22 wherever you're the closest?
- 23 A. That's my interpretation, yes.
- 24 Q. And you've observed a downward trend on spring

- 1 likely?
- 2 A. I don't want to --
- 3 O. That's fine.
- 4 A. -- speculate on that.
- 5 Q. And your simulations showed that throughout
- 6 that period of time before reaching equilibrium spring
- 7 discharge will continue to decline at Rogers and Blue
- 8 Point and in the Muddy River Springs area?
- 9 A. That's what the simulation showed, yes.
- 10 Q. You ran your model at 14,500-acre-feet per
- 11 year, correct?
- 12 A. That's correct.
- 13 Q. And we just stated just a few minutes ago that
- 14 current pumping, which is 9318-acre-feet per year, at
- 15 least from 2015 to 2017 -- although it may be different
- 16 at this exact moment -- also shows decreases in spring
- 17 discharge?
- 18 A. That's correct.
- 19 Q. In your report you deined to provide an
- 20 estimated number of sustainable yield for reasons
- 21 you've explained, and instead said that it should be
- 22 somewhere below 14,500, correct?
- 23 A. That is correct.
- 24 Q. Given that what we just stated, that current

Page 652

Page 654

- 1 discharge as well?
- 2 A. Yes.
- 3 Q. Does this imply that the state of declining
- 4 water levels will mean continued declines in spring
- 5 discharge at the status quo pumping level?
- 6 A. For at least some time, yes. I can't estimate
- 7 how long.
- 8 Q. Okay. Now, you stated that within 500 years,
- 9 according to simulations you ran, the system at pumping
- 10 levels of 14,500-acre-feet per year will not reach
- 11 equilibrium; is that correct?
- 12 A. Those were the results of the simulation.
- 13 Again, the 1169 pumping test demonstrated that the
- 14 pressure response is transmit much faster than
- 15 simulated by the model.
- So, in reality it would be some period. It
- 17 would be faster than what the model simulated, but, I
- 18 can't tell you when.
- 19 Q. The drawdown would be faster?
- 20 A. I was trying to say that if equilibrium were to
- 21 be reached it would occur sooner --
- 22 O. Oh.
- 23 A. -- than predicted by the model.
- 24 Q. Okay. But it will be hundreds of years most

- 1 pumping is showing current decreases at spring
- 2 discharge. Shouldn't it likely also be below current
- 3 pumping levels, 9318?
- 4 A. I would say that the recent data showed that
- 5 levels are continuing to decline. That would suggest
- 6 it ought to be less than the current amount, but, you
- 7 know, continued monitoring would be prudent.
- 8 Q. Indeed. We can all agree to that.
- 9 I want to switch tracks a bit.
- o In your role as a hydrologist, you have had an
- 11 opportunity to visit many desert springs?
- 12 A. I don't know what you mean by many. I have
- 13 toured the Muddy River Springs area.
- 14 Q. Okay.
- 15 A. I've been to Rogers and Blue Point Springs.
- 16 I've been to springs in the Death Valley System.
- 17 Q. You've been to a desert spring or two?
- 18 A. Yes.
- 19 Q. Okay. And have you observed not as a
- 20 biologist, but just as a observer of desert spring
- 21 systems wildlife in those springs? For instance, fish,
- 22 invertebrates, et cetera?
- 23 A. I have, yes.
- 24 Q. Have you been to Blue Point Spring?

Min-U-Script® Capitol Reporters (14) Page 775-882-5322

Page 655

- 1 A. I have.
- 2 Q. So, in your report you mentioned that Blue
- 3 Point Spring is home to three endemic springsnails; is
- 4 that correct?
- 5 A. The report says that, that's something that
- 6 Gary Karst wrote.
- 7 Q. Okay. And the report also mentions that one of
- 8 those snails was recently petitioned for the Endangered
- 9 Species Act; is that correct?
- 10 A. I believe so, yes.
- 11 Q. In slide 32 to 33 of your presentation, you
- 12 have hydrographs for Blue Point and Rogers Springs. I
- 13 believe I have those numbers correct.
- So, I'm wondering if you observe a trend in
- spring discharge in these springs over the past several
- 16 years with regard to mean annual discharge, for
- 17 instance?
- **18** A. Rogers Springs, which I think -- it appears
- 19 that after approximately 2009, discharge rates are
- 20 lower, but, I'm hesitant to conclude that a discharge
- 21 has actually decreased. If you look at the period in
- 22 2008, there's a rapid decline in discharge that I think
- 23 is probably not due to actual changes in discharge,
- but, maybe changes in the discharge system.

- 1 Q. So, if spring discharge is below historic norms
- 2 here as you attested just moments ago over the model
- 3 simulation, spring discharge will continue to decline
- 4 at Blue Point in spring, based on the piece that you
- 5 said Mr. Karst wrote, we can expect impacts to biota at
- 6 Blue Point Spring?
- 7 A. I'm not a biologist, and I don't know what the
- 8 sensitivity of the biota are at discharge. So, I won't
- 9 answer.
- 10 Q. Okay. But, your report does say that reduction
- 11 of spring discharge would have adverse impact on the
- 12 species?
- 13 A. It does say that. And what it doesn't state,
- 14 just so that there's clarification, is how much
- 15 discharge it's anticipating to occur.
- 16 Q. Sure. Okay.
- MR. DONNELLY: I have no more questions, thank
- 18 you.
- 19 HEARING OFFICER FAIRBANK: Next would be
- 20 Georgia Pacific, Republic.
- MR. HARRISON: No questions.
- HEARING OFFICER FAIRBANK: Okay. Same,
- 23 questions? Muddy Valley Irrigation Company.
- 24

Page 656

Page 658

- 1 I think you're probably familiar with the
- 2 spring monitoring that took place in the Muddy River
- 3 Springs area in this year -- through the years with
- 4 those gages, and there had been -- put up slide 33,
- 5 which shows Blue Point Spring, and there's a gap in the
- 6 data, which I understand is during a period of
- 7 reconstruction of measuring apparatus because of the
- 8 leakage around that.
- 9 So, it does look like things may have --
- 10 discharge rates may have gone down, but there are other
- 11 factors that need to be checked out, and I have not
- 12 done that.
- 13 Q. Okay. But, without assigning causation, we can
- 14 say that discharge right now is below the historic
- 15 average?
- 16 A. I would say that measurements are.
- 17 Q. Measurements. Thank you. Yes. Measuring
- 18 desert springs is a tricky art perhaps.
- In your report you say that reduction or
- 20 cessation of spring discharge on federal lands would
- 21 have an adverse impact on sensitive habitat and
- 22 species; is that correct?
- 23 A. I believe the report says that. It sounds like
- 24 something that Gary Karst wrote.

- 1 CROSS-EXAMINATION
- 2 BY MR. KING:
- 3 Q. Good afternoon, Dr. Waddell. I'm Steve king.
- 4 I represent Muddy Valley Irrigation Company.
- 5 A. Good afternoon.
- 6 Q. Several questions. I believe you testified
- 7 that you're aware of a published response, Fourth Turn
- 8 Report's yet to be released noted, USGS. I believe it
- 9 was titled the Amargosa Tracer Site Report; is that
- 10 correct?
- 11 A. I didn't say that. I don't know that title at
- 12 all.
- 13 Q. I'm just asking the questions from my notes,
- 14 sir. But associated with Amargosa Tracer Site Report
- 15 on USGS?
- 16 A. What I had talked about was -- and let me ask
- 17 you a question. Are you referring to the pumping that
- 18 I was describing that happened in Yucca Flat with PR61
- 19 number two?
- 20 Q. I don't have an answer for -- let me perhaps
- 21 ask a better question.
- I believe that you stated that you felt that
- 23 the Fourth reports by the USGS would show a pumping
- 24 response further west, perhaps to the Amargosa or Ash

Min-U-Script®

Capitol Reporters 775-882-5322

(15) Pages 655 - 658

Page 659

- Springs area from pumping within the Lower White River
- Flow System, would that be inaccurate?
- A. No. I did discuss pumping that took place
- during a tracer test at ER61 number two. And that
- pumping responses were observed in that area extending
- to the south and then to the southwest. The report
- that I referred to has not yet received direct approval
- from USGS. So, I don't know if it will be coming out,
- but, I assume that it will.
- And that work was documenting pressure 10
- responses from that pumping extended to the Amargosa 11
- tracer site. I did not say that it concluded, that 12
- those responses extended to the Ash Meadows area, and 13
- it's certainly not from pumping in the Lower White 14
- 15 River System.
- Q. Very good. In fact, that explanation is the 16
- 17 answer to my next question, if you knew or were aware
- of a possible release date for that report to the 18
- public? 19
- A. I do not. 20
- Q. Thank you. 21
- HEARING OFFICER FAIRBANK: Nevada Energy. 22
- /// 23
- /// 24

- If there was water that was being discharged --1
- groundwater into that area, could that be captures by
- pumping without affecting the Muddy River flows?
- A. I believe it would be possible to put a well
- close to the lake and pump it and capture water from
- the lake. The permeability between the are of Rogers
- and Blue Point Spring and the lake are fairly low
- permeability as sediments. There are salt deposits in
- that area. Which indicates there's not a lot 9
- groundwater movement. So, it's pretty low prem, but 10
- dry. If you put a well there, I didn't think you'll be 11
- 12 capturing water out the carbonate system.
- 13 MS. CAVIGLIA: Thank you. I have no further questions. 14
- 15

19

- HEARING OFFICER FAIRBANK: We'll go ahead and
- open it up to questions from the staff of Division of 16
- 17 Water Resources and the State Engineer.
- MS. BARNES: Michelle Barnes, for the record. 18
- EXAMINATION 20
- BY MS. BARNES: 21
- Q. I was wondering for the plot shown on slide 37, 22
- use to generate this from Appendix A, table three of 23
- the report. Do you have the standard deviations for that

Page 660

Page 662

- **CROSS-EXAMINATION** 1
- BY MS. CAVIGLIA: 2
- Q. Good afternoon, Dr. Waddell. My name is
- Justina Caviglia, and I represent Nevada Energy. I
- believe you stated that you estimate there's
- approximately 2500-acre-feet of groundwater that is
- being discharged to Lake Mead and the Colorado River;
- is that correct?
- A. I don't recall making that statement, no.
- Q. Okay. I thought that that's what that stated. 10
- Was it groundwater discharge, or was it surface water 11
- discharge that is making its way to Lake Mead?
- A. I do not think I talked about any amount
- discharging to Lake Mead. What I did talk about was
- that in the past decade or so, there were estimates of 15
- leakage or recharge into the flow system. And when I 16
- asked where that water was going, it wasn't going to
- the Muddy River Springs area. The response was it's 18
- discharging into the Colorado River or to Lake Mead. 19
- 20 But I don't recall stating an amount.
- Q. Okay. Was there anything in the model that
- estimated that --
- A. No.

17

24 Q. -- by chance?

- data?
- A. I'm sorry, do I have what?
- 3 Q. The standard deviations from the laboratory
- analysis?
- A. I don't know that I do.
- Q. Okay. Then I'm a little unclear on I guess
- your perception of recharge. You had mentioned at the 7
- beginning of your talk that the pest analysis shows --
- depending upon the current variable input, that there
- 10 may be little impact on recharge within a model. But
- then you talked about changing your Tetra Tech Model to
- include transient recharge. Can you clarify for me?
- A. Yes. What I was -- the point I was trying to 13
- make is that typically it is a lot of uncertainty in
- recharge rates, estimates of recharge rates. And the 15
- question that I was trying to answer with respect to 16
- that particular model was does that uncertainty effect 17
- decisions based on or made from modeling results? 18
- And so, I looked at the sensitivity of modeling 19
- 20 results to changing our estimate of recharge rate and
- found out that the management decisions wouldn't 21
- 22 change.
- That's a separate question than putting 23
- transient recharge into a model to allow you to better

Page 663

- 1 match the observed changes in water levels.
- 2 You know, everybody who talks from the
- 3 hydrographs is talking about this recharge bump 2014,
- 4 2005. And without putting a mechanism in the model to
- 5 allow that to occur in simulations, we really can't
- 6 match those. And so improve the calibration process to
- 7 include that mechanism. Those were the changes I
- 8 was -- one of the changes I was talking about
- 9 implementing.
- 10 MS. BARNS: Thank you.
- MS. COOPER: Christie Cooper for the record.
- 12
- 13 EXAMINATION
- BY MS. COOPER:
- 15 Q. Just for some clarification on your opinion, do
- 16 you think that by using more recent total pumpage
- values -- which I'm not going to throw out a number but
- 18 would just be less in your simulation -- would that
- 19 change the outcome of your simulation?
- 20 A. I missed part of your question. If we used
- 21 updated pumping values would that change the output?
- 22 Q. Yes.
- 23 A. Yes, it would.
- 24 Q. Can you elaborate onto how?

- 1 would be proportionately less?
- 2 A. To make sure I understand the question, if
- 3 instead of using 14, 5 we used something around 10,000?
- 4 Q. Yeah.
- 5 A. Yes, it would decrease the simulate effect.
- 6 MR. BENEDICT: I'm sorry. John Benedict. For
- 7 the record. I had a couple questions.
- 8 Q. So, early on in your discussion you suggested
- 9 that seasonal responses could be seen in the record and
- 10 ascribed them as I think to the Muddy River area
- 11 predominantly, and I just wanted you to elaborate on
- 12 that. When it -- whether I misheard that, or whether
- 13 that was during a period of time when most the pumping
- 14 occurred there. I think you also ascribed it both
- 15 pumping and ET. So, I want -- do you want to may be
- 16 talk a little bit about that seasonal response, and
- 17 it's relationship to pumpage and ET?
- 18 A. Okay. To ask for further clarification, I had
- 19 mentioned looking at discharge records at one of the
- 20 Muddy River gages. We had went back to about 1910. Is
- 21 that what your question's about?
- 22 Q. I don't that. I think what I heard was I think
- 23 you suggested that the seasonal responses and water
- 24 levels in monitoring wells or --

Page 664

Page 666

- 1 A. Well, perhaps I answered to hastily. When we
- 2 did the simulations that were recorded in our report
- 3 earlier this year, we updated our pumping rates based
- 4 upon data on the State Engineer's website. So, those
- 5 were updated from our 2012 modeling data sets.
- 6 So, I should have answered we've already done
- 7 that. Going forward, if we change the numbers, the
- 8 pumping, yeah, it would change the results.
- But, you bring up a point, that, you know, the
- 10 simulation or the model at the time we started those
- 11 three scenarios was based upon lower pumping rate and
- then that pumping rate was bumped up to the 14, 5.
- So, you know, part of that bump-up is why you
- 14 started seeing -- I mean, I think there are responses
- 15 that would be occurring regardless of whether we did
- 16 the increase in discharge rates. But, by increasing
- 17 that, it increased the amount predicted change.
- MS. COOPER: Thank you.
- 19
- 20 EXAMINATION
- BY MR. BENEDICT:
- 22 Q. I'm sorry clarify that a little bit further.
- 23 So, if you were to use pumpage, which I think now is
- 4 more like 10,000 acre-feet, then the captures also

- 1 A. Okay.
- 2 Q. -- groundwater wells showed seasonality and you
- 3 seemed to imply that it was vectored towards Muddy
- 4 River Springs area, but, I may have misinterpreted
- 5 that. So, I just wanted to get your thoughts on the
- 6 cause and effect I guess for that seasonal variation,
- 7 whether it's a function of some specific pumpage within
- 8 the region or any and all pumping?
- 9 A. Okay. I was looking at a hydrograph that went
- 10 further -- furthest back in time, and I think it was
- 11 MX-4. And we saw seasonal affects in that well. I did
- 12 not go see if there was seasonal pumping occurring in
- 13 Garnet Valley at that time. But because of the
- 14 proximity to Muddy River Springs area, I guess I would
- 15 say I interpreted that to be driven by pumping and ET
- 16 in the Muddy River Springs area. But you raise a good
- 17 point. If seasonal pumping were occurring in Garnet
- 18 Valley, that could be an input as well.
- 19 Q. Okay. I'm curious -- next to -- kind of
- 20 shifting gears to Black Mountain area and talking about
- 21 temperature, as I recall, Blue Point and Rogers are
- 22 warmer springs; is that correct?
- 23 A. That's my understanding, yes.
- 24 Q. Could that be used as a tracer to talk about or

Page 670

Page 667

- describe or maybe refine whether the aquifer system
- that drive that water was from the deeper carbonate or
- from a carbonate that's thrusted in there? I don't
- know exactly what those depths are, but I'm curious
- about what pathway would cause that water to be what I
- think is probably warmer than Garnet Valley California
- Wash water?

into the sediments.

- A. I have not looked at it, the temperatures in
- comparison to Garnet, California. It certainly could
- be useful information. You know, if what you say is 10
- 11 correct, that it's warmer than what we see in
- California and Garnet Valley, that would certainly be 12
- something to take a careful look at. 13
- Q. And my last question, in terms of discharge in 14
- 15 the Black Mountain area, do you have an opinion on the
- amount of discharge that exists within that basin? I 16
- 17 know we've got discharge measurements on the springs.
- Do you -- do you or does your model simulate simply 18
- that discharge as being another discharge in the Black 19
- Mountain area? Or do have you an opinion on that? 20
- A. The model is set up to calculate from the
- modeling result what the flux is into the lake. But,
- that calculated number is going to be very dependent

rocks and near the lake are. And that's an area -- I

permeability is low enough that we see a barrier

effect. In other words, the springs are at the

mean, I would say that's uncertain. We know that the

elevation you are because the water can't flow out the

base of the carbonate, at least it my interpretation,

And so, we're probably looking at a similar

gradient within the sediments and rocks between the

fault line and the lake. And it's probably something

similar to what the surface to base gradient is. But,

moving in that area. But, you know, the model does

I don't think that there is a large volume of water

calculate it. I just don't know what it is, off my

Q. Good afternoon, Dr. Waddell. My name's

MR. BENETICT: Thank you.

EXAMINATION

Adam Sullivan.

A. Good afternoon.

BY MR. SULLIVAN:

upon what the assumed permeability was, sediments and

- management decisions that you provided in your
- slideshow. And you're also really careful to point out
- the appropriate uses and limitations of a model. And
- in your testimony you generally put a lot of weight on
- the actual data over model simulations. 5
- So, my question is, given the amount of 6
- hydrologic and geologic data that we have for this
- region that continues to be collected, could you expand
- on that recommendation, or explain why what you think a
- model would give us, how that would improve our 10
- understanding of the system? 11
- A. Excuse me -- I'd be glad to. 12
- First, the statement that was part of my 13
- presentation. The use of a model was the Tetra Tech 14
- 15 2012 model as it currently stands, that clearly needs
- some additional work to improve it based upon -- I
- 17 mean, what we learned through the Order 1169 test, as
- well as just a -- modelers, or at least modelers I
- respect always have an uneasy feeling. You know, are 19
- we good enough at this point, and even when I was 20
- doing -- you know, finishing up that model I was like 21
- this could be improved. We knew that from our
- 22
- calibration. 23
- 24 But, I think that additional work can improve

Page 668

- the calibration. We've gotten good comments from
- reviewers. We've learned a lot in terms of data.
- The -- what the data can't tell you without having a
- calculation tool is what's going to happen longer term.
- It tells you what's happening now. It helps you set
- the framework for constraining the model. But, if
- we're making predictions with it, we'd be done in the
- context of not obeying, say, throughout the domain that
- you're interested in, mass balance constraints versus
- law, these types of things the model does provide to
- you. So, I do think that models are -- can be quite 11
- 12 useful for, you know, helping guide management
- decisions. But, they have to be a model that it -- it 13
- has to be a model that you're comfortable with its 14
- performance, that it's a good representation of the 15
- system, that it matches observations better than my 16
- existing model does. 17

Capitol Reporters 775-882-5322

- There will be uncertainty in the model. I 18
- mean, we cannot know everything. And if you're trying 19
- 20 to make management decisions based upon your existing
- database, you're going to be making errors in that as 21
- well. Because you can't know everything. 22
- But, the model puts it in the construct that 23
 - obeys the flow loss, which are important constraints.

that the State Engineer employ regional model to guide

Q. I want your concluding recommendations. Is

(18) Pages 667 - 670

Page 671

- 1 It also tells you what you don't know, and it gives you
- a tool that you can look at the affects of not knowing
- 3 things that -- otherwise, we're just looking at data,
- 4 my gut tells me this or my gut, you know? It's a tool.
- 5 Not to be, you know, viewed as a tool. They can be
- 6 very useful.
- 7 MR. SULLIVAN: Thank you.
- 8 HEARING OFFICER FAIRBANK: Okay. So, we've
- 9 been going for close to two hours, so, let's go ahead
- 10 and take a break, and we'll reconvene at 3:00. And
- 11 we'll open it up for some additional questions by
- 12 participants. Thank you.
- 13 (Recess.)
- 14 HEARING OFFICER FAIRBANK: Let's go ahead and
- 15 go back on the record. All right.
- All right. So, what we're going to go ahead
- and is we'll open it back up for additional questions
- 18 by the participants, and we're going to go ahead and
- 19 give everyone seven minutes. Get my chair situated so
- 20 I can keep track.
- All right. And we'll go ahead and start again,
- 22 back with Coyote Spring Investments.
- MR. HERREMA: Thank you.
- 24 ///

- 1 1.0, and at least parts of section 1.1, the setting.
- 2 Looks like he wrote section 1.2. Or at least parts of
- 3 it. And then section 3.2.
- 4 Q. Okay. So is the work in those sections, are
- 5 those your conclusions or are they Mr. Karst's
- 6 conclusions?
- 7 A. Those are my conclusions.
- 8 Q. But, Mr. Karst did them for you?
- 9 A. I answered on top of you.
- 10 Q. Whose work is this? I'm sorry. Go ahead.
- 11 A. I was going to say would you restate your
- 12 question?
- 13 Q. What's written in those particular sections,
- 14 section 1.0, 1.1, 1.2, 3.2 of your July 3rd, 2019,
- 15 report, are those sections your conclusions or
- 16 Mr. Karst's conclusions?
- 17 A. I don't know if I would classify those as
- 18 conclusions as opposed to statements, kind of setting
- 19 the background. They don't appear to be conclusions
- 20 from the work that I did.
- 21 Q. Okay. In regard to the recharge from Sheep
- Range, have you done any analysis of that recharge?
- 23 Recharge from the Sheep Range to the Coyote Spring
- 24 Valley?

Page 672

Page 674

- 1 RECROSS EXAMINATION
- 2 BY MR. HERREMA:
- 3 Q. Brad Herrema for CSI. Dr. Waddell, just a few
- 4 more questions.
- 5 First, do you recall during your exchange with
- 6 Mr. Donnelly, you've indicated that something he quoted
- 7 sounded like something that Gary Karst wrote?
- 8 A. I remember -- excuse me.
- 9 Q. You responded a couple times I think. Okay?
- 10 Do you recall which particular documents or writings
- 11 Mr. Donnelly was referring to?
- 12 A. I don't remember exactly what he was saying,
- but, I think it was probably our report prediction if
- 14 effects of changing special distribution pumping in the
- 15 Lower White River Flow System.
- 16 Q. Who is Gary Karst?
- 17 A. Gary Karst is an employee of the National Park
- 18 Service who is stationed in Las Vegas and has been
- 19 working for the Park Service. So, these particular
- 20 questions.
- 21 Q. And which particular portions of this report
- 22 did he write?
- 23 A. Sorry to be eating up your time.
- He wrote it looks like a large part of section

- 1 A. We did back in -- in support of the 2012 model,
- 2 but, we did not revist those estimates.
- 3 Q. So, you haven't done any work on Sheep Range
- 4 recharge since 2012 or earlier?
- 5 A. We have not.
- 6 Q. Okay. In response to a question from
- 7 Mr. Taggart, you indicated that groundwater pumping in
- 8 the Lower White River Flow System captures Muddy River
- 9 flow. Do you recall that?
- 10 A. Yes.
- 11 O. What is the mechanism for that capture? Does
- 12 the pumping pull water out of the river toward the
- 13 wells?
- 14 A. It lowers the water level in the groundwater
- 15 system beneath the river or adjacent to the river which
- 16 pulls water from the river. It doesn't pull it to the
- 17 well. It's, you know, contributing to the pumping,
- 18 but, it reduces the flow in the river.
- 19 Q. Changes the gradient between the groundwater
- 20 and the river?
- 21 A. That's correct.
- 22 Q. Okay. Groundwater pumping affects other
- 23 discharges from the lower labor of closest to them
- 24 besides river flow; isn't that correct? Such as

Min-U-Script® Capitol Reporters (19) Pages 671 - 674 775-882-5322

Page 675

- evapotranspiration?
- A. Yes. 2
- Q. And even groundwater subflow?
- 4 A. It will effect groundwater subflow, yes.
- Q. If I could turn your attention to slide 54?
- Where is the station -- the weather stations located
- from which this data comes from?
- A. I don't know where the station or stations are.
- These are data downloaded from the website.
- Q. Do you know which website? 10
- 11 A. It's listed at the bottom. Western Regional
- Climate Center, 2015, and there's a link at the right
- 13
- Q. Is this data specific to the Lower White River 14
- 15 Flow System?
- 16 A. No.
- 17 Q. You don't know exactly where it's specific to?
- A. I do not. 18
- 19 MR. HERREMA: Thank you.
- HEARING OFFICER FAIRBANK: Thank you. United 20
- States Fish and Wildlife Service. And the Moapa --21
- MS. BALDWIN: Tribe. 22
- RECROSS EXAMINATION 23
- BY MS. BALDWIN: 24

- 1 A. That's the same presentation, yes.
- 2 Q. Yes, okay. Do you have any opinions on whether
- there's a similar century scale steady state in the
- Lower White River Flow System?
- A. I think the first question is, is there a
- century steady state?
- 7 Q. Yes.
- A. The -- provide more information on your first
- question about was this done to develop a steady state
- model. This was done to develop -- help in the 10
- development of the transient model of what's called DV3 11
- or Death Valley three. And the concept is that there 12
- is an approximate steady state. It's not absolute. 13
- You know, you're trying to develop a model which has a 14
- 15 good representation of average conditions,
- predevelopment, and to use that for doing transient 16
- calibration simulations from that point on. And 17
- there's a process of going back and forth between
- calibrating the -- and quote "steady state" in
- transient. 20
- Q. So, these are -- it's an approximation, and
- therefore, up for debate, subject to new information?
- A. Certainly. 23
- 24 Q. Do you have any opinion on whether groundwater

Page 676

Page 678

- 1 Q. Hello, again.
- 2 A. Hello.
- 3 Q. Since we're on this slide, which is slide 54, I
- do have a question about this one, as well.
- This -- if I'm not mistaken this graph is taken
- from the USGS PowerPoint that was Appendix A to your 6
- rebuttal?
- A. That's correct. 8
- Q. And it was entitled, "What Drought? Water
- levels on the rise in Southern Nevada."? 10
- 11 A. That's correct.
- O. Okay. 12
- Is it correct that when the USGS produced this 13
- chart, it was in the context of trying to define a
- steady state for the Death Valley Flow System?
- A. No, I don't believe it was. 16
- Q. I'm looking -- unfortunately, the Appendix does 17
- not have page numbers, but, I'm looking at a slide 18
- entitled, "How do we define steady state?" Then it 19
- says, "Steady State. Water levels do not change over a 20
- period of time. What is that period of time? 21
- DVRFS" -- which is Death Valley -- "Assume steady state 22
- is on a century scale." And then it appears to 23
- reproduce that same chart; would you agree?

- levels could be responding to previous climate
- variability in that there's some sort of time lag
- between when the hydrographs respond to wet conditions
- and dry conditions?
- A. Oh, I think there is. That was the reason I
- started off by describing what was going on up there
- near Mesa, which is known to be a new charge area and 7
- showing the quick response that occur there. And then 8
- moving to other areas that have slower responses, and
- it's due to the time it takes for things to work their 10
- way through the system. 11
- A part of the recharge model -- we haven't 12
- talked about SeriesSEE today. Thank you. 13
- Q. And we're not going to.
- A. Good. There is a recharge capability within
- SeriesSEE that has two components to it. One of those
- is the response to wet precipitation that you can put 17
- in. And then the other is a long-term drainage from 18
- the system, such as from springs that are a long 19
- distance away from the recharge areas. And so, the concept is that the -- or the simplification is that 21
- the discharge in the spring areas doesn't change 22
- quickly to changes in what goes on in the recharge 23
- area. 24

20

Min-U-Script® (20) Pages 675 - 678 Capitol Reporters 775-882-5322

Page 682

Page 679

- 1 Q. I think I have at least one other question.
- 2 Do you agree that a decline in water levels is
- 3 not necessarily drawdown?
- 4 A. It certainly can be other causes, yes.
- 5 Q. And in your opinion, what would water level
- 6 trends look like in the Lower White River Flow System
- 7 in the absence of pumping?
- 8 A. I think water levels would be rising.
- 9 Q. Why?
- 10 A. Because there's been a change from drier
- 11 conditions to wetter conditions, and the system will
- 12 respond to that.
- 13 Q. Okay. I'm looking now at slide 74, where you
- 14 talk about the effect of moving water rights between
- 15 alluvial and carbonate wells.
- You propose that areas should demonstrate that
- 17 they are -- there should be a demonstration in an area
- 18 is not connected with the Muddy River Springs area
- 19 prior to permitting long-term use of the water. That's
- 20 per -- that's an accurate statement of your opinion?
- 21 It's the second bullet point.
- 22 A. Just for you reading to make it short. I wrote
- 23 it the way I intended to, yes.

demonstrate no connection?

talking Coyote Spring Valley.

associated with that.

24 Q. What kind of test -- what would that test look

A. What I would recommend is that there be a

certainly between the area of the well and the

And if the -- if that pumping shows a quick

response in those monitoring wells in areas that are

Otherwise, if it takes -- you know, in talking

about in terms of several months, I think what

well-connected, you basically established that there is

connection, and you can terminate the test and expense

Braumiller had suggested was a several month long test.

connected, you basically got information that you need.

But, additional testing would be required. Longer term

Once you see a responses in areas that you know are

pumping would be required if the response isn't seen

until you're satisfied that it's not connected. There

pumping test that has a different pumping schedule than

the seasonal pumping schedule that occurs elsewhere so that you have a separate signal to detect. That there

be good monitoring in the vicinity of the pump well,

well-connected parts of Coyote Spring Valley. If your

- 1 calibrated flow model would help you answer.
- 2 MS. BALDWIN: Thank you.
- 3 HEARING OFFICER FAIRBANK: Southern Nevada
- 4 Water Authority, Las Vegas Valley Water District.
- 6 RECROSS EXAMINATION
- 7 BY MR. TAGGART:
- 8 Q. Good afternoon.
- A. Good afternoon.
- 10 Q. We're getting there. Just a couple of follow
- 11 up questions.

5

- And your model simulated 14,000-acre-feet of
- 13 pumping. Some questions were presented to you about
- 14 what if your model had simulated pumping at levels that
- are more like what's occurring now as opposed to what
- 16 was occurring during the pump test. And I -- and so my
- 17 question is, even at lower pumping volumes -- and I
- 18 think the hypothetical was 14,000 instead of that being
- 19 10,000 -- there would still be captured stream flow
- 20 from -- demonstrated in your model; is that a air
- 21 statement?
- 22 A. Yes.
- 23 Q. And the -- and the bulk of that pumping would
- 24 be capturing Muddy River stream flow?

Page 680

- 1 A. I'd have to look at how much of the model
- 2 simulated stream flow versus ET.
- 3 Q. Uh-hum.
- 4 A. So, I would know.
- 5 Q. Okay. Oh, I didn't mean --
- 6 A. I can't answer.
- 7 Q. But in the long term -- and in the long term,
- 8 would your answer be different, like at equilibrium?
- 9 Strike that. And I do that because I don't have a lot
- 10 of time.
- So, could you go to slide number 56?
- Okay. And your last two bullets there indicate
- 13 the conditions at a new equilibrium condition or before
- 14 a new equilibrium condition. And so, is it -- is it
- 15 your testimony that currently we are not in an
- 16 equilibrium condition, and therefore, the last bullet
- 17 on your slide here is the condition we're in?
- 18 A. No. The last bullet is intended to address the
- 19 situation where new equilibrium can't be obtained.
- 20 Q. Okay.
- 21 A. So, that, you know, your rate of capture isn't
- 22 sufficient to sustain the pumping.
- 23 Q. Okay.
- 24 A. So, eventually it will stop capture.

. ago ooo

Capitol Reporters 775-882-5322

(21) Pages 679 - 682

Page 683

- 1 Q. Okay. But the bullet before that, at an
- 2 equilibrium condition, all pumping would be capturing
- 3 discharge with an equal relationship. Every drop of
- 4 pumping would be capturing river flow at equilibrium?
- 5 A. I would say not -- you asked a similar question
- 6 before. Not -- I can't say every drop because you're
- 7 going to be increasing flow into the system through the
- 8 boundaries, and part of what you're capturing is ET.
- 9 But, it's primarily going to be capturing ET and stream
- 10 flow.
- 11 Q. Okay. Now, if you could look in the -- at the
- 12 bind I put on your dais there. And this is from SNWA
- 13 Exhibit 9, the 2000 SNWA rebuttal report. And there's
- 14 a figure 3-3 there. And I want to ask you a few
- 15 questions about that.
- During your testimony you talked about the
- 17 current trends in water levels, and my question is
- 18 going to be whether this information here is consistent
- 19 with your own view.
- So, in the top panel is CSDM1, which is Coyote
- 21 Spring Valley Monitoring Well Number 1. And you see on
- 22 the right-hand side there, there's a -- there's a
- 23 trendline.
- 24 A. Yes.

- 1 about is, is the trend, the current trend in EH-4 and
- 2 given your testimony, would you be expecting based on
- 3 precipitation trends for water levels to -- if that was
- 4 the exclusive factor, water levels would be rising,
- 5 currently, right? And when I ask you that, you can
- 6 look at the second panel from the bottom, which shows
- 7 precipitation. Shows in 2017 a little bit more than a
- 8 70 percent of the average. In 2019 a major -- or not a
- 9 major. I'll just say a 150 percent precip events.
- 10 Would you normally expect those kind of precipitation
- 11 events to effect a hydrograph?
- 12 A. I don't know if they're sufficient in magnitude
- 13 to effect it. My concept of recharge is similar to Tim
- 14 Mayer's. It takes a certain amount of water to match
- 15 the other needs for the soil, and that until you
- 16 overcome that, you're not going to get a recharge.
- | 17 Q. Okay.
- 18 A. That's general sense.
- 19 Q. Do you have any reason to believe that the
- 20 declining trend you saw in other areas of the Lower
- 21 Flow System is not also occurring at EH-4?
- 22 A. I have no reason to believe that.
- 23 Q. So, the same. You think your opinion -- you're
- 24 viewing the same condition as -- existing at EH-4 as

Page 684

Page 686

- 1 Q. Is that trendline consistent with what you
- 2 found in Coyote Spring Valley at monitor wells as well?
- 3 A. I would say, yes.
- 4 Q. Okay. And I don't want to test you here, but,
- 5 is it generally your testimony that in Coyote Spring
- 6 Valley, Garnet Valley, which is shown in the second
- 7 panel, and then below that California Wash, that this
- 8 is the type of declining trend we're seeing currently
- 9 in water levels in those three areas?
- 10 A. Yes.
- 11 Q. Okay. Now, what I'd look you to look at is, is
- 12 there's a single piece of paper there that I've given
- to you which is SNWA Exhibit 81. Do you see that?
- 14 A. I do.
- 15 Q. Have you -- have you reviewed hydrograph of
- 16 EH-4 at all in preparation for your testimony?
- 17 A. Yes.
- 18 Q. Okay. So at the -- and EH-4 is -- is it fair
- 19 to say it's a monitor well that monitors water levels
- 20 close to the Warm Spring West area and is sometimes
- 21 used by folks as an index well for changes to stream
- 22 flow related to changes in water level?
- 23 A. I agree.
- 24 Q. Okay. So, what I -- what I want to ask you

- 1 the rest of the area?
- 2 A. That's correct.
- 3 Q. All right. Now, there was some questions about
- 4 modeling, and I appreciate you're -- you are a modeler
- 5 and modelers love to model. The -- but, the question
- 6 that I have for you is, at this time, do you think
- 7 there's sufficient empirical data at hand for the State
- 8 Engineer to use to limit permanent other water uses at
- 9 this time instead of waiting for a new calibrated
- 10 groundwater model? Do you understand my question?
- 11 A. I understand your question.
- 12 Q. Well, I'm -- and I just -- sometimes we feel
- 13 constrained to wait for more tools to make decisions.
- 14 But, given that we had a pump test 1169 pump being
- 15 tested 1169, and all the talk about all this evidence,
- 16 is that sufficient evidence for the State Engineer to
- 17 use to make decisions?
- 18 A. Well, I think it is. The reason I was
- 19 hesitating is it depends on what the nature of that
- 20 decision is.
- If it is to not allow additional pumping, I
- 22 think the information is sufficient. If it's to decide
- 23 upon a rate at a lower rate that would be a safe yield,
- I don't think it is sufficient.

Page 687

- 1 Q. Okay.
- 2 A. Depends what the answer is, the question you
- 3 are trying to answer.
- 4 Q. All right. Thank you very much.
- 5 HEARING OFFICER FAIRBANK: Moapa Valley Water
- 6 District.
- 7 RECROSS EXAMINATION
- 8 BY MR. MORRISON:
- 9 Q. Good afternoon, Dr. Waddell. I'm Greg Morison
- 10 with Moapa Valley Water District. I know it's the end
- 11 of what's certainly been a very long day, so I have
- what I think are just a couple of softballs for you.
- 13 We'll see.
- A little bit earlier in your cross-examination
- 15 you were asked by Ms. Peterson from Lincoln/Vidler
- 16 about Ruling 5712. Do you recall that interaction?
- 17 A. I do.
- 18 Q. I just want to follow up a little bit on that.
- 19 In your recollection of Ruling 5712, do you remember
- 20 whether the State Engineer found evidence of a
- 21 hydrologic connection between Kane Springs Valley and
- 22 Coyote Springs Valley?
- 23 A. That's my recollection, yes.
- 24 Q. If I told you that the exact words were that

- 1 MR. MORRISON: All right. That's all I have.
- 2 Thank you.
- 3 HEARING OFFICER FAIRBANK: Vidler Water.

4

- 5 RECROSS-EXAMINATION
- 6 BY MS. PETERSON:
- 7 Q. Hi, Dr. Waddell. Just a couple.
- 8 Do you recall the -- sorry. Karen Peterson
- 9 representing Lincoln County Water District and Vidler
- 10 Water Company.
- We had a discussion with regard to slide 23
- 12 about drawdown and recovery. Do you remember that?
- 13 A. Yes.
- 14 Q. And you referenced Mr. Leake in I believe a
- 15 paper that he had prepared?
- 16 A. I remember that. I messed up my presentation
- 17 +though, so.
- 18 Q. Yeah, we don't need the slide?
- 19 A. Okay.
- 20 Q. I'm just asking you if you remember that. Do
- 21 you -- we can't find reference. So, were wondering if
- you could provide some more information about that?
- 23 Like the paper, or the journal?
- 24 A. It was a USGS publication. And I would have to

Page 688

Page 690

- 1 evidence indicates a strong hydrologic connection,
- 2 would you have any reason to doubt that those are
- 3 accurate words?
- 4 A. No.
- 5 Q. All right.
- 6 In the bi-op, Fish and Wildlife Services --
- 7 A. Let me --
- 8 Q. Sorry.
- 9 A. His definition of hydrologic connection or
- 10 strong might be different than mine. But, it's my
- belief, my interpretation that there is a hydrologicconnection. You know, I think there's connections and
- 13 not the strong connection I showed for other wells.
- 14 Strong isn't the word I used. But.
- 15 Q. Okay. Thanks.
- On the bi-op that led up to Rule 5712, Didn't
- 17 that bi-op evaluate a thousand acre-feet of pumping; is
- 18 that accurate?
- 19 A. I don't recall.
- 20 Q. Okay. Did you know if any further biological
- 21 opinions have been requested or issued regarding
- 22 Lincoln/Vidler applications or Kane Springs Valley
- 23 pumping?
- 24 Å. No, I do not.

- 1 search for a reference for you, but, I'd be happy to do
- 2 that.
- 3 Q. Okay. And then I'm just trying to understand
- 4 the drought position I guess of the Park Service.
- 5 And would you agree that the Bureau of
- 6 Reclamation has repeatedly stated that we are in the
- 7 20th year of the largest drought in history? Would you
- 8 agree with that?
- 9 A. Have no reason to dispute it. I don't know
- 10 what they've said.
- 11 Q. You didn't know what they say. Are you aware
- 12 that water purveyors, local governments, SNWA, they're
- 13 all preparing drought contingency plans?
- 14 A. I was not aware of that, but, it doesn't
- 15 surprise me.
- 16 Q. Okay.
- MS. PETERSON: I don't have any other further
- 18 questions. Thank you.
- 19 HEARING OFFICER FAIRBANK: Thank you.
- 20 City of North Las Vegas.
- MS. SCHROEDER: No more questions.
- 22 HEARING OFFICER FAIRBANK: Okay. No further
- 23 questions.
- 24 Center for Biological Diversity. No additional

Page 698

- 1 CARSON CITY, NV, THURSDAY, SEPTEMBER 26, 2019, A.M. SESSION
- 2 -000-
- 3
- 4 HEARING OFFICER FAIRBANK: Good morning. This is
- 5 a continuation of the hearing in the matter of a Lower White
- 6 River Flow System Order 1303 proceedings. And so today, we're
- 7 going to go ahead and hear from the Moapa Band of Paiute
- 8 Indians. And we might have additional -- more time for
- 9 cross-examination today based upon conversations I've had with
- 10 the Tribal representative.
- 11 So once we get through the initial presentation
- 12 by the Tribe, then we'll go ahead and make a determination of
- 13 how much time to assign, and then we'll go from there.
- And so I'll go ahead and let you guys start in,
- 15 Ms. Baldwin.
- MS. BALDWIN: Thank you, Mr. King, Ms. Fairbank,
- 17 Ms. Flatley, the Division of Water Resources staff. My name
- 18 is Beth Baldwin. I'm an attorney for the Moapa Band of
- 19 Paiutes. With me is Debbie Leonard, our local counsel.
- Before we put Dr. Johnson on to testify today, we
- 21 have two things that we want to put into the record.
- The first is a general objection to the State
- 23 Engineer's authority to engage in the proceedings based on the
- 24 absence of an express legislative direction. The only

- 1 United States for the benefit of the Tribe, and the United
- 2 States has a money mandating responsibility to manage those
- 3 rights for the Tribe's benefit.
- 4 Those rights are unadjudicated and unquantified
- 5 as of yet, but the Tribe has the right to invoke those rights
- 6 and ask that they be adjudicated in Nevada State Court.
- 7 The Tribe leases 3,700-acre-feet annually of
- 8 Muddy River surface water from the Muddy Valley Irrigation
- 9 Company, and those rights are contractually senior to all
- 10 other Muddy Valley Irrigation Company rights per the 2006
- 11 lease, which is Nevada State Engineer's Exhibit Number 242.
- And one housekeeping matter. I brought about 30
- 13 copies, paper copies of the PowerPoint presentation. That's
- 14 probably enough for every party, but maybe not every person.
- 15 So if someone didn't get one, if you could share with your
- 16 neighbors, that would be appreciated.
- And now I'll stop talking and let Dr. Cady
- 18 Johnson, the Tribe's hydrogeologist begin.
- 19 HEARING OFFICER FAIRBANK: And before you start
- 20 speaking, Mr. Johnson, let's go ahead and have you sworn in.
- 21 DR. CADY JOHNSON,
- called as a witness in this matter,
- having been first duly sworn,
- testified as follows:

Page 699

Page 701

- 1 statutory provision cited authorizing Order 1303 is Nevada
- 2 Revised Statute 533.024, which is a legislative declaration of
- 3 policy to conjunctively manage the waters of the State.
- 4 It does not expressly authorize the State
- 5 Engineer to manage distinct basins is one, and secondly, even
- 6 if that does provide statutory authority, this proceeding is
- 7 an ad hoc rule making in the absence of any regulations
- 8 regarding conjunctive management in multiple hydrographic9 basins that until now, were managed as the State, therefore,
- 10 it's arbitrary and capricious. We just want to make this
- 11 objection known on the record. Thank you.
- Secondly, the Tribe chose not to put on any
- 13 witnesses as to policy matters because we understood those to
- 14 be outside of the scope of this proceeding. We only have a
- 15 technical expert. But we understand that other parties may be
- 16 putting on witnesses describing the extent of their water
- 17 rights or hypothetical interference with their water rights.
- So for that, we'd like to just point out three
- 19 things for the record:
- 20 The Tribe possesses federally reserved rights to
- 21 surface and groundwater appurtenant to the original 1,000-acre
- 22 reservation with an 1873 priority date and groundwater rights
- 23 to the 70,000-acre expansion with a 1980 priority date.
- Those rights are an asset held in trust by the

- 1 DIRECT EXAMINATION
- 2 BY MS. BALDWIN:
- 3 Q. Dr. Johnson, can you spell you name -- say your
- 4 name and spell it for the record, please?
- 5 A. Cady Johnson, C-A-D-Y --
- 6 Q. And turn your microphone on?
- 7 A. Thank you. C-A-D-Y, Johnson, J-O-H-N-S-O-N.
- 8 Q. And are you currently employed as a
- 9 hydrogeologist?
- 10 A. I'm an associate with Mifflin and Associates,
- 11 practicing as a hydrogeologist, self employed.
- 12 Q. How long have you been working in this field?
- 13 A. 47 years.
- 14 Q. How long have you been focusing on the
- 15 hydrogeology of southern Nevada?
- 16 A. 47 years.
- 17 Q. We've already presented Dr. Johnson's CV as MBOP
- 18 Exhibit 1. So I believe it's already in the record. What
- were you asked to do for this proceeding?
- 20 A. Quite specifically, offer our analysis of the
- 21 most appropriate boundaries, administrative boundaries for
- 22 the -- what's presently designated the Lower White River Flow
- 23 System. Try to estimate the flux through that system.
- 24 Address issues related to transfers of water rights from

Page 702

- alluvial locations in the MRSA, in the Muddy River Springs 1
- area, to presumably someplace more remote and in the carbonate 2
- rock, completed in carbonate rock. And then there was an 3
- offer to raise any other issues that we felt were legitimate
- and related to this topic.
- Q. And you formed opinions as to all these matters?
- A. Of varying certainty, yes.
- Q. Did you author any reports containing those
- opinions? 9
- A. Many. 10
- 11 Q. Specifically, the two reports that were submitted
- to the State Engineer's office?
- A. Yes. There was an Order 1303, I think we filed 13
- it with the original report and then there was also -- after 14
- 15 we reviewed the other participants submittals, there was a
- rebuttal report. 16
- 17 Q. And those reports are your own work?
- They are in consultation with Martin Mifflin. 18
- And they accurately reflects the opinions you're 19
- going to offer today? 20
- A. They do. They do. 21
- Q. And you intend to allow yourself be
- cross-examined by the other parties present?
- 24 A. Actually I'd like to keep the direct as brief as

- And as you'll see or may have seen if you read 1
- the reports, there's a lot we could -- a lot more we could do 2
- with the model. 3

9

- But just briefly, at this point, I'd just like to 4
- say that we -- what enabled this, what enabled this is a
- conversation I had with Andrew Burns --
- HEARING OFFICER FAIRBANK: Mr. Mifflin, if I can
- just remind you to speak in the microphone --8
 - DR. JOHNSON: -- oh, I'm very-- I'm very sorry --
- HEARING OFFICER FAIRBANK: -- so everyone else --10
- 11 DR. JOHNSON: -- I was looking at Colby because
- 12 she was present at the conversation.
- 13 I've always thought, in thinking about the Las
- Vegas Valley, that all that water can't be coming from the 14
- 15 Spring Mountains. There's just -- on one end, not enough high
- terrain up there. And underlying the carbonates in the high 16
- 17 terrain is Aztec sandstone, which you can see from Las Vegas,
- the beautiful red cliffs up there in Red Rock. 18
- And that Aztec sandstone is a heck of a difficult 19
- environment to get a groundwater supply out of. And 20
- Dr. Mifflin worked on it a lot, I've worked on it some, trying 21
- to get a water supply in a Valley of Fire, and it's not a very 22
- satisfying place to get somebody a potable water supply. 23
- But anyway, I don't want to get distracted. All 24

Page 703

- possible and do most of our information exchange during cross.
- I prefer to take questions that matter to the other 2
- participants than try to anticipate those. 3
- MS. BALDWIN: Okay. Thank you. We would like to 4
- offer MBOP Exhibit Numbers 2 and 3, which are Dr. Johnson's 5
- report into the record. 6
- HEARING OFFICER FAIRBANK: Those shall be 7
- admitted. 8

1

- 9 MS. BALDWIN: Thank you.
- (Exhibit 2 admitted into evidence.) 10
- (Exhibit 3 admitted into evidence.) 11
- BY MS. BALDWIN: 12
- Q. Dr. Johnson, if you want to just go ahead and 13
- start giving your presentation and I'll interrupt you with
- questions as they arise. 15
- A. Thank you. I'll start with just touching on our 16
- model we developed. This was -- and we'll lead from this to 17
- why we did this. 18
- We built a finite element model in two weeks with 19
- 20 a demonstration version, I mean, fully capable demonstration
- version of the de-flow code. And what we were able to 21
- accomplish is two weeks is part of the record, I don't have 22
- the number there, but the actual binary model is available for 23
- anyone who's licensed for de-flow. 24

- I want to show here is the way this model, you can present
- model results in a number of ways. Most of -- or I would say
- all of what we've seen in the past three days has been
- potentiometric surfaces or contours, potentiometric maps. 4
- You can also present the groundwater flow field 5
- as stream lines and -- in a steady state in a steady field. 6
- It -- let's just leave it at that. 7
- So we built a steady state model based on Andrew 8
- 9 Burns' comment to me that they're pumping between 70 and
- 80,000-acre-feet per year in Las Vegas Valley, reinjecting 10
- about 15, and so that gives me a nominal 60,000-acre-feet to 11
- 12
- Q. And, Dr. Johnson, when you say "they" and refer
- to Mr. Burns, can you explain who that -- who you're talking 14
- 15
- 16 A. Well, I had a certain conversation -- I made -- I
- made a -- in our first 1303 meeting, I made a comment and 17
- 18 Colby objected regarding Las Vegas Valley and its relevance to
- this topic. 19
- 20 And I was asking for a -- I felt they should do a
- 21 full-blown analysis, water balance analysis within Las Vegas
- 22 Valley to see how closely the system has reached a new steady
- state, you know, how would you characterize that. 23
 - How much water is really being produced and what

Min-U-Script® (3) Pages 702 - 705 Capitol Reporters 775-882-5322

Page 706

does that mean in relation to the 25,000-acre-feet that 1

Malberg estimated back in the '60's as the sustainable yield. 2

So something's not making sense. You got a lot 3

more water coming out of Las Vegas than the estimated

perennial yield by Malberg and where is all that water coming 5

from? 6

7

9

13

You know, it's been how many years since the

pipeline, '46 or '7, and the temporary permits were revoked. 8

And we've had nearly half a century for those water levels in 9

Las Vegas Valley to reach new equilibrium, and that's clearly 10

the goal is to stop the drawdown in Las Vegas Valley. 11

So whether it's really happening or not, I don't 12

13 think anybody could argue that in Las Vegas, the runaway

decline's been arrested. But without an analysis, all I have 14

is a number from the expert, a rough number, and I don't 15

know -- I don't know if it includes what the big hotels are 16

17 pumping, what Nellis Airforce Base, what the Airforce is

pumping, and any miscellaneous small, but senior rights. 18 So I don't know the total from Las Vegas Valley. 19

But based on what Dr. Burns told me, I went ahead and started 20

the model with a sync -- with a 60,000-acre foot feeder 21

strength in Las Vegas Valley and through the calibration 22

process, which was both the water levels and temperatures. 23

Now, this is the -- how a model differs. It's a 24

groundwater. But our question is, where does that water go?

There was some preliminary attempts by John Sass. 2

We have one of those exhibits, preliminary interpretation of 3

the Eureka low. The Yucca Mountain people care, the Eureka

isolation people care because it's a tracer. It's a tracer 5 and they're really interested in groundwater travel time. In

7 fact, the early regulations restrict -- they put a numerical

limit on the groundwater travel time for a nuclear waste site. 8

But anyway, we see two flow fields indicated here 9

and the red one on the left includes Pahranagat Valley, just 10 kind of -- or Pahranagat Springs, Pahranagat discharge area,

11 12 it's kind of nested in this much larger flow field through Las

13 Vegas Valley. And these flow lines over here ought to make

the lake (ph.) isolation people really unhappy if there's any 14

15 related to that.

There's a -- there's another flow field indicated 16 that feeds the MRSA, and I didn't include the slide. It's in

17 the report. But this -- these -- this area needs to be turned 18

off of the model. The model domain has line segment 19

boundaries just because of the way the meshing works, and like 20

I said, I only had two weeks. So this is what you get for two 21

weeks of work. 22

And whoever can afford free flow and load it in a

model, the first thing you want to do is cut off the flow of

Page 707

23

24

1 model of anisotropic system, and surprisingly, we've been here

for three days, and the word "anisotropy" has not been 2

mentioned. It was mentioned that the Theis equation needs an 3

anisotropic aquifer on these anisotropic ya da, ya da, ya da, 4

perfectly confined, but nobody's mentioned the anisotropy. 5

We've mentioned faults and the anisotropy they create at a 6

7 larger scale, but the word wasn't mentioned. I'm just amazed.

So we're taking a regional approach. This shot 8

mean let me get off the slide so I don't run out of time. 10

is just about the southern third of our model, which we -- I

Okay. Let me go back and do this better because I'm going 11

12 to -- first slides are for history.

Basically we present our model results that's

calibrated in terms of temperatures at Tule Springs and an

assumed one degree Celsius temperature of the recharge. Okay. 15 So -- and we're solving for the temperature at the springs,

16 all right, at Tule Springs. So -- and the way we're doing 17

this is we're taking heat from the Eureka low. 18

Now, that's another thing, I was shocked I 19

20 haven't heard in the last three days, especially yesterday

with all the Nevada test site experience that was referenced. 21

22 Has the -- has somebody else solved the problem of the Eureka

low? The Eureka low is a heat flow deficit in the central 23

great basin and it's always been assumed to be due to flowing

Page 709 the mountains and some of this stuff over here. And I've got

an illustration with how we clean that up. And there were 2

other things to clean up. So here we have, apparently, a

4 hydrodynamic life. I mean, this is a -- it's a

two-dimensional system, it's one layer, constant

transmissivity, 10 to 1 anisotropy ratio. In other words, 6

transmissivity north/south is ten times as great as the 7

transmissivity east/west, not exactly, no. 8

9

10 A. Transmissivity in the primary, in the most

transmissive direction in any element is ten times the 11

12 transmissivity normal to that.

Q. Dr. Johnson, I'm sorry to interrupt you. But 13

when you're talking about the hydrodynamic divide, for the 14

record and for people who can't see your pointer, you're 15

referring to those blue dots? 16

17 A. Thank you.

18 Q. That run down the middle?

19 A. Yes. I should have spoken while I was pointing.

20 There's a series of blue dots dividing the red streamlines

from the yellow streamlines, and that is a hydrodynamic 21 divide.

And the red dot is where there were numerical 23

difficulties in the model, but one of the goals was just to

(4) Pages 706 - 709 Min-U-Script® Capitol Reporters 775-882-5322

Page 710

see if we could get a numerical solution. 1

I mean, I was amazed that the model solved with 2

realistic -- how should I say realistic? Everything in this 3

model was assumed. On cross, don't ask me what we assumed 4

because we assumed everything. 5

6

7

8

9

10

11

12

13

14 15

16 17

18

8

We assumed the transmissivity, we assumed the anisotropy angles, we assumed the thickness. We assumed the amount of heat going into the aquifer under the water, and I'm not sure if that was correct.

I didn't have a way to figure out, do you apply the heat just to the water, to the aquifer or both? Where do you apply the heat? The Eureka low is ill defined and we've got a couple of slides later and in the report, you can see.

But without knowing what -- how much heat is really being lost, see, you have to know how much is coming in from the bottom, which is probably the order of 80 to 90 milliwatts per square meter, but we don't know. We don't

19 So anyway, I'd like to get off this, but what 20 you -- off this particular slide. But this is the defined 21 element model and we'd love to keep working with it. It's a joy to work with. You can couple geochemical codes, you can couple FREAK, which means you'd be doing a nonlinear iterative 23 24 solution for the geochemistry in every element. Now, there

and heads. We calibrated heads between Tule Springs and we'll

have them on another slide. The Steptoe is next up off this 2

map to the north. 3

21

22

23

24

Just catch me on cross with this, I've got to get 4

off this slide. We talked about a little history. We don't 5

like cumulative rain averages or that kind of thing either. 6 7 But Eakin did it, Maxey did it.

And just for history, I just want to show, and 8

I'm going to point at two features of this graphic that's from Eakin 1964 where he noted that at the weather station at or about up in White River Valley, he had some wet years in the '40's and then the Muddy River seemed to peak in around 1960.

Well, Maxey comes along two years later, trying to get the water supply for Nevada Power and he got a couple more years of data. And he -- and the same data that Eakin used, and he, again, make this suggestion that it looks like maybe you've got a 15- to 20-year lag between your wet years and your response in the river.

Well, that was -- just keep that in mind. As we look through this and for our whole professional careers, we've known about this. What is the lag? We're talking about a regional system and I think the argument today is whether it's centuries like the Water Authority has asserted in their DDC work and accepted by you in your rulings, or is it decades

Page 711

Page 713

are about 49,000 elements here on this one. 1

But it's doable. I mean, this model solves in 2

five seconds. So it's not like a big complex model with a 3

framework that you don't want to touch. We can fix this or 4

add a layer below it or, you know. These days now, we can 5

make a good mesh. 6

Now, this is the first finite element I've ever 7

built on my own, only because, you know, I've studied finite

9 elements for 30 years, taken courses and things, but they

never give you a good meshed area, so you can't apply it. 10

Q. Dr. Johnson, did you make -- and I don't know the 11

exact term, but did you make the code or the file that you

used to generate your model available to the other 13

stakeholders in this proceeding?

A. Yes, it's binary. All you can see is the first 15

line that identifies it as a feed flow file. Apparently the 16

binary file has a first line of text when I tried to look at 17

it. But it'll load right into a feed flow, and this is what 18

you'll have. 19

20 Q. And to your knowledge, do you know if anyone else

has attempted to work with your model or build upon it? 21

A. I really hoped Tim Durbin would be here because 22

he would -- he would have. 23

Okay. Yeah, so we calibrated temperatures to --24

like we'll try to convince you today with bringing in 1

additional lines of evidence. 2

So we'll get to that. But first, I'd like to 3

show a slide of tree ring data. And this is from Salzer, 4

from -- he's at the University of Arizona. These are proxy 5

temperatures and there was a comment made and this is a really 6 7 important point. There was a point made that why use proxy

data if you can do the real thing? In other words, why use a 8

9 river base flow when you can measure the rain?

And the answer is the rain is proxy data. We're talking about recharge. So is the snow pack. So we -- and so that's one point. This is all proxy data. And the other point is if you want to extend the instrumental record, now we're open to the idea that these groundwater travel times could be centuries.

How do you -- what's diasostic? But what we do -- and so if you want to extend the instrumental record, say, of temperatures, I don't know what it is, a couple hundred years at the most before we had good thermometers and record keeping, the tree rings were as good as a thermometer for what's going at the tree line.

So we use and value and cherish proxy data like this. It's these -- and I'm going to point at the warming since the industrial revolution. You know, you talk about the

Page 714

anthropogenic or climate or driven climate signal, I'm 1

- pointing at the up ramp from about 18 -- oh, just before 1850 2
- up to the present. And the tree ring proxy temperatures from 3
- the year about 850-AD, they wiggle a lot, but they trend down
- until about 1850 and then they just take off. 5
 - And then you see, I'm pointing at the top chart
- 7 where this -- you've got the same record, just squished down
- for comparison with the model record. 8
- So the climate modelers build the climate 9
- modelers and build on the climate modelers and trying to track 10
- 11 this. It's tree ring data, and the tree ring data are now a
- sufficient resolution where they're getting pretty good, 12
- 13 pretty good.

6

- So we have a -- we're getting to a point where we 14
- 15 have a theoretical and an empirical proxy database for
- temperatures at the recharge areas. That -- by the way, that 16
- 17 Salzer paper was from Great Basin data all across the Great
- Basin, from Bristlecone pines up the tree line. 18
- Why did we build a finite element model when 19
- we've never done that before? Well -- and there was a -- let 20
- me clear one thing up. Our model explains this one. We have 21
- another separate parallel model for the H-4 water logs. This 22
- is a model for Big Muddy Spring, explaining its annual 23
- discharge -- annual total discharge in terms of a prior 24

- BY MS. BALDWIN:
- 2 Q. Dr. Johnson?
- з A. Yes.

11

12

- 4 Q. Just to orient us all to the slide, what you're
- talking about is Big Muddy Spring discharge; is that correct?
- A. Yeah, let me -- before -- let me just speak to
- 7 the slide before I speak generally.
- So the slide, representing the climate response 8
- model, has observed data in the blue dots connected by a solid 9 dark blue line, and these are in acre feet. So there's 53, I 10
 - think. Yeah, 51, 53, 5500, 700-acre-feet.
 - So Big Muddy Spring varies quite a bit and we were avoiding it for the longest time because the swimming
- 13 pool and the Boy Scouts, when you get in and look at that 14
- record, they used to drain the pool every weekend. 15
- So you get this huge surge going down there one 16
- 17 day and then there wouldn't be anything the next day when you 18
- fill up the pool. And so your day to day looks pretty bad, but your annual data, it all adds up. 19
- So we looked at annual discharge from the Big 20 Muddy Spring as measured by the USGS. It's their gage 1549 --21
- 5900 -- I mean, I -- scratch that. Strike that. I'm not 22 23 going to give you a gage number off memory.
- 24 So then the other parts, others items on this

Page 715

8

10

18

Page 717

- interval of climate history as represented by water year total 1 flows of the Humboldt River.
- 2
- So when we do that, and we don't know what that 3
- span of time is. Is it two years worth of precip or climate
- data from this year and last year or last year and the one 5
- before? Fish and Wildlife, I think, uses a two-year -- and 6
- get me -- if I misrepresent anything, please get me on cross, 7
- because I'm not trying to. 8
- It's -- I think, if I understand the Mayer 9
- Congdon work, it's a couple of years of climate that they're 10
- dealing with, immediately preceding the observation. And we 11
- wanted to test that. 12
- And what we had to do is figure out how to 13
- automate the search because what we're talking about is once
- we found a hundred year record at the Palisade Gage of the 15
- Humboldt River, and each annual discharge tallied, how are we 16
- going do a thousand multiple regressions, every two-year 17
- interval going all the way back to the beginning of record, 18
- you know, which would indicate, if that worked, maybe we do 19
- 20 have a hundred year lag and two years of climate to explain
- the discharge. 21
- So we had to do a thousand or so multiple 22
- regressions and find out how to do that and look for the --23
- and hope there was one fault positive correlation coefficient.

- chart -- well, the model predictions. These are forecast.
- See, this model, the one that works, the only solution out of
- a thousand-plus trials of different pieces of time at 3
- different locations in time, the only solution was all 4
- positive correlation coefficients, suggesting that -- you 5
- know, more flow, more water in the system. 6
- And I also agree with the comment about the 7
 - negative. You shouldn't have negative correlation
- coefficients, and that's another issue and I've had no 9
 - argument with that.
- We have -- there are two -- our spring flow model 11
- and our gage floor model, we insisted there be no negative 12
- correlation of coefficients. And there was one unique 13
- solution. It was the interval of time from 12 -- inclusive 12 14
- to 22 years before an observation, weighted roughly normally 15
- across that distribution explains the river flow. 16
- So here's -- we have got two models. We have --17 the yellow dots are the actual, that -- those solutions, those
- spring flow estimates, forecasts or estimates are based on the 19
- 20 actual model, the coefficients that came out of the model. 21 The other one, the green one, the smoother looking one --
- let's see. 22
- I don't think I put the -- no, I didn't put the 23
- response function in there. But the way those regression

Min-U-Script® (6) Pages 714 - 717 Capitol Reporters 775-882-5322

Page 721

Page 718

- 1 coefficients vary across that interval of time, in the oldest,
- 2 they're low, at the oldest measurement, then they're highest
- 3 in the middle years, and then they're, again, low at the
- 4 youngest, at the 12-year mark. And so I approximated the real
- 5 solution with a normal -- with a bell curve shaped response
- 6 function and got this.
- And so now we've got a system where we can hind
- 8 cast all the way back to -- as far as we want and we can
- 9 forecast 16 years, because that's the way -- I mean, it's
- 10 history that's driving the spring flow, not yesterday.
- So first couple of years, and these are the two
- we presented at Devil's Hole, talking about the climate sweet
- 13 spot. That's one of our -- we got a cool PowerPoint as one of
- our exhibits. These we presented in 2018 at Devil's Hole
- 15 workshop.
- This one was from last -- from water year 2018,
- just -- all that the same there. And this one here, I've
- 18 estimated the last two weeks of water year 2019 at the average
- 19 rate for the prior two years for -- the average September rate
- 20 for the prior two years.
- So this one will change a tiny bit, what we can
- finalize this in four days. But it's not -- it's hardly
- 23 moving. We've got a whole year behind -- record behind it and
- 24 two weeks to go. And I've guessed that two weeks. So my

- 1 Q. Before we get off the slide, just to clarify some
- 2 things. So when you -- so you looked at Muddy -- Big Muddy
- 3 Spring discharge and you said that there's a lag of 12 to
- 4 22 years, but I don't think you actually explained what you
- 5 were comparing it to.
- 6 A. I'm not sure -- Beth, I'm not sure I understand.
- 7 Q. You were talking about the Humboldt River flow?
- 8 A. Oh, that was -- there's another very important
- 9 point, very important point. In the rebuttal reports, there
- 10 was some misunderstanding. I'm not sure which one. I think
- it may have been Nevada Energy's -- clearly, there was a
- misunderstanding. We're not saying water comes from Humboldt
- 13 River and goes to Big Muddy Spring.
- We're saying that the Humboldt River with its
- huge catch of perennial flow and location in the zone two of
- climate is representative of the climate that we think is relevant to recharge.
- So we think, as you'll see from our model input
- 19 that I'll show next, we think the recharge occurs in high
- 20 country from snow, no recharge to the regional system. Let me
- make sure we understand.We're talking about a regional
- We're talking about a regional system that
- recharges, in our opinion, in high terrain, regionally high
 - terrain in central and east central Nevada, and then finds its

Page 719

24

- 1 guess can't be off enough to move that, or else you'd be
- 2 reading about Big Muddy Spring in the newspaper.
- 3 Okay. And so in hind cast, here's -- now, this
- 4 is a really important point. When we hind cast this model,
- 5 19 -- I'm pointing with my pointer to the hump on the left of
- 6 the diagram, hind cast high flow in Big Muddy Spring in 1960.
- 7 1960, that's when the river was high.
- 8 So the little we know, it seems like the Big
- 9 Muddy Spring type or form of hydrograph is representing the
- 10 system that dominates the Muddy River in terms of its
- 11 discharge.

13

- So the many hydrographs we have with the same
 - form, I would -- we'll get to this, but a form that I would
- 14 claim is dominated by climate and somewhat perturbed by
- bumping, they're all very similar and so similar that they've
- been called -- well, the reason we're here is that they're so
- similar, it looks like -- if you think the hydrograph is
- 18 drawdown, it's the same everywhere.
- But when you start subtracting hydrographs from
- one another and looking at differences, that's when you see
- 21 the drawdown. This is one piece of the hydrograph. That's
- our professional opinion and a very strongly held one.
- 23 Q. Dr. Johnson?
- 24 A. Yes.

- 1 way through the regionally continuous pre-Mississippian shelf
- 2 carbonate section to southern Nevada.
- 3 So the water, we're not claiming that the water
- 4 is moving. We're claiming that the annual water going down
- 5 the Humboldt River is a proxy for the wet versus dry climates,
- 6 that because of that tree ring data, you'll see whether it's
- 7 centuries or decades, those tree ring signals are driving the
- 8 oxygen or the -- both the stabilizer to composition of the
- 9 recharging precip.
- And so we should be seeing those tree ring
- signals somehow transformed through whatever hydrodynamics
- occur to some other signal like the -- at the discharge area.
- Now, regional springs are not constant. Muddy
- River flow is not constant, the natural flow. That's
- absolutely clear. Eakin knew that. So when we start
- averaging things, we get into trouble and we've got some examples where people have averaged things and they're in big
- 18 trouble.
- I don't have anything in direct here on the
- 20 isotopics, but we have a lot of information and some slides,
- and that's one reason I'd like to leave plenty of time for
- 22 cross. I'd hoped Jim Thomas would be here to talk about that.
- Dr. Thomas is a former director of the DRI Water
 - Center. He's a geochemist and was the author of the -- he's

Min-U-Script® Capitol Reporters (7) Pages 718 - 721 775-882-5322

Page 725

Page 722

- one of the -- it's an important report. We've got a 1
- geochemistry report in support of the Water Authority's 2
- Delamar Dry Lake and Cave work, very important report. 3
- But we've got problems with it and without him 4
- there or somebody that's equivalent for -- to discuss it with,
- we're not going to bring it up on direct. But we're happy to
- 7 talk about it on cross.
- BY MS. BALDWIN: 8
- Q. And, Dr. Johnson, you've been going about 9
- 30 minutes. 10
- 11 A. Thank you.
- Q. If that's helpful to you. 12
- A. Oh, thank you, thank you. Let's look at some 13
- model input. 14
- 15 On the left is the way we defined our flow to
- main and then this -- and then on the right, you can see with 16
- those straight boundaries, that's the way that they 17
- approximated it. 18
- And what you see, and I'm going to point first to 19
- the left diagram, it's the one that's blue. This shows how we 20
- constructed our recharge cutoff surface. 21
- Now, our -- our idea for the recharge is that it 22
- comes -- it's a regional problem, there's a regional solution 23
- or a regional component of the solution. The regional high 24

- good recharge cutoff elevation in the south at latitude 36 2
- On the other hand, in the northern areas, we look 3
- at the hill slope in Ruby Valley up behind the fish hatcher,
- and the whole thing -- you know, there's no runoff from that
- thing. So it's -- you know, the carbonate section there on 6
- 7 the Ruby Mountain, the east side of the southern Ruby
- Mountains. So we think maybe 7,000 feet is an appropriate 8
- recharge cutoff. 9
- So in other words, up north, you only get 10
- recharge above 7,000 feet to the regional system. To the 11
- south, you have to be up above 8500 feet to get recharge. And 12 13 so look what that does to the Spring Mountains.
- What I've done here with this tint, this isn't 14
- 15 all that effective, but you can see the white areas are where
- that recharge cutoff surface. As I'm pointing, I'm pointing 16
- 17 now to the Spring Mountain, just a little white speck with a
- little gold in it at the -- near the southern part of the blue 18
- flow domain and there's a Sheep Range. 19
- Almost all of that high terrain is carbonate 20
- rock. Sheep Range is a pretty good recharge area. Spring 21
- Mountains, look at that. All that high country and just a 22
- 23 little carbonates up there above 8500 feet, just reinforces
 - what I've been claiming about Las Vegas Valley. You just

Page 723

24

11

- terrain is in central and east central Nevada, Kane, the 1
- Monitor Range, the Grant Range, Egan, Schell Creek and Snake 2
- Range, that's the high country. And I'm pointing. 3
- Q. So just for everyone, we're looking at slide
- number seven and you're pointing at the diagram on the left, 5
- which is mostly blue. And can you explain maybe what the 6
- different colors are showing? 7
- A. Yeah. Yes, yes, I'm getting there. The point --8
- 9 the first point I wanted to make, though, was the way we
- constructed our recharge cutoff surface. We -- we constructed 10
- a plainer surface. In other words, we're going to chop off 11
- the terrain model to leave us a bunch of islands where we 12
- think the recharge occurs. 13
- But the surface we used to chop off the terrain, 14
- to cut off -- you know, our recharge cutoff surface is higher. 15
- It has to be higher in the south. The pine trees are higher 16
- up on the trees in the south, the climate's warmer. 17
- So where is that? Well, fortunately, the Kaibab 18
- Plateau over in the Grand Canyon area is well enough 19
- 20 constrained in terms of its area and the spring discharge,
- because you can see the spring discharge is coming out of the 21
- 22 canyon wells to where you can take a pretty good -- and just
- because of the way the elevations are there, we thought 8500 23
- feet, about where the Ponderosa pines start, was probably a 24

- can't get all that water off the Spring Mountains. 1
- And the sheep range, maybe, but we know the sheep 2
- range is -- is -- the water is flowing this way because
- there's -- and I'm pointing to the area of the Divide well, 4
- BLM wells, up toward the northern -- east side of the 5
- northern -- or sorry, west side of the northern Sheep Range. 6
- There's a three well complex up there where you 7
- can see it flows to the north and -- but there's also plenty 8
- 9 of opportunity to -- for a flow off the sheep range to get to
- the Muddy River Springs area or to Las Vegas Valley. So we 10
 - think the sheep range is an important recharge area.
- And all I've done here with these circles, too, 12
- those are just sort of scaled representations of how much 13 discharge is occurring from these different sinks that I have 14
- in the model. 15
- And just for your -- because of our concept of 16
- 17 this system in the model, you don't have Pahrump and you don't
- have Indian Springs. Our concept is that Spring Mountain --18
- I'm pointing at the Spring Mountains with the pointer, I'm 19
- 20 pointing at Indian Springs, which is north of the Spring
- Mountains. 21
- I'm pointing at Pahrump, which is southwest of 22
- the Spring Mountains, and also Tecopa, which farther to the 23
- southwest than the Spring Mountains. The USGS work says that 24

lower Amargosa -- or that the Amargosa River also gets a lot 1 of its water from the Spring Mountains. So how do you all 2

that and supply Las Vegas with 60,000-acre-feet or more? 3

- You've got to have water coming in from the north. That's our strongly held professional opinion. 5
- Now, how does that happen because the water 6
- levels are iffy. A lot of questions. Now, the other item on
- this that I'm pointing to with a little gold -- still on the 8
- blue left-hand diagram. 9

10 11

19

The gold areas are those elements that are mapped as either Ortivision, Silurian or Devonian carbonate rocks. So those are the regionally continuous shelf rocks. And so what we did is we just got -- the Bureau of Mines has a beautiful GIS data set of all the county geology reports.

And so I just went through that table and clicked off everything that had a -- one of those rock types in it and then went through and selected the elements that -- and with the map as a guide, the geologic map, just selected all those elements with those rocks in it.

So what we're left with is a right ring where the 20 recharge -- we take all the recharge from -- based on the 21 discharge. Remember Dr. Waddell's comment from Dr. 22 Bredehoeft? It's the discharge. It is the discharge. It's 23 the discharge, we believe it. 24

strongly anisotropic system. And I think at that point, you want to start thinking about two bundles or streams. 2

And there was a comment that -- how capture zones 3 are misleading, they're for surface water. You can get into all kinds of trouble and so forth. And I accept that, but again, the word "anisotropy" was not mentioned and that worry

7 becomes less and less relevant as the anisotropy ratio gets higher and higher. 8

So what we have here, the way you enter anisotropy angles or directions into free flow is as counterclockwise rotations from the east direction.

So let's just -- now I'm going to point at the left-hand slide here and just show you, I mean, here in the greens, say, between -- not even the 90-degree area. Okay. 90 degrees, all these greens, those were -- the green areas represent a principal access of anisotropy that's rotated 90 degrees from east. So in other words, it's north/south.

So the green areas are most transmissive in the north/south direction. Then you have areas like the Pahranagat Sheer Zone, which I'm pointing to here, and it's got more of a purple hue to it, lower numbers, and those numbers are like in the 30's.

So picture 30 -- a 30-degree rotation from east, so the -- I'm pointing now, I'm moving the pointer over the

Page 727

We use the discharge, add it all up, it's a 1

couple thousand acre-feet annually and distribute that over 2

all these elements equally. 3

All these yellow or gold elements get what? See, 4 they like -- these are all -- well, fee flow, they're from 5 Germany, so they like, you know, some funny units. These are 6 recharge in meters per day. Okay. Fine, .00, that's -- it's 7

about 15 centimeters a year, okay? So all these gold spots. 8

9 Also, here, you can see on this right-hand

diagram, the location of the Steptoe annex well. And Tule Springs well, we calibrate -- see, we first did this as a one dimensional problem. And I showed it to -- I showed it to

Christi and she laughed in my face so we made a --13

(Reporter interrupted proceedings.) 14

MR. JOHNSON: Oh, I was -- I just said that I showed a one-dimensional version of this model to Christi and she chuckled. So anyway that's the way we handle -- we take all the discharge measured and the portion after the right geology to tie enough up in the mountains.

20 We also build an anisotropy and I would have like to go farther with this and I would like to try an anisotropy 21 ratio greater than ten. 22

But in my reading, you get in numerical 23

difficulties, more numerical difficulties if you have such a

Pahranagat Sheer Zone in the model grid, moving it from southwest to northeast, showing the principal direction of 2

anisotropy in the Pahranagat Sheer Zone.

And that's what this -- pretty much the same 4

thing all the geologists were saying over the last three days, was how these faults affect the -- you know, you can have an 6

enhanced permeability parallel to the strike of the fault or 7

your reduced relatively low permeability perpendicular cross 8

9 fault.

And then you have other areas like down here in 10 11 the -- where you start getting down into the Gerlach fault 12 domain, where the north Las Vegas sheer zone, like here, I think, where the -- or, no, the resin oranges are places where 13 you have northwest striking structure, I believe, yeah, 14 because there you're up in the 150 degrees from east. 15

So now you're at a northwest orientation with the principle axis. So every element of those, almost 50,000 of them, gets its own preferred -- it's own anisotropy angles.

And on the right, we got the Eureka well and that's another -- it was mentioned, this is a heat flow deficit in the central Great Basin. It was well known for years, almost universally attributed to groundwater flow removing the heat.

Nobody's ever said where that heat is going. So

Page 729

Min-U-Script® (9) Pages 726 - 729 **Capitol Reporters** 775-882-5322

16

17

18

19

20

21

22

23

Page 730

- that's what we tried to do is say the heat is going to the 1
- Warm Springs. Again, that would be a terrible thing for DOE 2
- to come up with from what I saw the waste at Yucca Mountain. 3
- You know, to have -- if this -- now, our solution didn't work
- over on that side for unknown reasons, probably because the --
- I'm pointing at our representation of the Eureka well now, 6
- 7 probably because we should have had more heat loss on the west
- side of our representation of the Eureka well. 8
- But anyway with these values of -- and they're 9
- like joules per square meter per day. I like milliwatts per 10
- square meter, but whatever, because a joule -- watts joule per 11
- second, okay. So they like joules, we use watts. But what 12
- 13 you see here is that's how, you know, our -- we had two weeks,
- we had one shot at it. 14
- 15 This is what we came up with to see if we could get a model, first off --16
- (Reporter interrupted proceedings.) 17
- THE WITNESS: Sorry. Thank you. 18
- Okay. One of our -- well, our first and foremost 19
- goal in modeling was to just see if we could get it to solve 20
- and not just be mathematically unstable, not diverge, not 21
- reach a solution. And so that was the goal. And we knew from 22
- our one-dimensional approach, what worked. 23
- We knew how fast the water had to move and how 24

- know, driving 515 to Salt Lake.
- So, no, that's the Colorado Plateau. You're 2
- breaking away a little bit over by the front range in
- Colorado. But that in fact blocked the Colorado Plateau and
- I've been pointing at that. Also, now pointing at the Baja
- Peninsula that hasn't formed yet. And so this is the
- 7 landscape 30 million years ago with some of the plate tectonic
- boundaries shown.
- 9 I think there's a triple junction about to go
- under the edge of the continent. I'm pointing almost at the 10 middle of the slide, kind of near where probably you'd want 11
- 12 San Diego to go. But I'll play this and I'll probably play it
- 13 a couple times.
 - And remember, seduction stops and strikes the
- 15 faults, starts about between 10 and about 14 million years
- ago. So watch the Baja, California start to break away, watch 16
- 17 the Great Basin start to extend, now the Calderas come out.
- It was about 11, Kingsbury Wash Caldera and takes us up to the 18
- 19

14

- Again, yeah, there it goes. See seducting, 20
- seducting, seducting, and then the transform fault goes under 21
- the edge and starts ripping away Baja, California. Another 22
- 23 thing to watch, look at these accommodation zones. Watch in
- 24 here, how things extend a lot and not much.

Page 731

1

10

Page 733

- much to move to assume the amounts of heat loss to the 1
- springs, and warm them by the -- warm the water from one 2
- degree C to, we assumed -- I think we assumed 30. We might 3
- have assumed 35, but I don't remember. And this is awkward,
- too, see, because I can't get back into the model code because 5
- we're not licensed. 6
- So I can't go back and go back into the model and 7
- answer any questions you might have or improve it, because 8
- 9 it's -- you know, I need 10,000 bucks and another couple
- thousand a year to get back on the model. 10
- I've run out my demo. But anybody else can get 11 12 two weeks on this thing, go for it. You know, and the mesh
- and hard work is done, I think. 13
- Now, this one, I hope you like this. This is an 14
- animation of the last 35 million years of western North 15
- American tectonics, what plate tectonics have done to the 16
- continent. And you're probably wanting me to play this, and 17
- I'll be happy to play it again. 18
- But before I start it moving, this is what --19
- 20 it's the Colorado Plateau. Las Vegas or former Las Vegas is
- going to be somewhere over in here because you got the -- you 21
- know, the root country, the transition zone, you've got 22
- Flagstaff, and you know, all that -- the Muddy Rim is down 23
- here. And then up here is Wasatch Front and the whole, you

- So I think if you're looking for an impediment --
- this another thing we need to talk about. If you're looking 2
- for an impediment to north/south flow, and again, last three
- 4 days, I didn't hear anybody tell me why the Muddy Springs are
- there. Nobody showed us a structure. 5
- We saw a lot of north/south faults, we've seen 6
- maps from the Water Authority, showing no obstacles to flow 7
- from either California -- or Coyote Spring Valley to 8
- 9 California Wash or the MRSA to California Wash. So my thought
 - is then why the springs.
- See, we couldn't get our model to work. This is 11
- 12 not our first model. We did publish a little element models,
- one of our exhibits. And where was I going with that? I lost 13
- my train of thought. I'm sorry. Let me just move to the next 14
- slide. 15
- 16 This is just zoomed in a little bit to the -- to
- our solution, the streamline solution for the Muddy River 17
- Springs capture zone, and this is the area that needs to be 18
- cut out of the model. So we see -- because you've got the 19
- 20 Mormon Mountains, you've got basin rock exposed in there, and
- you've got the Clover Mountains, intrusive rocks. 21
- And so I would put my -- I -- you know, it's just 22
- a matter of time. You know, we can be running the thing, we 23
 - see things we don't like about it, and we fix what we can and

Min-U-Script® (10) Pages 730 - 733 **Capitol Reporters** 775-882-5322

Page 737

Page 734

1 then we're out of time. Demo's over.

22

23

24

2 And so the last thing I did -- was able to do in

3 the demo with the help, you know, of tech support was get

4 these time to travel capture zones mapped in there.

And so our model with a 300-meter squared per day regional transmissivity, one kilometer thickness, tiny proxy, which I don't remember, but it's in the report, I think .00015 as a an inter -- regionally interconnected proxy. So that's

9 what we -- that's what we get. I mean, that's our solution.
10 And the water's coming from the high mountains.

And the water's coming from the high mountains. I mean, I don't know what else to -- how else to argue the regional -- our case for this being a regional problem. Now, here's our -- where we get 40,000-acre-feet and this is not tongue in cheek. This is serious and I think it's relevant.

An anisotropic system, and these are just roughly indicating how we think the flow works following the preferred orientation of the transmissivity field, we go from the elevation at the bedrock well across from the mouth of Kane Springs Valley to the Gil Breece Ranch spring mountain in northwestern Las Vegas Valley.

Here we go from MX-6 down to the Wilshire well, north Las Vegas, one of the longest production well records.
And just by accident or happenstance, you get exactly the same -- and I'm pointing to the lines along which we estimated

1 happen with all this fault discussion. In anisotropic system,

2 the water does not move perpendicular to the full extension

3 lines. Those are at an angle. And they were strongly

4 isotropic, the more they differ. Until you get to a pipe and

5 it flows straight down the preferred orientation because

there's no permeability, lateral permeability to that

7 preferred orientation.

8

9

10

11

12

13

14

16

17

18

19

20

21

22

23

24

So I'm doubting this a little bit on the west side if -- maybe we shouldn't move this boundary in only because our well -- like I say, our well, Mifflin and Associates -- no, it was DRI at the time, did a groundwater exploration project for Nevada Power in 1986, and one of the wells we drilled was -- the one I worked on was a 4,000-foot

But we had tertiary rocks all the way to 4,000 feet. We -- the first 400 was Muddy Creek. All the way down to 12,000 was a gooey white, greenish sticky ash. It was ash, ashy, very ashy, very thick.

well under what is now the tailings or flash.

And 3960 -- and this is from memory, I remember it well, dense red sandstone, fine red sandstone and quit, because after 40 more feet because we decided 4,000 feet was deep as we'd go looking for carbonate aquifer.

So there may be a fault. There -- with as much geophysics that's been done, I would not be surprised at all

Page 735

the hydraulic rating in -- from Coyote Spring -- or from the
LWRFS to Las Vegas Valley.

So between bedrock and to Gil Breece's place, we get -- I can't read it, .00021, I think, for hydraulic gradient. And in between MX-6 and the Wilshire well, we get the same thing. It's different in the third significant --

(Reporter interrupted proceedings.)

THE WITNESS: Oh, the hydraulic gradients from those two lines are identical in -- they only differ in the third decimal place.

Now, going by colors here, the reds are what we think are the boundaries. We're actually doing the first two questions in this one slide. The red lines are what we think are the flow domain boundaries. The gas peak thrusts are not bothered by that, really, but we query whether water actually goes under there. But you got to get the water into Las Vegas Valley.

This is just not acceptable, getting that -getting any quantity of water -- and we tried this. This is
what our -- our published element model had outflow on this
boundary because hydraulic gradient is like this, it's from
west/northwest, east/southeast. But we don't think -- but in
anisotropic system -- and nobody called this out yesterday.

I don't understand why this -- how this could

1 if there's a fault out here that's keeping the good water away

from the tribal plaza. They can't get good water there. So

3 here along the north Muddy Mountains, there's probably -- we

4 should probably move this boundary in.

What haven't I talked about? This is the -- this

6 is the hydraulic barrier that we presented it at the GSA in

7 Seattle in 2003, because in building our model, we couldn't

8 get the water to come out without obstructing the flow.

Then I called Brian Wernicke. He's the author of a couple of our exhibits. He's a professor at Cal Tech and he's -- he and his mentor, Clark Birchfield and Greg Davis, they've been leading the charge in reinventing the geologic framework, if you will. And I'll show a slide. It's the next slide.

Now we may have trouble. We'll talk about geologic frame works in just a little bit. The other thing I haven't mentioned here, I've got a couple of colors, the model -- see, the captures on the model showed us -- included this part that I've colored brown. The part that I said should be cut out of the model. So I just -- for this slide, I just colored it.

So this is roughly elevations in Lower Meadow Valley Wash that are too low to the springs. I just went up there, I think about the elevation of the -- elevation of the

Min-U-Script® Capitol Reporters (11) Pages 734 - 737 775-882-5322

Page 741

Page 738

- springs or along the contour line. That's just hand -- that's 1
- just our -- that's just our -- but this is -- this is -- the 2
- model solved in here where it shouldn't have. 3
- Wells, these are so close together, they look 4
- like one. Kane Springs well, Vidler well, Lincoln County 5
- wells right there. CSVM-4 is right there in Coyote Spring 6
- 7 Valley or maybe it's this one. I think it's this one.
- Anything else? Pahranagat sheer zone, you can see it from the 8
- terrain. You know, it's a bunch of washed up faults and the 9
- way -- there's another thing. 10
- 11 We know they're actually faults because the
- Caldera Rim's offset, you can see it and you can measure 12
- offset. Now, whoever says there's a fault in Pahranagat Wash 13
- and the Water Authority is putting arrows on it, I don't see 14
- the offset. I mean, show me the offset. I mean, I'll believe 15
- it. It's schematically consistent with the right lateral 16
- 17 fault. But if you don't -- if you can't show me offset, don't
- show me the fault. 18

are there.

Q. Okay.

hour. I know you want to --

derivative framework.

- But back to what Dr. Wernicke said, I was asking
- him about the structure because the existing structural maps 20
- and interpretation don't help us explain why those springs are 21

look at that Glendale thrust, some places, it sits on

Mississippian rocks, and some places, it sits on -- I mean,

the -- you know, the -- I'll just refer you to the exhibit.

The fact that the rocks under the Glendale thrust

differ imply that that thrust had to cut through the section

at some point that's not -- somewhere that's not exposed.

be, but there's so much we don't know about the subsurface out

there. It's obvious because we don't know why the springs are

there. And, you know, maybe on cross, I'll leave you as much

time as you can, maybe somebody will tell me why those springs

Q. And, Dr. Johnson, you've been going for about an

A. Yeah, I going to zoom right through these now.

A. Okay. Here, you have the geology we've been

These are two sections from -- oh, it's noted

hearing about. This is the traditional framework, whether

it's Page, Dixon, Rowley, it's the USGS framework or the USGS

there, north and south of the section that Swanson and

Wernicke published. And they recognized in the central Meadow

Valley Mountains, and I don't think anybody said the phrase

And if that lateral ramp -- it could be, it could

- there. Something is obstructing that flow. And he said, 22
- well, maybe you found the lateral ramp. 23
- Well, that's a really good point because if you 24

- Meadow Valley Mountains yesterday either.
- Did I do something wrong? Did you --2
- 3 O. I didn't say anything.
- 4 A. Nobody interrupted? Okay.
- 5 Q. No, proceed.

13

- 6 A. Okay. They believe they've got the ramp's
- incline identified in the central Meadow Valley Mountains,
- which allows them to correlate -- or how should I say, 8
- characterize the extension, because there are a number of 9
- features in these thrust faults that you can see in the Spring 10
- Mountains, you can see in the Sheep Range, and now you can see 11 12
 - in the Meadow Valley Mountains.
 - So some of these -- and this is the key to
- Swanson and Wernicke's long history of waking us up to the 14
- 15 extensional regime is using what they know about the thrust
- faults and the style of thrusting. You know, the leading 16
- 17 thrust, the Keystone thrust is the dead column one. In other
- words, the thrust moves along parallel to the stategraphy for 18 19 a long ways.
- Other thrusts, part of their back, the older ones 20
- cut up section there and they don't follow the stategraphy as 21
- much. So each of these thrust faults has its own unique 22
- characteristics that, once understood, can be found in these 23
- fragmented extended rocks. 24

Page 739

- - 1 And also kinematic model like that allows you to 2 extrapolate much deeper. Now, I'm pointing to the Swanson
 - Wernicke section on the slide. They extrapolate much deeper
 - in the subsurface than we can with the surface mapping. 4
 - What are the -- oh, and this slide, slight
 - modification from the report. And I hope you don't make me 6
 - 7 turn it off. We just added the Delamar, Dry Lake and the Cave
 - basins because there's a little sample calculation I would 8
 - 9 like you to -- there's an area there where we can do another
 - Darcy-flux calculation that I'd like to show you next. 10
- But this is Allen Chamberlain's dissertation map 11

 - of the 21 Devonian sequences that make up the Sunny Side 12
 - Basin, and this is a Devonian shelf, continental shelf. There 13 was a -- well, a lot of stories there. Anyway, the point is
 - 14 the Sunny Side basin is thick in the middle, thins off to 15
 - 16
 - nothing around the edges, and we're sitting on the flanks of it.
 - 17

5

- 18 So one idea, and a very reasonable one, the
- reason we have the springs, maybe it's purely stratographic. 19
- 20 I mean, even though we find the water there in Mississippian
- rocks, don't forget, those aren't the regionally continuous. 21
- The regionally continuous rocks are the 22
- Ortivision, Silurian, Devonian carbonate rocks for sure and I 23
 - didn't include Cambrian because there's not a lot of exposure

Min-U-Script® (12) Pages 738 - 741 Capitol Reporters

775-882-5322

Page 742

- and, for example, with the Grand Canyon, the water comes out
 of the top of the Cambrian Limestone. So it seems to be more
- 3 of an aquatar.
- 4 Even though we have Cambrian rocks just surging
- 5 over in the groundwater over in the Amargosa, we didn't use
- 6 them. This shows why we picked our flow domain for the model
- 7 the way we did. There's a structural thinning, you know,
- 8 Eureka quartz side's is absent. You know, all the Paleozoic
- 9 is in -- across it.
- So we took that as a boundary and plus there's
- 11 a -- on the surface, there's a drainage divide to the Humboldt
- River up here. So we took this as a rational northern
- 13 boundary for our flow model and we did have to let some water
- **14** out.
- But that -- and then the western boundary, the
- 16 Roberts Mountain thrust is part of the whole orogeny that
- 17 thrusts deep water. So let's just -- let's say impermeable
- 18 rocks up over the shallow water are permeable carbonate rocks.
- You don't have carbonate aquifer over here, so that's the
- 20 boundary.
- Anyway, let me just -- okay. This is a good one.
- 22 I think everybody yesterday was kind of on the same page,
- 23 thinking this was --
- 24 Q. Okay. Can you talk into the microphone?

- 1 unperturbed site, even in terrain like this, I'm going to feel
- 2 pretty safe because I know that in the case of MX-5, the well
- 3 right beside it only draws down to two feet. You know, pump
- 4 it for years and it only draw downs two feet.
- 5 And so -- and you go, you know, a couple of miles
- 6 away and because we don't believe the full hydrograph is drawn
- 7 down, draws down a fraction of a foot. So ten miles away, I'm
- 8 comfortable with draw down's in there. I can't see it.
- 9 So we -- well, I -- Marty and I are -- I don't
- 10 think Marty -- Dr. Mifflin is convinced, but I'm emphatic that
- 11 I believe this is not pumping response. And if I add the
- whole Order 1169 evaluation to do over, this would be the
- signal I would use for my reference well.
 - I'd go in and clean that up interplate with -- or
- 15 approximate it with empirical mode composition and use that as
- 16 a reference

14

- 17 Q. So, Dr. Johnson, for the record, because it's
- 18 hard to know what you're -- exactly what you're doing, I'm
- 19 just going to recap.
- We're looking at slide 14 and you're comparing
- 21 the hydrographs for KMW-1 and CSVM-4, and you've been pointing
- at -- there's an apparent dip beginning around early 2014;
- 23 that's correct?
- 24 A. Correct.

Page 743

Page 745

- 1 A. I am so sorry. Yeah -- and I actually -- I'm
- 2 sorry, I'm not talking more directly to the panel, but it's so
- 3 much easier to see the slide on the wall than on my little
- 4 computer screen here.
- 5 So I'm pointing at a feature of this CSVM-4
- 6 hydrograph, beginning in 2014, and only lasting about a year,
- 7 maybe a little more, maybe two years.
- 8 That's been -- I think whoever -- all the
- 9 speakers that addressed this feature, I think, were on board
- 10 with it being a pumping response and I don't think so. If
- it's pumping response, it starts up here.
- The hydrograph doesn't look anything like the
- other ones, except KMW-1. There's no -- I don't think this is
- 14 it with monthly measurements. But there's no mid-test
- recovery from that 2012, 5-month shutdown.
- It's diagnostic in the southern -- what we'll
- 17 call the southern flow field as far as apex. You know, the
- 18 BMDL well shows it clearly. I'd say that mid-test recovery is
- what is diagnostic and it's absent here.
- So if these things are moving in lockstep or
- 21 anything close to it, this one seems like it waited two years.
- 22 And as a -- one other philosophical point, as a practicing
- 23 hydrogeologist, you know, if I go ten miles up gradient from a
- well I'm interested in to try and find a reference well or an

- 1 Q. And when you -- and at the top of your figure,
- 2 you say "reference trend negative .2 feet per year". Can you
- 3 explain what you mean by a reference trend?
- 4 A. Oh, yes. Thank you. That's a linear regression.
- 5 In other words, the slope of each of those records. So the
- 6 blue line is the slope of the blue measurement trend and the
- 7 red line is the slope of the red, CSVM-4 measurement trend.
- 8 Thanks. Thanks for that.
- 9 Q. You're welcome.
- 10 A. Okay. Now, you might want to object to this.
- 11 It's an example calculation of inflow to northern Cave Valley.
- 12 Q. Just -- this is inserted for demonstrative
- purposes only; correct? You're showing a sample Darcy
- 14 calculation?
- 15 A. I don't know. You tell me.
- 16 Q. We're trying to clarify that this actual slide is
- not in the report, but Dr. Johnson is trying to show an
- 18 example of how you would take different numbers from different
- 19 wells and do a Darcy calculation.
- 20 A. I just made it up. Thank you.
 - The Steptoe MX well, which we pointed out
- earlier, and the Water Authority's 180 -- 180W5011 monitoring
- wells, the northern most monitoring well in the Cave Valley.
- What we've done is just look at the difference in

elevation of the water levels in those wells. And they vary, 1 so this is what they're -- you know, an approximate --2 approximation of the water level, both are trending. 3

But just separation, distance and difference in elevation gives you the hydrologic gradient. And because of our model, we had a number we could guess with and that's 300 meters squared per day, much less than any of our aquifer tests have given us.

So we used our regional transmissivity, the observed water levels, and by the way, this area is, in its entire width, underlaid by Paleozoic carbonate rocks. So if you look at the geologic map, I mean, it's covered. These wells are -- there's cover, but the expected section is entirely Paleozoic carbonate rocks in both of those wells.

So -- and I haven't looked at the well rocks, and maybe I'm wrong. But what we do have is a hydraulic gradient that assumed or derived, I would say, calibrated regionally transmissivity, and we take -- for the width of the aquifer, what did I say, 14 miles.

So for 14-mile width of aguifer with those 20 properties, we can get 25,000-acre-feet of water into Cave 21 Valley from the north. 22

Now, remember the assessment for that area said 23 all the water supply is derived from within the mountain linear regression through, and take that -- project that line

back. We want to find our datum again. And this is -- here's 2

something that is pretty amazing. 3

4 These are adjusted data, they're -- our green data there are adjusted for Arrow Canyon Well pumping 5 according to our model that's one of our appendices in our 6 7 direct report -- or in our original report.

So we fit that projected trend to pretest data. 8

And I didn't include it, but that is exactly the trend that Rick Felling presented at the Nevada Water Resources Association meeting in 2014, in early February, only his was offset. His was -- it was almost exactly that slope, but his fit the blue. See, his data weren't adjusted for Arrow Canyon Well pumping.

But I think, you know, Congress can recover that data, but -- that datum, but they need to -- they need to fix that because it's really misleading. We saw that, tried to resolve it with converse, and when we weren't able to, you won't -- this is our favorite hydrograph and we didn't include it in our report because of that.

Okay. Inclusions and recommendations. We've authored 40,000-acre-feet based on Darcy's law with two estimates of hydraulic gradient in close agreement, a transmissivity intermediate between what's been measured in

Page 747

Page 749

1 blocks surrounding the three basins. And I'm not doing this to pick on the Water Authority. We're trying to make the case 2 that all this water, the regional water comes from farther 3

19

Now, this one, there's an addition here, and I hope this is going to be helpful to Nevada Energy because this is not -- this is VH-4 water levels from the last three years.

And this record, I don't know, you might want to go spank the contractor, but this is actually based on four discontinuous record segments, three breaks in the record, not very long ones, but the data was confused.

And we called numerous consultants who actually does the work to ask about these offsets that I've prepared here and they didn't know about it, they weren't sure.

You know, I talked to a senior person and the field tech wasn't there, and I don't know if they were inspired enough to go fix the problem. But I know Nevada Energy has, in their rebuttal, the fragmented record. But that's the record that's in your files. So there's -- there is a problem, but there's also something beautiful here.

Once you reconnect the dots, you've lost the 21 22 data, but you've got the trend. And so when we take an even three years, just so we don't do something screwy at the end, 23 we've got exactly three years there of data that we do a

our aquifer tests and yours. And that leaves 19,000-acre-feet

from somewhere else, Spring Mountains maybe, though I think 2

that's way too much for the Spring Mountains, to make up the 59,000 that we assume is coming from Las Vegas Valley. 4

And the two flow fields are -- those that explain 5

the Big Muddy Spring are those that nourish, I guess, Big 6

7 Muddy Spring and another that seems to be represented in most hydrographs, I'd say those of the EH-4 form. And because that 8

9 latter one, the response function was funny and Dr. Mayer 10

pointed out it was funny.

Well, it's funny because it's got two humps on it and I think we may have also something local, most likely Sheep Range because that's the only available recharge area that fits our criteria, sending in those immediate pulses and maybe that needs to be treated separately.

And so using the Virgin River as a proxy to explain the needs for water levels, we got a funny response function and I'm not comfortable with it either.

And when we combine the two to try and make the Muddy River, we get negative. And that was just an experiment and probably shouldn't have been in the report. And we don't accept negative correlations coefficients. It didn't work. You know, it fits the data, but it doesn't make physical

23 sense, and that's incredibly important. 24

Min-U-Script® (14) Pages 746 - 749 **Capitol Reporters** 775-882-5322

We've got a lot of things that seem to fit the observations, but don't make physical sense like this. It was assumed, and I don't think anybody can offer me one shred of evidence that this was not just an assumption, pumping goes up, water goes down, cause and effect. And that's why we're here.

That's why we're here today is because of that assumption. Oh, there's -- oh, yeah, see these -- this is the response function for the EH-4 explanatory. It's these jagged -- it's this jagged curve. See, instead of having a -- what you hope for or normally distributed or somewhat normally distributed, you know, high in the middle, low on the end, you got two humps.

And so I say, well, maybe that really is an environmental distribution and this is coming from the Sheep Range and this is coming from -- now we're -- this one now, it looks like it makes more sense coming from the north, though we can't -- I don't know how to separate these. You know, maybe somebody else can. It's important. If we could find the well -- if we could find the hydrograph that we could attribute to the Sheep Range purely, we could do that. Okay. Everybody seems to ignore the antecedent

attribute to the Sheep Range purely, we could do that.
Okay. Everybody seems to ignore the antecedent
trend that was -- you know, that's been our thing is, you
know, most aquifer tests, you know, you're going to get your

Page 752

And we know, even though this is not really the

And we know, even though this is not really the issue, I don't think there is an issue about drought. It's a red herring. It's a red herring. It's the pattern -- it's a pattern in past climate over a number of years that explains these hydrographs in a regional system, because it takes time

for the signals to get through the system.

That's all there is to it. And the farther away, in general, the longer the signal. So we think Big Muddy is sourced from farther away than the Refuge Spring.

We think recovery is complete to that declining trend. I'll let you ask the geochemistry questions. There's some very intriguing anomalies or -- how should I say it? Anyway, interesting geochemistry if anyone wants to talk about it.

Oh, I did put that in. Okay. Yeah, cold water. Dr. Waddell, cold water, I wanted to ask how cold. We've got -- if anybody wants to go into that, we'll show that the water assumed to be recharged, modern recharge for the DDC study is way, way, way too cold. It's a collaboration -- the collaboration temperature based on the oxygen isotopes is way, way, way too cold.

And finally, this is the last slide. We think this is the way to think about this hydrologic system. We don't have the mountains on the right end. We have a chart

Page 751

Page 753

- Theis response in the first half-hour in a place like this if
 there is any Theis response. And so what point am I trying to
 make here? There's not much of an issue with the reference
 water level, starting water level changing during that six
 hours.
 - If it -- they'll be a little bit from the -- from, you know, barometric and title effects or semidiurnal, so you will have something. But those are small, those are small. If you're going out now a week, you might have some weather, you know, a big barometric dip.

And so you might have things coming in, interfering with the test. And now if you're going a year or two years, there is absolutely no way that you can predict -- or there was no way that you can predict what that hydrograph would look like in the absence of pumping. We heard yesterday, one interpretation that would likely be rising if there was no pumping.

there was no pumping.
You know, all those rising hydrographs, I'd say,
well, if it's not rebuilding and the hole's full of drilling
mud and slowly, slowly, slowly, the water freshening, and
therefore, rising because of the equivalent fresh water head
is rising, well, you know, it's delayed climate. You know,
you can't have bad well construction in all the Nevada test
site wells.

here based on a work of Joe Toad in Alberta, early in the
60's, conceptualizing regional flow. And then that was
implemented as numerical modeling came on in 1967, one of the
first applications, looking at the effects of layered
heterogeneity on groundwater flow.
And in this example, you have a number of basins

And in this example, you have a number of basins with a low hydraulic conductivity, and a beneath them a layer, continuous layer with a hydraulic conductivity a hundred times greater.

And so you can see these basins are -- and the little -- I've got some -- I've colored in some little green splotches in the basins to represent phreatophytes. And I've colored in blue in the regional aquifer just to point at them with the pointer, just to clarify the diagram a little bit.

But we think this is how it's working. The water is coming in in the high mountains, following the lower -- the Paleozoic shelf domain rocks to the south and discharging these warm springs, picking up heat from the Eureka low on the way. Now, this is the system we're here to protect.

Now, as far as the basins, we'd suggest that any kind of phreatophyte capture up here, if you truly don't value those phreatophytes and what lives in them, take it. But it's not going to affect the regional aquifer hardly at all, you know, at this contrast.

Min-U-Script® Capitol Reporters (15) Pages 750 - 753 775-882-5322

Page 754

- 1 So that's really where I'd like to leave it
- 2 before I just, you know, blabber on and go ahead with as much
- 3 cross as you want to throw at us.
- 4 Q. We'd like to save about 30 minutes for redirect,
- 5 if necessary, but Mr. Johnson's making himself available for
- 6 cross. So that's all I have.
- 7 HEARING OFFICER FAIRBANK: Okay. Thank you.
- 8 Okay. So thank you. So we'll go ahead and start
- 9 the cross-examination. And based upon kind of the additional
- time that you guys are allocating for the use of
- 11 cross-examination, we'll go ahead and assign 17 minutes to a
- 12 participant for cross-examination.
- And as we've done for the past several days, if
- 14 there's additional time remaining, then we may open that back
- up to participants to ask additional questions if they don't
- get through all their first questions in the first go-round.
- 17 So we'll go ahead and start with Coyote Springs Investments.
- MR. JOHNSON: May I have a question?
- 19 HEARING OFFICER FAIRBANK: Yes, Mr. Mifflin?
- MR. JOHNSON: May I -- no, Johnson.
- 21 HEARING OFFICER FAIRBANK: Johnson. Sorry.
- 22 Excuse me.
- MR. JOHNSON: That's okay. Would it be okay if
- 24 the attorney sits here to do any computer things that need

- 1 A. You went past. That's three. That's one --
- 2 there's 1, 2, 3, 4 -- Maxey?
- 3 O. Yes.
- 4 A. Okay.
- 5 Q. When you were discussing this slide, you stated
- 6 that you do not like cumulative departure from mean curves.
- 7 Are you familiar with the limitations of CDM curves?
- 8 A. Not in a formal sense, I'd say no.
- 9 Q. Okay. Do you know whether there's a limitation
- 10 associated with a set of data's period of record, meaning is
- 11 there a minimum number of years required to accurately use a
- 12 CDM curve?
- 13 A. No, I think the -- I would only use it with
- 14 really sparse data if I -- you know, when I'm looking for a
- 15 trend and I've got data that's too sparse to, you know, look
- at -- well, I really don't want to go there, because we're
- 17 sort of venturing into statistics and I want to completely
- 18 fail at answering any statistics questions and refer those to
- 19 the -- you know, to the experts and we can do that.
- 20 Q. Okay.
- 21 A. But I'm not going do well answering that line of
- 22 questioning.
- 23 Q. Okay. Then what methodology would you recommend
- 24 for describing periodic wet and dry cycles over century-long

Page 755

Page 757

- 1 doing, so I can just talk?
- 2 HEARING OFFICER FAIRBANK: I think you -- I mean,
- 3 you know your PowerPoint presentation probably more
- 4 extensively.
- 5 THE WITNESS: Okay.
- 6 HEARING OFFICER FAIRBANK: And so I think we'll
- 7 just go ahead and let you go to those pages and we'll let the
- 8 attorneys --
- 9 THE WITNESS: Right. I was just concerned about
- 10 being distracted by the technology when I'm trying to answer a
- 11 question.
- 12 HEARING OFFICER FAIRBANK: If it -- if we -- if
- there's a problem, we can go ahead and address it.
- THE WITNESS: Okay. Okay.
- 15 HEARING OFFICER FAIRBANK: Thank you.
- 16 CROSS-EXAMINATION
- 17 BY MR. HERREMA:
- 18 Q. Good morning. Brad Herrema and Emilia Cargill
- 19 for CSI.
- 20 A. Good morning, Brad and Emilia.
- 21 Q. Good morning, Dr. Johnson. I'd like to start
- 22 with a question that relates to something you said when you
- 23 were looking at slide four, although I'm not sure that -- I'll
- to find slide four. Let's see.

- periods based on rainfall data?
- 2 A. Well, I would not base it on rainfall data.
- 3 Q. Okay. What methodology would you recommend for
- 4 describing periodic wet and dry cycles?
- 5 A. Well, I think I -- I think I understand your
- 6 question. Try again, if I don't. I think you're saying what
- 7 type of proxy records are most appropriate in my opinion to
- 8 characterize climate annual -- let's say annually -- annual
- 9 climate
- 10 Q. If you don't think CDM curves are a good way to
- 11 describe these trends or cycles, what do you think is the best
- way to do that?
- 13 A. Well, I think you don't get more than one trend.
- 14 I mean, it -- I don't -- I won't do well -- I'm just admitting
- here, I won't do well with this line of questioning.
- 16 Q. Okay. I can move on.
- 17 A. Yeah.
- 18 Q. In Appendix 4 of your initial report on page 66,
- 19 you stated that drawdown in EH-4 resulting from Arrow Canyon
- 20 well pumping has been established by comparing hydrographs of
- 21 EH-4 to reference well MX-4. Does that sound familiar?
- 22 A. MX-4 was the reference well, right.
- 23 Q. Could you describe the relationship you found
- 24 between EH-4 and MX-4 during 1993, 1994 testing of those Arrow

Min-U-Script®

Capitol Reporters 775-882-5322

(16) Pages 754 - 757

Page 761

Page 758

- Canyon wells? 1
- A. Well, the figure -- we have a figure with a 2
- direct comparison, one on top of the other. So without 3
- looking at it and it's not in my packet -- oh, thanks, Beth. 4
- MS. BALDWIN: You're welcome. 5
- MR. JOHNSON: Okay. I've got the figure. What 6
- 7 would you like to know?
- BY MS. BALDWIN: 8
- Q. You're on Page 66 of your initial report? 9
- A. I am, I've got it. 10
- Q. Okay. Great. Could you describe the 11
- relationship you found between EH-4 and MX-4 during the '93, 12
- '94 testing? 13
- A. Oh, actually that's not the figure. We do figure 14
- 15 of another figure. Well, the adjustment is given in Figure 4
- on page 69. I think the point -- I think the point of this --16
- 17 yeah, I can't answer that precisely. That interval is what's
- considered on page 69, I think. Adjustment of EH-4 for the 18
- 19 121-day testing of Arrow Canyon well. So that's what we ended
- 20 up with.
- The comparison here is just meant to show you how 21
- similar they are. You know, they have the same form and those
- differences are what we consider to be drawdown, because we 23
- consider MX-4 to not be affected by Arrow Canyon Well pumping

- storativity. I don't know if anybody else analyzed that
- record. Crazy, but no, I analyzed that one. 2
- The Arrow Canyon Well, I didn't analyze in terms 3
- of aquifer properties. All I did was come up with a procedure
- for establishing the drawdown in response to Arrow Canyon Well
- pumping and it could be analyzed.
- 7 But, again, you got such funny geometry that it
- won't be a Theis well, but I'm going off. The point is I
- didn't analyze Arrow Canyon well pumping for aquifers, I did 9
- the other. 10
- 11 Q. Okay. Do you recall what the pumping rate
- during -- was during the Arrow Canyon Well pump test? 12
- 13 A. I don't recall. It was -- no, I don't recall.
- Q. Okay. Do you recall whether you took different 14
- 15 pumping rates into account when you were preparing the impacts
- caused by the 1169 pumping test in the Arrow Canyon well 16
- 17 pumping test by comparing those impacts at Warm Springs West
- Gage? 18
- 19 A. I'm not sure I understand the question. I'm
- really not trying to be difficult, I just -- I'm not sure I 20
- understand. 21
- 22 Q. Well, this is complicated stuff.
- 23 A. It's complicated.
- 24 Q. When you were comparing the impacts at Warm

Page 759

- and we considered EH-4 to be affected by Arrow Canyon Well
- pumping. You know, MX-4 is eight miles up gradient, EH-4 is 2
- what, a mile down gradient. 3
- So we're pretty comfortable, as hydrogeologists, 4
- that MX-4 is an appropriate reference well with which to 5
- compare EH-4, if you're looking for differences attributable 6
- 7 to somebody pumping remote from MX-5.
- Q. You stated that Order 1169 pumping created about 8
- a one-foot drawdown at EH-4 and a reduction in flows of .6 CFS
- at Warm Springs West? 10
- A. I believe so.
- Q. Okay. And then you compared that to the '93
- Arrow Canyon Well tests that produced the .8 feet of drawdown
- at EH-4 and about .5 CFS reduction of flow at Warm Springs
- West? 15
- 16 A. Okay. It sounds reasonable. I can't remember
- the place and time I wrote that. 17
- Q. So do you recall whether you accounted for recent 18
- hydrologic conditions when you compared the two pump tests? 19
- 20 A. Interesting question. Recent hydrological
- conditions. Well, we didn't -- put it this way, when you say 21
- 22 compare the tests, I analyzed the 1169 test. Every
- combination of pumping and observation using MX-5, MX-4 and 23
- RW-2. I think I got five estimates of transmissivity and 24

- Springs West Gage from the Arrow Canyon Well pumping to the
- 1169 pumping test, when you were comparing those impacts, did
- you take into account the different pumping rates during those
- tests? 4
- 5 A. I'm still -- maybe I'm just slow today. I'm just
- not understanding the question. I'm sorry. 6
- Can we -- do it again. We got time, do it again.
- I want to answer you, I just -- I'm not sure I can. 8
- Q. Okay. The two different pumping tests, 1169
- pumping test, Arrow Canyon well? 10
- 11 A. See, you're referring to things that I wrote that
- I can't clearly remember writing what I was thinking at the 12
- time. So that's why I'm having a problem. 13
- Okay. I'll move on. 14
- I believe you indicated that pumping at Arrow 15
- Canyon wells does not affect Big Muddy Spring and Warm Springs 16
- West measured flows equally; is that accurate? 17
- 18 A. Yes.
- Q. Okay. What evidence did you use to make that 19
- 20 conclusion?
- **21** A. Maybe I shouldn't have answered so emphatically.
- The -- just ask me again so I can be clear. 22
- Q. In your conclusion, in making your conclusion 23
- that pumping Arrow Canyon wells does not affect Big Muddy

Min-U-Script®

Capitol Reporters 775-882-5322

(17) Pages 758 - 761

Page 765

Page 762

- Spring and Warm Springs West measured flows equally, what 1
- evidence did you use to make that conclusion? 2
- A. Oh, okay. Well, the way I'm thinking about it,
- I'm not sure if I -- you know, historically, if I'm accurately
- thinking about it. We accept and value the correlation that
- Dr. Mayer's made between EH-4 and the Pederson Spring flows, 6
- 7 and so we accept that fully.
- And so, with no hesitation, if we see an impact 8
- on the EH-4 hydrograph, we know what that means in terms of 9
- flow at the high elevation springs. 10
- 11 And so through this Order 1169 test, you know, we
- see within the southern flow field, widely propagating pumping 12
- signals, but not of the magnitude that everybody has been 13
- thinking. 14

Valley?

Q. Okay.

time.

- So Big Muddy, I'd say there's only, you know, 15
- negative -- what's the right word? There's no evidence that 16
- 17 Big Muddy Spring of Arrow Canyon Well impact, but on the other
- hand, I haven't figured out how to analyze it. 18
- There's no reference spring or well. We don't 19
- have another hydrograph that looks like that. I just -- I 20
- don't know how to -- I can't say that Big Muddy Springs is not 21
- affected. I can't say that. But I can say that the higher

A. Oh, absolutely, through the Meadow Valley

be the United States Fish and Wildlife Service.

Q. Good morning, Luke Miller for the Fish and

A. Are we speaking of the trigger levels? Do I

understand the rationale for the trigger levels?

Q. Well, just -- I believe it's just the reason for

24 A. Oh, that was one of my earlier points, is we

Q. Dr. Johnson, just a few questions here. Are you

aware of the Fish and Wildlife Service, I guess, proffered

reason for the discharge at the Muddy Springs at the location

why there was discharge at the Muddy River Springs at their

that they exist?

A. Morning.

MR. HERREMA: I have no further questions at this

HEARING OFFICER FAIRBANK: Thank you. Next will

elevation springs are. 23

Mountains, yes.

24 Q. Okay. Could there be a contribution to the Muddy

- don't know. We think we need to -- we need to impede the flow
- to get the water to come out and I know that from my own 2
- modeling. 3
- But the feature that actually causes the water to 4
- come out is -- it's not in anybody's map. And, you know,
- the -- you know, the Cal Tech geologists suggested, you know,
- maybe it's the lateral ramp. Well, we just don't know.
- We put an obstacle to flow. We reduced the 8
- permeability until the water came out. You know, all I can 9
- say, we don't know. We don't know what it is. But if there's 10
- not an obstacle to flow, it's going to keep going. 11
- 12 You know, there's some permeability reduction,
- 13 whether it's a -- whether it's a barrier like we represented
- it, whether it's a thinning of the section, whether it's a 14
- 15 lateral ramp fault that's maybe just not exposed, we don't
- know. We don't know. But you got to impede the southward 16
- 17 flow to get the water to come out.
- Q. All right. In reference to some of the
- 19 statements in the report, you mentioned that there has been a
- 20 20-year drought or so that began in 1999. Can you clarify the
- data that you relied on to determine when that drought started 21
- and how it's lasted 20 years? 22
- A. Thank you for that question. On the one hand, I 23
- think arguing about drought is a red herring. What we think 24

Page 763

- is a more important or valid or legitimate concept is the idea
- And so how do you find that interval of climate? 4
- 6
- but in general, no. And like you saw in our -- I guess that's 7
- five -- no, six, yeah, in our slide six, there's a lot of 8
- 9 action in the discharge and what is that? You know, the --
- Q. Well, you know, in reference to the slide six,
- is in here for the Big Muddy Springs? 14
- A. Well, let me -- can I first answer you? I got 15
- you sidetracked a little. I can answer your first question, 16
- 17 the way this started. If anybody has access, and I've got the
- proceedings of the National Academy of Sciences, the issue is 19
- 20 on the drought in the southwest. It's full of articles.
- I've got another article from 2019. Now, they're 22
- talking about mega-droughts and if we don't change our 23
- behavior, we might have a drought like we haven't had since 24

River Springs from flow paths other than from Coyote Spring

- that some interval of past climate is responsible for the
 - discharge in any given year at, let's say, Big Muddy Spring. 3
 - Now, that interval of climate won't be all 5
 - drought and it won't be all wet. Maybe if it's a short one,

 - everybody seems to think it's pumping. I just think that's 10
 - madness. 11

 - here, can you kind of explain then where the drought response

 - image here to the December 14th, 2010, issue of the 18

 - There's fear of mega-drought. 21

Min-U-Script®

location?

Capitol Reporters 775-882-5322

(18) Pages 762 - 765

Page 769

Page 766

1600 or before 1600. 1

So drought's an important concept to uncover, by 2

the way, of that issue, which shows Lake Mead with the water 3

- levels way down, you know, obviously the Colorado catchments
- have seen hard times water wise.
- So, you know, the drought, we can argue about the 6
- 7 drought. But in aggregate, you know, a series of less than
- normal water years are going to decrease the resource at the 8
- outlet, whether it's the lake or the spring or whatever. 9
- So I think -- I really do think this is the right 10
- way to think about the problem and we presented it as an 11
- analysis opportunity. And knowing we're not statisticians, 12
- but we think -- and we think -- and as far as any expertise, 13
- all I know is I'm licensed to use Excel and I know how to run 14
- 15 some regression in it. And what was hard to figure out was
- how to look at a thousand cases without wasting the next year 16
- 17 doing it.

19

- And we got that in our report, too. It's a 18
 - little R routine that you still have to, you know, look
- 20 through output for each interval length, but we got it done.
- And we found one, this is out of a thousand or more candidate 21
- solutions. The only one came up positive correlation 22
- coefficients. But the reason I hope somebody else would get 23
- engaged with this is because you might do better or worse with

- to explain the whole procedure.
- Let's say, just in the simplest case, that the 2
- amount of water coming out this year, let's say 3
- 5,000-acre-feet, let's say I can explain that as -- and let's
- say I've got three measurements of river flow. Let's say
- Humboldt River flow, which is what we actually use.
- 7 So I've got three years of data and I've got
- three years of -- three years of spring flow data and I've got 8
 - three years of run-off data, just the totals. Okay.

So I'm going to say, can I come up with something like one times this amount of river discharge, plus two times this amount of river discharge, plus one times this amount of river discharge equals spring flow numerically. Forget about

dimensions and units and stuff numerically. 14

And so, if so, if one times this one, plus two times that one, plus three times that one equals 5,000, 16

17 perfect. But now if I have -- if I'm going to have a test

case where -- well, all I'm saying is that you take a chunk 18 19 of -- a sequence of annual river discharge measurements and

see if statistically you can explain those through some set of 20

variables with individual weights that the program tries to --21

it does -- Tim is going to have to explain this if you really 22

need it. 23

9

10

11

12

13

15

But you're trying to explain a variable with some 24

Page 767

- a different base flow selection. 1
- See, our explanatory variable set are these 2
- 3 annual base flows and those are obtained by chopping off the
- storm searches in the hydrograph, and there's no one best way 4
- to do that. And maybe for this, we care most about the snow 5
- and we only chop off little piece. You know, there's rain and 6
- 7 melting snow in that hydrograph. So somebody that's expert in
- that could run with this and I think it's the keys to the 8
- 9 kingdom. And instead we get beat up about it.
- Q. Well, I -- you know, I'll admit to having some 10
- layman approach to this and I'm just trying to determine 11
- whether there is -- you know, the slides labeled climate 12
- response for big Muddy Springs, and I'm trying to understand 13
- the climate response, it seems to go, again, layman term here,
- around 1990, seems to drop, then it goes pretty up to 2000 and 15
- then it drops down roughly 2009? 16
- A. Are you looking at -- are you looking at the 17
- spring discharge? That's the heavy -- the dark blue line, 18
- solid line? Those are the observations. Those are the 19
- 20 observations. That's what actually came down the -- came out
- of the spring in each year, each water year, so --21
- Q. Is the spring discharge equivalent somehow to a 22
- climate response that's coming through the system and --
- 24 A. Oh, I see. I see. Okay. Let me go back and try

- other variable. So you're trying to explain spring flow with
- river flow, which we're claiming is -- those are parallel with 2
- the climate. In other words, low river flow, you've got a dry
- 4
- 5 Q. Well, I think I'm following you that far and
- that's why I'm just trying to stay with this.
- 8 Q. This slide represents even maybe a delayed pulse
- or something, I think is the word -- some of the terminology
- I've heard as precipitation or --10
- 11 A. Oh, I see. I see what you're saying. I see
- 12 what -- okay. In the old days, there was an observation or a
- suggestion that this -- the river flow, because that's all 13
- that was gauged at the time, Muddy River, and the springs 14
- weren't measured yet. 15
- 16 But the suggestion was made that the high flows
- in the river seem to follow wet weather by about 15 or 17
- 18 20 years. And so -- and then Maxey got into that. So we came
- on the scene with two of the greatest Nevada hydrogeologists 19
- 20 suggesting there's a 15- to 20-year lag in response. And
- so -- but how do you do better, you know? 21
- And so that's what we tried to do with this 22
- exploratory multiple regression thing is just try and see if 23
 - we could find a way to -- you know, without wasting our -- the

Min-U-Script® (19) Pages 766 - 769 Capitol Reporters 775-882-5322

Page 773

Page 770

- 1 rest of our lives, get in there and test all these
- 2 possibilities and see if one worked really good. And there
- 3 was only one with all positive correlation coefficients. It
- 4 was mind boggling.
- 5 Q. So do you think this slide represents a general
- 6 trend of drought for the past 20 years?
- 7 A. Not drought. This -- no, because this record --
- 8 see, these are projections. The only record is the blue line.
- 9 So let's just talk about that. What we're saying, we're
- agreeing with Eakin and Maxey that this wet in these -- this
- 11 high spring flow in about 2000, okay, followed by about
- 20 years something back here, where's 20 years? Okay.
- 20 years. 12 to 22, 12 to 22.
- So from here, some interval of climate in this
- 15 range up north produced what you see in that year. So in
- other words, the measurement from 2000 is explained by
- function of base flow measurements, weighted base flow
- measurements dating from 12 to 20 -- two years before that
- 19 observation. And the model just seems to hit that observation
- 20 right on almost.
- I mean, it's not very good in some places. I
- 22 mean, you know, it's not good here and especially not good
- 23 here. But it comes back, it comes back in the last two years
- 24 we're on, we're on our projection. And we'll keep this going

- 1 Q. My name is Paul Taggart, I represent the Southern
- 2 Nevada Water Authority and Las Vegas Valley Water District.
- 3 Mr. Johnson, are you aware of how many other
- 4 expert reports have been submitted in this proceeding?
- 5 A. Well, I've looked at all of them and printed and
- 6 bound the thick ones, no.
- 7 Q. Okay. Would it surprise you if there was 11
- 8 separate expert reports submitted on the --
- 9 A. Not a bit.
- 10 Q. Okay. And your analysis is one of those 11
- 11 expert reports. Does that sound about right?
- 12 A. The one outlier, yeah.
- 13 Q. And I guess that's one of my questions is, do any
- of the other expert reports agree with your conclusions?
- 15 A. Well, in part. That's why I was so hoping I'd
- 16 hear the word anisotropy because when you back off from these
- individual fault studies to a regional picture, that's what
- those local features give you.
- So we're, in a small sense, comparing apples and
- 20 oranges in your question, because we base all of our thinking
- 21 at this point on regional study. And even though our Tribe
- has local interests, the physics is regional. And everybody
- 23 else has -- seems to have taken a much more local approach.
- So I think there's lots of points of agreement

Page 771

- 1 for ten years and see what happens.
- You know, it looks like the Muddy River or the
- 3 spring is in for a not too bad the next ten years according to
- 4 our model.
- 5 Is that helpful at all?
- 6 Q. I think I'll -- I'll leave it there. I'm trying
- 7 not to be redundant as well.
- 8 A. Okay.
- 9 Q. So okay.
- MR. MILLER: Okay. Yeah, no further questions.
- MR. JOHNSON: I feel kind of bad about that. I
- wasn't very effective.
- 13 HEARING OFFICER FAIRBANK: Okay. National Park
- 14 Service.
- MS. GLASGOW: The National Park Service has no
- 16 questions at this time. Thank you.
- 17 HEARING OFFICER FAIRBANK: Okay. Seeing no
- 18 questions from National Park Service, we'll move to the
- 19 Southern Nevada Water Authority and Las Vegas Valley Water
- 20 District.
- 21 CROSS-EXAMINATION
- BY MR. TAGGART:
- 23 Q. Good morning, Mr. Johnson.
- 24 A. Good morning, Mr. Taggart.

- 1 regarding any or all of the discussions in faulting. But
- 2 it's -- there's not a direct -- they're different. I mean, we
- 3 think differently about this.
- 4 Q. Okay. And you describe, I think, your report as
- 5 the outlier; is that a fair statement?
- 6 A. Just this moment, I did. It is.
- 7 Q. Okay. And who's Marty Mifflin?
- 8 A. Dr. Martin Mifflin wrote the book on delineation
- 9 of groundwater flow systems in Nevada in his doctoral
- dissertation in 1968 and he's sitting behind me.
- 11 O. Okay. And you've worked with Mr. Mifflin on a
- lot of the questions and issues that your presented in your
- testimony this morning; correct?
- 14 A. All of the key issues. I mean, he's reviewed
- 15 everything. We're in general agreement, not on every single
- small item, but yes, he's reviewed all my submittals -- our
- 17 submittals, our submittals.
- 18 Q. Now, do you have the -- well, I'll ask you to
- turn to the slide under presentation. Do you have that
- 20 available?
- 21 A. Well, I can click down to it.
- 22 Q. All right. Let's go to -- well, there's the
- slide with the large blue dots on the line with the large blue
- 24 dots; do you recall that slide?

Min-U-Script® Capitol Reporters 775-882-5322 (20

Page 774

- 1 A. Um-hum. It was a -- I think -- yep.
- 2 Q. And that's in your report; correct?
- A. It's in the appendix on the scope and model.
- That's a plot made by the scoping model or by the software
- hosting the scoping model.
- Q. Now, you're familiar with the MX-5 well and the
- 1169 pumping that occurred at that well; right?
- A. Yes, sir. 8
- Q. And do you agree that the MX-4 well and the 9
- hydrograph for the MX-4 well reflects the pumping signal from 10
- pumping at MX-5 during 1169 pumping test? 11
- A. Well, it's dominated by that, and of course, you 12
- didn't ask about the environmental, the barometric and title. 13
- But I think there was some Coyote Spring Valley pumping. I 14
- doubt if it would be -- we don't know, we can't resolve it. 15
- But there would be minor influences, but I'd say that would be 16
- 17 dominated to our measurement limitations by MX-5 pumping.
- Q. Okay. And you'd agree with me that the two wells 18
- 19 are essentially on the same pad. They're on the same property
- within a couple hundred yards of each other; right? 20
- A. I think they're in a broken zone of sorts and
- we've seen different representations of that. But they're
- definitely in a -- they share a high permeability domain.
- 24 Q. Okay. And you heard the testimony from

- EMX-4 area and the EMX-5 area and EH-4?
- A. Oh, not just that, I think that pumping signal is
- diagnostic all the way down to Apex. And the reason it's
- diasostic is because of that unplanned -- I won't say
- unplanned, maybe you planned it, that five-month shutdown,
- that recovery during the early 2012, that was diagnostic.
- 7 Nobody could say that BMDL-2 signal is not MX-5 pumping.
- But I will say the upper Kane Springs Wash does.
- No, that's a -- that put out a diagnostic signal, that went
- along these features 20 miles. 10
- Okay.
- 12 A. Maybe not 20, but all the way to Apex.
- 13 Q. And the next question I have is, do you -- you
- have a page in your PowerPoint that I was a little confused 14
- 15 about, page 14?
- 16 A. Okay. Yeah, and I'm not counting. What do you
- 17 want to see? About there, am I close? I don't have -- oh,
- yes. 18
- 19 O. Yes, next slide, right there.
- 20 A. Yeah, yeah, yeah. Good, good.
- Q. I thought I heard you say that, in your view,
- this would be the only index that should be used in the area?
- 23 Was that --
- 24 A. No.

Page 775

Page 777

- Mr. Reich; correct?
- A. Yes. 2
- 3 Q. Okay. And I don't want to mischaracterize his
- testimony, but do you recall what his testimony was about his
- conclusion regarding the effect of pumping at MX-5 during the
- Order 1169 pumping test on EH-4? 6
- A. No, I've just been focused on that horse block, 7
- having some ideas about that. 8
- 9 Q. Okay.
- A. Not EH-4. 10
- Q. Would it -- do you know if you were the only
- expert who believes that pumping at MX-4 during the 1169
- pumping test does not influence EH-4 water levels, do you know
- if you're the only expert that believes that?
- A. It does.
- 16 Q. Oh, it does. Okay. Could you --
- A. Oh, yeah, yeah, yeah. 17
- Q. Okay. 18
- A. Yeah, it's in -- oh, yeah, we've presented that 19
- 20 over and over in different places, yeah. The -- it's got -- I
- want to guess roughly half of the drawdown of MX-4, maybe 21
- 22 more.
- Q. Okay. So you agree that pumping in the Order 23
- 1169 pumping test demonstrated a hydrologic connection between

- 1 Q. Am I accurate in --
- 2 A. If I knew what I know now and we were beginning
- the Order 1169 analysis, trying to separate the pumping from
- whatever else was interfering with it, and that we do that in
- every pump test, I mean, to some extent. 5
- This one is just difficult because it was so 6
- 7 alarming because the antecedent trend is so dynamic and not
- predictable. And it's not very --
- Q. Well, in your earlier diagram where there was the
- dotted line, the blue dotted line?
- 11 A. Um-hum.
- 12 Q. On the right side of that dotted line or to the
- east was shaded in yellow, right?
- A. Yeah, I cut out some low elevation terrain that
- the model solved, but shouldn't even be in the model. 15
- Q. Okay. But that -- other than that part that you 16
- cut out, which was to the far extreme east, I think, of the 17
- original domain? 18
- A. Um-hum.
- 20 Q. But the area that would remain in shaded yellow?
- 21 A. Yes.
- 22 Q. And you referred to that as Muddy Springs
- 23 capture?
- 24 A. Well, the -- yeah, the capture zone, it goes to

Page 781

Page 778

- Meadow Valley Wash, Meadow Valley Mountains and out into 1
- Coyote Spring Valley. 2
- Q. Okay. And so when we talked about MX-4, MX-5
- earlier, you'd agree that's in that capture zone for the Muddy
- River Springs area?
- A. Yes. 6
- Q. Right? Okay. And is this well that we're
- looking at on this hydrograph, which is in Kane Springs, I 8
- believe, is -- do you also believe this is in that capture 9
- zone? 10
- 11 A. Yes, yes.
- Q. Okay. And I guess when -- I mean, I don't
- understand what you mean by this one being an index. Is it an 13
- index for seeing what happens? 14
- 15 A. Oh --
- Q. Well, sir, let me finish my question, please. 16
- 17 Because I understand what you mean by an index
- well. But to what value does that well provide you that 18
- 19 index? Is it what occurs from pumping or what doesn't occur
- from pumping? I mean, do you see --20
- A. Oh, the background, yeah, yeah. What we like --
- I mean, ideally you'd like to know what that water level in
- your -- at your test location would look like if you weren't 23
- pumping because that's what you subtract from to get drawdown.

- 1 A. Um-hum.
- 2 Q. Why did you only have two weeks?
- 3 A. No money. It's a demo. It was a -- it's -- the
- software developers will give you a free two weeks, hoping
- you'll buy their software. And this is a really high-end
- expensive software package, really capable world wide.
- 7 Q. I see.
- 8 A. You know, in the waste management community, it's
- used everywhere.
- 10 Q. So the demo period ran out in the two-week
- period? 11
- 12 A. Yeah, I need to give them -- they haven't given
- me a price, but it's real -- it's too expensive for DRI, put 13
- it that way. 14
- 15 Q. Okay. So that two weeks is the demo period that
- you were able to use the model and --16
- 17 A. I did as much as I could in two weeks.
- 18 Q. Okay.
- 19 A. Around my drinking.
- HEARING OFFICER FAIRBANK: Mr. -- Dr. Johnson, if 20
- you'll just go ahead and let Mr. Taggart finish his questions 21
- before you start answering. Otherwise, it creates a very 22
- 23 difficult record for the court reporter to decipher.
- MR. JOHNSON: I caught myself, and I apologize. 24

Page 779

- And so if you don't know it, you don't know
- drawdown if you don't know the antecedent trend. And these 2
- long-term acre antecedent trends are horribly difficult. I 3
- mean, I can almost not believe that we've actually got a 4
- useful working relationship for it. It can be improved for 5
- the -- now we're back to the climate model. 6
- But, no, this is what I would take as what those 7
- water levels would look like throughout the -- what we've been 8
- 9 calling southern flow field. Let me -- I would say
- hydrographs of the EH-4 form might be subtracted from this 10
- hydrograph to get a different kind of pumping signal than we 11
- analyzed. 12

1

- Q. Okay. 13
- A. Yeah.
- Q. And in your testimony, you indicated that you 15
- only had two weeks to perform your modeling exercise? 16
- A. Yeah, it's --17
- Q. And I have a question about that. 18
- A. Yeah. 19
- 20 Q. You understand the order that the State Engineer
- issued requiring -- or asking stakeholders to submit 21
- 22 information was on January 11th, 2019, and the due date for
- expert reports was in July of 2019. So that's roughly six 23
- months, I think? 24

BY MR. TAGGART:

- 2 Q. Would you agree with me that, generally, before
- numerical model is developed, a conceptual model has be to
- created; right?
- 5 A. Yes.
- Q. And you developed a conceptual model of the
- regional area that you believe contributes to the Muddy River
- Springs, you developed a conceptual model before you developed
- the numerical model, right?
- 10 A. Yes.
- You'll have to --11 O.
- 12 A. Yes.
- 13 Q. And would you agree with me that that conceptual
- model that you developed is not the consensus of scientific 14
- opinion regarding the hydrologic and geologic conditions in 15
- the region you analyzed? 16
- A. Well, it's a -- there's a couple of points worth 17
- making. It's a scoping model and you're the only folks that 18
- have seen it, you know, so there's not -- and I don't know if 19
- 20 even if you've seen it, if you've had a chance to really
- digest what we're saying and think about it. 21
- Q. Okay. And let me clarify my question because I'm 22
- short on time. But you understand that many times when a 23
- numerical model is developed, the conceptual model is 24

Min-U-Script®

Capitol Reporters 775-882-5322

(22) Pages 778 - 781

Page 782

- 1 documented and distributed for peer review by other scientists
- 2 in the community; right? That occurs; correct?
- 3 A. Well, I won't agree because I'd like to make a --
- 4 well, let me just not -- can I just not answer that question?
- 5 Q. Okay.
- 6 A. Because I don't have a good one.
- 7 Q. So you do not agree that the conceptual model of
- 8 a hydrologic region is not generally reviewed prior to the
- 9 development of a numerical model?
- 10 A. Now, can I speak? Yeah, here's my answer. You
- 11 have a conceptual model. The binary model is on the website.
- 12 It's very simple. We like simple models. If you read our ADM
- paper from 2006, the entire model -- I mean, there's pictures,
- but the entire model is in one table.
- You have recharge, your permeabilities of free
- 16 flow domains, the thickness, it's all in one place. You
- 17 could -- half an hour, you could have G-flow, you could
- 18 recreate our model.
- Same with this one, except you don't have to do
- 20 the mesh. You can just load it up and start filling in with
- 21 properties. So it's so simple that it is the conceptual model
- and it's all our assumptions. So everything is assumed, so it
- is our own conceptual model.
- It's just not -- it hasn't been circulated and

- 1 any other person who have any other literature that you can
- 2 point to that postulates that amount of inflow to Las Vegas
- 3 Valley?
- 4 A. Well, I've told you, it's misestimated.
- 5 Everybody's stuck with the Spring Mountains ever since Maxey.
- 6 Q. Okay. So just to be clear, that's a new idea
- 7 that you've authored; correct?
- 8 A. See, I don't know that. I don't know that it's a
- 9 new idea.
- 10 Q. Well, then is -- you can't point to any other
- 11 literature with that opinion in it; correct, other than your
- 12 own?
- 13 A. Well, there's no -- yeah, I'll agree with that.
- 14 Q. Okay.
- 15 A. We're out in -- we're outliers.
- 16 Q. Do you know what the gradient is between Garnet
- 17 Valley and Las Vegas Valley?
- 18 A. Yeah, we showed you -- we've got the photo --
- 19 Q. Okay. Is it true that there is an upward
- 20 gradient before you can get into Las Vegas Valley from Garnet
- 21 Valley?
- 22 A. Not necessarily, because you don't know the
- 23 thickness or the composition of the water colony.
- **24** Q. Okay.

Page 783

Page 785

- 1 thought about enough for too many people -- well, nobody's
- 2 really argued with us because nobody really understands it
- 3 yet. I mean, it's easily understood, it's just, you know, are
- 4 these guys crazy or is there something that -- you know,
- 5 bringing in the heat and the anisotropy, does it help us.
- 6 Q. Well, and earlier when you were testifying, you
- 7 said something about getting beat up about all of this when we
- 8 presented it. What did you mean by that?
- 9 A. Tongue in cheek. This -- you know, this Las
- 10 Vegas Valley, you know, just think about, what if that's real?
- 11 Q. Okay. I don't want to ask you --
- 12 A. And -- well, who brought up that --
- 13 Q. Well, Mr. Johnson, you understand the State
- 14 Engineer has to make a decision about groundwater in the Lower
- 15 White River Flow System?
- 16 A. Right.
- 17 Q. And that decision needs to be made based upon,
- 18 you know, sound scientific judgment?
- 19 A. You bet.
- 20 Q. Right? But is there any other scientist who
- 21 believes that the amount of water is flowing into Las Vegas
- Valley as much as you believe?
- 23 A. Yeah, he's sitting behind me.
- 24 Q. Okay. Other than you and Dr. Mifflin, is there

- 1 A. So the freshwater head is unknown.
- 2 Q. All right. Well, there's a page in your
- 3 PowerPoint, it's page 11.
- 4 A. I didn't mean to get testy there, Paul. Sorry.
- 5 Q. That's okay. I understand. I think my time is
- 6 up.

13

- 7 HEARING OFFICER FAIRBANK: It is. Let's go ahead
- 8 and take a ten-minute break and we will go ahead and resume at
- 9 I'll say 10:50.
- 10 (Recess.)
- 11 HEARING OFFICER FAIRBANK: All right. We will go
- ahead and go back on the record.
 - And so the next participant up is the Moapa
- 14 Valley Water District. And I saw Mr. Morrison here a moment
- ago, but I do not see him here right now. I think maybe --
- and we may end up -- if Mr. Morrison doesn't step in here in a
- 17 moment, we may just go ahead and go out of turn slightly, just
- to go ahead and keep this proceeding moving forward.
- Not seeing Mr. Morrison, so we'll go ahead and
- get back to Mr. Morrison and open it up to Lincoln County andVidler.
- MR. MORRISON: We've got no questions for
- 23 Mr. Johnson.
- 24 HEARING OFFICER FAIRBANK: Okay. Just for the

Min-U-Script®

Capitol Reporters 775-882-5322

(23) Pages 782 - 785

Page 786

- record, we'll go ahead and just make a note that the Moapa 1
- Valley Water District indicated they did not have any 2
- questions. Thank you. Ms. Peterson. 3
- MS. PETERSON: Thank you. 4
- **CROSS-EXAMINATION** 5
- BY MS. PETERSON: 6
- Q. Dr. Johnson, Karen Peterson representing the
- Lincoln County Water District and Vidler Water Company.
- A. Good morning. 9
- Q. And I heard you say, I thought a couple times 10
- 11 during your direct presentation, that you couldn't get your
- model to work; is that correct? 12
- A. No. 13
- Q. Okay. Is your model calibrated? 14
- 15 A. No. Oh, correction, I might say there are
- degrees of calibration, but remind everybody this was a 16
- 17 scoping model where we just pick a set of parameters and see
- if it works, see if it works both in terms of getting 18
- 19 reasonable predictive heads and temperatures or -- and also
- mathematically if it works. So it was a scoping model, we 20 just set out to see what we could do in two weeks. 21
- Q. Right. And you don't recall testifying that you
- couldn't get it to work? I thought I heard you say that a 23
- couple of times. 24

- 1 Q. Is -- again, not to -- I think calibration's
- really important. So is your model calibrated to observations
- of groundwater elevations in the Lower White River Flow
- 4 System?
- A. We attempted to match -- well, this is a
- beginning. But we attempted to match heads and temperatures
 - at Tule Springs based on -- no, we calibrated to the head at
- Tule Springs and the Steptoe MX-4 well, and let the model
- calculate temperatures with the assumption that the water goes 9
- in at one degree Celsius. 10
 - So we think we've got a foundation that we can
- 12 build on. It's mathematically stable and if -- with
- 13 reasonable parameters, it gives us reasonable outputs of heads
- and temperatures. 14
- 15 Q. But it's not fully calibrated?
- 16 A. Not --

11

- 17 Q. Would you agree?
- 18 A. No, no, no, not even close. It's the beginnings.
- It's just the beginnings of a working tool.
- 20 Q. The model, we're talking about your feed flow
- model? 21
- 22 A. Yes.
- 23 Q. All right. And so would you agree that at this
- point, just because it's the beginnings, that it's probably,

Page 787

Page 789

- 1 A. Well, it worked -- when you say "worked," we
- think it gives reasonable results in the eastern part because 2
- both the heads and the temperatures look reasonable and the 3
- captures zones look reasonable. 4
- But in the west, there's no warming in the 5
- springs. So it doesn't work in the western areas and also 6
- there's some elements along the edges that need to be removed 7
- from the model domain. So I'd say it's partially calibrated 8
- 9 and incomplete.
- Q. And would you agree that a model must be fully 10
- calibrated in order for it to be reliable? 11
- A. Well, models have all different purposes and
- there are many kinds of models. I'd say, no, without being --13
- I'm not being argumentative, but the answer is no.
- Q. You don't think models need to be calibrated? 15
- A. No. I have a model for how fast this will hit 16
- the floor. I'm holding a pen and threatening to drop it. 17
- That comes from gravity. So calibrated, I'm not -- I mean, 18
- I'm not calibrating anything and I don't know about -- but 19
- 20 see, that's a model.
- A model is just a concept and it can be 21
- implemented in a number of ways, mathematically, by experiment 22
- or whatever. Model is just a way of thinking in our case a 23
- 24 process.

- at this point, not something the State Engineer can rely on;
- would you agree with that? 2
- 3 A. Well, the -- without having a big discussion
- about reliance, I mean, he's going to put some weight to it
- and it's at his discretion. So I don't think it should be 5
- discarded and I don't think that it's accurate in the sense 6
- that, you know -- well, on the west side, it's completely 7
- wrong. The water doesn't warm up. So, no, it's the 8
- 9 beginnings.
- There -- it's a -- it illustrates a conceptual 10
- model. That's its value is it shows the State Engineer how 11
- we're thinking about the problem and we're thinking about it 12
- differently. 13
- Q. And is your model calibrated to observations of 14
- spring discharge in the Lower White River Flow System? 15
- 16 A. The spring discharge is an input. We take -- we
- total up the -- from one reference from a recent USGS -- it's 17
- Carlisle and Brooks, I believe. We total up all the regional 18
- springs or a -- we select the larger regional springs and take 19
- 20 that total discharge estimated, except for Las Vegas Valley
- now. We take a new number for that. 21
- But we distribute that quantity of water annually 22
- over all those elements that were colored yellow and gold, so 23
- over about 1400 square miles, which comes out to about 24

Page 790

- 1 15 centimeters a year of recharge into the carbonate rocks.
- 2 So that's the conceptual model.
- 3 That's a conceptual model and it's easily
- 4 recorded or documented in our submittal. So that's what a
- 5 submittal does. It's not a calculation tool, it's an
- 6 illustration of how we think about the problem.
- 7 Q. So would you agree it's not a -- it's not a
- 8 calibrated model, you said if it's an illustration?
- 9 A. Well, it's calibrated because we have a
- 10 calibration point. We have a temperature and a head at Tule
- 11 Springs that we're trying to match. And so we matched it as
- 12 closely as we could with the uniform transmissivity.
- See, our -- part of the -- part of the reason we
- 14 did it this way is what does this system look like in the
- absence of features? It's unform -- uniformly anisotropic --
- how should I say? There's no faults, there's no faults.
- 17 There's no heterogeneity, it's all the same transmissivity,
- 18 just the orientations are different.
- So you take out all that stuff that the others
- 20 build into -- or typically we build into a framework and we
- 21 don't have that. So our model is really simple. It's not
- 22 a -- it's not a calculation tool.
- It's an illustration of how we think about the
- 24 system with the potential for being calibrated, depending on

- 1 A. Well, I -- at this point, and depending where, I
- 2 think you could use it for first approximation of impacts.
- 3 You know, something you might -- might help you design an
- 4 aquifer test maybe, maybe in terms of how much area might I
- 5 need for this aquifer test, because if it's tight rock, you
- 6 need to be enclosed if it's like we have, you know, you'll get
- 7 responses possibly miles away.
- 8 So it could be useful for test design, for
- 9 identifying areas where we're less confident about the
- 10 relationships, but not in a quantitative sense to -- it's not
- a management tool, but perhaps could be grown to be one.
- .2 Q. And so directing your attention to page 59 of
- 13 Appendix 3 in your Exhibit 2?
- 14 A. Um-hum.
- 15 Q. You make a statement there at the bottom of the
- page with regard to pumping in Kane Springs Valley?
- 17 A. I'm sorry. I'm looking for the page.
- 18 Q. Yes.
- 19 A. Okay. Okay. 59?
- 20 Q. Yes, 59 on the bottom?
- 21 A. Okay.
- 22 Q. The very last paragraph?
- 23 A. Um-hum. Right. Those are the time of travel
- 24 capture zones that the program computes.

Page 791

- 1 what your purpose might be, because this is a -- it's
- 2 a powerful software that can do lots of different things that
- 3 we haven't tried to do.
- We just tried to set out the geometry and answer
- 5 the question, why is this recommended flow domain so big,
- 6 because that's where the physical boundaries are. And what
- 7 are the -- what are the properties of this great big thing?
- 8 Well, transmissivity pretty much has to be what it takes to
- 9 get the water and the heat at the right place at the right 10 temperature.
- And so it's a beginning. It's a beginning and
- 12 it's not calibrated in the sense that management tool would be
- calibrated, not even close. But there was a period of time
- devoted to calibration just as there was a period of time
- prior to that developing the mesh, dealing with the anisotropy
- angles, you know, a number of things before we could even
- 17 think about calibrating in the last couple of days before
- 18 sending the thing.
- So it illustrates how we're thinking about it,
- and if we ever get back into it or someone else does, they can
- 21 start making it work better.
- 22 Q. Do you -- is it a tool or calibrated in any
- 23 fashion that impacts could be -- impacts could be shown that
- 24 would be reliable?

Page 793

- 1 Q. Correct. But do you agree that that should --
- 2 that's, I guess -- well, sorry.
- 3 Did you calculate the propagation of drawdown
- 4 from assumed pumping in Kane Springs Valley?
- 5 A. Well, the model is a steady state model, so no.
- 6 Q. All right. And how about in Delamar Valley?
- 7 A. Well, it's a steady state model, so it's all
- 8 constant in time.
- 9 Q. And then, Dr. Johnson, I'm going to direct you to
- 10 Lincoln County, Vidler, Exhibit 19, and I have a copy for you
- 11 here and I have a copy for your counsel.
- MS. PETERSON: And may I approach?
- 13 HEARING OFFICER FAIRBANK: Yes.
- 14 BY MS. PETERSON:
- 15 Q. Are you familiar with that, Dr. Johnson?
- 16 A. I wrote it, at least part -- no, I'm sorry. I
- 17 wrote it with Marty Mifflin.
- 18 Q. Yes. And if I could direct your attention to
- Table 1, which is on page -- well, it's page 31 on the bottom?
- 20 A. Yes.
- 21 Q. And could you read -- do you see the -- on the
- 22 left-hand side, there's a column that says "far field
- 23 controls," and under V-12, it says, "Kane Springs Wash Fault
- 24 fault". Do you see that?

23 controls, and under v 12, it says, Rane Springs wast

Page 797

Page 794

- 1 A. I see far field controls.
- 2 Q. Oh, I'm sorry. No flow barriers. I apologize.
- A. Yeah, um-hum. I do. I see that.
- Q. All right. And could you explain what this
- means, the notes here under the stream flow barrier that you
- have here for Kane Springs Wash fault?
- A. Okay. I need to look at the figure to see B2.
- Q. This was a model that you built; is that correct?
- A. Yes, and the reason -- you know, it's been a long
- time. But that was one of the features. We put a number of 10
- 11 features in there to impede flow to try and reproduce water
- levels using known or suspected fault zones. 12
- I mean, simplified, obviously, but with those F's 13
- and B are barriers to flow. And I think they're fully 14
- 15 penetrating, I think they're like a wall, if I'm not mistaken.
- Q. And this was a model that you built the AEM 16
- model; is that correct? 17
- A. That's correct. 18
- Q. And this was a regional carbonate aquifer model 19
- that you built -- well it was -- this abstract was published
- in this groundwater publication in 2006; is that correct?
- A. Well, the article was published in 2006, but it
- took us about two years of peer review. So I'm not -- what 23
- was your question? I'm sorry. It was published in 2006.

- simple minded, we've got a -- we've got a steady state flow
- field. 2
- We're trying to assign -- we assume a thickness 3
- and we assigned hydraulic conductivities to the different
- domains and then we try to match water levels. And we fiddled
- with it and we fiddled it. It's trial and error. I mean,
- 7 this one is truly trial and error.
- And it runs quickly and so over thousands of 8
- attempts over, you know, two months, we get the water levels 9 to match pretty well with the transmissivities that we've 10

measured.

11

17

22

1

- 12 You know, that's the beauty of this, is these K's
- in there are with our assumption of -- I think we said 13
- 4,000-foot thickness. I can't remember. But with the --14
- 15 these give the -- with our assumed thickness, these get our
- representative of transmissivities that were measured. 16
 - So that's the one place we're proud of the model.
- The place we're not proud of the model is the EH-4 and 5 18
- simulations, Figure 5. 19
- MS. PETERSON: I don't have any other questions. 20
- 21 Thank you.
 - HEARING OFFICER FAIRBANK: Next, City of North
- Las Vegas. 23
- MS. URE: We have no questions. 24

- HEARING OFFICER FAIRBANK: Okay. Seeing no
- questions, the Center for Biological Diversity. 2
- MR. DONNELLY: Thank you. 3
- **CROSS-EXAMINATION** 4
- BY MR. DONNELLY:
- Q. Patrick Donnelly for the Center for Biological
- Diversity. Thank you, Dr. Johnson, for your testimony.
- 8 A. Greetings.
- Q. I've got a number of questions. I guess, first,
- as a baseline question, how long do climate signals take to 10
- show up in the Lower White River Flow System approximately? 11
- A. Our position -- I'll have to answer in general,
- because obviously there's not a single number.
- O. Sure.
- 15 A. I mean, in reality. But our position based on
- our analyses is decades. And the previous, I will say, 16
- conventional wisdom is centuries. 17
- Q. You cited, at various times, a 20-year lag time. 18
- And in a previous question with the Fish and Wildlife Service, 19
- 20 you cited that the two greatest hydrogeologists had determined
- that time. Who are these two greatest hydrogeologists? 21
- 22 A. Did I say that? George Maxey and Tom Eakin, I
- think. 23
- 24 Q. Okay. And so you're citing Maxey-Eakin for a

Page 795

1 Q. Right. And so the model was built sometime, a

- little prior to 2006?
- з A. Yes.
- Q. Would that be accurate?
- A. Um-hum.
- Q. And if I understand this correctly, what you're 6
- 7 indicating is to make the model work, you had to put in this
- Kane Springs Wash fault no-flow barrier, right, to make the 8
- 9 water elevations match between the two wells that you have
- there? 10
- 11 A. Well --
- Q. VF-2 and CSV-3?
- A. Well, two parts to the answer, if you don't mind.
- You know, I don't remember the details just because it's been
- as long as it has and I -- there are a lot of things I do in 15
- this paper differently now. 16
- But I think the takeaway was that, you know, from 17
- this whole effort, was that without B -- let me just make sure 18
- which B it is in the figure. 19
- Q. It's Figure 3; is that right? 20
- A. Yeah. 21
- Q. Or are you looking at Figure 5? 22
- A. Yeah. Well, okay, I would have taken these from
- geologic mapping. And all we're doing here, this is pretty

Page 801

Page 798

- 20-year lag time on pond signals? 1
- A. Well, Eakin found it by comparing the autobahn 2
- precip gage record with the Muddy River discharge record. And
- then when Maxey and his students came along, a couple of years
- later as consultants for Nevada Power, they had a couple of
- more years of record and basically made the same suggestion,
- that it looks like you might have a 15- or 20-year lag between 7
- wet years and high discharge. 8
- Q. Were you here for yesterday's testimony from the 9
- National Park Service? 10
- 11 A. Yes.
- Q. And do you recall them siting data showing 12
- climate signals taking less than one year to show up in the 13
- carbonate groundwater levels in the Lower White River Flow 14
- 15 System?
- 16 A. Well, we think -- yes.

lost my train of thought.

A. All right. I just --

A. (Nodded head.)

recharge rates?

number of other questions.

from tree rings in your report?

- Q. And you did not find that data compelling? 17
- In part. 18

2

5

6

7

8

10

13

16

17

18

19

21

22

23

- Which part? 19
- A. Well, we have -- if -- well, we find two distinct
- forms of the -- of discharge hydrographs. Okay? There's one
- common that I'll call the EH-4 form that is the form that

diagnostic. I'm sorry. Now, with that, going off on that, I

3 Q. I'm actually going to have to move on. I have a

Q. Thank you, thank you. You cited climate data

Q. Does tree ring data demonstrate anything about

reading. This is not expertise. But the width of the tree

Q. Does that indicate anything about recharge rates?

Q. Okay. So the tree rings do not indicate recharge

Palisades. Do Humboldt River flows indicate anything about

A. The width of the tree ring -- now, this is from

A. Potential recharge rates, yes, but not recharge

ring, in general, represents a wet year.

20 Q. You cited data from the Humboldt River at

A. I believe they do as a proxy for available

- receives these diagnostic pumping signals. 23
- The ones with the 2012 recovery in the middle 24

- 1 Q. Might there be confounding factors which might
- alter the climate signals as -- excuse me.
- Might there be confounding factors, which might 3
- confound climate signals as they pertain to recharge rates?
- A. Well, where I have been confounded with this
- particular problem was the increasing flows in Maggie Creek
- 7 that affect the flows at Palisade, which we're using as an
- explanatory variable set. The municipal water used in Elko, I 8
- don't know if they take river water. 9
- Somebody upstream is taking some river water. So 10
- I'd say, in my mind, the biggest confounding factor is that we 11
- 12 don't know if the diversions have affected our -- the total at
- 13 Palisade.
- 14 Q. Are you aware of mine dewatering in the Humboldt
- 15 River basin?
- 16 A. That was my point -- yes, yes.
- Q. Are you aware that it has cumulatively removed
- millions of acre-feet of water from the groundwater there?
- 19 A. Well, that's another confounding factor -- yeah,
- 20 yes.
- 21 Q. Might this make it such that Humboldt River flows
- at the Palisades do not accurately depict a climate regime?
- 23 A. Yes, if that -- if that cone of depression is
- interacting or affecting or depleting the river, absolutely. 24

Page 799

- 1 Q. In your report, you also cite data from the
- Virgin River; correct?
- 3 A. Yes.
- 4 Q. Are you aware as to where the head waters of the
- Virgin River are?
- A. In Zion Park, I believe.
- 7 Q. Is Zion Park part of the Colorado Plateau?
- A. I don't know.
- Q. Okay. Are you aware as to whether the climate in
- Zion Park and the other head waters of the Virgin River is the 10
- same climate as the Great Basin in North Mojave Desert? 11
- 12 A. Well, the climate -- if you're looking for a
- hundred year representation of the climate, there's nothing 13
- else out there. 14
- Q. You seem to indicate that significant recharge 15
- occurs only above 8,000 feet in eastern Nevada; is that 16
- correct? I was not totally clear on that. 17
- A. It's a northward plunging recharge cutoff 18
- surface, that latitude 36 north is at 8500 feet based on 19
- horology of the Kaibab Plateau. 20
- And at latitude 40 north, it's at 7,000 feet, 21
- just above the fish hatchery, entering the Ruby Mountains is 22
- where it comes out. 23
- 24 Q. Does this imply that there's essentially no

Min-U-Script®

rates.

rates?

A. No.

recharge rates?

moisture.

Capitol Reporters 775-882-5322

(27) Pages 798 - 801

Page 802

- 1 recharge within the Lower White River Flow System, for
- 2 instance, since there's no terrain above 8,000 feet?
- 3 A. We have some -- very minor areas, but I'd say,
- 4 yes, to the regional system that's sustaining these Warm
- 5 Springs, most of it comes from further north.
- 6 Q. If there is no recharge below 8,000 feet at
- 7 latitude 36, doesn't that imply that the vast majority of
- 8 Nevada's calculations for recharge in perennial yield are
- 9 wrong across the whole state?
- 10 A. Well, the basin -- see, the difference is there's
- so much more water in the alluvial systems than in this
- regional carbonate system, that for water balance in
- individual basins, they can just ignore this.
- 14 Q. They can ignore recharge?
- 15 A. Well, the -- we're talking about
- 16 200,000-acre-feet of water here. And how much water is in
- 17 Spring Valley? I mean, this is a -- you know, we're -- as far
- as the state-wide resources, this is not a big deal.
- 19 It's a big deal environmentally, but it's -- in
- 20 terms of the recharge, there's plenty of recharge through
- 21 infiltration into the alluvium basins through the stream beds.
- 22 And like we heard yesterday, much less -- any of
- us that have dug holes in the desert know that there's not a
- lot of -- even after it's raining, that the wetting front

- 1 MR. DONNELLY: Before I give it to him.
- 2 HEARING OFFICER FAIRBANK: Well, we --
- 3 THE WITNESS: We're looking at --
- 4 MR. DONNELLY: I've given him Figure 5 from the
- 5 Center for Biological Diversity's July 3rd report, a depiction
- of annual precipitation from 1990 to 2018 in the southern --
- 7 extreme southern Nevada District of the Western Regional
- 8 Climate Center data.
- 9 HEARING OFFICER FAIRBANK: Thank you.
- 10 BY MR. DONNELLY:
- 11 Q. Do you observe a trend with that data?
- 12 A. No.
- 13 Q. So we see that precipitation is essentially --
- 14 I'm sorry?
- 15 A. No.
- 16 Q. So precipitation, on the whole, is essentially
- 17 flat?
- 18 A. There's an annual periodicity, but the trend
- is -- there might be a trend, but it's not visually.
- 20 Q. So there's no reason to think there's a drought
- in southern Nevada over the past 30 years?
- 22 A. Well, from the dying vegetation, something's
- 23 going on.
- 24 Q. No doubt, no doubt. But there's no reason to

Page 803

Page 805

- 1 isn't very far into the soil.
- 2 So there's recharge to the alluvial basins
- 3 primarily through the streams and well documented, like
- 4 40-mile wash especially, good data there, Amargosa, good
- 5 data --
- 6 Q. Excuse me. Is there a connection between the
- 7 alluvial and carbonate aquifers?
- 8 A. Unknown, but probably because the isotopic
- 9 composition continues to become more and more -- in general,
- more and more enriched as you go southward.
- 11 O. Thank you.
- 12 A. So there's got to be some contribution.
- 13 Q. Thank you. Excuse me one moment. I have a
- 14 figure I need to pull up.
- MR. DONNELLY: May I approach the witness with a
- 16 figure?
- 17 HEARING OFFICER FAIRBANK: Yes, you may.
- MR. DONNELLY: I have to apologize, it's on my
- 19 laptop. I'm a new fangled kind of guy and didn't print
- 20 anything out for this thing. So -- but I have it blown up and
- 21 the brightness all the way up.
- HEARING OFFICER FAIRBANK: And, Mr. Donnelly, if
- you'll just make sure that you identify what it is that you're
- 24 showing the witness.

- 1 think there's a drought or decline in precipitation over those
- 2 30 years; correct?
- 3 A. Correct. From that record, correct.
- 4 Q. Thank you. You declared that the drought starts
- 5 in 1999; correct? The drought signal begins in 1999?
- 6 A. I don't think I did. But that would be about
- 7 when -- well, no, no, no, that's not -- I don't think I said
- 8 that and I don't know how you would define the beginning of
- 9 it, a drought.
- 10 Q. I'm going to have to come back to that at a later
- 11 time. You show on page 32 of your report, an increase of
- 12 approximately one CFS at Big Muddy Spring from 2010 to 2014,
- after which it continued increasing by more than 12 percent;
- 14 is that correct?
- 15 A. 132, I've got Iverson and Warm Springs West. Are
- we on the same figure?
- 17 Q. I'm sorry, I was going off of our rebuttal
- 18 report. So now I need to -- I'm going to come back to this
- 19 question as well in my next go-round. Thank you.
- You estimate 40,000-acre-feet per year to the Las
- 21 Vegas Valley. That estimate is based on Darcy's law; is that
- 22 correct?
- 23 A. In part.
- 24 Q. And what was the transmissivity used for that

Min-U-Script® Capitol Reporters (28) Pages 802 - 805 775-882-5322

Page 806

- 1 calculation?
- 2 A. It was in -- it's in the report. It's
- 3 intermediate between what Mifflin International got at some
- 4 wells down in Black Mountains area and the MX-5 or the --
- 5 yeah, the Order 1169 transmissivity and it was higher than we
- 6 determined at ECP-1, I believe. But the number is in there.
- 7 Q. And for one of the references to determine that
- 8 transmissivity, you used your own unpublished report from 19
- 9 -- I'm sorry, your collaborator, Dr. Mifflin's unpublished
- 10 report from 1992 prepared for Nevada Cogen?
- 11 A. I did.
- 12 Q. Is that correct?
- 13 A. Yeah, he --
- 14 Q. Was this 1992 report peer reviewed?
- **15** A. I don't know.
- 16 Q. There are no fewer than 13 unpublished reports in
- your July 3rd report; is that correct?
- 18 A. I'm not sure. They were mostly HRT reports, I
- 19 think
- 20 Q. There are 13, at least 13 reports unpublished
- 21 from a variety of years dating back to 1945, I believe?
- 22 A. '45?
- 23 Q. -- or, I'm sorry, sometime previous to 19 --
- 24 A. Our reports?

- 1 The uncertainty is not much.
- 2 Q. Did you rely on a water budget to determine the
- 3 40,000-acre-feet per year of inflow?
- 4 A. It was purely Darcy's law.
- 5 Q. Were you able to measure discharge or other
- 6 variables related to that within the Las Vegas Valley?
- 7 A. I used the estimate of 60,000-acre-feet, the net
- 8 withdraw rate of 60,000-acre-feet a year that I got from
- 9 Dr. Burns, as a starting point, and had to back that off a
- 10 little through calibration to 59,000.
- 11 Q. Is there any reason to think the Las Vegas Valley
- is in steady state?
- 13 A. Yes.
- 14 Q. What evidence do you have that the Las Vegas
- 15 Valley is currently in steady state?
- 16 A. Because the Las Vegas Valley Water District has
- been trying for 47 years to make it so.
- 18 Q. Okay. Well, I'll leave it at that.
- But -- and you did not use a water budget;
- 20 correct?
- 21 A. What -- budget for what?
- 22 Q. For calculating the 40,000-acre-feet of inflow?
- 23 A. Well, yes, I -- oh, for that? No, no, no, just
- 24 Darcy's law.

Page 807

Page 809

- 1 Q. I do not know. I would have to double check.
- 2 A. Our reports are almost -- have been considered or
- 3 submitted here, all have been shared with the HRT, I believe.
- 4 Q. You site this report for your estimates of
- 5 transmissivity -- excuse me. Your report indicates that the
- 6 anistropy causes that high transmissivity are directly
- 7 parallel to the flow path to the Las Vegas Valley; is that
- 8 right?
- 9 A. In the Darcy's flux calculation?
- 10 Q. Yes
- 11 A. Well, we have -- our two hydraulic gradient
- estimates are along almost parallel lines and the flow is
- 13 generally southward. And so we just simply use the
- transmissivity, the width, the gradient and Darcy's law.
- 15 Q. Was there geophysical evidence to back that up?
- 16 A. To back what up?
- 17 Q. The analysis you just stated that you conducted?
- 18 A. Well, I mean, there's always geophysics in the
- 19 literature. I mean, the big issue with that particular
- 20 calculation is the Las Vegas sheer zone. We don't know what
- 21 it is and the Air Force owns it.
- So, you know, that area is unknown, but the
- 23 gradients are such that if you follow the structural grain,
- 4 you can easily get water comfortably in the Las Vegas Valley.

- 1 Q. So no water budget was used and no discharge was
- 2 measured?
- 3 A. Well, I'm not sure how Andrew measured it, but
- 4 they obviously know what their production is. So, yes,
- 5 discharge was measured.
- 6 Q. Is there evidence that the Las Vegas Valley is in
- 7 steady state, other than the heroic efforts of the Southern
- 8 Nevada Water Authority to make it that way?
- 9 A. The existence of the import water, the revocation
- of all the temporary permits since it first showed up in 1972,
- and the determination of the Water District to stabilize it.
- 12 Q. You reference many efforts made to bring it into
- 13 steady state. Do you have any evidence of it actually being
- in steady state, of those efforts being successful?
- 15 A. No, no, I have a model that assumes it is in
- steady state and the model can be tested.
- 17 Q. Okay. You allege that there is a vast flow field
- 18 originating in northeast Nevada and moving, down gradient to
- the Las Vegas Valley; is that correct?
- 20 A. According to the fee flow results, yes.
- 21 Q. And this flow field includes the Ruby Mountains,
- 22 the Steptoe Valley, the upper White River and the Pahranagat
- 23 Valley?
- 24 A. Well, not the Ruby Mountains, a portion of

Min-U-Script® Capitol Reporters (29) Pages 806 - 809 775-882-5322

Page 813

Page 810

- 1 Steptoe. I'd have to look at -- I mean, we can look at the
- 2 map. But it extends up -- it includes part of the Schell
- 3 Creek range, does not include -- well, the southern most Snake
- 4 Range. It includes the Grant, the Eagan.
- 5 Q. Perhaps the most pertinent here, it does include
- 6 the Upper White River and Pahranagat Valley?
- 7 A. Well, the model domain does, but the elevations
- 8 are low. So the recharge areas are not there.
- 9 Q. Sure. I guess the point is, you're saying there
- 10 is not flow from the Upper White River to the Lower White
- 11 River in Coyote Springs Valley?
- 12 A. I'm not saying that. I don't understand what
- 13 you're thinking I said.
- 14 Q. The map you depicted showed flow from Pahranagat
- 15 Valley, heading westward toward Las Vegas Valley.
- My question is, is there any flow from Pahranagat
- 17 Valley in the carbonate to Coyote Springs Valley and beyond?
- **18** A. Oh, we would agree with pretty much everybody,
- 19 the other presenters that believe there's flow southward
- 20 across the Pahranagat sheer zone from Pahranagat Valley to
- 21 Coyote Spring Valley.
- 22 Q. So the waters part?
- HEARING OFFICER FAIRBANK: And that will be your

MR. DONNELLY: Thank you.

Q. The waters part at the southern end of the

MR. DONNELLY: Okay. Thank you.

MS. HARRISON: We have no questions.

THE STATE ENGINEER: No questions.

Pahranagat Valley and half goes to -- some portion goes to Las

HEARING OFFICER FAIRBANK: Next is Georgia

HEARING OFFICER FAIRBANK: Thank you. Seeing no

questions, and Nevada Cogeneration Associates? Okay. I

haven't seen Mr. Flangas today. Muddy Valley Irrigation

HEARING OFFICER FAIRBANK: Seeing no questions,

and I have been informed that Nevada Energy does not have any

questions. So let's go ahead and open it up to the Division

of Water Resources and State Engineer for questions.

Q. Christi Cooper, for the record. Hi, Mr. Johnson.

Vegas and some portion goes to Coyote Springs?

A. Every molecule has to go somewhere. It can't go

both.

- 1 Q. Page 11 in your presentation today. Thank you.
- 2 Based on your flow domain boundary lines on this
- 3 slide, do you think that the current geographic boundary
- 4 defined as the Lower White River Flow System is appropriate?
- 5 A. Not for the intended purpose as I understand it.
- 6 Not for the intended purpose as I understand it.
- 7 Q. What is -- elaborate on what you think is the
- 8 intended purpose.
- 9 A. Well, I think the -- there's enough evidence that
- 10 there's throughput. In other words, the water in the Warm
- 11 Springs, the water in Las Vegas has to come from somewhere.
- 12 Let's just get back to Las Vegas. And the Spring Mountains
- don't cut it. I don't think anybody can torque max the
- 14 Maxey-Eakin method enough to get warm water out of the Spring
- 15 Mountain.
- So it has to come from somewhere else. So that's
- our thought process is if the water has to get to Las Vegas in
- 18 much greater quantities than the Spring Mountains can sustain,
- and will it -- I think we know where it's coming from.
- 20 Q. Okay. I have just one more question and I'm
- sorry if you did say this in the presentation and I missed it.
- 22 But what do you think is the source of the Big Muddy Springs?
- 23 A. Northern high terrain probably. And this is just
- based on our capture zones, probably areas east of the area

Page 811

- 1 sustaining Pahranagat and Las Vegas. So probably areas east
- 2 of the blue dots in our first blue graph cover slide.
- 3 MS. COOPER: Thank you.
- 4 THE WITNESS: Um-hum.
- 5 EXAMINATION
- 6 BY MR. BENEDICT:
- 7 Q. Jon Benedict for the record.
- 8 Dr. Johnson, to follow up on the question about
- 9 Big Muddy Springs, so a discharge hydrograph for that looks
- 10 also different from other springs that are in the Muddy River
- 11 area. Would you care to provide an opinion on why those are
- 12 different and then what the source area might be for those if
- 13 you think it's a different source?
- 14 A. Well, the -- it's a whole leap to go from
- 15 recognizing that you've got a different source area to
- 16 recognizing what it is.
- But what I can say with high confidence is that
- 18 the conceptual model for the sensitive high elevation springs,
- and the low elevation springs both being fed by the same
- 20 carbonate aquifer.
- I don't see any way in the world you can make
- 22 those such vastly different hydrographs from the same aquifer,
- you know, half mile apart.
 - So I think it's just inescapable that there are

r ago o i i

24 A. Hi, Ms. Cooper.

Min-U-Script®

Page 817

Page 814

- different sources. Now, they may -- like was suggested 1
- earlier, flow paths might have diverged. We've got some very 2
- similar isotropic compositions, but they haven't been 3
- monitored sufficiently. See, that's the thing. We have 1 or
- 2 or 10 analyses, possibly not arid in time, these different 5
- springs. So we don't know. 6
- 7 Big Muddy might be more different than we think
- it is chemically and isotopically than Warm Springs, because 8
- they can't be coming from the same place under the refuge, you 9
- know, or under the MRSA. So if they're not coming from the 10
- same place under the MRSA, where are they coming from? 11
- Well, we can track that EH-4 form hydrographs 12
- back up into Coyote Spring Valley and down to Apex. But we 13
- don't have anything that looks like Big Muddy Springs, except 14
- 15 for the river itself. So it's a really interesting problem.
- We don't know where -- all I can say is it's coming from 16
- 17 somewhere, right? That's a famous quote from Ed Weeks, it's
- coming from somewhere. 18

north 60 east; is that correct?

- 19 So it's coming from the north and it's coming
- 20 from High Mountains. And it's probably not coming from the
- Snake Range, just because of the geology. So any of the other 21
- ones. 22

21

- Q. Could we go to your slide number -- I think it's 23
- 8? A couple of questions here. I just want to make sure I

understand the image on the left with anisotropy. The color

for the Pahranagat sheer zone area is blue and you suggest

that that anisotropy is has a principle direction that's about

about right. And I'm pointing with the pointer on the screen

to the Pahranagat sheer zone that's colored blue based on its

south of the Sheep Range and it kind of trends in a north 80

west direction, but it has an anisotropy with a principle

direction, which I think is probably similar color. So it'd

A. That's about right -- I'm sorry, that would be

Q. You've got a large area that's also blue, I'd say

Yeah, the faults, the structural grain bends

around -- see, up the Las Vegas sheer zone.

Q. So I'm just curious what that blue zone

- 1 A. Yes, that's bedrock. This is the bedrock.
- 2 Q. Okay. The next question goes to slide seven.
- You had stated that your recharge that was used 3
- was 15 centimeters a year. Is that applied across the --
- well, is that an average for the whole area?
- 6 A. Well --
- 7 Q. Or is that an average for the mountain range or
- what's that --
- 9 A. Well, it's the total amount of -- quantity of
- assumed or measured discharge from the different regional 10
- springs, spread over the fixed area of high altitude carbons. 11
- 12 So we'd have to fiddle with it. See, when we let some water
- out of the model to improve the calibration, then we'd have to 13 14
 - do something with the recharge.
- 15 We never messed with the discharge. It was all
- 16 assigned. We never messed with the temperatures and we never
- 17 messed with the Eureka well, you know, trying to vary things
- to make them better. 18
- 19 But we -- to get it to work, you know, we needed
- 20 to let some water -- and I'm pointing to the northwest corner.
- We'd have to let some water out up by Kobeh Valley to go into 21
- Diamond Valley. 22
- And there's some good -- there's MX wells up 23
- 24 there. It'll give you a pretty good hydraulic gradient and a

Page 815

- good basis for estimating the outflow of -- and we'd have to
- do other work on the model. But the way it worked is we'd 2
- have this fixed amount of water we'd want to apply on the --
- to these recharge areas, but then how well did it work? 4
- Well, we've got to let some water out over here, 5
- and so then we've got to increase the recharge a little bit to 6
- 7 make up for the deficit. So that was sort of the workflow in
- the last two days when we got everything built. 8
- Q. Do you recall what the overall discharge volume
- for the model was that you used to --10
- 11 A. It was about -- it was a little over
- 12 200,000-acre-feet a year. But they're all -- it's all in how
- Allen and Crooks, in their table -- it's in our references and 13
- I'm not sure which table, but it's in their table of spring 14
- flows. And we used their numbers exclusively except for Las 15
- 16 Vegas Valley where we assumed 59 -- well, we assumed 60 and
- 17 then backed it off to 59,000.
- Q. Okay. And so just to be clear, that recharge is 18
- really considered only the recharge that you would apply to 19
- 20 the carbonate aquifers and not recharge that would go into the
- 21 alluvial system; is that correct?
- A. Right. This is treated as isolated from the 22
- alluvial system. 23
- 24 Q. Okay. So that portion of recharge that might

17

represents?

18

be about north 60 east?

anisotropy.

- A. You're seeing northeast trend -- you're seeing
- northeast trends. See, those are the structure bending around 19
- 20 in California Wash and, you know, Dry Lake and Garnet Valley.

The special grain bends in there, and so right in here is

- trending northeast. 22
- Q. Okay. So that fabric is -- principle direction 23
- is northeast to southwest; right?

Page 821

Page 818

- otherwise go into the alluvium wasn't considered? 1
- A. Well, recharge going into the alluvium is 2
- irrelevant, unless it also recharges the -- I mean, it's not 3
- irrelevant, it's irrelevant to our analysis.
- Q. Okay. 5
- A. So unless there's a gradient that gets it into
- the carbonates, which we don't see or know about, we don't
- care about it. So we're saying all the water that goes into 8
- the carbonates goes into the mountains. Yeah, that works. 9
- Q. Okay. Same for the discharge then? 10
- A. And the discharge is all coming out at the 11
- regional springs at a temperature -- we assumed the 12
- temperature and I can't remember if it was 35 or 35C, but warm 13
- and -- you know, just trying to see if this will work and --14
- 15 yeah.
- Q. Okay. I think that's all I have. 16
- **EXAMINATION** 17
- BY MR. KRYDER: 18
- A. Levi Kryder, for the record. 19
- Mr. Johnson, I've heard, I think, several 20
- different things today. If you could go to slide -- your 21
- slide 14, please?

correctly?

A. Yeah.

1303.

quantify that?

A. Okay. 23

24 Q. Thank you. So I thought I heard you say earlier

A. Yes, because I don't know of any pumping near

BY HEARING OFFICER FAIRBANK:

Q. And I'm going to focus on page 35 of your July

2019 report submission where you basically summarize your

conclusions and relations to the questions that were, you

know, requested or proposed by the State Engineer in Order

And I guess I wanted to focus on -- first on your

fourth conclusion on that page where you state that pumping

from California Wash has little to no impact on the Muddy

River Springs area and much more groundwater is available in

And my question is, did you conclude how much

more water is available than previously assumed? Did you

24 A. Well, I don't know what previously assumed was,

California Wash than previously assumed.

Q. Dr. Johnson, I have just a few questions.

there in those -- in that time frame, yes.

MR. KRYDER: Thank you.

EXAMINATION

- but our 40,000-acre foot estimate is quite a bit different
- than everything else we've heard, you know.
- 3 Q. So just to clarify, so then are you saying that
- there's 40,000-acre-feet additional water in California Wash?
- A. In transit, and including also Hidden and Garnet
- Valleys through the -- flowing through the Las Vegas sheer
- zone to Las Vegas Valley is 40,000-acre-feet, according to our
- Darcy flux calculation.
- Q. But you didn't quantify that additional water 9
- over those prior assumptions specific to California Wash. 10
- 11 You're only talking about that pass-through flow to the Las
- 12 Vegas Valley?
- A. Well, I guess I must think about it differently, 13
- because I'm not really making sense of the distinction. 14
- I mean, we've got a -- there's really no alluvial 15
- aquifer out there, except for near the springs. So we've got 16
- 17 a carbonate aquifer transmitting an unknown quantity of water
- southward. I think we could probably all buy that. I mean, 18
- 19 there's anywhere from little to no water going through the Las
- 20 Vegas sheer zone or maybe as much as 40,000-acre-feet.
- It depends on how you calculate or if you 21
- calculate it. Now, the zero to -- some of the early ones that 22
- we heard about this morning references two other calculations. 23
- I didn't really see any data, any evidence. 24

Page 819

- 1 Q. But your conclusion was that there was that the responses or the trends on this graph were due solely
- to effected climate and not pumping? Did I understand that 40,000-acre-feet going to the Las Vegas Valley wash --2
 - 3 A. Well ---
 - 4 Q. -- based upon the numbers to support what you see
 - is to be the deficit between the Spring Mountain recharge and
 - the water budget essentially in Las Vegas Valley?
 - A. Oh, I think I understand you better. The 7
 - uncertainty in that Darcy-flux calculation is almost entirely
 - 9 in the transmissivity that we used. You know, the hydraulic
 - gradients pretty much indisputable. The transmissivities is 10
 - -- they vary over the magnitude. So they could be northern 11
 - magnitude, less, it could be more. 12
 - Q. So are you -- never mind. I'll move onto another 13
 - question. 14
 - With respect to Subpart 6 on page 35 of your 15
 - report where you make a statement that if a long-term drought 16
 - 17 trend evident in climate records persists, no amount of
 - pumping curtailment will restore or maintain high elevation 18
 - spring flows. 19
 - Curtailment of pumping in sustainable locations 20
 - will serve no purpose, and thus, mitigation measures, 21
 - including curtailment will likely not prove effective in 22
 - protecting seeded right holders in the Muddy River and Moapa 23
 - Dace habitat from continued drought impacts. 24

Min-U-Script® Capitol Reporters

775-882-5322

(32) Pages 818 - 821

SE ROA 53284

Page 825

Page 822

So my first question is, is -- and I haven't been 1

- clear today on what you believe or what your opinion is as to 2
- that timing delayed response for climate in the water flow. 3
- It's -- I've heard a range from it can be as little as ten 4
- years to centuries. 5
 - And so I'm trying to understand a little bit
- 7 better from our perspective in terms of trying to make
- management decisions, what your opinion is as to what you 8
- believe that climate delay may be? 9
- A. Yeah. We're advocating centuries as shown in 10
- that last figure of our direct report with the time of travel 11
- capture zones. That's the best we can do now. 12
- 13 And it's consistent, we believe, with both the
- isotopic data and the heat flow and the radiocarbon ages. If 14
- 15 you take the -- well, I don't want to get too technical on
- 16

6

- 17 But we think it's decades. I only mentioned
- centuries because others have claimed it's centuries. And, in 18
- fact, in the waste isolation business, there's a school of 19
- thought that we're looking at ice age water, just centuries 20
- just sitting there. 21
- Q. So I guess I'm still confused because you started 22
- out your response saying you believed your opinion was it was 23
- centuries, and then you said that you believe it's at least 24

- So that leads us to suspect that maybe that is 1
 - actually a composite hydrograph as something from the north 2
 - and something from the Sheep Range. 3
 - Q. And so I guess the final question is based upon
 - that opinion that was expressed in Subpart 6, and in this kind
 - of uncertainty or this delayed response to climate change or
 - 7 that -- you know, these declines as you've expressed in your
 - testimony today and in response to Mr. Kryder's question, that
 - if these declines are -- the declines in water availability is 9
- due to climate change, and that there's nothing that we can 10 do. 11

12 Is it your opinion that the State Engineer

13 shouldn't actively manage the system to try to create some

form of sustainability? I guess I'm just confused? 14

15 A. Well, I won't say a word about what you should do, okay? But what I will say is that is a very big "if". I 16

17 should have capitalized that "if," the number six, if the

trend continues, because all those hydrographs were presented 18

in the EH-42 now that we have an update to it.

Everything is still declining after the test.

Now, we're not doomed. That's not going to go on forever. 21

Nothing goes on forever. But if it continues, the big "if," 22

23 if it continues, at some point, we'd start hitting trigger

levels at the Warm Springs West Gage. We know it. 24

Page 823

19

20

- decades. And so I'm trying to get a better understanding.
- A. You misunderstood me. I was giving credit to the 2
- Southern Nevada Water Authority and their work to the north in
- the estimating centuries to impact to senior water rights from 4
- activities north of us. 5
- So with that background, that's not my belief. 6
- That's a professional opinion of somebody else that you've 7
- accepted. So I just gave that for reference. 8
- 9 And in our analysis, because -- both because of
- these climate solutions, and I think you may have a little 10
- misunderstanding. 11
- What we're saying with these two climate 12
- solutions, the one for Big Muddy, we're saying is explained by 13
- the wet years between 12 and 22 years prior to the
- observation. 15
- So in other words, this year, whatever we total 16
- up in two weeks or a week from Big Muddy Spring for the last 17
- year is explained by the weather between 12 and 22 years ago 18
- as proxied by domino. 19
- 20 The other one in the EH-4 hydrographs, we're
- saying that those were explained by weather from last year to 21
- 22 16 years ago. So it's got a 16-year memory, but it's right on
- us. You know, the first year, we don't know. The first year, 23
- we get a kick in the hydrographs. 24

- 1 And so that's what we're trying to call out for
 - you is a big "if," and try to bring in all this other evidence 2
 - to show you that it's not pumping to blame for all of this.
 - Pumping has an effect. The location matters, it really 4
 - matters. 5
 - Q. So to understand that, then, no matter what we do 6
 - with respect to pumping, if we don't -- if -- you know, if 7
 - pumping is able to escalate or deescalate, it will make no
 - difference in the end? Is that what you're saying to us?
 - A. No. Pumping, in general, will affect -- have 10
 - more effects closer to the pumping well than more distant. 11
 - 12 But we all know already that in this heterogenous and
 - anisotropic terrain, you can get minimal effects close in or 13
 - almost identical effects, you know, drawdowns, you know, a 14

 - great distance as near. So I don't -- that's a big "if". 15
 - 16 You know, we're not saying we're doomed and the climate drought is going to keep going. Everybody needs to be 17
 - concerned about that, but there's not anything we can do about 18
 - it. But what we can do is just recognize that all of this 19
 - water level change is not -- you don't blame the pumping. It's about as -- I don't think it's scientific, honestly. I 21
 - don't think it's scientific to continue to attribute all the 22
 - water level change in the EH-4 form hydrographs to pumping. 23
 - It's just -- you know, I feel like we've proved 24

Min-U-Script® (33) Pages 822 - 825 Capitol Reporters 775-882-5322

20

Page 826

- it, but -- and obviously it's -- there's a lot of doubt. But 1
- I think the pumping effect is minimum. And if something 2
- happens with the climate, you're going to have to deal with 3
- that as a new process. You've never had to deal with that
- before. But I would just manage the -- you know, I think if
- you manage the pumping smartly, you'll be fine. 6
- 7 The climate will do what it will do. You might
- have to take some extraordinary measures someday, but that's 8
- to be figured out. It's a hypothetical. What we do know 9
- is -- I say "we," and this is me and Marty and the few we've 10
- 11 convinced, is that once you start looking at this more
- realistically in terms of the flow field and the nonuniformity 12
- of -- spatial nonuniformity and temporal nonuniformity of 13
- impacts, you'll see it completely differently and I think much 14
- 15 more favorably.
- Now, it won't be favorable to anybody that --16
- 17 like Dr. Waddell pointed out, what do you about the excessive
- production in Las Vegas Valley if it's excessive? Did you 18
- really issue water rights far in excess of the perennial 19
- yield? That's your problem. But if you didn't, that's 20 somebody else's problem. But I can't talk about -- I'm not
- 21 authorized or experienced to talk about, you know, the 22
- water -- the users. 23
- HEARING OFFICER FAIRBANK: Thank you. All right. 24

- HEARING OFFICER FAIRBANK: Okay. And then Muddy 1
- Valley Water District -- excuse me, Moapa Valley Water 2
- District? 3
- 4 MR. MORRISON: We don't have any questions.
- HEARING OFFICER FAIRBANK: No additional
- questions. And Lincoln County, Vidler, will you have
- additional questions?
- MS. PETERSON: Not right now, but I don't know 8
- what Mr. Taggart's going to do, so --9
- HEARING OFFICER FAIRBANK: And City of the North 10
- 11 Las Vegas?
- MS. URE: No. 12
- HEARING OFFICER FAIRBANK: And Center for 13 14
 - Biological Diversity?
- 15 MR. DONNELLY: Yes, regardless of what Taggart
- does. 16

17

22

- HEARING OFFICER FAIRBANK: And Georgia Pacific?
- MS. HARRISON: No questions. 18
- HEARING OFFICER FAIRBANK: Okay. Seeing no 19
- questions there. And then Muddy Valley Irrigation Company, 20
- will you have any additional questions? 21
 - MR. KING: No questions.
- THE STATE ENGINEER: No questions. 23
- HEARING OFFICER FAIRBANK: And then, Ms. Baldwin, 24

Page 827

Page 829

- So we're about ten minutes from noon. I just want to kind of
- get a sense of additional participants because we'll -- we do 2
- have time to open it up for additional questions if there are
- additional questions. 4
- So I'm just going to kind of run down the list, 5
- and then assuming there's additional questions, we'll resume 6
- after lunch. So Coyote Spring Investments, will you have 7
- additional questions? 8
- 9 MR. HERREMA: No.
 - HEARING OFFICER FAIRBANK: No. Okay. U.S. Fish
- and Wildlife Service, any additional questions? 11
- MR. MILLER: No. 12
- HEARING OFFICER FAIRBANK: And National Park 13
- Service? 14

10

- MS. GLASGOW: No. 15
- HEARING OFFICER FAIRBANK: No additional 16
- questions. Southern Nevada Water Authority, Las Vegas Valley 17
- Water District? 18
- MR. TAGGART: Well, I don't want to be the only 19
- reason we come back after lunch. 20
- HEARING OFFICER FAIRBANK: So if you're not the 21
- only person, then yes, you have additional questions? 22
- MR. TAGGART: If there's going to be redirect and 23
- we're going to come back, then we would have questions.

- will you have -- want to do some redirect? 1 2
 - MS. BALDWIN: Not the full half-hour, but yes.
- HEARING OFFICER FAIRBANK: Okay. So let's plan 3
- on coming back after lunch and so we'll resume at noon -- or, 4
- excuse me, 1:00 p.m. 5
- (Lunch recess at 11:52 a.m.) 6 7

Page 835

- 1 CARSON CITY, THURSDAY, SEPTEMBER 26, 2019, P.M. SESSION
- ---oOo---2
- HEARING OFFICER FAIRBANK: Okay. We'll go ahead 3
- 4 and go back on the record. And we're going to go ahead and
- reopen things up for recross-examination. And we'll start
- with Southern Nevada Water Authority. And we'll allow an
- additional ten minutes at this point in time for the further
- questions.
- **RECROSS-EXAMINATION** 9
- 10 By Mr. Taggart:
- Q. All right. Good afternoon, Dr. Johnson. Again,
- Paul Taggart for the record. A couple of quick questions. 12
- One is you were asked about -- by Ms. Peterson 13
- about this groundwater study or paper that you did in the 14
- 15 groundwater magazine that's marked as Tribe's Exhibit Number
- 30. Do you remember those questions? 16
- 17 A. I remember the session. Not the specific
- questions. 18
- O. Okay. Do you remember whether in that study you 19
- considered the -- there to be a no-flow boundary between
- Garnet Valley and Las Vegas Valley?
- A. Well, from the F-1 -- Excuse me. I'm referring
- to figure one in the reference publication. The F-1 is drawn 23
- along the Las Vegas shear zone but it's a segment. It

- that would be taken out if you were to do that again today.
- Does that make sense?
- 3 A. Excuse me. I missed most of that as I was
- looking for figure five in our initial report. And I've got
- a hydrograph for that of BMDL 2.
- 6 Q. I'm looking at page 55.
- 7 A. In our initial report?
- 8 Q. Yes.
- 9 A. Okay. That's the same figure as on the screen.
- 10 Q. Okay. And I just want to ask you do you know
- whether you would consider CSI Well Number 1, CSI Well Number
- 3, and CSI Well Number 4 to be within that yellow MRSA area, 12
- 13 which is the MRSA capture area in your figure?
- 14 A. Repeat the wells again, please.
- 15 Q. CSI-1, CSI-3, and CSI-4.
- 16 A. I think so -- I have another plot, I believe,
- with those plotted, and I would say yes.
- Q. Okay. So, therefore, in your opinion would
- pumping from those wells, CSI-1, 3, and 4, impact the Muddy
- River Springs?
- 21 A. No. With qualification.
- 22 Q. Okay. Well, they're within your capture; am I
- 23 right?
- 24 A. It's a scoping model.

Page 836

Page 838

- doesn't -- Yes, there's a segment of the Las Vegas shear zone
- that's represented as an impermeable boundary. 2
- 3 Q. Okay. Do you believe that alluvial pumping in
- the Muddy River area captures Muddy River flow, water that
- would otherwise, I'm sorry, be in the Muddy River as flow?
- Yes. 6
- Q. And do you believe that happens essentially as 7
- a -- on a one-to-one ratio?

23

- Q. Do you believe that carbonate pumping within the 10
- capture zone that you've identified also impacts the Muddy
- River and the Muddy River Springs?
- A. Yes. With qualifications.
- Q. Okay. Now, do you have a figure that shows where
- your Muddy River -- your Muddy River capture zone is?
- 16 A. Figure -- Page two.
- Q. It's the one with the --17
- A. Power point. First figure up in the --18
- Q. Yeah. I was hoping we could find one that's a 19 20 little bigger. But -- Oh, yeah, figure five from your
- report, but also that one that's up on the screen. So my 21
- 22 specific questions have to do with what is in and what is not in the MRSA capture zone, which I think is depicted in yellow
- here with your qualification that part of the eastern part of

- - 1 Q. Okay. Earlier you were testifying about how
 - Sheep Range recharge makes it to the Big Muddy Spring, do you
 - recall that?
 - 4 A. No, I don't believe that's correct.
 - 5 Q. Okay. Do you think that that Sheep Range
 - recharge makes it to the Muddy River Springs?
 - 7 A. Yes. To those with the hydrograph of VH-4 form,
 - if that makes sense.
 - Q. Okay. Now, I think earlier I asked you about
 - impacts from pumping at MX-5 during the Order 1169 pumping
 - test. Do you believe that pumping at Arrow Canyon impacts 11
 - 12 the MX-5 area?
 - 13 A. No.
 - 14 Q. Are you -- Are you aware of anyone else who
 - shares that opinion other than Dr. Mifflin? 15
 - 16 A. Well, the opinion has been shared with everyone
 - in this room. And I haven't taken a poll. And I think 17
 - opinions are changing. 18
 - Q. Okay. Now, I'd like you, if you could, could you 19
 - look at Figure 5-5 that I put in that binder right in front 20
 - of you? 21
 - 22 A. Thank you.
 - Q. So that is a -- that is in SNWA's initial report 23
 - and you've reviewed that; correct? You reviewed that report?

Min-U-Script® Capitol Reporters 775-882-5322

(2) Pages 835 - 838

Page 839

- 1 A. Well, yes, weakly, w-e-a-k-l-y, reviewed. I've
- looked at it. 2
- 3 O. All right. Okay. I'm just using this to look at
- the hydrographs. So, do you see the top hydrograph there,
- which is CSVM-1, the top panel?
- A. I do.
- 7 Q. And would you agree with me that this is a
- monitor well that is very close to MX-5?
- A. I think it is. That's one I'm not as certain of
- the location on as some of the others. But I believe it is 10
- 11 close and northeast, if I'm not mistaken, of MX-5.
- 12 Q. Okay. And do you agree that that monitor well
- shows the signal of pumping at MX-5 during the pump test? 13
- A. I do, because of the diagnostic -- Let me see
- here. 2012. The 2012 recovery. So yes. 15
- Q. Okay. Now, and can you -- have you quantified
- 17 the amount of drawdown at that location in quantity?
- A. I am not sure. I don't believe -- Well, I'm not 18
- sure. I'm not sure. I looked at several wells using our 19
- method of differences. And the nearest well was MX-4. And I 20
- think the next one out was UMVM-1. So I think I have not 21
- looked at any of the detail CSI-1 or -- Is that what it is?
- CSVM-1. 23
- 24 Q. But is it kind of, in your words, is it okay to

- 1 Q. Yes. Could you go to slide 17 on your power
- point there, please.
- 3 A. I'm trying. I'm trying. 17?
- 4 Q. Yes. No. Keep going. Two more. Now, before I
- ask this question, I've got another slightly different one.
- You talked about a opinion that you have regarding roughly
- 40,000 acre-feet of water going through the shear zone, Las
- Vegas shear zone in to Las Vegas Valley from the Lower White
- River Flow System; right?
- A. Yes. Qualified. 10
- 11 Q. Okay. But would you agree with me that if that
- 12 was occurring that that amount of water is already being
- appropriated in the Las Vegas Valley? 13
- A. I don't know what the status of appropriations 14
- is. All I have is verbal hearsay. I think better than 15
- hearsay, but a verbal total quantity pumped and total 16
- 17 quantity reinjected estimates both.
- Q. Okay. Did you check the State Engineer's pumping
- inventories on their website and to validate the statement 19
- that was made to you by Mr. Burns or did you just simply rely
- upon that statement that he made? 21
- 22 A. I relied on his statement.
- 23 Q. Okay.
- 24 A. And it was modified slightly during the modeling,

Page 840

Page 842

- 1 blame pumping for this drawdown in this particular
- hydrograph? 2
- 3 A. Important point. Drawdown, yes. Water level
- change, no.
- Q. Okay. Now, if you look down at the California
- Wash, there's one, two, three panels down, there's
- Pauites-TH2 California Wash. Do you see that panel? 7
- A. Got it. 8
- Q. Okay. And would you agree with me there was also
- a change in water level during the pumping test?
- Yes.
- Q. Okay. But in this well you do not believe that
- pumping can be blamed for that change in water level;
- correct?
- A. Not for the entire change. There's a component 15
- of environmental -- environmentally -- Excuse me --16
- environmentally-driven change also. 17
- Q. Okay. But can pumping be blamed for any of this 18
- change in this water level? 19
- 20 A. Absolutely, based on the diagnostic 2012 recovery
- peak. 21
- Q. Okay. And, let me specify, pumping at MX-5 22
- during the 1169 pumping test.
- 24 A. Understood.

- 1 during the calibration. But initially precisely on his
- estimate. 2
- MR. TAGGART: Okay. Thank you very much. 3
- HEARING OFFICER FAIRBANK: All right. So the
- next participant who had expressed interest in asking
- additional questions after the lunch break was the Center for 6
- Biological Diversity. And you will have ten minutes. 7
- MS. PETERSON: I think I would like some 8
- 9

13

- HEARING OFFICER FAIRBANK: I'm sorry. What was 10
- that, Ms. Peterson? 11
- MS. PETERSON: I think I had a couple of 12
 - questions and I had reserved some time after I heard
- Mr. Taggart's questions. 14
- HEARING OFFICER FAIRBANK: I'm sorry. I didn't 15
- mark you down. But I will go ahead and -- Mr. Donnelly, if 16
- you'll wait, we'll just continue in the order as we've been 17
- going. So, excuse me. 18
- Ms. Peterson, we'll go ahead and call you up for 19
- 20 Lincoln County and for Vidler. Thank you.
- MS. PETERSON: Thank you. 21
- RECROSS-EXAMINATION 22
- By Ms. Peterson: 23
- 24 Q. Hi, Dr. Johnson.

Min-U-Script® (3) Pages 839 - 842 Capitol Reporters 775-882-5322

Page 843

- 1 A. Hello.
- Q. Karen Peterson again for Lincoln County Water
- District and Vidler Water Company. Were you here for
- Dr. Waddell's testimony yesterday?
- Q. And did you hear him express an opinion that
- drawdowns do not stay in capture zones?
- A. I did.
- Q. And do you agree with that? 9
- A. No. Qualifying.
- 11 Q. No. Qualify. Okay. What's your qualification?
- A. Depending on the anisotropy of the system, which
- we're the first to discuss and I'm not sure if we're the 13
- first to analyze. But depending on the degree or the extent 14
- of how anisotropic the transmissivity is, in the extreme you 15
- would have a pipe. And then he's wrong, okay. 16
- 17 So the argument or the explanation that
- Dr. Waddell gave us is absolutely correct for an isotropic 18
- 19 system. And it begins to -- And if you can get him to
- respond, maybe I've got this wrong. But I would suggest that 20
- for an anisotropic system, which is what we analyze, that's 21
- less correct than the context of the statement he made
- yesterday. 23
- MS. PETERSON: Thank you. I don't have any 24

- the water from all of these little recharge patches tries to
- get in to get organized in to the system. So it's much less 2
- clear. 3
- There is a boundary between the capture zones 4
- farther north. But the look of those -- The stream lines are
- a mess. Put it that way. For it to solve all of these
- little bits of flow, it doesn't do anything for you visually.
- Q. So the northern and eastern boundaries of these
- flow paths are unclear?
- 10 A. Well, not so much the boundary. It widens out.
- 11 What the eastern captures zone widens out. So they're more
- 12 proportional to the north. But you do have more water in our
- 13 assumed conceptual model coming out of Las Vegas and
- Pahranagat in those springs than you do out of Muddy and 14
- 15 Panaca. So we would have a proportionately smaller capture
- zone, all other things being equal. 16
- Q. Do you have any geochemical or other types of
- analysis to prove these flow paths? 18
- 19 A. Yes.
- 20 Q. Did you present those here and I'm just glossing
- over that? 21
- 22 A. No. I didn't present any geochemistry, because I
- was hoping to get it on cross, and so far nothing.
- 24 Q. So you have a geochemical analysis tracing water

Page 844

Page 846

- 1 further questions.
- HEARING OFFICER FAIRBANK: Thank you. 2
- Mr. Donnelly. 3
- **RECROSS-EXAMINATION** 4
- By Mr. Donnelly: 5
- Q. Thank you. Patrick Donnelly with the Center for 6
- Biological Diversity. Hello again, Dr. Johnson. 7
- A. Mr. Donnelly. 8
- Q. I want to hit a couple of topics we talked about
- before in a little more detail. First, I would like to get
- back to this idea of the two flow fields. One we can call 11
- the illegal Las Vegas Express. And the other I feel like we 12
- didn't get a whole lot of detail about. You know, the map 13
- you showed -- I believe it was slide two in your presentation
- with the two flow fields -- shows a pretty small area for 15
- recharging the Muddy River Springs. 16
- And can you expound more on the exact boundaries 17
- of this recharge area, particularly how far north and east it 18
- goes? 19
- 20 A. And I, unfortunately, because the -- Well, we had
- access to the software, we didn't make a plot of -- or I 21
- didn't preserve a plot of stream lines for the whole state, 22
- for the whole flow domain. So what these do north of the 23 illustration is widen out and get really squirrelly as all 24

- - from north and east of Panaca to the Muddy River Springs
 - area, you're saying?
 - 3 A. Well, can I show you just one example from a
 - slide?
 - 5 Q. Sure.
 - A. I'm going to have to go backwards in my power
 - point. But I want to show you one -- a couple locations and
 - a couple of numbers. Okay. That was it. We've got the
 - 9 slide. That's slide 11. It shows our Darcy flux
 - calculation. And, by the way, that 40,000, in our opinion, 10
- is, even though we use transmissivities that were mid-range 11
- of what's been measured, we're only comfortable with 12
- asserting to you that that would be an upper limit, pending 13
- any more data. 14
- But in this figure --15
- 16 (The court reporter interrupts)
- THE WITNESS: I'm pointing to the Craig Ranch 17
- Number 2 Well at the southern end of the page 11 diagram of 18
- our power point. That well, if you refer to Thomas and
- 19
- 20 others professional paper, I believe it's 1409C, that's got a
- 21 stable isotope composition of, if I recall correctly, minus 107 and a half or 107 on the deuterium and about minus 14 on
- 22 the oxygen. That's exactly what Vidler has in KPW-1. 23
- How did that isotopic composition that's lighter 24

Min-U-Script® (4) Pages 843 - 846 Capitol Reporters 775-882-5322

Page 847

- 1 than anything that can be developed at this latitude, how did
- 2 it get from there to there?
- 3 Q. (By Mr. Donnelly) So that is on the western, the
- 4 Ely to Vegas Express flow path, but not on the Muddy River
- 5 Springs area flow path; correct?
- 6 A. The way we visualize the flow fields as, again,
- 7 drawn by a scoping model and we can see in detail the
- 8 problems. But, yes, the water that we claim as entering Las
- 9 Vegas Valley, I forget the quantity at the moment. But we've
- 10 got a gradient and everything has got a finite permeability.
- 11 So some water has got to be going in there.
- 12 Q. Can I move this on? But I appreciate this
- depiction there. Thank you. You're aware of past
- 14 characterizations of the carbonate groundwater flow paths in
- 15 central Nevada showing Railroad Valley as a regional sink?
- 16 A. Can you be more specific about the literature?
- 17 Q. You got me. I do not have a reference for that,
- 18 so I'll move on. You declared in your report the drought
- starts in 1999; is that correct?
- 20 A. I don't think I said that.
- 21 Q. On page 29 of your July 3rd report, you say,
- since the start of the ongoing drought in 1999.
- 23 A. Okay. There's -- If you want to --
- 24 Q. I'm just asking if those words are in your report

- 1 A. I'm not trying to be funny with you. I'm
- 2 serious. I don't know. I don't know. I hope we've
- 3 convinced somebody. I hope one hand would go up.
- 4 Q. Okay. Thank you. I have one remaining set of
- 5 questions and I'll move things along here. You show on page
- 6 32 of your report, you describe an increase of approximately
- 7 one CFS at Big Muddy Spring from 2010 to 2012 -- '14; is that
- 8 correct?
- 9 A. Page 32?
- 10 Q. Page 32.
- 11 A. Figure 27?
- 12 Q. You just verbally describe or in text you say
- there's an increase.
- 14 A. Tell me where in the text.
- 15 Q. I'm sorry. I don't have it in front of me.
- 16 A. Okay. I can find it. Just read it to me.
- 17 Q. You say there's an increase of approximately one
- 18 CFS at -- I'm sorry. I'm flipping between files here -- Big
- 19 Muddy Spring. Center of the page. Second sentence of the
- 20 second paragraph.
- **21** A. However between 2010 and 2014?
- 22 Q. Yes. Discharge --
- 23 A. The Muddy Spring increased by one full CFS.
- Okay. And I'm referencing a figure, 27.

Page 848

Page 850

- 1 or not.
- 2 A. Well, I don't remember, so I would have to look.
- 3 Tell me again the page. Actually, let's don't waste time on
- 4 it. I believe you.
- 5 Q. Okay. So you said the start of ongoing drought
- 6 in 1999. Are you aware of when the significant increase in
- 7 Arrow Canyon pumping began?
- 8 A. It was about the same time. And that's the
- 9 assumption that we're challenging. That's the fundamental
- 10 problem here. That assumption that those two are cause and
- 11 effect rather than just correlative.
- 12 Q. I understand.
- 13 A. But it is our -- That's our fundamental problem.
- 14 It all starts there.
- 15 Q. Are you aware of anyone else, hydrologists, the
- other 11 reports being presented here, who agree with that?
- 17 A. My co-author.
- 18 Q. Indeed. From the 11 other parties in this?
- 19 A. I'm not sure. I really honestly think opinions
- are evolving here. And so ask for a show of hands.
- 21 Q. I don't think I'm permitted to do that, so I'm
- 22 not going to.
- 23 A. Well, no. I mean --
- 24 Q. I'm not an attorney, but I don't think --

- 1 Q. Yes. So are you aware of a fire near Big Muddy
- 2 Springs in 2010?
- 3 A. Absolutely. I was there.
- 4 Q. Might the reduction in evapotranspiration due to
- 5 the fire cause increases in spring discharge?
- 6 A. There's been that speculation. I don't know that
- 7 there's any evidence.
- 8 Q. But that could be a cause for the increase in
- 9 spring discharge?
- 10 A. An influence. A component, a forcing agent, yes.
- 11 O. Okay. Finally, one last thing. As we've
- determined, you said your 40,000 acre-feet inflow to Las
- 13 Vegas Valley number is based on modeling; correct?
- 14 A. Very simple. It's all there, all of that
- 15 modeling.
- 16 Q. Yes, yes. And then in a question from the State
- 17 Engineer's office you said it could be in order of magnitude
- 18 more or less?
- 19 A. If you were to use the transmissivity of roughly
- 20 a hundred thousand meters squared a day from the MX-5, 1169
- 21 pump test, you would get a lot more water coming across that
- 22 boundary. But from our steady state, from REM, the published
- one, we think the transmissivities in that domain in
- 24 California Wash are much less than at MX-4. And because --

Min-U-Script® Capitol Reporters 775-882-5322

Page 851

- So we put a mid-range between our Calpine test, our ECB-1 1
- test, and the Mifflin International Test down in Black 2
- Mountains that got about a -- I'm going to screw up units 3
- because they use gallons per day per foot -- about a million.
- Q. So but in theory, as you've attested earlier, the
- amount flowing in to Las Vegas Valley could be between 4,000
- acre-feet per year and 400,000 acre-feet per year?
- A. Well, if you --8
- Q. Is that correct? 9
- A. Yes. With qualification. 10
- 11 Q. Would having 4,000 acre-feet of inflow a year
- throw off the budget that has been conceptualized here? 12
- A. Well, hasn't -- Excuse me to answer with a 13
- question. But I think everybody has hypothesized inflow from 14
- the Pahranagat Valley. I mean -- I guess I don't understand 15
- what you are --16
- 17 Q. You developed a model for the Las Vegas Valley
- and the amount of water flowing in and this flow path --18
- A. Now, this is this simple little model that's on 19
- the screen. Is that the one you're discussing? 20
- Q. Yes, yeah. 21
- A. Good. Okay. 22
- Q. So would a flow amount, in-basin flow amount of 23
- 4,000 acre-feet substantially alter your results here?

- we did at EH-4, but we would have to go back in to R and look
- at the thousand possibilities for -- Again, I use -- I would 2
- try both rivers. I would try both rivers and see which one I 3
- get a better fit with. But, you know, we have hundred year
- stream flow records that we can sample to try and explain
- these hydrographs. And if we get with one all positive
- correlation coefficients, maybe we got it. Maybe that's it. 7
- So that's what -- I don't like to talk about 8
- drought anymore. I think it's a red herring. I think most 9
- of these explanatory climate intervals are longer than the 10
- typical drought segment. So we're better off, I think, 11
- thinking in terms of a data-driven model based on the best 12
- 13 climate long term, century type climate proxies that we can
- 14
- 15 MS. COOPER: Thank you.
- **EXAMINATION** 16
- 17 By Mr. Sullivan:
- Q. Adam Sullivan. I have one question on your slide 18
- 19 11. You give an explanation for this in your testimony, and
- 20 maybe I didn't quite understand it. But at the bottom end of
- the figure, there's -- you're showing flow arrows in blue 21
- that are going in the southwestern direction and then you 22
- show water surface elevations at Gilcrease and Wilshire 23
- Wells? 24

Page 852

Page 854

- 1 A. No.
- MR. DONNELLY: Okay. I guess we'll leave it at 2
- 3 that.

8

- HEARING OFFICER FAIRBANK: Okay. Thank you. So 4
- and just to confirm, those were the only parties that I had 5
- listed for asking questions after the break. Are there any 6
- other parties, participants, that wanted to ask questions? 7 Seeing none, then I'm going to go ahead and open
- 9 it up to State Engineer staff for any questions.
- **EXAMINATION** 10
- By Ms. Cooper: 11
- Q. Hi. Christi Cooper for the record.
- A. Hi, Christi. 13
- Q. Can you go to slide 14, please. Thank you. I
- believe that you stated that the drop in the water levels 15
- that we see after 2014 in to 2015 maybe but you thought that 16
- was not due to the pumping response; is that correct? 17
- A. Correct. 18
- Q. Okay. So what do you think is the reason for the 19
- 20 subsequent water level rise?
- A. The way I would approach this is exactly the way 21
- we approached the Big Muddy Spring to find that piece of 22
- climate record that explains the, in this case, the 23
- hydrographs. In other words, it's a parallel study to what

- 1 A. The Gilcrease is a spring. Wilshire is a City of
- North Las Vegas well.
- 3 Q. Can you just explain why it appears on this
- figure that water is flowing from low gradient to high
- gradient?

14

- 6 A. It's a function of the anisotropy. It's not --
- If you follow the flow path, it's not.
- O. Maybe I'm misunderstanding. I'm just looking at
- the number 539.5 and the number 714.8.
- A. Yeah. But that's not where the -- The water is 10
- flowing down those -- follows those arrows. See, that's the 11
- anisotropy. That's what's confusing people. See, if you 12
- believe that the -- Just imagine a bundle of tubes, a tube 13 bundle, a bunch of little pipes instead of an aquifer,
- contained between those red lines, the California Wash and 15
- the Gas Peak Thrust, you've got a river. You've got a river 16
- and it -- a molecule stays about the same distance from the 17
- bank of that river all the way down. 18
- So that's the conceptual model that we suggested, 19
- 20 I believe, somewhere that maybe a paradigm shift is needed.
- Maybe treat the system like the Muddy River was treated. You 21
- 22 know, lock in the water rights, get a special master if you
- need it, treat it like a stream. Because there's no question 23
- there's a hydraulic gradient. There's no question there's 24

Min-U-Script® Capitol Reporters 775-882-5322

(6) Pages 851 - 854

Page 855

- flow. There's a lot of water to the south that's coming from 1
- somewhere. And so it's an idea that it's new, it's not 2
- basins anymore. And you've got to start somewhere, but at 3
- least you know where you finish. 4
- So that's what an anisotropy does. Just imagine
- that you've got a bundle of little tubes in that aquifer that 6
- 7 it can't -- the water can't move sideways. We're not that
- restrictive in our model. It's a ten-to-one ratio. But 8
- imagine if that anisotropy ratio was a hundred-to-one or a 9 thousand-to-one like it might be down a fault fracture, 10
- right. Super permeable transmissivity in the long axis of
- 11 the fracture next to nothing, you know, out in to the rock. 12
- 13 So that's the concept that -- one of the concepts we bring
- that I'm sure everybody has that's got any hydro background, 14
- 15 but it's not been part of this analysis. And once you start
- treating this as a strong anisotropic system favoring 16
- 17 north/south flow, everything looks a little different and
- easier actually, management wise. 18
- So it's a function of the anisotropy that's 19
- giving it. The water is not flowing that high. It's flowing 20
- north to south and restricted in how much it can get out and 21
- flow east to west. That's the anisotropy.
- Q. Is there some water level data that you can point 23
- to that supports that characterization?

- that and yet another response 20 miles away that looks --
- that's half as strong, I mean, it's attenuated, but there's 2
- no doubt based on that 2012 recovery signal that, yeah, that 3
- pumping schedule is getting down to apex but it can't get
- across half a kilometer of rock in the other direction. 5
- So, once you realize how strongly anisotropic the 6
- system is, everything changes. You might want to treat it
- like a river. And I don't say that tongue in cheek. I mean,
- we don't know how strong anisotropic is. So it's just an
- idea that might make things easier. 10
- 11 Q. Okay. Thanks.
- 12 A. Yeah.
- **EXAMINATION** 13
- By Mr. Benedict: 14
- 15 Q. Jon Benedict for the record. I just want to
- follow up on that. Do you see any problem with using MX-6 as 16
- 17 the monitoring well to measure that gradient going across the
- capture zone that's shown in --18
- A. Well, it's a production well, so you have to go
- look at the recovery intervals to estimate water level. And,
- of course, it's trending too. So these are -- We've got --21
- Let's take that one, 553 and 539, there's 14 meters of 22
- difference between those and there's not that much 23
- uncertainty in taking the water level at roughly the same 24

Page 856

Page 858

- A. Well, these are all -- Well, it's more the
- pumping response. When you see a direction -- directional 2
- dependence to the pumping response, you've got -- Well, one 3
- explanation is that you've got an anisotropic system. 4
- Heterogeneities will do that too. But if the water, for 5
- example, the best example I can think of is the response of 6
- 7 CSVM-6 to MX-5. This response and actually its water levels
- are identical to those in MX-4, identical. So that thing is 8 9 one transmissive fracture connecting the broken zone or
- whatever it is at the pumping site with a well a couple of 10
- miles to the north in Covote Spring Valley. So that thing 11
- responds instantly and exactly like the monitoring well close 12
- right beside the pumping well. 13

20

- On the other hand, CSI-3 production well there to 14
- the west of the Horst they discussed the other day, they did 15
- a, it was either 24 hours long aquifer test on that thing 16
- while CSVM-6 was being monitored by transducer. No response. 17
- 18 No detectible response. And then you can quibble about
- whether there was any response from CSI-1 or CSI-2, which 19
- were on and off during that testing. They didn't silence the other production wells while they tested a new one. 21
- So there's a little bit of -- But there's good 22
- evidence that there's directionality to the transmissive 23
- properties, strong directionality. I mean, how can you have

- time. So, you know, if we're off by a meter so in
- representative water level three to one, it won't change the 2
- fact that there's a gradient north to south.
- 4 Q. But if you think they're in separate capture
- zones then why would you suggest that that gradient is
- 6 important?
- 7 A. Oh, I see what you're saying. Well, again, the
- capture zone is from a scoping model and you can see -- we 8
- 9 can already see that it's not accurate out in the Coyote
- Spring Valley. We're capturing from areas where we know 10
- there's -- The example I just gave you, the CSI-3 example. 11
- No effects. But, you know, you go where you can get a good 12
- water level. 13
- Now, if I went to -- Actually, if we want to do 14
- some math, we could. I know Wilshire -- Well, somebody 15
- 16 convert 539.5 to feet. And we're looking for something up
- there about 1812 or 1815. So I think there will still be a 17
- gradient. I think you can move south on that. I was looking 18
- for long -- the longest distance I could get, you know, to do 19
- 20 those Darcy calculations.
 - So you either use just the other one. If you
- don't like that one, let's go down and use maybe H-4. That's 22
- a couple of feet lower, but it's also a little bit south. So 23
- I bet it would come out pretty close. 24

Min-U-Script® (7) Pages 855 - 858 Capitol Reporters 775-882-5322

21

Page 862

Page 859

- MR. BENEDICT: All right. 1
- **FURTHER EXAMINATION** 2
- By Ms. Cooper: 3
- Q. Christi Cooper. Can you just maybe following up
- on your statement about CSI Well Number 3. Do you think that
- there was any pumping effects seen from the MX-5 pumping test
- 7 there?
- A. It's a production well, so I don't know. It's 8
- been busy and it was in service.
- Q. What would you say as far as to the other CSI 10
- wells, 1, 2 and 4? 11
- 12 A. Well, the production wells aren't -- You know,
- when I think about the effects, I want to look at them in the 13
- CSVM sense and not in the production wells. I mean, we 14
- 15 could. But that's exactly where you'll find the messiest
- data and the most uncertainty about what's, you know, 16
- recovered water levels. So I avoided those for -- as 17
- designers. 18

1

2

8

16

- MS. COOPER: Okay. Thank you. 19
- **EXAMINATION** 20
- By Ms. Barnes: 21

available.

7 Q. Three.

- Q. Michelle Barnes for the record. I'm looking at
- figure seven from appendix three. It's the isotope data. I 23
- don't have a question specifically on the chart. I was just

wondering if you would be willing to make that data

3 A. I don't have any isotope data of my own. Let me

A. Page three. Oh, I see. That must be here. It

Q. I'm just wondering if you would be willing, I

guess, and able to make that data available?

A. It's TRI data. It's in your -- This is all out

got it. I've got it. Which page? I'm sorry.

must be here. Oh, okay, okay. We're getting there. I've

see what this is. I'm sorry. What --

Q. Appendix three, figure seven, page 57.

A. Which appendix, number wise, is this?

- analyses, so everything in that one reference.
- Q. Okay. Thank you.
- HEARING OFFICER FAIRBANK: All right. So we're 3
- doing well on time today and so I wanted to just find out
- whether or not Southern Nevada Water Authority has any 5
- additional questions? 6
- Seeing no additional questions, Lincoln County,
- Vidler, do you have any further questions? Seeing none. 8
- And, finally, Center for Biological Diversity? 9
- Okay. Well, then we'll go ahead and open it up 10
- to -- you wanted to reserve some time for redirect? 11 12

MS. BALDWIN: I think we're okay.

HEARING OFFICER FAIRBANK: So seeing that you're going to not do anymore redirect, okay, we'll wrap things up and we will go ahead and conclude the hearing for today.

Oh, yeah. Thank you for reminding me. So 16

yesterday Mr. Waddell -- Dr. Waddell, you had wanted to

get -- you had said you were going to get back with some 18

information regarding a report. Would you like to go ahead 19 and share that with us? 20

THE WITNESS: Should I move, pack up? 21

HEARING OFFICER FAIRBANK: Yes, Dr. Johnson,

you're done for the day. Thank you. 23

MR. WADDELL: Yes. Rick Waddell for the record. 24

Page 860

13

14

15

17

22

- I was asked to provide the reference to that Stan Leake work
- dealing with recovery time from pumping. And so I found
- that. It's in a US Geological circular -- US Geological 3
- Survey circular by Paul Barlow and Stan Leake. It was
- published in 2012. Title is Stream Flow Depletion by Wells,
- Understanding and Managing the Effects of Groundwater Pumping
- on Stream Flow. That's US Geological Survey circular 1376.
- And it's available on the web at the following URL: HTTPS,
- 9 colon, front slash, front slash, DOI, dot ORG, front slash, 10
 - 10.3133, front slash, CIRC, 1376.

HEARING OFFICER FAIRBANK: Thank you very much, 11

Dr. Waddell. 12

All right. Well, I think we've concluded our 13 proceedings for today. So we will go ahead and commence 14

tomorrow promptly at 8:30 a.m. Thank you very much. (Hearing concluded at 1:40 p.m.) 16

of the baseline data report. 17 Q. Oh, okay.

- A. It's Southern Nevada Water Authority's baseline 18
- data report. 19
- 20 Q. Perfect. Thank you.

Q. Page 57, figure seven.

A. Oh, yeah, good, yes.

- A. And I don't think we put that as one of our
- exhibits, but it's in here. It's around.
- Q. Okay. Thank you.
- 24 A. Yeah. It was just the number and just the

1 CARSON CITY, NEVADA, FRIDAY, SEPTEMBER 27, 2019, A.M. SESSION

-000-2

3

HEARING OFFICER FAIRBANK: Good morning. So we

- will go ahead and get started this morning. This is a
- continuation of the hearing regarding the Lower White River
- Flow System and Order 1303.
- And this morning, we will be starting with 8
- Southern Nevada Water Authority and Las Vegas Valley Water
- District. And, Mr. Taggart, you may go ahead and proceed. 10
- MR. TAGGART: Good morning. As was said, my name 11
- is Paul Taggart. I represent the Southern Nevada Water 12
- Authority and Las Vegas Valley Water District. 13
- We've assembled a panel this morning to provide 14
- 15 you with the information -- hydrologic information related to
- the 1303 order, and we will also have a panel to describe the
- 17 biological issues that we have -- that we plan to present,
- that will be on Monday. 18
- So with me here today is Ms. Colby Pellegrino, 19
- Mr. Andrew Burns, and Ms. Warda Drici. And after we swear
- them in, I'll have them introduce themselves to the panel. 21 HEARING OFFICER FAIRBANK: Okay. If we can go
- ahead and swear in the witnesses. Thank you. 23
- (Panel sworn.) 24

1 A. Okay. So very briefly, the Southern Nevada Water

- Authority is essentially a wholesale water provider with seven
- member agencies, the largest of which is the Las Vegas Valley 3 Water District. We were originally created in 1991 to manage 4
- the State's Colorado River allocation, but our 5
- responsibilities now include regional water supply planning. 6
- So we have a myriad of water rights in this area 7
- and I'm going to go through those very briefly. The SNWA 8
- controls about 20,000-acre-feet of decreed surface water on 9
- the Muddy River, about half of that is through the Muddy 10 Valley Irrigation Company shares that we own and lease. 11

12 We also have 9,000-acre-feet of water from Coyote

13 Spring Valley that was originally owned by the Las Vegas

Valley Water District. 2200-acre-feet of water in Garnet and 14

15 Hidden Valley that are used to meet the needs of the power

plants and the future needs of the City of north Las Vegas. 16

As I mentioned, the district is the largest member agency of SNWA. The two agencies share common staff,

19 and in addition to the district owning the groundwater rights

20 in the Las Vegas Valley, they are also the operator of the Coyote Springs Water Resources General Improvement District, 21

which is responsible for the water -- which is responsible for 22

the water system that serves the Coyote Spring Development. 23

24 Q. Is SNWA also a party to the MOA and could you

Page 869

17

18

1 BY MR. TAGGART: 2

DIRECT EXAMINATION

- Q. Good morning. And could each of you, for the
- record, state your name and spell it for the record, and also 4
- what is your position at the Southern Nevada Water Authority. 5
- MS. PELLEGRINO: I'm Colby Pellegrino, 6
- 7 P-E-L-L-E-G-R-I-N-O, Director of Water Resources for the
- 8 Southern Nevada Water Authority and Las Vegas Valley Water
- 9
- MR. BURNS: I'm Andrew Burns, A-N-D-R-E-W, 10
- B-U-R-N-S, and I'm the Manager of the Water Resource Division 11
- for SNWA and Las Vegas Valley Water District. 12
- MS. DRICI: Good morning. I'm Warda Drici, 13 Warda, W-A-R-D, as in David, A. Drici, D, as in David,
- R-I-C-I. I am a hydrologist with the Southern Nevada Water 15
- Authority. 16
- BY MR. TAGGART: 17
- Q. Thank you. And my first questions will be for 18
- you, Ms. Pellegrino. 19
- 20 Could you provide the State Engineer briefly with
- an explanation of the role SNWA has in the Lower White River 21
- 22 Flow System, why SNWA and the Las Vegas Valley Water District
- is a stakeholder in these proceedings? 23
- ANSWERS BY MS. PELLEGRINO: 24

- describe their role in that way?
- A. Yes. So there's a series of agreements that were
- implemented post Order 1169 to allow the pump test to
- 4 continue. One of those was a memorandum agreement with the
- Moapa Band of Paiutes. It's actually a series of agreements. 5
- The Muddy Valley Irrigation Company, the Moapa 6
- Valley Water District, ourselves, the Fish and Wildlife 7
- Service all related to the compliance and settling claims to 8
- groundwater associated with these basins.
- Q. And could you describe the role SNWA has played 10
- in the activities that have led us to where we are here today? 11
- A. Okay. I think I'm going to go back and talk a 12
- little bit historically to do that. 13
- One of the things that the Water Authority in 14
- every -- and the Water District in every proceeding before the 15
- State Engineer has said, is that our conceptual models cannot 16
- be validated until we have not only significant pumping 17
- stresses, but also recovery data. 18
- So in 2001, we went before the State Engineer on 19
- 20 applications in this area, and I want to read two quotes that were Mr. Ricci summarizing our testimony in that hearing. 21
- And the first one says, "while testimony 22
- presented indicated that belief that significant quantities of 23
 - water may be available for capture from storage, it is unknown

Min-U-Script® (2) Pages 868 - 871 Capitol Reporters 775-882-5322

24

what quantity that would be and if any underground water could 1 be appropriated without unreasonable and irreversible 2

impacts." 3

He went on to summarize that our testimony and 4 evidence, and I quote again, "indicates that their own expert 5 witnesses are unable to make a suggestion to the State 6 7 Engineer as to what part of the water budget could be captured without a great deal of uncertainty and that the question 8 cannot be resolved without stressing the system." 9

So after Order 1169, we prepared for the pump test and entered into the MOA and several other agreements, like I mentioned previously. A few years after that, we also had a series of agreements in relationship with NV Energy regarding the surface water on the Muddy River as well as water for Garnet Valley for use of the power plants.

We later constructed the 348 pipeline to 16 17 facilitate the Order 1169 pump test, and we were required to submit, within a relatively short period of time after that 18 test was done, data to the State Engineer that would be used 19 to determine whether the outstanding applications, how they 20 would be dealt with. 21

After that, it was a pretty significant period of 22 time where through the recession, economic activity in this 23 general area was low. But we began to see more aquifer 24

Page 874

THE WITNESS: So as the development began to ramp 1 back up in this area through our role as the operator of the 2

general improvement district, we began expressing concern that

the water that they were relying upon would not be there in

perpetuity to support that development. 5

I'm not going to get into the whole history here, 6

7 but essentially after sending that message to Coyote Springs

Valley several times without much response, we asked the State

Engineer for their opinion on whether there was water there 9 for that development, and ultimately that's what's led us to 10

the process that we're here involved with today. 11

12 BY MR. TAGGART:

13 Q. Ms. Pellegrino, are -- was SNWA's reports for the

hydrologic and biologic resources that were submitted to the 14

15 State Engineer, were those prepared under your direction and

supervision? 16

17 A. Yes.

18 Q. And I'm going to ask you to just summarize for

the State Engineer what SNWA's recommendations are based on 19

the four 1303 questions that were asked. And I just want to 20

clarify for the record that you're summarizing what would be 21

supported through the expert testimony of Mr. Burns and 22

Ms. Drici? 23

24 A. Yes.

10

Page 873

Page 875

- 1 recovery data in the response to the aquifer in general after
- the pump test had concluded. And then we began, within the 2
- last maybe 3 to 4 years, seeing more significant economic 3

activity occurring. 4

5

6

7

9

10

11

And we were really coming to a new realization that the aquifer was not recovering as well as that there were on going declines. So when the Coyote Spring development really began ramping up again, we began expressing to the developer --

HEARING OFFICER FAIRBANK: Mr. Herrema. MR. HERREMA: Brad Herrema for CSI.

Ms. Pellegrino has not been designated or qualified as an 12 expert. I believe she's here as a fact witness and so 13 opinions or conclusions about recovery of the aquifer, I don't 14 think are appropriate. 15

MR. TAGGART: We don't disagree. Any expert 16 conclusion on that topic will be provided by Mr. Burns and 17 Ms. Drici. 18

HEARING OFFICER FAIRBANK: Okay. So the 19 20 testimony will only be considered in this relationship as that as a fact witness, and certainly any expert opinions or 21 interpretations of data will be relied upon by the testimony 22 of those experts so designated. 23

MR. HERREMA: Thank you. 24

1 Q. Okay. Please -- what recommendation is SNWA

making regarding the geographic boundary for the Lower White

River Flow System?

4 A. This question was the hardest question in a lot

of ways for us to reach a conclusion on, because it's much

easier for us to identify where there is high levels of 6

connectivity and degree of connectivity. 7

But the boundary really depends a lot upon how 8 9

the basins are jointly managed together. And I'm going to give just a few hypotheticals that I think will shine some

light on why this is a little bit perplexing for us. 11

12 For example, if there are water rights that are really at a very far distance from the springs and the impacts 13 to senior water rights and a new basin is added, and that 14 water is allowed to move between all of the basins, there is 15 the potential that that pumping could move closer to the 16 springs and could impact senior water rights and the 17

endangered Moapa Dace sooner. 18

So in some ways, hydrologic connectivity may be 19 20 there, but the management decision of allowing water to move across the basins could be a problem. 21

Similarly, there's less connected areas, which 22

Ms. Drici will talk about, such as the Black Mountains area 23 24

where taking that water and moving it closer to the springs

Page 876

1 and into a more connected area would accelerate impacts.

- 2 So ultimately, regardless of the boundary, we
- 3 know that the State will have to continue managing the
- 4 adjacent basins to ensure that we're not negatively impacting
- 5 the Lower White River Flow System, because no matter where the
- 6 boundary is drawn, if the adjacent basins are allowed to
- 7 significantly pile up points of diversion along the boundary,
- 7 significantly pric up points of diversion along the boundary
- 8 that's going to have a negative impact along with -- so
- 9 there's just some unintended consequences that were really
- 10 hard to contemplate here.
- So we make the recommendation that the boundaries should not change, but should be revisited in the next portion
- of this where we'll talk about groundwater management
- designer. Dut we do have some extensive testiment on
- 14 decisions. But we do have some extensive testimony on
- 15 hydrologic connectivity within this region.
- 16 Q. Now, the second question that the State Engineer
- has asked under 1303 has to do with the hydrological responses
- to the Order 1169 pumping test and what will SNWA's
- 19 recommendations be regarding that?
- 20 A. I'm going to be very brief here, again, because
- 21 Andrew and Warda are going to present a lot of testimony on
- 22 this. But essentially water levels are continuing to decline
- in this area as a result of the ongoing pumping.
- 24 Q. And with respect to the question about moving

- 1 senior water rights and look at what the Moapa Dace need, we
- 2 formed the conclusion that based upon protecting a flow of
- 3 3.2 CFS at the Warm Springs West Gage, there's approximately 4
- 4 to 6,000-acre-feet of water that can be pumped long term.
- 5 However, that water cannot and should not be
- 6 pumped long term without dealing with the conflicts and the
- 7 capture of Muddy River water. I'm just going to go on to say
- 8 that conflicts, the State's very familiar with. There's
- 9 litigation, there's damages and that can be very costly.

But violating the SAS criminal penalties and as a

- water manager, I take that very seriously, and I don't believe there's any way that we can reasonably separate those two
- issues when we consider how much water can be pumped in this
- 14 basin.
- 15 Q. And my last question for you, Ms. Pellegrino, is
- 16 what would you like the State Engineer to do at the conclusion
- of the hearing with those recommendations?
- 18 A. We appreciate the State Engineer's process that
- 19 they've laid out, that this is the first phase in that
- 20 process. We would ask that the State accept written closing
- 21 arguments as well as a written draft order that addresses the
- technical findings that are the subject of this hearing,
- including the hydrologic connectivity of the basin, asking
- 24 that they reserve final resolution of the jointly managed

Page 877

2

14

19

- alluvial pumping to carbonate wells or moving current
- 2 carbonate pumping to alluvial wells, which is the fourth
- 3 question the State Engineer had in his 1303 order, what is
- 4 SNWA's recommendation with respect to that?
- 5 A. Our recommendation is essentially that it doesn't
- 6 matter where you move it. You may change the timing of
- 7 impacts, but impacts will still occur to the Muddy River
- 8 Springs and senior decreed water rights.
- 9 Q. Okay. Now, lastly, what is SNWA's recommendation
- 10 regarding the long-term annual quantity of groundwater that
- 11 can be pumped in the Lower White River Flow System, including
- 12 the relationships between the location of pumping on discharge
- 13 from the Muddy River Springs and capturing Muddy River flow?
- 14 A. This hydrologic region is unique. I think
- 15 everyone in this room knows that. If the Muddy River were not
- 16 there, the changes that we see in groundwater levels would not
- 17 constitute an unreasonable lowering of the water table. And
- 18 if the springs were not there, there weren't endangered fish
- 19 in those springs. The capture of senior decreed water rights
- 20 could be dealt with in a way that the Moapa Dace prohibit in a
- 21 lot of ways. So we have kind of two answers on this.
- There's no quantity of water that can be pumped
- 23 long term without conflicting with the decree by capturing
- 24 Muddy River water. If you set aside those conflicts with

- 1 boundary for the next phase of management discussions.
 - We also feel that there's ample evidence that
- 3 groundwater pumping should not be allowed to increase and new
- 4 permanent use is not being allowed within the five basin area
- 5 while we continue to set out on a path for decreasing water
- 6 use in this general managed area.
- 7 Q. Thank you. Now, I have some questions for
- 8 Mr. Burns and Ms. Drici.
- 9 Both have been pre-qualified in this proceeding
- 10 based upon being qualified in prior State Engineer hearings.
